THE Maldives were the first islands discovered by the European navigators on their arrival in the Indies. The most northern of them are reckoned fifteen leagues from Cape Comorin; they extend from seven degrees twenty minutes north to one degree south latitude; but are no where above thirty or thirty-five leagues broad. Within this space are contained such a prodigious multitude of little islands, that their number cannot be fixed. The prince, who is sovereign of them all, takes the title of sultan of thirteen provinces and twelve thousand islands. There is doubtless some pride and great exaggeration in this pompous title, which strongly favours of oriental vanity.

In this multitude of little islands a great number are uninhabited. Some are only covered with herbs and timber; others have no verdure, and are nothing but moving sand: some of these last disappear with the flux of the tide; others are daily washed away; and those that have only trees and herbs are covered with crabs, large lobsters, and penguins, a species of birds as large as a goose. Not only the desert islands, but those which are habitable, are extremely small, since Male, the most spacious of them, and the place of the king's residence, is no more than a league and a half in circumference.

They are divided into thirteen provinces, or divisions, called by the inhabitants attolons; and are separated from each other by freights, which either their narrowness, the rocks, or sand-banks, render impassable to merchant-ships. Nature has in a surprising manner fortified these islands against the rage of the impetuous torrents, by encompassing them with rocks, which serve as a rampart, against which the waves dash in vain: yet they have four openings opposite to each other, where the channels which cross this long and narrow cluster of islands serve them for harbours, according to the difference of the seasons.

As these islands are in the midst of the torrid zone, it may be imagined that the heat is excessive. The days and nights are equal, and the nights are always extremely cool, and attended with a plentiful dew. This coolness renders the heat of the day more supportable; and, as it refreshes the earth, the vegetables thrive here as well as in temperate climates.

The rainy season begins in April, and lasts six months. The fair weather begins in October, after which it never rains, and the wind is always at east, till the approach of the rains.

The soil is as fertile as can be desired, in such things as it produces; which are millet, pulse of various kinds, and chiefly cocoa-nuts; and, it is said, that there is no country in the world where that fruit is so fine and plenti-

ful, and as this alone is sufficient for all the necessaries of man, the expence of living in the Maldivia islands is almost nothing. With the cocoa-trees they build vessels of three hundred tons burthen, and from them have all their rigging. They also make oil of the fruit for their kitchens and lamps. Oranges, citrons, and pomegranates are no less plentiful here. The sea also abounds with variety of fish; and on the land are tortoises that have large and beautiful shells. Black and green amber are found here, and also black coral, and the shells called couries, or blackmoor's-teeth, which in many parts of the world serve instead of money.

The Maldivians are a tractable people, easily dealt with. They are of an olive complexion, and small of stature, but well proportioned. Most of them go quite naked, except wearing a cloth about their waist; yet they are said to excel, in manufactures, and also in letters and the sciences, most of the Eastern nations, and have particularly a very high esteem for astronomy. They are besides prudent and sedate, skilled in the management of their naval vessels, brave and courageous, expert in the use of arms, and there reigns amongst them a well regulated police. The people are of the Mahometan religion, and when one of them has made a voyage to Mecca he has the privilege of wearing a long beard as a sign of his sanctity.

The king's revenue chiefly consists in the fifth of the fruits gathered by his subjects, and of what they can save from vessels wrecked on their coasts. The allurements of this sort of gain has rendered them surprisingly dexterous in recovering goods from the bottom of the sea.

However, the small profits to be made here is the reason why none but the Portuguese have endeavoured to establish themselves in these islands. They were discovered in 1507 by admiral Soarez, who concluded an alliance with the king of the country, which was confirmed by Segueira, who according to custom, asked leave to build a fortified magazine at Male; which was granted without difficulty by the prince, who was delighted with the presents he had received, and hoped to derive great advantages from an union with a nation then so famous. Gomez erected the fort on the sea-side of wood and earth; he having neither stone nor lime to raise a more solid structure. But this work was scarcely compleated, when, trusting too much to the reputation of the Portuguese and to the friendship of the king, he shewed that he was disposed to rule both over the foreigners and the natives of the country, and to give the law in matters of commerce. The Mahometans plotted secretly against him; they attacked the fort suddenly, when he had only fifteen or twenty soldiers with him; they killed him, and made themselves masters of the place. Thus the Portuguese, by their own pride and folly, lost that establishment as quickly as they had acquired it.

C H A P XXIV.

O F P E R S I A.

S E C T. I.

Of its Name, Boundaries, Situation, and Extent. Its Provinces, Climate, Rivers, and Minerals; with a particular Account of the Springs of Naptha, found in Persia.

PERSIA, according to the Poets, derived its name from Perseus, the son of Jupiter and Danae. Less fabulous authors suppose it derived from Paras, which signifies a horseman, the Persians being always celebrated for their skill in horsemanship; but the name is too ancient for us to receive any certain account of its origin, and it is to little purpose to give an account of the conjectures of authors, when all disagree.

This kingdom is bounded on the east by the dominions of the Mogul; on the north by Usbec Tartary, the Caspian sea, and Circassia; on the south by the Indian ocean and the gulph of Persia, or Bassora; and on the west by the Turkish Empire. This extensive kingdom is situated between the twenty-fifth and forty-fifth degrees of north latitude, and between the forty-fifth and the sixty-seventh degrees of east longitude from the meridian of London. The length and breadth of this kingdom is therefore nearly equal; and were not the north-east parts of Persia divided from the north-west by the Caspian sea, the form of this country would be almost square. However, it is twelve hundred miles from east to west, and nearly as much from north to south.

This extensive kingdom is divided into the following provinces: on the frontiers of India are Chorasan, part of the ancient Hyrcania, including Herat and Elterabad; Sableustan, including the ancient Bactria and Candahor; and Sigistan, the ancient Drangiana.

The southern division contains Mazeran, Kerman, the ancient Gedrosia, and Farsistan, the ancient Persia.

The south-west division on the frontiers of Turkey contain the provinces of Chusistan, the ancient Sufiana, Irac-Agem, the ancient Parthia, and Curdestan, part of ancient Assyria.

The north-west division, lying between the Caspian sea and the frontiers of Turkey in Asia, contains the provinces of Aderbeitzen, the ancient Media; Georgia, Gangea, and Dagistan, part of the ancient Iberia and Colchis; Ghilan, part of the ancient Hyrcania; Shirvan, and Mazanderan.

The longest day in the south of Persia is thirteen hours and a half, and in the north above fifteen hours. In a country so extensive the air and seasons must necessarily be very different: thus in the middle of the kingdom their winter begins in November, and continues till March, with severe frosts and snow, great quantities of which fall on the mountains, but much less in the plains. From the month of March till May the wind is generally high, and from thence till September they have a calm serene sky, without even a cloud. In the day-time the weather is pretty hot, but the refreshing breezes which constantly blow in the mornings and evenings, as well as in the night, render the summer very tolerable, especially as the nights are ten hours long. The air is so pure, and the stars shine with such lustre, that people usually travel in the night; and the air is so dry during the fair season, that not the least dew or moisture falls on any thing exposed to the air. No country is more healthful than the heart of Persia; and the foreigners, who come there strong and robust, generally enjoy a constant series of health; but it is observed, that those who are sick at their arrival seldom recover.

In the southern part of Persia the air is very unhealthy in the spring and fall, but this is not the case in the

months of June, July, and August; the weather, however, is so very hot, that both natives and foreigners retire to the mountains. The hot winds which blow from the eastward over long tracts of sandy deserts are extremely suffocating, and sometimes a blast strikes the traveller dead in an instant. In the north part of the Persian dominions, particularly the provinces of Georgia, Shirvan, and Aderbeitzen, though very dry and warm during the summer, are subject in the winter to storms and tempests, and as severe a frost for six months together as any countries on the continent in the same latitude: but these provinces being very mountainous, there is frequently a surprising difference between the air on the north and south sides of the mountains, so that people in a few miles travelling imagine themselves in a different climate; but though these mountains are cold, they are extremely healthful. On the contrary, the flat country of Ghilan and Mazenderan, which lie near the Caspian sea, are very damp and unhealthy; and the inhabitants are obliged in summer to retire into the mountains, their water in the low grounds being foul and corrupted.

It has been observed, that there is no country in the known world of so large an extent as Persia, that has so few navigable rivers; for in the heart of that kingdom there is not a single river that will carry a boat of any burthen, and in some parts a person may travel several days without meeting with any water at all. Indeed the river Oxus, which separates Persia from Usbec Tartary, has a large stream; but none of its branches rise in the Persian dominions. The rivers Kur and Aras, antiently called the Cyrus and Araxes, which rise in the mountains of Ararat, and flow through Georgia, Shirvan, and Aderbeitzen, and, after joining their streams, fall into the Caspian sea, are much the most considerable rivers in the dominions of Persia. There are, however, several small rivulets which fall from the mountains, and are conveyed to their principal cities.

As water is so scarce, it is no where husbanded better; nor have any people more ingenious methods of conveying it to their cities, the corn-fields, and gardens. This is a public affair, and there is an officer in every province to take care of the proper distribution of the waters. All their little rivulets and springs are turned to those parts of the country where they are most wanted; they also dig wells of a prodigious depth and breadth, out of which they draw the water with oxen in great leather buckets, which being emptied into cisterns, is let out as occasion requires for the service of the country. They have likewise vast subterranean aqueducts, through which water is conveyed to places at the distance of twenty or thirty leagues. These aqueducts are two fathoms high, and arched with brick; and at the distance of every twenty paces are holes, like wells, made for the more easy repairing them. The distribution of the river and spring water is made one day to one quarter of the town, and another day to another, when every one opens the canal or reservoir, in his gardens to receive it; for which a certain sum is annually paid for every garden to the government, particularly about Isphahan; and as it is easy for a person to divert his neighbour's water into his own channel, this crime is severely punished.

As to the Persian minerals, they have good mines of copper, iron, and lead; sulphur and saltpetre are found in the mountains: they have also antimony and emery. There are plains near twenty leagues over covered with salt, and others with salt-petre and alum. In some parts of Carmania the salt is said to be so hard, that the poor people use it instead of stone in building their cottages.

In the provinces of Fars and Shirvan are found great quantities of bole armoniac, and a marl used by the country people instead of sope.

In the island of Wetooy, in the Caspian sea, are springs of black or dark grey naptha, which boil up highest when the weather is thick and hazy. This naptha frequently takes fire on the surface, and in great quantities runs in a flame into the sea, to an almost incredible distance from the shore: but in clear weather the springs do not boil up above two or three feet. This oily substance in boiling over becomes of such a consistence, that by degrees it almost closes up the mouth of the spring; and sometimes these mouths are closed up, and hillocks formed over them as black as pitch; but when they are stopped up in one place, they break out in another, though some that have not been long open form a mouth of eight or ten feet in diameter.

This substance has a disagreeable smell, and is chiefly used by the poor as we use oil in lamps, or to boil their provisions. It burns best when mixed with a small quantity of ashes; and, as they have great plenty of it, every family is well supplied. The people keep it under ground in earthen vessels, at a small distance from their houses, on account of its being very liable to take fire. There is a white naptha of a much thinner consistence in the peninsula of Apcheron, which the people drink as a cordial and medicine, and also use it externally. It is said to be carried into India, where, being properly prepared, it makes a most beautiful and lasting varnish.

Their marble is either red, white, or black; and some is veined with white and red. One sort of it will split into large flakes or tables, like slate; but the best, which comes from Tauris, is white mixed with green, and is almost as transparent as crystal. In the country about Tauris is also found the mineral azure; but it is inferior to that brought from Tartary. The most valuable mines in Persia are those in which are found turquois-stones.

S E C T. II.

Of the Face of the Country. The Corn, Plants, Trees, Fruits, and Shrubs of Persia; particularly of the Senna Tree, the Tree that produces Manna; the Persian Poppies, and the Manner of extracting Opium from them; the Tree which yields Assafoetida, and the Method by which it is obtained. Of the Beasts of Burthen, particularly of the Persian Camels, Horses, and Mules. The Birds, Reptiles, Insects, and Fishes.

AS to flowers, there are few of them in the south part of Persia, excessive heat being as destructive to them as extreme cold; but nothing can appear more beautiful than the fields of Hyrcania, where are groves of orange trees, jellamines, and all the flowers known in Europe; and the east part of Persia, called Mazenderan, is one continued parterre from September to April, the whole country being covered with flowers; and though this is their winter season, it is also the best time for fruits. In the other months the heat is so intolerable, and the air of the plains so unhealthy, that the natives are obliged to retire to the mountains. In Media the fields produce ranunculuses, anemonies, and tulips. About Ispahan and some other towns, jonquils grow wild: they have also violets, lilies, daffodils, and pinks in their season, and some flowers which last all the year round; but they have the greatest quantity of roses and lilies, and export a great deal of rose-water.

In the spring there is plenty of yellow and red gilly-flowers, and another red flower resembling a clove; it is of a beautiful scarlet, and every sprig bearing thirty of these flowers, forms a fine head as large as a tennis-ball.

Rice, wheat, and barley, are almost the only corn that grows in Persia; for they have no oats, and little or no rye. Their seasons are different in the north and south, for when they are sowing in one part of the country, they are reaping in another, and in some places the di-

stance between seed-time and harvest does not exceed three months.

Most of the roots and fallads of Europe are to be found in their kitchen-gardens; and they have no less than twenty sorts of melons, which the people make their constant food. Those that are first ripe in the spring are round and small, but those that ripen in the latter part of the season are the best; these are as sweet as honey, and some of them are so large that they weigh eight or ten pounds. People of quality have them all the year round; for they preserve them by placing them under ground till the season returns. The best melons grow in Chorassan near Tartary, from whence they are carried as far as Ispahan, for the king's use.

Cucumbers are also much eaten by the common people; one sort of them has scarce any seeds, and is eaten without paring or dressing, and is not esteemed unwholesome.

They have several kinds of grapes, and some so large that a single grape is a mouthful. They keep their grapes all winter, and let them hang a considerable time on the vine, wrapped up in linnen bags.

Dates are esteemed the most delicious fruit of this country, and are no where so good as in Persia. The pulp which incloses the stone is a clammy substance extremely sweet. When ripe they are laid in heaps, and candy or preserve themselves without sugar. The tree which bears them is very tall, but slender, and, like other palms, has branches only at the top, and the fruit grows in clusters of thirty or forty pounds weight. The tree does not bear till it is fifteen years old; but it is said to continue bearing till it is above a hundred.

Persia has most of the fruits of Europe, and if the people understood gardening, they would have them in much greater perfection: but they are neither acquainted with grafting, inoculating, or the management of dwarf trees; hence all their trees run up very high, and are loaded with wood. They have, however, excellent apricots of several kinds, and their nectarines and peaches weigh sixteen or eighteen ounces each. They have an apricot red within, called the egg of the sun; these are dried and exported in great quantities. They boil them in water, which is thickened by the juice of the fruit, and converted into a perfect syrup without sugar. Apples and pears grow chiefly in the north part of Persia. They have also oranges, quinces, prunes, and pomegranates of several kinds; and such varieties of fruit, that Mr. Chardin observes, he has seen above fifty sorts at an entertainment, some of which grew nine hundred miles from the place.

Olives grow near the Caspian sea, but they neither know how to preserve them, nor to extract the oil. Pistachio nuts are almost peculiar to Persia, and are exported in great quantities. They have also plantations of sugar and tobacco.

They have likewise the palm, the cypress, and the mulberry, and of the last they have large plantations for their silk-worms.

The fenna tree is very large, and commonly rises forty or fifty feet high: the body is as straight as the mast of a ship, and has no branches but on the head: the bark is of a bright grey, and the wood serves for all the purposes of building: but the trees most common in Persia are the plane tree, the willow, the fir, and the cornel tree.

There are trees that yield gum-mastic, and frankincense; the latter resemble a pear-tree, and are chiefly found in Caermania. There are also trees that produce manna of several sorts; the best has a yellowish cast, and a large coarse grain. There is another sort called tamarisk, because the tree from which it drops is thus named, and is found in large quantities in the province of Susiana; and a third sort, gathered about Ispahan, falls from a tree which resembles the tamarisk, but is larger. The leaves during the summer drop liquid manna, which the natives take to be the sweat of the trees, and in the morning the ground under them is perfectly greasy with it.

Persia likewise affords plenty of other physical drugs, as nux vomica, gum ammoniac, a kind of rhubarb, and cassia. The Persian poppies are much esteemed for the quantity and strength of the opium they produce.

ducc. In some places they grow four feet high, and have white leaves. They extract the juice from them in June, by making little incisions in the head of the poppy, on which a thick liquid oozes from them, which is gathered before sun-rise. It is said to have such an effect upon the people who are employed in this work, that they look very pale, and their limbs tremble. The liquor thus drawn from the poppies soon grows thick, and is made into pills.

A great deal of saffron is also produced in Persia.

Asiaticum is much admired by the natives both of Persia and India, who frequently eat it with their food. It is a liquor that flows from a plant called hiltot, an incision being made in the root for that purpose. It thickens after it is drawn, and grows as hard as gum; it is of two kinds, the white and the black, the former of which they esteem the best for eating. The smell of this drug is so exceeding strong, that it is communicated to such goods as lie near it in the ship, let them be wrapped up ever so close, and it is almost impossible to clear them of it.

In the deserts of Carmania are two small shrubs of a poisonous nature, the first called gaibad samour, or the flower which poisons the wind, for some people imagine that this occasions those killing winds, which, in the hot season, blow in this province. The other shrub is called kerzebrée, the trunk of which is about as thick as a man's leg, and grows about six feet high; its leaves are almost round, and it bears a flower resembling that of the sweet-briar.

Among the cattle of Persia the camels, horses, mules, asses, oxen, and buffaloes, are very serviceable, and more particularly the camel, which is valuable, both on account of the weight he carries, and the little expence of keeping him. Of these camels there are several kinds, among which those engendered between a dromedary or camel with two bunches on his back, and a female with one, are esteemed the best, and sold for twenty or thirty pounds each; for they are seldom tired, and are said to carry nine hundred or a thousand weight. Those that travel between Ispahan and the Persian gulph are of a much smaller size, and carry no more than five or six hundred weight, yet these are almost as serviceable as the other, for they are much swifter, and will gallop like a horse; but the others seldom exceed a footpace. As the swift camels are kept by the king and the great men, for carrying their women and their baggage, they are generally adorned with embroidered cloths, and have silver bells about their necks. When they are to take their burden the driver touches their knees, upon which they kneel down till they are loaded, and when that is done suddenly rise. They suffer them to graze by the road side with their loads upon their backs, on weeds and thistles; and when they travel through deserts, in which nothing green is to be found, they feed them with balls compounded of barley-meal and chaff made up into a paste, and often mix cotton seed with it; but, considering his bulk, he is the least feeder of any animal. It is a great happiness, that camels will live two or three days together without water, there being scarce any to be met with in the deserts they are frequently forced to cross. They shed all their hair every spring, and become perfectly naked. Of this hair abundance of fine stuffs are made. They are extremely tractable, except in their rutting time, which lasts thirty or forty days, and then they are very unruly, on which account their drivers increase their burdens to tame them. They go with young eleven months, and some say twelve.

Asses, mules, buffaloes, and oxen, are also used differently for carrying passengers or burdens, and their land being ploughed by buffaloes and oxen, they are seldom killed for food. The asses of Persia are much larger and swifter than ours, and will travel very well; but the finest beasts are the horses, which are very beautiful and well managed. They are finely proportioned, and are light and sprightly, but are only used for the saddle: they are never gelded, and always wear their tails at the full length. They are, however, neither so swift as the Arabian horses, nor so hardy as those of the Tartars. Horses are very dear in Persia, some

being sold for two or three hundred pounds, and they are seldom sold for less than fifty each, which is chiefly owing to the numbers sent into India and Turkey. They have also excellent mules, valued at thirty or forty pounds each.

The usual food for horses is barley and chopped straw: they have no mangers, but give their horses their corn in bags, as our hackney-coachmen do; but sometimes they feed them with balls, or barley-meal.

There are here great plenty of sheep and goats, and the natives seldom eat any other meat. Their sheep are large, and remarkable for their fat tails, which commonly weigh eight or ten pounds, and some are said to weigh above twenty pounds weight. In some parts of Persia their sheep have six or seven horns, some standing straight out of their foreheads, so that when their rams engage, much blood is usually spilt. The Persian goats are not only valuable for their flesh, but for their hair or wool, of which considerable quantities are exported from Carmania.

There are few hogs, for as the Mahometans have the government of the country, and are taught by their religion to abhor those animals, their Christian subjects do not endeavour to breed them, except towards Georgia and Armenia, where the Christians are very numerous.

There are few wild beasts, either in the southern or middle part of Persia, where there is no cover for them. They have, however, some deer and antelopes, which are nearly of the same nature, only they have finer limbs, and are spotted. In the woody parts of Curdistan and Hyrcania there are lions, tigers, leopards, wild boars, and jackalls, and in Armenia and Media there are abundance of deer, wild goats and rabbits.

They have the same sort of tame and wild fowl as we have in Europe, but have more of them in the north than in the south part of the country. Their partridges are the largest and best tasted that are any where to be met with.

The pelican, which the Persians call tacob, or the water-drawer, is a very remarkable fowl; its body is said to be as large as a sheep, and its head very small; but has a bill sixteen or eighteen inches long, and as thick as a man's arm, and under it is a large bag, which will hold a considerable quantity of water; for they build their nests in the deserts, and frequently go two days journey to fetch water for their young ones; and then bring enough in this receptacle to last them a considerable time.

As to eagles, falcons, hawks, and other birds of prey, there are great numbers of them, and many of them instructed to fly at the game. They are taught not only to fly at birds, but at hares, deer, and all manner of wild beasts; and, by fixing on the animal's head, and beating him with their wings, he is so terrified and distracted, that the huntsmen and dogs which follow easily take them.

They have the same sorts of singing birds as we have, and some that are taught to speak; but it does not appear that they have any parrots or parroquets. They have birds whose plumage has a beautiful mixture of yellow, green, and blue; and have such number of sparrows, that when the harvest approaches the husbandmen are obliged to place their servants all day in the fields to keep them from the corn.

The country near the Caspian and Arcanian seas is full of serpents, toads, scorpions, and other venomous reptiles, many of which die in summer for want of water, and infect the air of that part of the country. There are scorpions in particular of a monstrous size, whose sting is said to be mortal, if proper remedies are not instantly applied; and, at best, a person stung by one of them is in such torture, that for some time he is raving mad. Muscatoes are very troublesome in the flat country near the Caspian sea; and there is a white fly, no bigger than a flea, whose sting is like the prick of a pin. Here are also millepedes, whose bite is as pernicious as the sting of a scorpion.

However, in the heart of Persia, which is very dry, they are not much troubled with insects, except their being sometimes visited by swarms of locusts, which fly in such numbers

numbers, that they resemble a cloud, and obscure the sun. Wherever these light, they destroy the fruits of the earth; but happily certain birds generally visit the country about the same time, and, by eating up the locusts, prevent the ruin of the husbandmen.

There are great plenty of sea fish of almost all kinds in the Persian gulph and the Caspian-sea; and the rivers Cur and Arras, which fall into the Caspian, have plenty of river-fish; but they are at too great a distance from Isfahan to supply that city, and therefore fish is seldom talked there.

S E C T. III.

Of the Persons, Dress, Food, Manners, and Customs of the Persians.

THE Persians have agreeable features, and are of a good stature, well shaped, robust, warlike, and hardy. In Georgia and the northern provinces they have a fine complexion; but towards the south are a little upon the olive. However, as many of the great men have for a long time past had their wives chiefly from Georgia and Circassia, the breed in the southern provinces is much mended. Their eyes and hair are generally black, and the men, in most parts of the country, shave their heads very close; but the young men have often a lock on each temple, which hangs down, and serves as an ornament to their faces. Their cheeks are shaved, but the beard of the chin reaches up to their temples. Their mollahs and religious people wear long beards, which they only clip into form; but the common people cut theirs pretty short. None of them suffer any hair to grow upon their bodies.

Most of them have caps of cloth, which rise ten or twelve inches, and terminate at the top in four corners. They have a shorter cap for summer faced with Bokharian lamb-skins; their ears, which are very large, are always left bare, and generally hang down, in consequence of the weight of the caps resting on them; and, when Mr. Hanway was there, many were proud of shewing that they were not cut off. They are fond of having their caps, as well as their outer garments, of a crimson colour, which has a grand appearance: deep blue, which is seldom worn, except in coarse cloths, is their mourning colour. People of superior rank wear a sash of Karmania wool wrapped about their heads as turbans; some of these are so exceeding fine, as to cost twenty-five pounds; and the common price for such as are good is eight or ten crowns. Thus their heads are kept very warm; and they seldom pull off their caps, but wear them even in the presence of their king. Next to their skins they wear a kind of shirt, or vest, of chequered silk or callicoe, generally blue, which they seldom or ever wash till it is worn out: it has an open bosom, but neither neck nor wrist-bands, and is made close to the arm. Over the vest they wear a waistcoat, and upon that a coat, which has close sleeves and is fastened before with buttons and loops, and also with a sash. This coat is wide at bottom, and hangs a little below their knees. They likewise frequently wear a loose upper coat, which some have lined with furs, as ermines, squirrels, or sables. This garment is worn for warmth, and also for state; for it is common to see a great man sit in his sable coat in the height of summer; but it must be observed, that these coats reach no farther than the waist. Their under garments, whether of silk, cotton, or woollen, are quilted, which renders them warm, without being heavy. As their shirts have no collars, they always go bare necked. The sleeves of their upper garment reach down to their fingers. They sometimes wear cloth stockings, which sit loose like boots; but for the most part they use only woollen socks, that reach over the ancles. They wear slippers, like womens shoes, without quarters. These are of shagreen, made of the skin of horses rumps, prepared hard and rough like a seal's skin; and the heels being high, are calculated to carry them out of the dirt; but are very uneasy to those who are unused to them. Their drawers, or rather trowsers, are more convenient in a hot country than

breeches, being without any tight ligatures. For this reason, says Mr. Hanway, their cloathing in general seems more conducive to health and strength than that of the Europeans: the sash round the waist may, however, keep their loins too warm; but girding up the loins is a part of dress the most antient we read of. Under this sash they carry a long pointed knife in a wooden case, mounted with gold or silver. Their writers carry their ink and pens about them in a case, which they also put under their sash, or in a pocket under the arm.

In short, with respect to the common people, they in general wear two or three light vestments, which reach only to their knees; so that the dress of the Persians gives them a great advantage over the Turks, who wear long effeminate robes.

When those of rank ride they have boots of yellow leather. Their bridles, saddles, and housings, are almost covered with gold; and the latter are so large, as almost to hide the hinder part of the horse.

The dress of the women differs from that of the men, rather for the distinction of sexes, than by affecting any preposterous form. They adorn their arms with bracelets, and neither the men nor women wear gloves. The ornaments of their heads consist of jewels disposed in several different forms: one of these is composed of a light gold chain set with small pearls, with a thin gold plate pendant about the bignets of a crown-piece, on which is impressed an Arabian prayer: this is fixed to the hair, at the upper part of the temple, and hangs upon the cheek below the ear. The poorer sort wear the same things in baser metal.

If ever they go into the streets, which the ladies of rank seldom do, they wear a white veil, which covers them from head to foot. The girls wear on their heads a stiffened cap turned up, with a heron's feather in it. Their hair, being made up in tresses, falls down their backs to a very great length. The married women sometimes comb their hair back, and binding it with a broad ribbon, or rich tiara, set with jewels, resembling a coronet, let the rest of their hair fall gracefully down their shoulders, and nothing can appear more becoming.

Black hair is not only the most common, but the most esteemed, and the thickest and broadest eye-brows are most admired. If their eye-brows are not black, the women will colour them; and it is not uncommon to paint their faces; they also rub their hands and feet with an orange coloured pomatum. Some have feathers standing upright in their tiara, and others have a string of pearls or precious stones fastened to it, and hanging down between their eye-brows; they also wear jewels in their ears, and rows of pearls fall down their temples as low as the neck; and in some of the provinces that border on India they have nose jewels. Their necklaces are either of gold or pearl, and fall upon the bosom; and to these usually hangs a little golden box filled with most reviving perfumes. The women wear drawers and slippers like those of the men.

As both the men and women are dressed in the richest flowered and brocaded silks, it is evident they spare no expence in adorning themselves. Their sashes are also brocaded, and are said to cost from twenty to a hundred crowns; and over this they have frequently another of camels hair, so curiously wrought, that it seldom costs much less. All this, with their rich furniture when they ride out, as they do almost every day, keeps them poor; but it is very common for them to feel the effects of poverty at home, while they are loaded with gold and jewels when they go abroad.

In fine, the Persians observe an outward decency in their cleathing; this their very religion seems to exact of them. They are neat in their houses; and even the meanest sort are usually very clean in their cloaths, which have seldom any rent: but if it was not for their repeated bathings, the want of changing their shirts would render their persons indelicate.

As to the food of the Persians, they usually drink a dish of coffee early in the morning, and about eleven o'clock go to dinner, when they eat fruit, sweetmeats, or curds and milk; but their principal meal is in the evening,

evening, when they have generally a dish of pilow, which is boiled rice well buttered, and seasoned, with a fowl, a piece of mutton, or kid, served up with it. They boil their rice till the water is perfectly dried away by the time the rice is enough, and then season it with spices, and mix saffron or turmeric with it to make it yellow, or give it what other colour they choose.

Their usual way of dressing their flesh is by cutting it into little slices, and then skewering them together, broil them over a charcoal-fire, but whether they boil or roast, it is almost done to rags, or it would be impossible to pull the meat in pieces with their fingers, which they are forced to do, as they use neither knives or forks.

They are naturally inclined to temperance, and with respect to diet seem more in a state of nature than the Europeans. They, however, use opiates, but not near so much as the Turks; and, besides coffee, they drink several kinds of sherbet, and an infusion of cinnamon with sugar. Hospitality is a part of their religion, and, on occasions of the least intercourse, men of any distinction invite strangers, as well as their friends, to their table, and take great pride in the testimonies of respect they shew them. The reader will doubtless be pleased with seeing here an account of an entertainment, at which Mr. Hanway was present; since the descriptions given by an author of such veracity ought always to be preferred to the accounts of unknown travellers, who are frequently careless and inaccurate, and borrow what they describe from the relations of others.

Supper being brought in, a servant presented a bottle of water, and, with a napkin over his shoulder, went to every one in the company, and poured water on their hands to wash. In the court-yard stood a large lamp supplied with tallow, and in the middle of the room, upon the floor, was one large wax candle, which they snuffed with scissars into a tea-cup of water. A large salver, in the form of a tea-board, was set before every person, covered with a plate of pilow, on which was a small quantity of minced meat, mixed up with fruit and spices. There were also plates of comfits, several china basons of sherbets, as sweet, sour, and other waters, with cakes of rice, and others of wheat flour, on which were sprinkled the seeds of poppies, and others of the like nature. As they esteem it an abomination to cut either bread, or any kind of meat after it is dressed, these cakes are made thin, that they may be easily broken with the hand; their meat, which is generally mutton or fowls, is so prepared, that they divide it with their fingers. When every thing was set before them they ate fast, and without ceremony, feeding themselves with their fingers. The Persians, indeed, are not very nice in their manner of eating, for they grease their hands, and besmear their beards. Supper was no sooner over than warm water was brought to wash, which being done, they resumed their discourse: and it is worthy of remark, that when the oldest man in the company speaks, tho' he be poor, and set at the lower end of the room, they all give strict attention to his words.

The usual salute in this country is by putting the right hand on the breast, and bowing the head; but they never move their turban. Those who are familiar press the palm of your hand between the palms of both theirs, and then raise them to their forehead, to express the high and cordial respect they have for your person. They bow before the king, the viceroys of provinces, and other great men, with their faces three times to the ground.

Upon occasions of mourning and rejoicing, the Persians do not fail to visit each other; and people of rank always expect the compliments of their dependants. They are introduced into a large hall, where coffee and tobacco are placed before them; but the great man no sooner appears than they all rise up, and he having bowed to them while passing by, every one bows much lower to him, and after he has taken his seat, makes a sign to the company to sit. If the master of the house be already in his hall, the visitor comes in softly, and stepping to the next vacant place, stands with great gravity with his feet close together, and his hands across, till the master makes a sign for him to be seated. But when a per-

son receives a visit from his superior, he no sooner sees him but he rises, and meets him half way, and if he has notice of his coming, receives him at the gate. In short, the respect shewn is in proportion to the quality of the persons; but they place those for whom they have the greatest respect on their left hand. They lie cross-legged, yet have frequently stools brought for the Europeans of rank, when they visit them.

They are extremely fond of tobacco; and some of them draw the smoke in so prodigious a quantity, that it comes out of their noses. The caalean used by the Persians in smoking is a glass vessel, resembling a decanter, and filled about three parts with water. Their tobacco is yellow, and very mild compared with that of America. Being prepared with water, and made up into a ball, it is put into a silver utensil, not unlike a tea-cup, to which there is a tube affixed, that reaches almost to the bottom of the vessel. There is another tube fixed to the neck of the vessel above the water; to this is fastened a leather pipe, through which they draw the smoke, which, as it passes through the water, is cool and pleasant. The Persians, says Mr. Hanway, have for many ages been immoderately fond of the caalean. Shah Abas the Great made a law to punish this indulgence with death; but many chose to forsake their habitations, and to hide themselves in the mountains, rather than be deprived of this insatiable enjoyment. Thus this prince could not put a stop to a custom, which he considered as unnatural, irreligious, and attended with idleness and unnecessary expence.

In their common discourse they frequently introduce moral sentences, and poetical narrations extracted from their poets, and other writings; and it was formerly their constant custom to entertain their guests with favourite passages out of their poets. They are polite, but at the same time are extravagantly hyperbolic in their compliments. The Persians were once celebrated for their poetic genius; but war, which has destroyed their morals and learning, seems likewise to have damped their poetic fire. The ancient Persians are said to have taught their children a most exact reverence for truth; but the present generation are notorious for their falsehood; and as the above moral historian observes, they poison with a sweetmeat, in always saying what is pleasing, without regarding the truth. They are of a cheerful disposition, and yet are rather inclined to seriousness than loud mirth.

It does not appear that they are vindictive: yet if their kindness to their best friends happens to be turned by any fortune of war into enmity, they frequently become insensible; but this seems more owing to a custom of cruelty than to a revengeful temper. But though there are not many instances of that placable disposition so strongly recommended by the Christian religion, they are in theory friends to this virtue, and in the duty of resignation apparently exceed the Christians.

SECT. IV.

Of the Language of the Persians; their Paper, Ink, and Seals; their Manner of Writing, Learning, and Skill in the Sciences; their Diseases, Methods of Cure.

THE Turkish language is the most common in Persia; it prevails on the southern coast of the Caspian sea, and in those provinces that were formerly conquered by the Turks, as Shirvan and Aderbeitzien; but the illiterate people speak a barbarous mixture, and there is a different dialect in Ghilan and Mazanderan. The pure Persic is little known but in the southern parts, on the coast of the Persian gulph, on the confines of Arabia, and particularly in Isfahan. In matters of learning they use the Arabian language, in which is deposited the greatest part of that knowledge for which the Persians were once distinguished; and polite people being fond of Arabian words, these render their discourse the less intelligible to their inferiors. As time seems to have made no change in the customs of Asia, but the same manners remain that we read were used two thousand years ago,

so the language of the Persians has the same idiom and sublimity of expression. As to the learned languages familiar to the Europeans, they are unknown in Persia.

They write, like the Hebrews, from the right hand to the left, and often range their lines in an arbitrary manner; so that upon one leaf of paper they sometimes write in ten different directions; only to shew the writer's ability in observing the proportion of words.

The Persians make their paper of cotton and silk rags, and after it is manufactured set a gloss upon it with a smooth stone or shell; and, as it is soft and liable to be torn, they always roll it up. Their letters of correspondence are written on small slips of paper, generally in few words, and with great exactness, no interlineations or blots being ever suffered to appear; they are then made up into a roll about six inches long, and a bit of paper is fastened round it with gum, and sealed with an impression of ink, which has some resemblance of that used by our printers; but is not so thick. It is composed of a mixture of galls, burnt rice, and gums, and answers the double purpose of ink and wax, as it not only serves for writing, but for subscribing with their seal. They write with pens made of reeds brought from the southern parts of Persia; and in their rings they wear agates, which generally serve for a seal, their name and some verse of the Koran being usually engraven upon it.

The Persians, like other Mahometans, consider paper as something sacred, and esteem it as a very ill action either to burn or tear it, and much more to put it to any ignoble uses; for, say they, the name of God, or some of his saints, may be written upon it, and therefore it would be impious to prophane it in that manner; and if there be no writing upon it, they say it is designed for great purposes, for containing subjects of religion, laws divine and human, and other things of great moment, and therefore ought not to be applied to common use.

As they have not the art of printing amongst them, their books are all manuscripts, and they excel in writing, which they esteem one of the liberal arts. They are said to write eight different hands, among which that called Nesky, in which the Koran is written, is in most esteem. They stand or sit gracefully, holding the paper in their hands; and write with all imaginable ease and dispatch, though they have no table to lay their paper upon; and it is said, they will transcribe a book as large as the Bible, in a fair character, for about ten pounds, provided the paper be found them. They have some clerks in all their great towns, but half of them hardly get bread. They usually write from morning till night for five-pence or six-pence a day.

But at present the want of literary curiosity, even among people of distinction, is very remarkable. Indeed most of these are of mean birth and education; and, though they have good natural parts, are fallen very low in point of knowledge; which is indeed the less surprizing, as reading, the first step to knowledge, has been of late years little taught either to those bred to arms, or to the vulgar, and is almost confined to the mullahs, or priests. They also fall into a great absurdity in their manner of instructing. I have observed their boys, says Mr. Hanway, reading lessons out of the Koran in Arabic, which they do not understand; and, to add to this farce, as they sit they make a motion with their head and body, alledging that this helps study. Thus does affectation supply the place of real learning.

In arithmetic the Persians make use of figures in the same manner as we do, and their method of addition, subtraction, multiplication, and division, is but little different from ours; but they go no higher.

As to astronomy they understand little of either the celestial or terrestrial globes, and their astronomers were surprized when some years ago an European brought a pair of them to Isfahan; but they have since endeavoured to imitate them. They have, however, an astrolabe, and can name the signs of the zodiac, and are not unacquainted with the other stars. Astronomy is studied in Persia merely for the sake of astrology, which they term the revelation of the stars. They look upon it, as the key to futurity, and consider a person as grossly ignorant and stupid who speaks slightly of that pretended science.

There are constantly a certain number of astrologers in waiting at the royal palace, and some of the chief of them are always about the king's person to inform him of the lucky or unlucky moments, except when he is in the haram with his women, and each of them carries an astrolabe in a neat little case hanging at his girdle. They are not only consulted in affairs of importance, but frequently upon trifles; as for instance, if the king should go abroad, if it be an auspicious hour to enter the haram, or a proper time to eat or give audience. When these questions are asked, the astrologer takes out his astrolabe, observes the situation of the stars, and, by the assistance of his tables, draws his astrological conclusions; to which they give entire faith as to an oracle.

They observe pretty justly the eclipses of the sun and moon; but there are instances of their being mistaken half an hour, especially in the eclipses of the sun. They imagine that comets portend some great calamity, but generally suppose their malign influences are directed against some other kingdom rather than their own.

The Persian almanack is composed of a mixture of astronomy and judicial astrology, it containing an account of the conjunctions, oppositions, aspects, longitudes, latitudes, and the whole disposition of the heavens; with prognostics on the most remarkable events, as war, famine, plenty, and diseases, with the lucky and unlucky times for transacting all affairs; but the authors of them endeavour to deliver themselves in dubious and equivocal expressions, that will bear several meanings; and if their predictions prove true in any sense, or but in part, they are sure to meet with applause.

The Persians have solar and lunar years, by which they regulate their different concerns. The Persian year begins at the vernal equinox, when their astrologers are employed in making an exact observation by the astrolabe, of the very moment the sun coming to the equator enters into Aries. As their lunar year only consists of twelve moons, or three hundred and fifty-three days, their solar computation exceeds their lunar at least twelve days. Their epocha, by which they reckon all their years, begins with the Hegira, or flight of Mahomet from Mecca, the place of his birth, to which he was compelled on account of his new doctrine; and which happened in July, six hundred and twenty-two years after the birth of our Saviour. Their week begins on Saturday, and the seventh day, which is their sabbath, therefore falls on a Friday, which they call the Day of Assembly. Their day consists of twenty-four hours, which they reckon in the same manner as the Italians.

Upon New-year's-day the great men wait on the king to wish him a happy new year, every one making him a valuable present; as do the absent khans, or cawns, who reside in distant governments. At this time they clothe all their retinue in the gayest manner, and the meanest of the people endeavour on that day, as much as possible, to be new clothed from head to foot; and the time is spent in entertainments and in making presents to their friends or patrons.

There is no country in the East where physicians are more esteemed, or that produces a greater variety of physical drugs. They are called the preservers of life, and the king always entertains a considerable number of them in his pay; but there are perpetual disputes between them and the astrologers; for when the physician has prescribed and prepared the medicine, the patient must wait to fix the lucky moment in which it is to be taken; and if it has not the desired effect, the astrologer lays the blame upon the ignorance of the physician; while the physician, on the other hand, assures the patient, that the reason of its having no better success, was owing to the astrologer's being mistaken in his calculation.

They form a judgment of a disease chiefly by feeling the pulse and inspecting the patient's urine; and, with respect to the female sex, this is done without their ever seeing them; for when a physician desires to feel a woman's pulse, they give him her hand covered with crape or fine linen through a curtain which hangs between them. They however seldom bleed in Persia, but give emul-

sions and other potions in a fever, which is the most common distemper in that country. In their prescriptions they frequently follow Galen, whom the Persians call Galenous; their other great masters in physic is Avicenna, the most celebrated physician and philosopher in Asia of his time.

The Persians are very ignorant in surgery, the barbers being the only surgeons, and few of them understand any thing more than letting blood. Bodies are never dissected in Persia, and therefore they can have but little idea of the animal œconomy: but they have the less occasion for surgeons, as the air is so good that green wounds heal almost of themselves; and they are exempt from many of those diseases which arise from a corruption and flux of humours among us.

The plague very seldom visits Persia, though the neighbouring kingdom of Turkey is seldom entirely free from it. They are also said to be strangers to the gout, the stone, sciatica, head-ach and tooth-ach; and the small-pox, consumptions, apoplexy, and falling sickness, are scarce known amongst them.

The diseases to which the Persians are most subject are fevers, St. Anthony's fire, dropsies, dysenteries, the cholic, pleurisy, and venereal disease; yet this last has not the same pernicious effects as in Europe. The people eat, drink, and bathe together while they are afflicted with it, and this may be one means of spreading it; but it is said that nobody is there ashamed of having that loathsome distemper. Near the gulph of Persia they are troubled with a small worm of a prodigious length, which breeds in the legs: these are drawn out by twisting them round a stick; but if they happen to break while this is performing, it is of ill consequence to the patient. The common distemper near the Caspian sea is the yellow jaundice; and travellers observe, that in Hyrcania the people in general have a sickly yellowish cast.

The Persian physicians, it is said, remove a fever very suddenly, by giving the cold seeds in water; but then they suddenly throw the patient into a dropsy, the most fatal disease in Persia. For the hæmorrhoids they apply the oil of naphtha; in the cholic and other distempers they use the actual cantery; and in a dysentery they give sour milk, boiled with rice till it be dry: but the most general remedy is bathing. They never suffer their patients to change their linen or cloaths while the illness lasts, or to eat either bread or flesh; for the sick are permitted to have scarce any other food besides boiled rice, and rice-gruel.

SECTION V.

Of the Trades and Manufactures of Persia.

EVERY trade has a warden appointed by the government, who takes notice that the rules and orders relating to the profession are duly observed; and whoever intends to set up a trade registers his name and place of abode with this officer. No enquiry is made who was his master, or whether he understands his business; nor is there any restraint laid upon him to prevent his encroaching on any other profession. They take no apprentices, but hire their servants, and allow them wages from the first day in which they are entertained. Almost every trade is obliged to work for the king whenever he requires it; and those who are exempted from this service pay an annual tax for enjoying this privilege.

The Persians fall much below the Europeans in painting. Instead of imitating nature they seem to delight in mis-shapen figures, and, like all the other Eastern nations, are entirely ignorant of perspective, and of the proper manner of disposing the lights and shades. Their human figures are commonly drawn in profile, for they scarce ever draw a full face; and when they do, they succeed very ill. Even the figures of animals are ill-performed; but their flowers are pretty well executed, and here they have the advantage of us in the liveliness of their colours and the dryness of the air. Their religion indeed discourages all the arts of imitation; for

some of their rigid doctors prohibit the representation of every created animal. Modelling, statuary, founding, and the curious art of engraving copper-plates, are unknown.

The Persians excel in making of earthen-ware, in which they almost equal the Chinese; and in the mending of glass and earthen-ware by drilling holes through them and fastening the pieces with wire.

The carpenters are very indifferent artists, which is said to be owing to the scarcity of timber, little of it being used in building; but their joiners and turners are more expert, and are well skilled in varnishing.

Braziers and tinmen work well with their hammers, files, and turning instruments. Most of the vessels used in their kitchens are made of copper tinned; and among their kitchen furniture they have neither brass, iron, nor pewter. Their armourers make good fabre blades, and damask them as well as any Europeans. The barrels of their fire-arms are very strong, but the stocks are ill contrived. They however, either purchase the locks abroad, or employ European workmen in making them.

They are well skilled in cutlery-ware, and make good knives, razors, and scissars; they likewise make little steel mirrors, which are used instead of looking-glasses. These are generally convex, and the air is so perfectly dry that they seldom rust or grow dull.

They are not skilled in the art of making looking-glasses, but have them from Europe; however, they have a manufacture of glass, which serves for windows and bottles.

As the Persians value themselves on using the bow, there are no where better bows made; the chief materials are wood and horn, with sinews bound round them: they are painted, varnished, and made as neat as possible. The bow-string is of twisted silk of the thickness of a goose-quill, and their quivers of leather embroidered with silk.

Their leather is exactly the same as that we call Turkey-leather; and, when the trade of Persia flourished, much of that brought to England as Turkey-leather was made in Persia.

The Persians are extremely well versed in embroidery, especially with gold and silver on cloth, silk, or leather. Their saddles and housings are covered with it, and their stitching of the leather exceeds any thing of the kind done in Europe. Their saddles are after the Morocco-fashion; the stirrups are very short, and where we use brass in our furniture the men of quality have gold.

Their gold wire-drawers are pretty good artists, and their lapidaries understand the grinding of soft stones and of cutting them pretty well, but their jewellers and goldsmiths are clumsy workmen. The Persians have not the least idea of enamelling.

Their dying is preferred to any thing of the kind in Europe, which is not so much ascribed to the artist as the air, which being dry and clear gives a liveliness to the colours, and fixes them.

The Persian tailors are neat workmen, and the men's cloaths are fitted exactly to their bodies without the least wrinkle; and their sewing exceeds that of our workmen. They also work flowers upon window-curtains, carpets, and cushions so neatly, that they look as if they were painted.

The barbers are no less skilful, for they shave the head at a few strokes of their razor, and have so light a hand, that you can scarce feel them; they use only cold water, and hold no basin under the chin, but have their water in a little dish, of the size of a tea-cup. After they have shaved a man they cut the nails of his feet and hands, then stretch his arms, and rub and chafe his flesh.

The principal manufactures of the country are silks, as sattins, tabbies, taffeties, and silk mixed with cotton, or camel or goats hair. They also make brocades and gold tissues. The gold velvet of Persia is admirable. All their rich stuffs are durable, and the gold and silver do not wear off nor tarnish whilst the stuff lasts, but keep their colour and brightness. They also make calico cloth, camblets, and silk and worsted druggets.

A met-

A merchant is esteemed a very honourable profession, and the more so as there are no hereditary nobility; for the honours of those in great posts terminate with their office, and their lives and fortunes are in perpetual danger from the weakness or cruelty of the prince.

S E C T. VI.

Of the Buildings of Persia and their Furniture. A Description of the Cities of Ispahan, Shiras, and Casbin, containing an Account of the Palaces, Mosques, Bagnios, and Bridges of Persia.

THE houses of the quality generally stand in the midst of a fine garden, and make little or no appearance to the street: nothing is to be seen but a dead wall with a great gate in the middle, and perhaps a wall within the gate, to prevent people from looking in. These houses have seldom more than one floor. In the front stands a small piazza, or cloyster open before, where they sit and transact their ordinary affairs. On the farther side of the house is another piazza, and before it a basin, or fountain of water, beyond which is a walk of fine trees, as there is also from the street to the house. Behind the first piazza is a large hall 18 or 20 feet high, in which they sit at great entertainments. At each corner of the hall is a parlour, which also serves for a lodging room. Between these parlours, on the sides, are doors out of the hall into an open square space as large as the rooms at the corners. There are also several doors out of the hall into the piazzas both before and behind the house, so that in the hot season they have nine or ten doors open into the great hall, and if any air be stirring they enjoy the benefit of it. In some palaces is a handsome basin, and a fountain, which plays in the middle of the hall, and contributes greatly to cool the air.

The walls of their houses are sometimes built of burnt bricks, but more frequently of bricks dried in the sun. The walls are of a considerable thickness, and the roof of the great hall is arched and raised five or six feet higher than the other rooms. The roofs of the buildings on every side of the hall are flat, and there is a pair of stairs up to the top, where the Persians walk in the cool of the day, the roof being surrounded with a wall, or with balustrades, and sometimes they carry up a mattress, and lie there all night.

The kitchens and other offices are at a distance on the right or left; and all the rooms, except the hall, stand separate, there being no passage out of one into another, but only from the hall. There are some chimnies, but usually instead of a chimney they have a round hole about four or five feet broad, and a foot and a half deep, in the middle of the room. In this hole they make a charcoal fire, and then cover the place with a thick board or table about a foot high, so close, that no smoke can get out, and over that table spread a large carpet, under which they put their legs in cold weather, and sit round it, the smoke being carried off by pipes laid under the floor.

Their doors are narrow and seldom turn like ours upon hinges; but a round piece being left at the top and bottom of the door, and let into the frame above and below, it turns upon them, and the very locks and bolts are frequently of wood.

The Persians go early to sleep. The beds being taken out of niches made in the wall for that purpose, are laid on the carpets. They consist of only two thick cotton quilts, one of which being folded double, serves as a mattress, and the other as a covering, with a large flat pillow for the head. The Persians usually sleep in their under garment and drawers, by which means they are less subject to catch cold than we, and are much sooner dressed and undressed. This is their ordinary method; but their princes and great men who indulge themselves, use sheets, and other delicate appurtenances of a bed, tho' without any of the parade practised in Europe; nor do they crowd their apartments with unnecessary and superfluous furniture; all they have consisting in carpets spread on the floor, with cushions and pillows to sit and lean upon.

The floors of the rooms are either paved or formed of a hard cement, on which they lay a coarse cloth, and over that a carpet. The sides of some of the rooms are lined with fine tiles about a yard high, and the rest of the wall is either hung with pictures or painted.

Ispahan, or as it is pronounced by the Persians, Spahawn, esteemed the capital of Persia, is seated in fifty degrees east longitude from London, and thirty-two degrees thirty minutes north latitude, in a fine plain almost encompassed by mountains, at about two or three leagues distance, in nearly an oval form. The river Zenderhond runs by it at the distance of about a mile; but there are several channels and pipes which convey the water from it into canals and basins, for the service of the court and city. Ispahan is without walls, and is ten or twelve miles in circumference. It had formerly twelve gates, but four of them are closed up, and the others always open. It is probable that it was formerly walled, and there are still the remains of an old castle.

The streets are for the most part narrow and crooked, and either exceeding dusty or very dirty; for scarce any of them are paved, and though the people use neither coaches nor carts, yet as all people of rank ride through them, attended by a great train of servants, the passage is necessarily rendered very disagreeable.

The city has, however, some fine squares, particularly the royal square, or Meidan, on one side of which is the royal palace. This square is one third of a mile in length; and above half as much in breadth; and on the sides are buildings which resemble Exeter Exchange in the Strand, they being covered at the top, and have shops on both sides. Every particular trade has a quarter assigned for it, and above the shops are others, where the mechanics perform their work. There are, however, no windows in these buildings; but instead of them are great openings at proper distances, to admit the light, and people ride through them on horseback. In the middle of the square is a market for horses and other cattle, and there all kinds of goods and eatables are exposed to sale.

On the side next the palace is a fine row of trees, a handsome basin of water, and some brass cannon taken from the Portuguese at Ormus. At the south and east ends of the square are placed a mosque, and opposite the great gate of the palace are several streets arched over, which renders them pretty dark. It is remarkable, that their houses and shops are never in the same place, and frequently their houses are half a mile distant; however, their valuable effects are locked up at night in chests and counters, and it is very rare any thing is lost.

The foreign merchants leave their goods in the public caravanseras, which also serve them for lodging. There are said to be no less than fifteen hundred of these structures at Ispahan, built by charitable people for the use of strangers, and most of them are formed upon the same model, and differ only in the dimensions. They are entered by a handsome gate, on each side of which are shops, and from thence you come into a square, round which are piazzas, and within lodging rooms, warehouses, and stables for horses, and other beasts.

In the principal parts of the town are handsome coffee-houses, where people meet for the sake of conversation, and are frequently amused by the harangues of their poets, historians, and priests, who hold forth, and expect a small present for their instructions.

The buildings belonging to the palace, with the adjacent gardens, are three miles in compass. Over one of the gates, which opens into the royal square, is a gallery in which the king used to sit and see martial exercises performed on horseback. However no part of the palace in which the court resides, is to be seen from the square; but having entered the principal gate, you see a hall on the left hand, where, on certain days, the vizier and other judges administer justice; and on the right hand, rooms in which offenders are allowed to take sanctuary. From thence it is a considerable distance to the hall where the king usually gives audience. This is a long room well painted and gilt; it is supported by forty pillars, and divided into three parts, one a step higher than the other, on which the great officers stand according to their rank. On the third ascent is placed the

the royal throne, which is raised about a foot and a half above the floor, and is about eight feet square; on the bottom of it is spread a rich carpet, and cushions of brocade, upon which this monarch, upon solemn occasions, sits cross-legged. The other apartments of the palace, and particularly those belonging to the women, are never entered by any but the eunuchs, and therefore it is impossible to obtain an exact description of them; but in general there are many separate pleasure houses dispersed through the gardens, which are adorned with fine walks, fountains, and cascades; and beyond the gardens is a park, in which the ladies hunt and take their pleasure with the Shah or King.

There are above a hundred and fifty Mahometan mosques in the city, covered with cupolas, which appearing through the trees planted in the streets and gardens almost all over the town, afford a very fine prospect. Though no Christians are allowed to enter the mosques, some travellers say, they have taken a view of them in disguise, and particularly of the great mosque, called the King's, from its being erected by one of their sovereign princes. The gate which leads to this mosque is covered with silver plates, and through it you pass into a court which has piazzas on each side; and in these houses the priests lodge. Opposite to the great gate are three large doors that open into the mosque, which has three iles beautified with gold and azure. In the middle is a cupola, supported by four great square pillars. The iles on the sides are lower than that in the middle, and the ceiling is supported by thick columns of freestone. The light is admitted at two great windows towards the top of the middle ile. On the left hand towards the middle is a kind of pulpit, which is ascended by a flight of stone-steps. On the out-side of the building the bricks and tiles are painted with various colours, and the floor of the mosque being covered with carpets, the people who enter it pull off their shoes. It is adorned with neither images nor pictures, nor are there any pews as in protestant churches.

At the south end of the royal meidan is a mosque, built with stone, and of a circular form: it is however divided into iles, and the walls are lined to the height of fifteen feet with white polished marble. In the midst of the square before the mosque is a large basin where the people wash themselves before they enter that structure. In short, most of the mosques are adorned with cupolas, and have minarets, or steeples, which the mollahs ascend in order to summon the people to their devotions, for they make no use of bells. This was the state of Ispahan about the beginning of the present century, when it had a hundred thousand houses well inhabited, many of which were not much inferior in splendor to the royal palace; but its glory has been for some years laid in the dust, and from the dreadful depopulation occasioned by war, when Mr. Hanway was in Persia, in 1744, there were said to be in that city not more than five thousand houses inhabited.

The many hammams, or bagnios, at Ispahan are another subject of admiration for the traveller. Some of them are square buildings; but most of them are circular, and formed of a white well polished stone, and the tops covered with blue tile. The inside consists of three rooms, which receive their light from little round glass windows in the arched roof. The first is a great room surrounded with wooden benches, in which they dress and undress. The second, which is usually square, is about six feet in diameter, and has a kind of copper three or four feet square set in the floor, which is covered with a copper plate, and is heated by a fire underneath lighted on the outside, that heats both the water and the room. In the third room is the place for bathing. The floors are formed of black and white marble. The Persians generally bathe every day, for they not only consider it as extremely refreshing, but as an act of religion, conducive to health, and an effectual remedy for colds, aches, and many other disorders.

Early in the morning a servant goes up to the terrace on the top of the house, and sounds a shell or horn, to give notice that the bath is ready. When a person comes to bathe, after undressing himself in the first room, he

ties a cloth round his waist that reaches to his knees, then enters into the stove, and soon after a servant comes and pours water on his shoulders, after which he rubs him from head to foot in so rough a manner that he is almost used to it think he is about to flea them. He then shaves the person's head and face if he desires it, cuts the nails of his fingers and toes, handles and rubs his body, and stretches every limb; after which the person plunges into the bath, and being wiped on his coming out with a clean linen cloth, he returns into the first room and dresses.

The men bathe from twilight in the morning till four in the afternoon, and the women go from that time till midnight. When it is the women's time to bathe, all the male servants of the bagnio withdraw, and are succeeded by females. The ladies are never so finely dressed as when they come to bathe, this being the only opportunity they have of vying with each other in the article of cloaths; and their perfumes and essences are enough to stifle a person not used to them.

Nothing is more admired at Ispahan by all foreigners than the Charbag, which is a walk above a hundred yards wide, and a mile in length, extending from the city to the river Zenderhond. On each side are planted double rows of trees, and along the middle runs a canal, which, at the distance of every furlong, has a large basin, into which the water falls in a fine cascade. Both the sides of the canal and basins are lined with hewn stone, broad enough for several men to walk a-breast upon them. On each side of this walk are the royal gardens and those of the great men which have pleasure-houses at small distances, and all together form a prospect as agreeable as can be conceived.

This walk is terminated by a bridge over the Zenderhond, which leads to the town of Julpha. There are also two other bridges, one on the right and the other to the left, which form a communication between the neighbouring villages and the city. The architecture of these bridges appears somewhat singular; for on each side, both above and below, are arched passages through which people ride and walk from one end of the bridge to the other, as in the covered streets of the city, and at little distances are openings to admit the light. The arches are not very high, no vessels passing under them; for neither this river nor any other of the Persian streams, is navigable. Indeed in spring, when the snow melts on the mountains, the Zenderhond makes a pretty good appearance, and is almost as broad as the Thames at London; but at the latter end of summer the channel becomes so shallow and narrow, that it does not contain water enough for the gardens that belong to the city. To supply this want the people about Ispahan have abundance of wells of very good water.

On the south side of the river stands the town of Julpha, which is chiefly inhabited by a colony of Armenians, transplanted thither by Shah Abbas. This town is about two miles long, and near as much in breadth; and is in general better built, and the streets wider than those of Ispahan; but the trees planted in the streets, and the large gardens about the houses, give it the appearance of a country village. There are Georgians, and several other Christian inhabitants, as well as Armenians. This colony has flourished extremely since their being settled there, and before the late civil wars in Persia they were esteemed the most considerable merchants in the world.

The city of Shiraz, or, as it is pronounced, Sheraz, is situated about two hundred miles to the southward of Ispahan, and is generally reckoned the second city of the kingdom. It is the capital of the province of Fars, the ancient Persia: and some imagine it received its name from Cyrus the Great, who is said to have been buried there.

The city is seated in a pleasant and fertile valley, about twenty miles length, and six in breadth. Through it runs a rivulet; which in the spring seems a large river, and is sometimes so rapid as to bear down the houses in its way; but in the summer it is almost dry. It is not defended by any walls, and though it is about seven miles round it does not contain at present above four thousand houses; but the greatest part of this space is taken up with gardens.

The viceroy's palace, the mosques, bagnios, caravanseras, and vaulted streets, are built after the same model as those of Ispahan. The mosques are here so numerous that there is one to every twenty or thirty houses; and their domes being covered with new-varnished tiles, have a pretty appearance among the trees. There is also a college for the study of the liberal arts.

The streets of Schiras are generally narrow and dusty; but there are some broad ones that have canals and basins faced with stone. Schiras is most remarkable for its gardens. The cypress trees, which form the walks, are the largest and tallest that are any where to be found, and grow in a pyramidal form: intermixed with these are several broad spreading trees, and fruit-trees of all sorts, as oranges, lemons, apricots, cherries, pears, and dates; none of which are planted against walls, as with us, but are ranged in lines, and sometimes irregularly, forming a wilderness. They have also abundance of fragrant flowers, which are not planted with the same regular order as in the gardens of Europe. Their vineyards and their wine are the best in Persia; and the fountains, cascades, and pleasure-houses are not inferior to those at Ispahan. The king's garden in this city is no less than two thousand paces square, and is surrounded with a wall fourteen feet high.

We shall now give a description of Casbin, the chief city of ancient Parthia, the residence of many of the Persian kings, and the burial-place of Hephæstion, the favourite of Alexander the Great. This city stands in a plain, though on very high land, and is surrounded with mountains at some miles distance. The air is fine and subtle, and in summer heat and cold alternately succeed each other; for though the days are very hot, the winds in the night are extremely piercing. This city, before the reign of Nader, had twelve thousand houses inhabited; but when Mr. Hanway was there it had no more than eleven hundred, and was reduced to a heap of ruins.

The houses are for the most part below the surface of the earth, to obtain the convenience of water, which is brought to them from a considerable distance in channels; for as we usually bring water up to our houses, they level their houses to the water; which are, however, not the less agreeable in hot weather. They are generally built with bricks, dried in the sun, cemented with a strong mortar. The roofs are flat, and they frequently sleep on the house-top. The buildings are inclosed with a mud-wall, and consist of two divisions; the outer stands in a large area, and is only a spacious room, called the *airan*, supported with pillars, and open on one side: here they dispatch their business, and also eat when they do not retire to the womens apartment. There are niches in the wall, which answer the purpose of tables; the floor is generally covered with large worsted carpets, and on the sides of the room are felts about a yard broad, and generally two or three yards long: these are made either with wool or camel's hair, and, being very thick and soft, are used for sitting upon. In the wings of this apartment are smaller rooms for lodging, and in the same yard are apartments for the servants, and the stables. On the back part of this building is another, likewise inclosed by a wall, which, for the sake of privacy, is generally entered by two turnings. Here is the haram, or womens apartment, into which no man is suffered to enter, except the master.

The palace built by Nader Shah in this city joins to the old one, and has an avenue leading to it near three hundred yards long, and fifteen or twenty broad, formed of lofty trees. The palace is encompassed by a high and thick wall, about a mile and a half in circumference, which has only one entrance. This is an arched gate, the top of which projects, and is ornamented in the Eastern manner. Within are four large squares, adorned with lofty trees, fountains, and running water, which give the place an awful and majestic appearance. The apartments are raised about six feet from the ground; the *airan*, or open hall is in the center, and shuts in with falling doors. The apartments are adorned in the Indian taste, and the ceilings formed into small squares, embellished with moral sentences in very legible characters. Most of the windows are of thick coloured glass, painted with such art,

that the glass seems cut into the several figures it is designed to represent. Many of the floors are only formed of hard earth, and others of a composition of beaten stone. This irregularity is concealed by the constant use of carpets.

The haram is magnificent, and consists of a square inclosed with a brick wall, thirty feet high and two and a half thick. It has four distinct apartments, in some of which are fountains that serve to moderate the heat of summer, by giving the air a refreshing coolness. The rooms are lined with stucco-work, painted in the Indian taste with birds and flowers; in which the colours are beautiful, and set off with gilt edgings. The apartments have small chimney-pieces, in a mean taste; and some of them are ornamented with looking-glasses in small squares, of many different dimensions, set into the walls. There are a few apartments below ground, admirably contrived for coolness. Near the haram is the eunuchs apartment, remarkable only for its having but one door, and that a very strong one. Here are also some old apartments yet standing, built by Shah Abas, in which are some bad painting done by European painters.

S E C T. VII.

A particular Description of the Ruins of the ancient Palace of Persepolis, destroyed by Alexander the Great: the Tombs of the ancient Persian Kings, and that of Noxi Rustan, supposed to have been made by Darius Hytaspes.

ABOUT thirty miles from the city of Schiras are magnificent remains of the ancient palace of Persepolis, wantonly burnt by Alexander the Great. These at a distance appear as in a kind of amphitheatre, they being seated in a fine plain, and partly encompassed by a range of mountains in the form of a half-moon.

This ancient palace of the kings of Persia, usually called the house of Darius, has part of the walls of three of its sides still standing. The front extended six hundred paces from north to south, and three hundred and ninety from east to west. The stones of the wall are black, harder than marble, some of them finely polished, and many of them of such a surprising size, that it is difficult to conceive how the ancient Persians were able to remove and raise such prodigious masses. On the front of the building was a spacious platform, to which there are several flights of steps, the principal of which is placed between the middle of the front and the north end of the edifice, where two flights wind off from each other to the distance of forty-two feet at the bottom. These steps are only four inches high, and fourteen in breadth. There are fifty-five of them on the north side, and fifty-three to the south; and there are probably others that have been covered by the earth by length of time, as well as a part of the wall which rises forty-four feet eleven inches high in the front. At the bottom of the two flights is a single flight extending fifty-seven feet four inches from one to the other; from thence the two flights are carried off from each other, and returned back from the center at an equal distance from the extreme parts of the top. Above these flights is a pavement of long stones, and another single flight of steps seventy-five feet wide, answering to that at the bottom, and leading up to the grand entrance of the edifice. This upper stair-case has a noble and singular effect, answerable to the magnificent remains of the rest of the building.

The spectator, on ascending the upper steps, sees before him two grand portals, and as many columns. These portals are thirteen feet four inches in breadth, and twenty-two feet four inches in depth. On the inside, upon a kind of pilaster on each hand, is a large figure resembling the sphynx, in basso relievo, fourteen feet and a half high, and twenty-two feet from the fore-legs to those behind. The faces are broken off, and the bodies much damaged; but what is extraordinary, the breast and fore-feet project from the pilaster. Those of the first portal are turned towards the stair-case, and those of the second face the mountain. Those pilasters stand

stand on a base five feet two inches in height, and the first portal is thirty-nine feet high.

The two columns that stand between the portals are the least damaged, particularly with respect to their capitals, and the other ornaments of the upper parts; but the bases are entirely covered with earth. These columns are fourteen feet in circumference, and fifty-four feet high. There were formerly two others between these and the portal, several pieces of which lie half buried in the earth.

At the distance of fifty-two feet to the south of the same portal is a large basin for water, formed out of a single stone twenty feet in length, seventeen feet five inches broad, and raised three feet and a half above the surface of the floor. From this basin to the north wall is an extensive ground a hundred and fifty paces in length, where nothing is to be seen but the fragments of large stones, with part of the shaft of a column, and the earth is covered with heaps of stones as far as the mountain.

To the southward of the portals just described are two other flights of steps resembling the former, the one to the east, and the other to the west. On the upper part, the wall is embellished with foliage and the representation of a lion tearing in pieces a bull, in basso relievo, much larger than the life. There are likewise small figures on the middle of the wall.

On the top of the steps is an entrance into an open place paved with large stones, in which are two ranges of columns, six in each, and twenty-two feet distant from each other; but none of them are entire: there are also eight pedestals, and the ruins of some others. At the distance of above seventy feet were formerly six rows of other pillars, six in each row, and twenty-two feet distant from each other; but, though no more than seven of them are now entire, the bases of all the rest are standing.

At above seventy feet distance from these last rows of columns on the west, towards the front of the stair-case, were once twelve other columns in two ranges, six in each, but only five are now remaining. The ground is, however, covered with pieces of these columns, and the ornaments that served for their capitals. Between them are pieces of sculpture, representing camels on their knees, and on the top of one of the columns is a compartment in which camels are also represented in that posture.

Farther towards the east you are presented with a view of several ruins, consisting of portals, passages, and windows. The insides of the portals are adorned with figures in bas-relief. These ruins extend ninety paces from east to west, and a hundred and twenty-five from north to south, and are sixty paces both from the columns and the mountains. In the middle of these ruins the earth is covered with seventy-six broken columns, nineteen of which still support their entablature; their shafts are formed of four pieces, besides the base and capital.

To the south of these columns, at the distance of a hundred and eighteen feet, is an edifice that rises higher than any other part of the ruins, from its being situated on a hill. The front wall, which is five feet seven inches high on that side, is composed of a single range of stones, some of which are eight feet deep; and the wall extends a hundred and thirteen feet from east to west, but has neither figures nor any other ornaments. However, in the middle of the front are the ruins of a double stair-case, on the sides of which are several figures. The rest of the building was chiefly composed of large and small portals, and is entirely destroyed. The largest of these portals is five feet wide, and five feet two inches deep. Among the rest, two portals appear to the north, with three niches or windows walled up. Under these portals are the figures of a man, and two women, down to the knees; for their legs are covered with the earth that is raised against them. Under the other gate is the figure of a man holding a lion by the mane. To the south is a portal and four open windows, each of which is five feet nine inches wide, and eleven in height, including the cornice; their depth is equal to that of the grand portals. The two sides of this gate are carved with the figure of a man, with something on his head resembling

a tiara. He is accompanied by two women, one of whom holds an umbrella over his head. On the inside, three niches are covered with ancient Persian characters.

To the west are two other gates uncovered. Within one of them are the figures of two men fighting with a bull that has a single horn in its forehead: this horn one man grasps with his left hand, while, with his right, he plunges a dagger into his belly. On the other side the figure, another man holds the horn with his right hand, and stabs the bull with his left. The other gate has the figure of a man fighting in the same manner with a winged deer, that has also a horn in its forehead. Horns were anciently the emblems of strength and majesty, and the orientals called Alexander the Horned, because, by they, he made himself king of the horns of the sun, that is, of the east and west.

Behind this structure are the ruins of another, which exceed it in length by thirty-eight feet. They have also niches and windows, the former of which are cut out of single stones. A little to the south is a double flight of steps, separated by walls embellished with foliage and small figures.

A little farther to the south are subterraneous passages, into which none of the Persians dare to enter, though they are said to contain great treasures. This proceeds from a general persuasion, that all the lights carried into them will go out of themselves. But both Sir John Chardin and Mr. Le Bruyn, far from being intimidated by this opinion, examined these passages with the utmost care, and proceeded through them with lights till they ended in a narrow opening, which extended a great length, and appeared to have been formed originally for an aqueduct; but its straightness rendered it impossible for them to proceed through it.

On proceeding still farther to the south, you perceive the remains of another edifice, which extends a hundred and sixty feet from north to south, and a hundred and ninety-one from east to west. The portals belonging to it are still to be seen, together with seven windows and forty inclosures, that were formerly covered rooms. In the middle are the bases of thirty-six columns in six ranges, and the ground is covered with large stones, under which were aqueducts.

Anciently there stood another structure to the westward of the last-mentioned building. On the ruins of the wall, which still rises near two feet above the pavement, are cut the figures of men in basso relievo, each represented with a lance. The ground inclosed by this wall contains a number of round stones that were the bases of columns.

On the east side of these last ruins are the remains of a beautiful stair-case, sixty feet in length, resembling that of the front wall: but though most of the steps are destroyed by time, the wall that separates the two flights is still eight feet in height, and adorned with figures almost as big as the life. The front contains the representation of a lion encountering a bull: there are also lions of the same workmanship on the wings of the stair-case, both of them accompanied with characters and figures almost as big as the life. Columns were formerly disposed between this edifice and the other last mentioned. Among these ruins are four portals, each adorned on the inside with a man, and two women, who hold over his head an umbrella.

To the north of the two last edifices are two portals with their pilasters, on one of which is also the figure of a man and two women, one of whom holds an umbrella over his head, and above the women is a small figure with wings expanded. There are also several other figures in relievo on both of these portals, and the earth is covered with fragments and other antiquities.

From hence you proceed to the last ruins of the structure on the mountain. On the south side are two portals, under each of which a man is seated in a chair holding a staff in his right hand, and a kind of vase in his left. Behind him is another figure, who has a cloth in his right hand, and something on his head resembling the tail of a sea horse. Below are three rows of figures with lifted hands; these are three feet four inches high, but the man in the chair is much larger than the life. Above are several ornamental ranges of foliage, the lowest of which is intermixed with small lions, and the highest with

with oxen. These portals are twelve feet five inches in breadth, and ten feet four inches deep, and the highest of the pilasters are from twenty-eight to thirty feet.

On the two pilasters towards the north a man is seated, with a person behind him, like the preceding figures, and behind this are two other men holding in their hands something that is broken; before the figure represented sitting are two other figures, one with his hands placed on his lips with an air of salutation, and the other holding a small vessel. Above these figures is a stone filled with ornaments, and below are five ranges of figures, three feet in height: these are a band of soldiers armed in different manners. From the foot of these mountains you have a full view of all the ruins, except the walls and stair-cases that cannot here be seen.

The principal difference observable in the columns consists in some of them having capitals and others none; and most of them are fluted. With respect to the elevation of those that are perfect, they are all from seventy to seventy-two feet high, and are eighteen feet five inches in circumference, except those near the first portals. The bases are round, and twenty-four feet five inches in circumference; they are four feet three inches high, and the lower moulding is one foot five inches broad. These columns have three sorts of ornaments towards the top, which may be termed capitals.

Besides the basso relievos already described, there are many others, particularly the representation either of a triumph, or a number of people going in procession to carry presents to a king, consisting of a multitude of figures with an empty chariot, a led camel, some led horses, &c.

It is observable, that the drapery of all the human figures in this edifice is extremely singular, and has not the least relation to that of the ancient Greeks and Romans; but their military habits resemble those of the Medes and Persians.

No muscles are visible in the naked parts of the figures, which have a heavy air, and nothing has been observed but the contours; this neglect makes them appear stiff and inelegant. The draperies have the same defect, and the whole has a tasteless sameness. The proportions, however, have been finely kept, both in the great and small figures, which is a proof that those who made them were not entirely destitute of capacity, but were probably obliged to be too expeditious to finish them with proper care. The ornaments are, however, exceeding beautiful, as are also the chairs in which some of the figures are seated, notwithstanding their being now much impaired. It is therefore probable, that some fine fragments have been destroyed. Besides, most of the stones are polished like a mirror, particularly those within the portals, and that compose the windows and pavements. These are of various colours, as white, grey, yellow, red, deep blue, and in some places black; but the stones of which the greatest part of the edifice is formed are of a clear blue. In short, every thing corresponds with the grandeur and magnificence of a great king's palace, to which the images and relievos give a surprizing air of majesty. There is no doubt of their having been very stately portals and grand galleries to afford a communication with all the detached parts of the edifice: most of the columns, whose remains are still so beautiful, were doubtless intended to support those galleries; and there even appears to be still some remains of the royal apartments. In a word, the magnificence of these ruins can never be sufficiently admired; and this structure must undoubtedly have cost immense sums.

Near the mountain are two ancient tombs of the kings of Persia, one to the north, and the other to the south. These are both hewn out of the rock, and are noble fragments of antiquity. Their fronts are covered with figures and other ornaments. The form of both is nearly the same, and therefore it will be sufficient to give a description of one of them; and we shall take that to the north. That part of the sepulchre on which the figures are carved is forty feet wide. The height is nearly equal to the width, and the rock extends sixty paces on each side. A range of four columns supports the entablature: each of their capitals is formed of the

heads of two oxen as far as the breast, with the fore legs bent on the top of each column. The gate, which is encompassed with ornaments, is placed in the middle between two of these columns, but is at present almost closed up. Above the columns are the cornice and entablature, adorned with nine small lions on each side in bas relief, advancing towards the middle, where there is a small ornament resembling a vase. Over the lions are two ranges of men, almost as large as the life, fourteen in each range, all armed, and holding up their hands as if to support the building above them; and on the side is an ornament that has some resemblance to a pillar, with the head of some animal that has but one horn. Above is another cornice ornamented with leaves. On the left, where the wall projects, are three rows of niches above each other, each containing two figures armed with lances, and three others on the side armed in the same manner. There are likewise two on the right side with their left hands placed on their beards, and the right on their body. By their side are three others like those on the other side. Above, on three steps, stands a man, who seems to be a king, pointing at something with his right hand, and holding a bow in his left. Before him is an altar, on which an offering is made, and from it the flames are represented ascending.

Two leagues from these ruins is a place called Noxi Rustan, where there are tombs of persons of eminence among the ancient Persians, that resemble those of Persepolis, only they are carved much higher in the rock. This place receives its name from one Rustan, a fabulous person, whose figure is carved there. It is pretended that he was a potent prince of so immense a stature, that he was forty cubits in height, and lived one thousand one hundred and thirteen years.

Before these tombs is a platform, above which their bases rise eighteen feet. The tombs themselves are four times that height, and the rock is twice as high as the tombs, which in the middle extend sixty feet wide. Under each tomb is a separate table filled with large figures in basso relievo, and on two of them are some traces of men fighting on horseback. Between these tombs are three other tables covered with figures, among which is a man on horseback preceded by two others, and followed by a third, which is almost defaced.

These tombs extend two hundred and eighty paces, and at the distance of sixty paces from the first of them is a little square building. Between the two tombs is a man on horseback placed in a niche; his hair falls down on his shoulders, and upon his head is a crown with a bonnet rising above it. He is dressed after the Roman manner, and has a large sword by his side, with his left hand on the hilt, and his right hand presented to a person before him, while a third figure, in a Roman habit, stands with his hands open in the attitude of a suppliant.

Figures half covered with earth are seen on the side of the third tomb, and in the middle of them is a man on horseback, which, the people say, represents Rustan; he is in a Roman dress, and has also a bonnet rising from a crown, with flowing hair, a long beard, and his left hand upon the hilt of his sword; but, notwithstanding the pretence of his prodigious stature, both he and his horse are of the common size. Before him is a woman with flowing hair, wearing a crown: she is dressed like Minerva, and holds up part of her drapery with her left hand. A third figure represents a warrior, with a tiara on his head, and his left hand placed on the hilt of his sword. In another compartment is an imperfect appearance of men fighting on horseback. All these figures are carved in the rock. This tomb of Noxi Rustan is supposed to be that made for Darius Hystaspes, from its perfectly corresponding with the description given of it by Ctesius in his History of Persia, and with that of Diodorus Siculus.

At two hundred paces distance, on the western side of the mountain, are two tables cut in the rock. That to the left represents two men on horseback, one of whom grasps a circle, of which the other has quitted the hold. Some imagine that the first is Alexander, and the other Darius, who by this action resigns to him the empire.

Others

Others imagine that these figures represent two potent princes, or generals, who, after being engaged in a long war, without obtaining any advantage over each other, at last agreed, that he who should wrest this circle out of the hand of his competitor should be acknowledged the victor. But these are at best no more than conjectures.

SECT. VIII.

Of the Exercises, rural Sports, Games, and Diversions used in Persia. Of the Manner of travelling; of their Couriers, and Foot Messengers.

HAVING considered the buildings of the Persians, and the noble antiquities still remaining of the grandeur of the ancient kings of Persia, we shall return to the moderns, and take a view of their exercises and diversions.

As the Parthians were for many ages famous for their skill in horsemanship, and the use of the bow, there are at present no exercises in which the young men of rank, both of that province, and of Persia in general, more excel.

In learning to shoot at a mark, a youth is first instructed to bend the bow, first a weaker, and then a stronger; after which he learns to shoot forwards, backwards, sideways, and almost in every posture. For some time they are exercised in shooting upwards into the air, to try which shoot the highest; after this they are brought to shoot at a mark, and to discharge their arrows with steadiness and truth. In these exercises they use arrows that have blunt iron heads; but for service they have them sharp, and shaped like the point of a javelin.

Their pupils are next taught to mount a horse with dexterity, to sit steadily on the saddle, to gallop with a loose reign, to stop short, and upon the least signal to turn to the right or left.

They are also taught to play at a game that has some resemblance to the game of bandy, only it is performed on horseback. Each person has a short bat in his hand, and a ball being thrown amongst them, they ride after it, and stooping almost to the ground, strike it while on a full gallop, and he who strikes it offiest before it comes to the end of the place appointed, wins the prize.

They are also taught to manage the sabre, and to throw the lance. The staves they throw by way of exercise are unarmed, and about five feet long, and with these they engage on horseback, and, though they have no steel point, frequently give each other dangerous wounds. After they had gone through these exercises they were formerly permitted to shoot for a prize in the royal meidan at Ispahan, before the king and court, that they might be witnesses of their activity and address. In that square is a high pole like the mast of a ship, and upon it was set a cup, sometimes of massy gold, especially if the king and great officers intended to shoot at it, as they frequently did before the reign of Nader. Those who contended for the prize rode full gallop with their bows and arrows in their hands, and when they had passed a little beyond the pole, without either stopping or turning their horses, they bent themselves backward, and let fly their arrows at the cup, and he who brought it down gained great honour. By these exercises the Persian troops have rendered themselves extremely formidable, not only when they attack an enemy, but when put to flight.

As to their rural sports, their manner of hunting seems no less remarkable. They have very fleet grey-hounds, but the stags and antelopes they course are so swift of foot, that the hounds cannot come up with them, without the assistance of their hawks. Of these they have various kinds brought from Circassia, the northern part of the empire, and even Russia. These hawks are not only taught to fly at quails, partridges, rabbits, and hares, but even at deer, and the most furious wild beasts. To bring them up to this exercise, they are said to take

the skin of one of these beasts, and having stuffed it, fasten a piece of flesh on its head, on which they suffer the hawk to feed while they draw the stuffed skin along upon wheels, to use them to fix themselves on the head, while it moves. When the young hawk has been for some time accustomed to feed in this manner, they carry him to the sport with an old staunch hawk used to the game. The dogs being let loose, the hawks are soon after thrown up, and fastening on the head of the beast, strike their talons into his flesh, and beat their wings about his eyes, so that not being able to see his way, the dogs come up and seize him. They usually carry a small kettle-drum at their saddle-bow to call off the hawks; and it is said that some of them were formerly taught to fly at men.

When the king or the great men go a hunting, the country people, for ten or fifteen leagues round, are ordered to drive all the wild beasts and game into a certain place surrounded with fences and strong nets; and when they are thus inclosed, every person in the company shoots at what he pleases, and there are frequently several hundred killed at one of these hunting-matches; but they generally stay till the person of the highest rank comes up, and discharges an arrow, after which they all let fly as fast as they can, there being generally a strange medley of animals driven in a crowd together, as antelopes, deer, wild boars, wolves, horses, and foxes. They know nothing of hunting by the scent, but they frequently bring up leopards and panthers to hunt, or rather surprize the game, for they creep from one cover to another, till they can leap upon their prey, but never pursue it in a continued course.

The Persians are not much addicted to gaming, and some of the most scrupulous look upon all games of chance as unlawful; however, some play at cards, dice, chess, tables, and other games. People of distinction also divert themselves with the fighting of wild beasts, and the common people amuse themselves with seeing the feats performed by rope-dancers, tumblers, and jugglers.

We shall now take a view of their manner of travelling, in which they differ greatly from the inhabitants of Indostan; for they have no vehicle that has the least resemblance to the palanquin, so adapted to indulge the indolence of the effeminate and luxurious; nor are there any wheel-carriages in the country. The only method of conveyance is by means of camels, horses, mules, and asses. The women of rank, who are as much as possible concealed, are put into a square wooden machine, two of which are hung like paniers on the back of a camel; they are about three feet deep, and just large enough for one woman to sit down in it, and over their head are three or four hoops, like those which support the tilt of a waggon, with a cloth thrown over them.

In times of peace, before the late reigns, and the civil wars that have spread desolation through the country, people usually travelled in caravans, consisting of four or five hundred camels, besides other beasts; this was attended with little expence, there being caravan-seras at proper distances, where they had their lodgings gratis, and purchased provisions at the best hand; and though the roads are frequently steep and mountainous, yet such care was taken in laying bridges and cañeways, and in levelling and enlarging the ways, that a traveller seldom met with any difficulties but what were easily surmounted.

The Persian couriers are armed with sabres, and wear a white sash girded from their shoulders to their waist, many times round their bodies, which enables them to ride for several days with little fatigue, they take horses wherever they can find them, which are frequently never returned to the owners: they even dismount travellers, and often leave them to walk and carry their baggage. The injustice of this behaviour occasions their being sometimes repulsed and severely treated: though according to the laws an entire submission is required, as they are employed in the king's service. Post-masters are supplied by the king's orders with thirty, forty, or fifty

fifty horses, according to their appointments; but as the demand is frequently greater than they are able to supply, and the shah's allowance very small, they are often obliged to abscond, which is a principal cause of the barbarity of the couriers. One of these post-masters, says Mr. Hanway, being challenged upon this account by Nader, answered, "That I have not supplied thy couriers with horses, is most certain; because for every ten horses thou hast provided, thou hast sent me twenty couriers: a man had better die at once, than live to serve a rascal;" and immediately stabbed himself. The shah cried out, "That is a brave fellow, save him:" but it was too late.

Those here called post masters are only appointed to keep the horses in readiness for the king's couriers, and have no concern with the letters of private persons. These are carried by shatirs, or footmen; and if any man has letters to send, he dispatches one of these with them on purpose. They will travel a thousand miles in eighteen or twenty days, and not ask more than twenty-pence or two shillings a day for their trouble. They take with them a bottle of water, and a little bag of provisions, which serve them thirty or forty hours. They generally leave the high road, and cross the country the nearest way. Some families make this their only employment, and breed their children up to it, by making them practise running from their infancy.

The shah and the great men have several of these in their retinue; but before a man can be admitted one of the king's running-footmen, he must give a very extraordinary proof of his being swift of foot; for he must run from the great gate of the palace at Isfahan to a place a league and a half from that city twelve times in a day, and every time bring an arrow delivered to him by those who stand at the end of the race, to shew that he has run the whole course; and this he performs between sun-rise and sun-set, that is, in thirteen or fourteen hours at most, though it is no less than a hundred and eight miles. None but the shah's favourite servants are admitted to this honour. On the day of trial the elephants and horsemen are drawn up in the royal square, with the drums, trumpets, and other music sounding, as if it was a great festival. All the great men make presents to the shatir, and several of them ride the course with him; and the mob, every time he returns, express their satisfaction by their shouts and acclamations.

Whenever the viceroys and khans admit a shatir into their service, they oblige him to run the same number of miles, and he is caressed and presented with gifts by all their dependents, in the same manner as the shatirs of the king.

S E C T. IX.

Of their Marriages, and Treatment of their Women; their Employments, and of the Death and Funerals of the Persians.

THE Persians are allowed four legal wives, but the people in general are far from making use of this liberty: and we are informed by Mr. Hanway, that a mullah observed to him, that though their law permitted a plurality of wives, and did not restrain men in the number of concubines; yet they always considered him as the most virtuous man who confined himself to one wife, without any concubine; and at the same time intimated his opinion, that celibacy seemed to be a war against nature, and was consequently a crime.

Indeed few men have more than one wife, who, among the great, seems to be taken from some political view, as the quality or interest of her family, and to serve as the mistress of the concubines, who wait upon her, though they are equally admitted to their master's bed, and their issue is no less legitimate than her's.

In choosing a wife they are satisfied with the account they receive from others of her beauty and accomplishments. Love, especially among those of high rank, is the least motive for entering into the marriage-state. This she does not much expect. Her great induce-

ments are the number of slaves, the cloaths, the equipage, and the figure the man makes in the world. Indeed if a woman is so unfortunate as to feel a very tender passion for her husband, she is commonly unhappy, from seeing him leave her bed for that of a slave, and perhaps for a common prostitute; and if she has the boldness to express her resentment, she will probably have the mortification to see another wife introduced into the house to govern in her stead.

The Persians, when they meet with an advantageous match, marry their children in their infancy, otherwise they are in no haste with respect to their sons; but allow them in the mean time a female slave for their bedfellow.

Before marriage the woman is stripped naked, and her person examined by the mother, or other relation of the man, as the man is by the parents or friends of the woman. A report being made, the woman's parents demand the price; which being paid, the judge, or, where there is none, the priest, having received notice that the parties are ready, marries them, often without their having seen each other.

The day before the bridegroom takes home his bride, he sends her a habit, ornaments, and jewels, suitable to her quality; and the next day, towards the evening, he goes on horseback, with the richest furniture he can procure, attended by his friends, with music and dancing-girls, to fetch her home. She meets him part of the way mounted on a camel or horse; but so veiled that her face cannot be seen. She is attended by her relations and friends in their gayest equipage, with her slaves, cloaths, and baggage. Both companies being joined, they march to the husband's house with lighted torches and music playing before them, and followed by the mob, who, with joyful acclamations, express their wishes for the happiness of the new-married pair.

On their arrival at the house the bride is led to her apartment, and the husband soon follows her. This is in general the first view he has of her face. The company spend the remainder of the evening, and sometimes several days successively, in feasting and rejoicing at the house; but the men and women are in separate apartments; and if it be the wedding of a man of quality, the music, the dancing-girls, and the mob, are also generally well entertained. But marriage does not give the women any liberty; for they, to all appearance, are considered as little more than servile creatures, formed for the pleasure and indulgence of their lord.

"Happy were it for the Christian world, says a pious and moral historian, if women were more generally taught from the earliest time of life, that rebellion against husbands in Europe is, at least, as great a crime as Asiatic tyranny over wives; and the thoughts of the latter must necessarily make them shudder. Women are not often taught the doctrine of subordination otherwise than by custom, which they sometimes call, and much oftener think, an arbitrary invasion of their rights; the understanding and the heart ought to subscribe to this doctrine, in order to establish this rule of conduct upon a solid basis. This women might more generally comprehend, that subordination is necessary to the very being of government; that the pre-eminence which men enjoy, consists chiefly in a superior toil; that whether a man has the mind of an angel, or a brute, still the gentle passions, and the submissive conduct of a wife, must establish her power in the heart of her husband, more permanently than all the arts of pride and rebellion; thus it must be if she means to possess his affections; and if she does not mean it, he has the greater reason to maintain that superiority with which nature has invested him. And as Providence has appointed man the guardian and protector of woman, he ought therefore to be the chief object of her love."

The Persians of rank have also a kind of concubines, whom they agree with either for life or a certain time. These contracts are also registered before a magistrate, and where a man parts with one of these, she must remain single forty days before she enters into a contract with another, to see if she be with child; for in that case the first man must keep her till she is brought to bed, and afterwards take care of her children. A man

may also take his slave to his bed, but he may dispose of her as he pleases without any ceremony, and yet their children inherit according to their seniority; and if the son of a slave be the eldest, he has an elder brother's portion.

With respect to the children, every person has a right to dispose of his effects to such of them, and in such proportions, as he thinks fit, except that he is limited by the marriage-contract to leave a certain part to his legal wife, which descends to her issue. But where the father makes no will, and is under no obligation to leave any part of his fortune to any particular woman and her children, the eldest son takes two-thirds of his estate and effects, and the rest is divided among the younger children without distinction.

Divorces are easily obtained, especially where both parties agree to part: the wife usually alleges, that the husband takes up too much time with his slaves and concubines to afford her due benevolence, or else that he is impotent; in either of which cases a divorce is readily granted, and both the man and woman are at liberty to marry again.

It will not be improper here to take some notice of the employments of the women. Those of Ghilan are very industrious; for the common sort are often seen abroad, without veils, planting rice, and performing other offices of agriculture; and within doors they are employed in spinning and working in different manufactures: but women of superior quality work very little, if at all. Quintus Curtius observes, that Alexander sent Darius's mother several pieces of purple, and other vestures, which he had received from Macedon, that if the manufacture pleased her, she might cause her grand-children to make them for her diversion. This was refused as a great indignity, it being esteemed mean and dishonourable for ladies in Persia to work in wool. Alexander excused himself as being ignorant of their customs, alleging, that his sister had worked the robe in which he was arrayed. The Persian ladies, says our author, are still of the same opinion; nor is this surprizing, if we consider that in Europe, where industry is reckoned a principal virtue, there are many women whose birth, fortune, and beauty might challenge the highest attention, who rather choose to be ignorant of the essential duties of life, than of its vain ceremonies and amusements.

The females who do not labour in the field are seldom seen abroad, except in a morning before the sun rises, and then they are covered with veils which reach down to their feet. When they travel on horseback, every lady of distinction is not only veiled, but generally has a servant who runs or rides before her to clear the way; and, on such occasions, the men, even in the market-places, always turn their backs till the women are past, it being thought the highest ill manners to look at them. "But this awful respect, says Mr. Hanway, is only a proof of the slavery in which they are doomed to live. The care which they take to conceal their faces, to avoid the imputation of acting indelicately, and contrary to custom, has made so strong an impression on them, that I was told of a woman, who being accidentally surprized in bathing, shewed her whole person, except her face; to hide which all her solicitude was employed."

The girls are esteemed at age when nine years old, and the boys at thirteen; and are no longer under the direction of their guardians: and when a guardian dies, the magistrate, upon examination, will admit them to be of age sooner. The eldest son is always guardian to the younger children, and the infants have the privilege of not having their estates seized for the debts of the deceased till they are of age and able to plead for themselves.

We shall now give some account of their treatment of the dying and the dead, particularly of their several funeral rites.

When a man is thought to be drawing near his last hour, they set up lighted lamps, or make small fires on the terraces of his house, that the people of the neighbourhood and those that pass by may pray for him. The mullah, or priest, is also sent for, who reminds him that it is time to review his past life, and repent of his sins;

they likewise make him repeat his creed, that there is but one God, who has neither companion nor equal; that Mahomet was his prophet, and sent into the world to publish the true religion; and that Ali and the eleven Imams are his true successors. When he can speak no longer, they read some chapters of the Koran to him till he expires. His death is immediately known by the groans and lamentations of those about him. The relations immediately set up a great cry, rent their cloaths, tear their hair, and beat their breasts; while the women in particular utter their complaints, and address the corpse with the most tender expressions.

In the mean time the cadi is informed of his decease; on which he gives an order to a person whose office it is to wash the dead, to send some of his people for that purpose. If it be a man he sends men, and if a woman those of her own sex, who immediately strip the corpse, taking all that is upon it for their own use, and then carry the body to a certain pool, or large basin, provided in every town for that purpose in some private place; but the great men have basins in their gardens, over which they pitch a tent for washing any of the family when they die. After they have cleaned the corpse they stop up all the vents, as the mouth, nose, ears, &c. with cotton, that nothing may issue from them. Afterwards the corpse is wrapped up in a new winding-sheet of cotton cloth; and if it be a person of fortune, some passages out of the Koran are stamped upon it. The body is then deposited in some place not near the house; and if it is to be buried at a considerable distance, it is put into a wooden coffin, filled up with fat, lime, and perfumes which is their only method of embalming the dead in Persia, for they never embowel them.

If they are interred not far from the place where they die, they are carried thither directly as soon as they are washed, without much ceremony; and the people who attend the corpse, follow it without the least order. At the interment of persons of distinction, the ensigns of the mosque are carried before them on long pikes; one has at the end of it an iron hand, which they call Ali's hand; others have crescents, and on the rest are written the names of Mahomet, his daughter Fatima, and his twelve successors. They have also silk streamers, and led horses, which carry the turban and arms of the deceased. The neighbours offer their service for carrying the corpse to the grave; and if a man of rank meets a funeral, he will dismount from his horse and assist in carrying the bier.

None are buried in the mosques, but in many places they have their burying grounds at a little distance from the town, by the road side: however, in Ispahan and several other great cities, there are burying-places within the city. Their graves nearly resemble ours, only on the side next Mecca the earth is made hollow, and the corpse laid in it wrapt in its winding sheet without a coffin, with the face towards Mecca. If it be a great man his turban, his sword, his bow and quiver of arrows are laid by him. The reason of their laying him under a hollow place of the earth is from the opinion, that the soul re-animates the body soon after its interment, and is examined by certain angels in relation to his life and manners. The Saïeds, who are of the family of Mahomet, never have any earth thrown into their graves, for they are only covered with a great stone. They have generally monuments and tomb-stones as with us, but instead of giving an account of the deceased, they usually engrave upon them some passages of the Koran; or an epigraph, in which, according to the common sense of mankind, life is compared to a flower that blossoms in the spring, and in the summer appears in the full lustre of its beauty; but in autumn begins to wither and decline, and when winter comes on, a gulf of wind blows it to the ground, where it lies and rots.

Eight or ten days after the funeral, and on certain festivals, the friends and relations visit the tomb, especially the women with their children, who there renew their lamentations, and beating their breasts expostulate with the deceased upon his leaving them; mean while their friends endeavour to comfort them, and sometimes leave

leave at their grave cakes, sweetmeats, and fruit, in order to please the angels who guard the sepulchre.

They usually mourn forty days, not by wearing black, which they detest as an infernal habit, but by shewing the most lively expressions of grief two or three times a week, and wearing a torn and negligent garb of a dark blue colour. This time being expired, they bathe, shave, and dress themselves in their usual habits. Their wives appear most inconsolable, for a widow in Persia seldom marries a second husband.

The Persian kings are frequently buried at Kom in great state, as appears from the following account of the interment of Soliman. The corpse was preceded by one hundred camels and mules, which carried provisions for a thousand people, who were to attend it on the road; after which was carried the body in a large litter covered with a pall of cloth of gold, by two camels led by the Nazir or high-steward. On the side of it went two servants burning perfumes in golden censers, and a company of priests singing their prayers. These were followed by an empty litter covered with red and green; then followed all the great officers of the court on foot with their cloaths rent, except the prime minister, who was permitted to ride, on account of his great age. Many thousands of the people joined the procession, and made dreadful lamentations, as for their common parent. In this order they proceeded about a league from Ispahan to one of the king's country palaces, where the corpse rested: and the following night those appointed to attend it proceeded on their journey to Kom, while the great officers returned to Ispahan to attend the new king. The shops were then opened, which had been shut ever since the people had notice of the king's death, and the court resumed its usual splendour.

S E C T. X.

Of the Religion and Superstition of the Persians.

AS to the established religion of Persia, the Turks and Persians equally acknowledge the Koran to be the great law of the prophet Mahomet; but trace their divisions and inveterate animosities as high as his immediate successors. Ali was Mahomet's brother's son, and married to Fatima, the daughter of the false prophet. Hence the Persians infer his right to the succession, which was notwithstanding invaded by his uncles Abubeker, Omar, and Osman, the brothers of Mahomet, whose usurpation, both as kings and prophets, is approved of by the Turks. Ali, at length, succeeded, and the dispute might have been lost in oblivion, had he made no different explications of the Koran. This, however, produced no extraordinary effects till the fourteenth century, when Sheshe, a man of an exemplary life, who pretended to a regular descent from Ali, began to teach and expound the Mahometan law, and the doctrine of Ali's followers, in preference to the precepts taught by the Turkish doctors. This reviving the remembrance of the injury done to Ali by his uncles, the Persians began to curse them in their public prayers, and changed the form of the Mahometan creed, by giving Ali the title of the friend of God. These two sects being thus divided, those who maintained the succession of Abubeker, Omar, and Osman, called themselves Sunnis, while the followers of Ali took the name of Schias.

The Persians acknowledge that the Mosaic was the true religion before Christ, whom they also believe to be a true prophet and teacher sent from God; but that the religion he taught was contained in a book, which, at Mahomet's coming, was taken by the angel Gabriel into heaven, and the Koran brought down in its stead. They also, like the other Mahometans, say, that Jesus Christ did not die upon the cross, but as he was going to his crucifixion, he was invisibly translated to heaven, and that Judas being miraculously brought thither in his place, his face appeared like that of Christ, and he was crucified in his stead. Thus they confess the truth of our Saviour's mission, but mingle almost every thing relating to him with extravagant fictions.

The Mahometans have two articles of faith, and five of practice. That there is no other God but God, and that Mahomet is his prophet; that men ought to observe bodily purifications; pray to God at the appointed times; give alms to the poor; fast all the month of Ramezan, and, if possible, go in pilgrimage to the temple of Mecca. To these the Persians add an eighth article, which is, that Ali is the friend of God.

The Persians maintain that all souls were formed long before the creation of the world, and many of their doctors believe the metempsychosis or transmigration of souls. Their history of the creation has many fables, mixed with the truths they have taken from the books of Moses.

They say that both good and evil angels were made of the substance of light and fire, and being composed of soul and body, their aerial forms may be so condensed as to become visible. That the first time the evil angels disobeyed God, the good angels fought them, and brought them captives to heaven, where God pardoned them; but he afterwards creating man, and commanding all the angels to bow before him, the evil angels, filled with pride, again rebelled; upon which they were cursed by the Almighty, who precipitated them from heaven into a place which their fury and despair has rendered hell.

They imagine that as soon as the deceased is laid in his tomb, the grave closed, and the company retired, the departed soul re-enters the body, and is visited by two black angels, terrible to behold, the one called Munkir, and the other Nekir, who oblige the person to sit upright, and question him concerning the unity of God, the mission of Mahomet, and the good or evil he has performed, which they record in a book to be opened at the general judgment: that in the mean while, the souls of the faithful are filled with transports of joy; while the wicked endure the dreadful pangs of remorse. They say, the soul wanders about till the body is interred; but that it has no sooner undergone the first examination in the sepulchre, than it enters an aerial body, in which it continues till the general resurrection, when it will be re-united to its earthly frame.

After the final judgment they maintain, that all men must pass over a certain bridge no wider than a razor's edge: that unbelievers and the wicked will infallibly fall in their passage into hell; but that the faithful shall pass the bridge swifter than a bird flies through the air, and enter into paradise.

They maintain, that the torments of hell consist in being put into the hands of devils, who shall hang up the body in dreadful caverns full of dragons, serpents, and all manner of noxious and loathsome animals, which shall perpetually gnaw it, and fill the soul with rage and remorse. On the other hand, the joys of paradise will, according to them, entirely consist in sensual delights.

The blessed, say they, after they have tasted of the fountain of living waters, shall seat themselves on the banks of the river of delight, which is shaded by a tree so immensely large, that was a man to ride post fifty thousand years he would not pass the extent of one of its leaves: that Mahomet, and Ali shall serve the happy with the water of this delicious river, mounted on the Pay Duldul, an animal that has the head of a woman, the foot of a stag, and the hinder part of a tyger: that they will be attended by innumerable companies of fair celestial beauties, with large black eyes, created on purpose for the enjoyment of the elect. They also maintain, that they shall enjoy the free use of these voluptuous pleasures, without being capable of sinning, because nothing is forbidden, nor shall they there experience the effects of satiety, but their life, and health, and vigour will be everlasting.

If they be asked how they can suppose, that in paradise they shall be taken up with mere corporal enjoyments, which perish in the possession, they boldly reply, That these are not formed to supply any necessities of nature, but for pleasure; and that all the delights we taste in this life, we shall enjoy in a much higher degree in paradise; for this world, say they, is but a type of that, and all that we see came from thence, though

though they are extremely degenerated from their excellent original. If it be objected, that if we eat and drink in heaven, we must be subject to the necessities and defilements which follow eating and drinking, they answer, that the delicious food of paradise shall evaporate in a perfumed sweat through the pores; and that though they say the Persian women shall be excluded paradise, they only mean that they shall not inhabit the same paradise as the men; but in another place will enjoy equal delights.

There are, however, some Persian doctors, who consider all the promises and threatenings in the Koran in a spiritual and allegorical sense, and say, that these things are thus delivered only to accommodate them to the gross ideas of the people; but that the happiness of paradise really consists in being employed about objects proper for the soul, as in the knowledge of the sciences, and the sublime operations of the understanding, and that the body shall have pleasures suitable to its nature, and enjoy all the delights of which it is capable; but not, as here upon earth, by meat and drink, and sensual indulgencies: that hell shall consist in regret and despair for the loss of paradise, while the body will be afflicted with the most excruciating torments, but after what manner they do not pretend to determine.

The Persians sometimes exalt Ali above Mahomet himself; they even pretend that Ali is not dead, but taken up into heaven, whence he shall return and fill the world with his doctrine. They never speak without the utmost detestation of Abubeker, Omar, and Osman.

They distinguish uncleanness into two kinds, one of which they esteem sinful from its being absolutely forbidden by their law, as to drink wine and strong drink, to eat pork, &c. while the other only communicates a defilement that renders a person unfit to perform certain acts of religion, as to pray to God, or read the Koran, while he continues in this state of uncleanness. They not only pretend that it is unlawful to drink wine, but that every thing is defiled in which wine has been put, or on which a drop of it has fallen; nor is it lawful for them to be in a room where wine is kept. But though the drinking of wine be forbidden by their law, and their commentators are very severe in their censures of those who use this indulgence, many of the Persians, particularly in the army, drink it pretty freely, and also intoxicate themselves with spirituous liquors. When they are asked by a Christian how they dispense with this precept, they answer, "In the same manner as you dispense with drunkenness, adultery, and fornication, which are no less forbidden to Christians, and yet many among you glory in their excessive drinking, and in their debauching women."

The bigotted Persians lay a greater stress upon the ceremonial part of their law, than on the moral; for their washings and purifications must be observed, whatever else they omit. They have the maxim of their prophet frequently in their mouths, that "religion is founded in purity, and half of it consists in a man's keeping himself undefiled." Their prayers are vain and criminal when offered up with unwashed hands, and it is the highest profanation to touch the Koran in such a state. There are indeed such a variety of defilements, that though they are obliged to pray five times a day, it is almost impossible to prevent their being polluted between one prayer and another.

As the Persians reckon their day from twelve at noon to twelve the next day, the first hour of prayer is exactly when the sun is in the meridian. The second is in the evening; the third when it is so dark that one cannot distinguish colours; the fourth is to be made on lying down to sleep, and the fifth in the morning, and may be performed at any time between the disappearing of the stars and noon. All these prayers would be an insupportable burden, considering the purifications and other preparations required before they begin their devotions, were they not indulged in some particulars: for instance, they are allowed to offer up two sets of prayers at the same time; for though that in the morning is performed singly, those for noon and the evening may be offered together; and those to be said when it

grows dark and at bed-time may also be said together; and if they are prevented saying their prayers at the appointed times by any pressing occasion, they may afterwards say them as soon as they have an opportunity. These set hours of prayer give the Persians an opportunity of retiring from company whenever they think fit, without being thought guilty of rudeness; for nobody is ever importuned to stay, when he declares that he is going to his devotions.

The mullahs, and those who have more religion than their neighbours, keep exactly to the five stated hours of prayer, and never deviate from them but in cases of the extremest necessity.

In most Mahometan countries the times of prayer are proclaimed by the officers of the mosques from their steeples; but in Persia those officers declare the time of prayer from the top of the mosques. Upon common days no more than one or two of these criers are employed; but upon festivals there are sometimes ten or a dozen of them, particularly on Fridays, their sabbath; and it can scarcely be conceived how far their voices are heard. They begin with these words, "O God, most great!" which they repeat four times, turning to the four winds; then they add, "The testimony we render to God is, that there is no other God but God. Mahomet is his prophet, and Ali his friend." This they also repeat four times as above, and then say, "Arise, and pray, perform that most excellent duty which Mahomet and Ali, the most perfect of created beings, have commanded." If it be at midnight, which is one of their times for offering up prayers of supererogation, or in the morning, they add, "Awake out of your sleep;" and having repeated the words, "O God most great!" four times, sing some verses of the Koran, and then conclude with "Omar be accursed." When the people hear these criers, they arise up and go to prayers in their houses, or wherever they think fit.

In performing their devotions they have several ceremonies, which must not be omitted; first they put off their slippers, and all their ornaments: even their turban must have neither gold, nor silver, nor embroidery, and therefore they usually put on a white callicoe turban. They take particular care to wear at such times no skins or furs belonging to any beast prohibited to be eaten by their law; and always wash their face, feet, and hands. Every person has a little carpet, about five or six feet long, and three broad; in this are wrapped the things they use at their devotions, as the Koran, which is kept in a little bag by itself, an earthen dish, their beads, a pocket-glass, and sometimes a few tattered relics. These they take out, and having spread the little carpet before they begin their prayers, they sit upon their heels, and range these little tinkers in order. They then take the comb and glass, and comb their beards; take off their purse, their seals and rings, their sabre and knife, that they may present themselves before God in the most humble manner. Then turning their faces towards Mecca, they begin their prayers; at certain parts of which they stand, then kneel, and then prostrating themselves on the earth, set their foreheads on a bit of clay of about the size of a crown-piece.

On these occasions they count their beads on a string, as is the custom of some Christians, who doubtless learnt it of them, as they did of the neighbouring pagan nations. Though they pray so often, their prayers are pretty long, and they seem to perform their devotions with inconceivable reverence and attention; nothing can divert them from what they are about; their eyes remain fixed, and every gesture is exceeding just and suitable to the occasion; and in short, they perform this duty with greater reverence and attention than most Christians. It will not be improper here to add the observation of Mr. Hanway, "Though the Persians, says he, are become extremely immoral, yet they give one proof of religion vastly superior to the Christians: for I never could observe that they mentioned the name of the Supreme Being, except upon solemn occasions, or at least in a respectful manner."

Prayers for the dead are recommended, but not enjoined by the Persian religion. They think it an act of

Commemoration of Abraham's sacrificing his Son.

of piety to commemorate at certain times their deceased friends, and some of them are of opinion, that God will increase the happiness, or lessen the misery of departed souls, in compliance with the earnest intreaties of their surviving friends. None of them, however, pray to their saints, or even to Mahomet or Ali, to intercede for them; for they do not believe that they even know what is done upon earth, but as God is pleased to reveal it to them.

In all their religious books and discourses charity is warmly recommended, without which their prayers are held to be vain and ineffectual. They dispose of their alms chiefly in public buildings, as in erecting caravanseras, bridges, cauleways, cisterns, receptacles of water, mosques, colleges, and bagnios.

The alms particularly ascertained are a kind of tythes of cattle, corn, money, and merchandize, only taken out of the neat profits after all rent and charges are deducted, and these are not given to the priest, but, like their acts of charity, are applied to different purposes; as to the maintenance of the Mahometan faquirs, or begging priests, to redeeming slaves severely treated by their masters, to the relief of insolvent debtors, and of strangers in distress. The rest are employed in public buildings, in erecting mosques, caravanseras, &c.

They have no set time for circumcising their children: some maintain that it ought to be at thirteen years of age, because Ishmael was circumcised at that age; but they generally administer it when the child is four or five years old, on account of its being less painful and hazardous than when they are older. Some barber performs the operation, and applies styptics and astringents to stop the bleeding. They observe neither any particular day nor hour for performing this ceremony, but do it when and where they please. However, on the circumcision of a great man's son, a mulah comes to his house, and reads in the Koran during the operation; but they have no office on purpose for it. The rest of the day is spent in rejoicings.

The Persians have several fasts, the most remarkable of which is that named Ramezan, from the name of the month in which it is held, and which lasts from the beginning to the end of it. When this moon first appears, it is proclaimed by the holy criers in great numbers on the terraces of their mosques, as a surprizing piece of news, and this publication is accompanied with their singing hymns on the occasion; the people answer in joyful cries, and illuminate the streets; while the horns sound from the terraces of the bagnios, to give notice that the baths are ready; for all their acts of devotion begin with washing themselves. Every one is obliged to fast during the month of Ramezan, from break of day till sun-set, during which time they are not even allowed to eat or drink any thing, or to wash their mouths, or even their faces, lest it should be any refreshment; and some even make a scruple of swallowing their spittle, or opening their mouths to let in the air. All amorous commerce is prohibited even in words and looks. At sun-set, when they are allowed to eat, this is proclaimed from the mosques; then the people having performed their purifications, and said a short prayer, begin to eat some light food, as fruit and sweetmeats, and some time after go to supper, in which they spend more time than usual; for they eat very slowly to prevent any ill consequence from a full meal after so long a fast. Those who live by their labour generally make a meal about two hours before day; and then lie down to sleep. Those of dissolute morals feast all night, and sleep the greatest part of the day; so that in many places the Ramezan rather resembles a festival than a fast, with this only difference, that like the debauchees in this part of the world, they turn day into night. Those who live regularly rise in the morning to go to bathe, in order to purify themselves from all pollution, and both their habits, their countenances, and discourses are suitable to the occasion. Great part of the day is spent in retirement, praying, reading the Khoran, and other books of devotion; and though they do not scruple to transact business, they are more cautious of conversing with people of a different religion, lest they should be defiled, and rendered unfit for their devotions. In the day-time

fewer people are to be seen in the streets than in the other months; but in the evening crowds of people appear in the markets and other places of resort: hence it is sometimes called the feast of candles, from the multitude of lights set up in all parts.

The Persians are also required once in their lives to make a pilgrimage to Mecca, the place of Mahomet's birth, where is a little chapel, called the house of God, which, according to tradition, was built by Abraham, and to which all the Mahometans pay an extraordinary veneration. Of this chapel we shall give a particular description when we come to Arabia.

The principal religious festivals of the Persians are those in commemoration of Abraham's sacrificing his son, and that of the martyrdom of the two Imans, Hossein and Hassien. Those who keep the feast of the sacrifice rise early in the morning, and ride out of the city at break of day, in order to sacrifice a sheep or goat, after which they cause several to be killed in their own houses, and distribute them among the poor. In every great town there is also a general sacrifice of a camel, at which, it is said, the king himself assists, when at Isfahan. This festival is performed in the following manner.

On the first day of the month Zilhah, one of the king's camels is delivered to the people, who, having dressed him up with garlands and ribbons, lead him through the city, preceded by trumpets and other music. This is done every day till the tenth, the people all the while following the beast in crowds, with loud acclamations; and he is even brought into the houses of all the great men, that the women of their harrams may see him unperceived, while the mob who attend the procession receive money or good cheer at every house.

The day of sacrifice being arrived, the camel is led to a field near the city, to which the king sometimes comes in his cap of state, attended by all his courtiers, whose turbans are adorned with precious stones, and who are attended with a magnificent retinue. They then make the camel lie down on his belly, with his head towards Mecca, several men holding him with ropes to prevent his stirring; and being surrounded by the king and the officers of his court on one side, and the priests on the other, who offer up certain prayers on the occasion, the beast is struck on the left shoulder with a lance, and immediately after his head is cut off and presented to the king: the body and the four quarters are given to the five great wards into which the city is divided, and the people carry them away in triumph amidst songs and rejoicings. A certain family in every ward has the privilege of keeping the sacred flesh, and the chiefs of these families make an entertainment for those who assisted at the sacrifice, they being furnished with provisions for that purpose by the wealthy people in the neighbourhood, to whom in return they send little morsels of the camel sacrificed the preceding year; for the quarters of the camel are always salted, and kept till another camel is slain. Those who get the least piece to eat, imagine that it is accompanied with every blessing.

The next great festival, which, in many respects, has the appearance of a fast, is in memory of the death, or martyrdom, as they term it, of their patriarch Hossein, who was slain in a battle with the califf of Damascus, who contended with him for the empire, in the sixty-first year of the Hegira. They say, that after he had lost the battle, he retreated with his broken troops into a desert near Babylon; but, when he had been pursued fourteen days, was overtaken by his enemies, and died bravely fighting and covered with wounds.

This festival continues ten days, during which no trumpets or musical instruments are sounded, and those who observe it strictly neither shave nor go to the bagnio. At this time they never begin a journey, nor even undertake any important affair. Many of them rend their cloaths, paint their skins black, and appear with sorrowful countenances. The streets from morning till night are filled with people, some almost naked, others stained with blood, and others in armour with naked swords in their hands: some seem faint and ready to perish, and, with all the signs of anguish and despair, cry out as loud as possible, Hossein! Hassien! This

P p p

Hassien

Hassien was the eldest brother of Hossien, who was slain in the same war. What the people endeavour chiefly to express is the heat and thirst with which Hossien was afflicted in the desert, which, they say, was so great, that his tongue hung out of his mouth. If they meet either a Pagan or a Christian they cry, Cursed be Omar; to which the other, if they would not be insulted, must reply by repeating the same words. During the ten days of mourning there are altars at the corner of every street, and a place inclosed and hung round with shields, firearms, colours, standards, drums, trumpets, and all kinds of war-like instruments. In the night-time the streets are illuminated, and their doctors preach to the people on the subject of the festival, inflaming their rage against the enemies of their saint. It is impossible to conceive the grief and anguish expressed on these occasions; they beat and utter lamentations, as if under the deepest affliction. On the first days of the feast their preachers entertain them with an account of the birth of Hossien, in which they relate a thousand fabulous circumstances. In the latter part of the feast they expatiate on Hossien's resignation, in voluntarily devoting himself to death. They pretend that four thousand angels in vain offered him their assistance; and that one, in particular, in the form of an hermit, brought him a cup of water when he was ready to expire with thirst; but Hossien, refusing to accept it, told him, if he pleased he could command a brook of water to issue out of the earth; and then touching the ground with his finger, there sprung up a large fountain; but declaring, that it was decreed he should die under his misfortunes, he never attempted to quench his thirst. The sermon being over, the people renew their cries of Hossien, Hassien, till being spent with this exercise, they return home and feast. During this festival the Persians are extremely charitable, and think it a crime to refuse alms to the poor. Before the houses of the great stand vessels of ice and water, that none may suffer by thirst; and the king daily entertains at least four thousand people, who attend the procession. A number of machines and pageants are carried at this feast; and among the rest open chariots and biers, in which are the representations of the mangled bodies of Hossien and his friends. This festival seems solely intended to keep up, from political views, an inveterate hatred against the Turks, whom they esteem their natural and most formidable enemies.

As the religion of the Persians leads them to conceive the most wild and extravagant ideas of the agency of invisible beings, these have an influence on their conduct in private life, and the most amazing superstition tinctures all their actions; and, by strongly influencing their hopes and fears, frequently prevents their taking those rational measures which alone can enable them to escape the misfortunes they dread. Hence, instead of having recourse to the dictates of reason, and the measures inspired by prudence, they have recourse to charms and amulets, formed of inscriptions on paper, and sometimes on precious stones; thus certain passages of the Koran, worn in a little bag about the neck, are esteemed a sovereign remedy against diseases and enchantments. Sneezing is held a most happy omen, especially when often repeated; the hands with the fingers interchanged, and some particular postures of the body, are esteemed full of magic power; and, if used maliciously, of dangerous consequence. Mr. Hanway mentions an officer whom he travelled with, and that was going to the shah to answer for his conduct, who endeavoured to learn by heart a prayer composed by Hossien, which, if repeated right in the presence of the king, he imagined would divert his wrath; but if falsely, increase it. This officer had another spell which he proposed to use; this was the repetition of ten particular letters in the alphabet, as he entered the royal tent, closing a finger at each, and keeping the first clasped till he came before the throne, when he was suddenly to open his hands, and by the discharge of this magic artillery, to subdue the king's wrath. As the minds of the Persians are tainted with an extravagant fondness for the marvellous, they imagine that the meteors, which resemble falling stars, and are vulgarly called so, are the blows of angels on the heads

of the devils who would pry into the secrets of paradise. Cats are held in great esteem, but dogs in abomination: so that though they use them sometimes at their diversions, they are never permitted to come into any room. The Turks are not much behind them in this folly: in the reign of Shah Abas the Grand Signior sent to that prince to desire, that as none but their prophet and his children had been dressed in green, none of his subjects might be permitted to wear that colour, especially in stockings. To this Shah Abas, who was a man of understanding, made answer, that if the Grand Signior would prevent the dogs pissing on the grass in Turkey, he would comply with the request.

S E C T. XI.

Of the Religions tolerated in Persia; particularly of the Gebers, or Gours; with an Account of an extraordinary Phenomenon called the everlasting Fire.

UNDER Indostan we have given a particular account of the Parsees of India, who were once driven from Persia, and are of the same religion as the Gebers, or Gours, only differing in some points of smaller moment. They are both descended from the antient Persians, and both are of the religion of the antient Magi, the followers of Zoroaster; both consider light as the most perfect symbol of true wisdom and intellectual endowment, and darkness the representation of ignorance, vice, and every thing hurtful and destructive; both abhor the worship of idols, and adore God under the form of fire, considering the brightness, activity, purity, and incorruptibility of that element, as bearing the most perfect resemblance of the nature and perfections of God; and therefore shew a particular veneration to the sun, as the noblest representative of the all-wise and all-perfect Creator. The Parsees of India, however, censure their brethren of Persia for corrupting the antient doctrine, and introducing an evil principle into the government of the world. This many authors represent as the antient doctrine; some assert, that the followers of Zoroaster held a co-eternity of these principles, which they termed Oroozm and Harriman, which the Greeks called Oromades and Arimanius; while others say, that, according to the Persian mythology, Oroozm first subsisted alone; that by him both the light and darkness were created; and that Harriman was created, or rather arose from darkness: that good and evil being thus mixed together, they would continue till the end of all things, when each should be separated and reduced to its own sphere.

But what is most remarkable with respect to these people, is commonly called the everlasting fire, a phenomenon of a very extraordinary nature, about ten English miles from Baku, a city situated in the north of Persia, by an excellent haven of the Caspian sea. This object of their devotion is on a dry rocky-soil, where there are several antient temples built with stone, supposed to have been all dedicated to fire, most of them arched, and only ten or fifteen feet high; among which is a temple, in which the Gebers still preserve the sacred flame, which they pretend has continued burning ever since the flood; and they believe it will last till the end of the world. It rises from the end of a large hollow cane, which is stuck in the ground, in a blue flame, in colour and gentleness not unlike a lamp that burns with spirits, but seemingly more pure. Here are generally forty or fifty poor devotees, who come hither in pilgrimage.

At a small distance from this temple is a cleft of a rock, in which is an horizontal gap two feet from the ground, near six long, and about three broad, from which rises a constant flame, of the colour and nature of that just described. In calm weather it burns low, but when the wind blows, it sometimes rises eight feet high; and yet the flame cannot be perceived to make any impression on the rock. The Gebers here also pay their adorations, and say, that if these fires are stopped in one place, they will rise in another.

What

What appears still more extraordinary, there is undoubted proof that these fires constantly burn without any supply being added by the people to feed the flame, for Mr. Hanway observes, that for above two miles round this place, the earth has this surprizing property, that by taking up two or three inches from the surface, and applying a live coal, the part so uncovered takes fire almost before the coal touches the earth: the flames heat the earth without consuming it, or affecting what is near it. Yet this earth carried to another place does not produce the same effect. If a cane, or even a paper tube be set about two inches in the ground, and closed with earth below, on touching the top of it with a live coal, and blowing upon it, a flame instantly issues, without injuring either the cane or the paper, provided the edges be covered with clay. This method they use for light in their houses, which have only the earth for their floor; three or four of these lighted canes will boil a pot, and thus they dress their provisions. The flame may be extinguished in the same manner as that of spirits of wine. The ground is dry and stony, and the more stony any particular part is, the stronger and clearer is the flame; it has a sulphureous smell, like naphtha; but it is not very offensive.

By means of this phenomenon, lime is burnt to great perfection, the flame communicating itself to any distance, where the earth is uncovered. The stones must be laid one upon another, and in three days time the lime is completed. Near this place are found springs of naphtha, and brimstone is dug up.

Since the greatest part of the Gebers were driven out of Persia by Shah Abbas, there have been few of them who have openly professed their religion in that kingdom; there is, however, a village near Ispahan inhabited by them, from whence it receives the name of Guebarabad.

There is also a sect in Persia named Souffees, who, though they outwardly conform, for the sake of peace, to the Mahometan religion, have a system of doctrines, that contain the purest mysticism, which contradicting no religion, can put on the forms of all. Their principal aim is to form within themselves a mental elysium by an extinction of all the passions in sacrifice to God. In this state of quietism they say they feel a certain pleasure, like that felt by the body, when, after its being over-heated, it is cooled by a refreshing breeze. They recommend three points to be observed in the conduct of social life; these are a grateful return to friendship, and for benefits received; to win all hearts by generosity, and never to depart from sweetness of temper, truth, and candour.

There are also another people in Persia, whose religion seems compounded of Christianity, Judaism, and Mahometism. These are called Christians of St. John, and sometimes Sabeen Christians. They dwell near the Persian gulph, where there are said to be many thousand families of them. St. John Baptist is their great saint, and it is said they acknowledge Christ in no other light than as a prophet, and yet pay an idolatrous worship to the cross. They are said to have lost their ancient sacred books, and to have only one at present, which is filled with Jewish and Mahometan legends, and contains their doctrine and mysteries.

There are also in Persia a number of the Armenian and Georgian Christians; but the latter are not found out of Georgia, the ancient Iberia.

S E C T. XII.

Of the Government of Persia; the Authority and Titles of the King; the cruel Use he makes of his unlimited Power; the Treatment of the Governors of Provinces, and of the royal Infants. Of the Ladies of the Harram and the Eunuchs.

THE Persian government is monarchical, and in every branch of it strictly despotic. The favour of the prince, and of those on whom he devolves his authority, is essential to the security of the great, and particularly of foreign merchants; and this may be best preserved by proper and timely presents, by a good ap-

pearance, and a resolute discreet support of their own dignity. The Persians are not ignorant of the laws of justice and humanity; but war having been for many years their only study, and a fondness for outward shew their predominant passion, these laws are little regarded when they interfere with their inclinations; hence it is said, that a good horse, a silver-mounted bridle, and a girl, will generally induce a Persian to violate justice, and even commit actions for which he is morally certain of death.

The usual title of the king is Shah, or Shaw, as it is pronounced, which signifies the disposer of kingdoms, and is the highest title known in Asia; it being equivalent to that of emperor in Europe. They also add to the king's titles those of Sultan, and Khan or Cawn, which is the title of the Tartar sovereigns. His arms, are a lion couchant, looking at the sun as it rises over his back.

When his subjects address him they stile him the source of power, majesty, and glory, equal to the sun, substitute of heaven, the head of the most excellent religion, prince of the faithful, the father of victory, the shadow of Almighty God, and lord of the revolutions of the world. With these and the like titles all petitions to the Shah abound; but when they speak to him they usually stile him the lieutenant of God, or the prince by whom God dispenses his grace and favour to men.

This prince has the lives and estates of his subjects intirely at his disposal: there is no prince in the world more implicitly obeyed, even though his orders are ever so unjust, or given when he is so little master of his reason, that he knows not what he says or does. Nothing can save the greatest subject, if he resolves to deprive him of his life or his estate; for neither zeal for his person, merit, or past services, will be of the least avail: if he be in a humour to ruin thm, to put out their eyes, or to inflict on them the most cruel death, it is done by a word of his mouth, or merely by a sign, and instantly executed without any form of law or evidence of guilt.

The Persians readily obey all the commands of their prince without reserve; so that if the son be commanded to be his father's executioner, or the father the son's, it must be complied with. Yet they say, if he commands any thing contrary to the peculiar tenets of their religion, they are under no obligation to obey him. Several writers mention a minister in the Persian court, whom the king commanded to drink with him; but he excused himself by saying, he had been a pilgrimage to Mecca, and could not drink wine without violating the laws of their religion: to which the king replied, "Thou sands have gone in pilgrimage to Mecca, and yet drink wine: drink therefore when thy sovereign commands thee;" but the minister still refusing, the king not only abused him in the grossest manner, but made the servants throw the wine in his face, and pour it by force into his mouth: then threatened him with immediate death; to which the other returned, that he had a right to his life, but not to his religion, and he chose rather to die than drink. The king then dismissed him from his employments; but he was soon after restored, and seemed to be doubly honoured by the king for the resolution he had shewn, in refusing to violate his conscience.

Scarce any thing appears more tyrannical in the Persian government, than the custom which has for a long time prevailed, of executing the governors of provinces and great officers of state, without giving them an opportunity of making their defence, or letting them know the crime laid to their charge. It is usual for the king to send every governor a royal vest, and as these are sent by persons whom the court intends to favour, the khan or governor always makes them a considerable present. When this messenger comes within two or three miles of the place where the governor resides, he sends him word, that he may come and receive the present; but instead of a royal vest, he is sometimes presented with an halter and dispatched without farther ceremony.

We are informed by Thevenot, that Shah Sefi, without any provocation, gave orders, that one of the greatest officers of his court should have his ears cut off in his presence.

presence by his own son, which that unnatural son immediately performed; he then commanded him to cut off his father's nose, and he instantly obeyed. The old courtier finding himself thus ill-treated by his own son, to gratify the caprice of a prince, whom he never intended to offend, entreated that he might be put to death. This favour he easily obtained; but the tyrant ordered his son to be the executioner, telling him, that when he had cut off his father's head, he should have his whole estate, on which the parricide drawing his sabre, severed his head from his body.

A prince of a cruel disposition may here give full scope to his inhumanity, and wantonly sport with the lives he is under the most sacred obligations to protect; he may enjoy the infernal satisfaction of making the torments of the guilty a subject of mirth; and of wantonly sacrificing the innocent to his avarice, his humour, or his lust. Mr. Hanway gives several instances of the cruelty of Nadir, that must shock every benevolent mind. A person, who had collected taxes, was complained of by the peasants, of whom it appeared he had exacted more than he had accounted for to that prince; this was a capital crime, and he was therefore condemned to suffer death. But Nadir, as if he had recollected something particular of this person; cried, "I understand you can dance well; dance, and I will save your life." The man immediately began to dance, doubtless with some transports of joy; but the shah ordered the executioner to strike him on the legs, which preventing his performance, the tyrant cried, "The rascal does not dance well; kill him." After his execution he was left near Mr. Hanway's tent, whence his friends removed him in the night.

We shall here mention, from the same worthy author, another instance of the cruelty with which that prince abused the despotic power with which he was invested. The shah having appointed a certain captain-general as governor of a province, imposed on it an exorbitant tax, to be levied in six months. At the expiration of the time the governor was sent for to the camp, and ordered to produce the account. He did so, but it only amounted to half the sum demanded. The shah called him a rascal, and telling him that he had taken the other half of the money, ordered him to be bastinadoed to death. His estate was then confiscated, but the value of all his effects fell very short of the sum demanded. The servants of the deceased being then ordered to come into the shah's presence, he enquired of them if any thing was left belonging to their master; to which they answered, Only a dog. He then commanded the dog to be brought before him; and observed, that he appeared much honestier than his master had been; however, he should be led through the camp, from tent to tent, and beaten with sticks; and wherever he expired the master of such tent should pay the sum deficient. According the dog was successively carried to the tents of the ministers, who hearing the case, immediately gave sums of money, according to their abilities, to procure the dog's removal; by which means the whole sum the shah demanded was paid in a few hours time.

The king has no privy council, as in the European governments, but acts according to his own caprice, or as he is advised by those about him. That which most perplexes the ministry is, the cabals carried on by the women in the harram, who frequently thwart their best laid schemes; and the ministers not only run the risque of having their councils rejected, but, if they are contrary to the inclinations of the ladies in most favour, they frequently turn to their destruction.

By the laws of Persia the crown is hereditary, but the females are excluded. However, the son of a daughter may inherit, though his mother cannot. It is also a law in Persia, that no blind man shall be raised to the throne: hence, as those males that proceed from the female branches are as capable of succeeding as those that spring from the males, that horrid policy of putting out the eyes of all that have the misfortune to be allied to the crown, is executed upon every male of the royal family, whether they proceed from sons or daughters; and as there are no common executioners in Persia, the orders for putting out the eyes of the royal infants

are executed by any one the king chooses: they are even not contented, as formerly, with extinguishing the sight by holding a hot iron to the eye, but the very eye-balls are scooped out with the point of a knife or dagger, just as the person sent happens to be provided; and those wretches not being used to such operations, the poor helpless children are put to an inexpressible torture, and sometimes expire amidst the most excruciating agonies.

But though the crown generally descends to the eldest son, the king has sometimes caused the eldest to have his eyes put out, in order to leave it to the youngest. These barbarous practices are excused by the Persians, on account of their preventing all disputes about the succession, and the spilling of much bloodshed. They alledge, that, in this respect, they are more merciful than their neighbours the Turks, who destroy every branch of the royal family; while they, on the contrary, permit them to live, give them wives, and allow them to enjoy in the harram all those pleasures that can be relished by the blind; but with what agony must these miserable princes reflect, if they have the least sense of parental affection, that all the males which proceed from them will be served as they have been, and have their eye-balls torn out too.

When the heir to the throne is marriageable, the shah generally gives him the choice of a mistress among the ladies of the harram, and sometimes of two, or more; he also gives him a number of domesticks suitable to his rank, consisting of eunuchs and female slaves, and an apartment in the harram, to which he is confined. He is there excluded from the conversation of all men, except the eunuchs who are placed about him, and are his tutors; whence, on his succeeding to the crown, he is generally as ignorant of the affairs of the kingdom, as if he had dropped from the clouds.

The princesses of the royal blood are usually married, as soon as they are of a proper age, to some ecclesiastic; but never to a minister of state, or a man of the sword, lest they should be inspired with ambitious sentiments. A princess is no sooner brought to bed than the news is immediately carried to the king, who gives his orders according to the humour he happens to be in, or his regard for the parents; and there have been instances in which the males were permitted to live and enjoy their sight.

The princes of the royal blood are called Mirza, as Ibrahim Mirza, or Sophi Mirza; the word Mirza signifying the son of a prince.

In the harram are three ranks of women, the princesses who are born there, those by whom the shah has any children, and those whom he has never taken to his embraces; besides these, there are a great number of others, who have the common name of slaves, and are employed in servile offices. When the shah dies, the ladies he has conversed with as wives are shut up in a quarter by themselves, and none of them permitted to stir out as long as they live, except the mother of the succeeding prince, who has generally an almost sovereign authority within the limits of the harram.

There are a great variety of beauties confined in the harram of the king of Persia, the governors of the provinces continually sending a fresh supply of young virgins from all parts of his dominions. If these are informed that any family has a girl of uncommon beauty, they immediately demand her; and the parents are frequently not averse to parting with their daughter, from the hopes of her being the means of raising the whole family; for a young lady no sooner enters the seraglio than a pension is settled upon her nearest relation: if she so far pleases the shah as to become his mistress, it is increased; and if he has children by her, she seldom fails to procure the advancement of all her relations. Among these beauties are the daughters of the governors of provinces, and of the greatest lords of the court; but there are many more Georgian and Circassian virgins of meaner birth, who, as they excel the rest in beauty, generally captivate the monarch's heart.

The ladies of the harram sometimes insinuate themselves into the favour of the king's mother, or the mother of the king's eldest son, in order that by their means they may be married to some great Man. The king's mother

of Geography.

A Scene in the Persian Seraglio.

keeps up a constant correspondence with the ministers of state, who, in hopes of advancing their interest at court, frequently desire her to bestow on them one of those ladies, and happy is she who is thus disposed of; for she not only becomes his legal wife, and the mistress of his house, but is treated as the daughter of a king. The women are also sometimes married to clear the palace and lessen the expence; but those are seldom disinherited from the harram who have been with child by the king.

The women are guarded by the white eunuchs, who keep the outward gate; but never come within their sight: the black eunuchs are stationed in the second court, none but the eldest and most deformed of whom attend the ladies and carry messages to them. The third and innermost guard are said to be composed of women, who are commanded by some antiquated matron, who receives orders from the prince himself.

The women who frequent the harram relate surprising things of the jealousies which subsist between the ladies there, and of the plots and conspiracies of one favourite mistress against another. Those who give the highest entertainment to the shah, with their singing, their dancing, or their wit, are sure of becoming the envy of the rest. The mistresses with which the king is intimate are never very numerous, and the others only sing, dance, and play before him; but, from the distractions he meets with from a variety of concerts, he frequently fixes upon one who may properly be stiled the queen of the harram. Amidst such multitudes of rival beauties the prince is sensible he can gain the hearts of a very few, and she whom he most admires has perhaps the least affection for him; but happy is the lady whom he really loves, and who can make him believe that she has a real fondness for him.

The eunuchs belonging to the king's palaces generally amount to three or four thousand. Men of the first rank have usually half a dozen in their houses, and those of inferior quality two or three. The eunuchs are usually cut when they are between seven and ten years of age; for few of them survive the operation if it be deferred till they are fifteen. These unhappy men, if they deserve the name, who have desires which they can never gratify, are supposed to be the best guards against those who, with the same desires, have the power which they have lost, and with them envy is a spur to vigilance. Besides, as they can have no views of raising families of their own, they are generally very diligent in their respective employments, and their whole study seems centered in the desire of procuring the esteem and confidence of their lord, which they seldom fail to obtain. They are however said to be revengeful, treacherous and cruel, and that there is seldom found a man of true courage among them; but there are some instances in which they have behaved with great bravery.

S E C T. XIII.

Of the Persian Camp, with a Description of the Tents of the Shah and his great Officers. Of the Camp-Market, and the Removal of the Camp: the rich Horse-Furniture belonging to the Shah; and, the Military Exercises of the Persian Army.

WE shall now give a description of the Persian camp, as it was formed in the time of the late Nadir Shah, which we shall do from the account given of it by that accurate writer on the Affairs of Persia, Jonas Hanway, Esq; In placing it a general regularity is observed, in proportion to the size and shape of the ground. The tents of certain principal ministers and officers are constantly pitched in the front, or to the right and left of the shah's quarters, that some of them may be always near him. The circuit allotted for the shah's own tents was very large; one side of the entrance consisted of a line of uniform tents, serving for guard-rooms; and the other of the tents in which were transacted the affairs of the chancery and the like public concerns. About two hundred yards beyond this avenue was a pavilion, in which the shah usually sat to give audience and transact

business. It was oblong, and supported by three poles, adorned with gilt balls at the top; the covering was of cotton cloth of a brick colour, and the lining of coloured silk. The floor was covered either with carpets or cloths, and the body of the pavilion had on each side a kind of alley, through which the attendants might walk round. Sometimes the shah sat on a large sofa cross-legged, and sometimes on a carpet on the floor. The back part of this tent is divided into small apartments, where the officers attend who do not appear in his majesty's presence. There was nothing magnificent in this pavilion, the front of which was always open, even in the worst weather; however, when it was extremely cold, several pots of lighted charcoal were placed in the middle.

At a considerable distance behind were the king's private tents, to some of which he retired at his meals; and, to render them warm, had Indian pannels, which were occasionally set up, and formed the linings of two small apartments. To these were only admitted his secret emissaries, when they had any remarkable intelligence to communicate.

Almost contiguous to these were the tents of his ladies, which differed from the others, in being divided by several curtains, that formed separate apartments one within another. The boundaries of the king's quarters were occupied by eunuchs and female slaves, and almost this whole circuit, especially towards the residence of the women, was encompassed by a strong fence of net-work, round which the night-guard patrolled, and severely punished all intruders. As there were no lights, nor any tents near them, it frequently happened that people coming by night to the camp ignorantly straggled thither; and whenever this was the case they were sure to be used ill.

It has been observed, that none but the officers in immediate waiting were admitted into the royal pavilion; for the officers of state and people of business stood in all weathers in the open air, forming a semi-circle at the front of the tent. If they were brought to answer for their conduct, they were held under the arm by proper officers, to prevent their escape. The same ceremony, with little difference, was also observed towards foreign ambassadors or great men.

The Persians cover their cotton tents with a kind of glazing, to prevent their being penetrated by water. The tents of persons of distinction are of various shapes, but generally oblong, and supported by three poles. The outside is always of coarse cotton cloth, and the inside is either lined with the same, or with silk or woollen, according to the seasons of the year and the circumstances of the owner. The ground is spread with a thick cotton cloth or mat, over which is laid a carpet or woollen printed cloth of British manufacture. Besides this covering the square of the floor is encompassed with felts, which supply the place of bedsteads and feather-beds, though some have their beds raised a little above the damp earth. The top and sides of the tents of some of the great officers were lined with pannels wrought with flowers, and a variety of figures. Large tents were often divided into two rooms by pannels or curtains. The back part was appropriated for the use of the women; but those grandes who had several of them, placed their tents at a distance from their own, and surrounded them with cotton cloths to prevent their being seen.

The camp-market began at the end of the square fronting the guard-rooms. It was about half a mile long, and consisted of tents on each side like a street, supplied with a variety of provisions, apparel, horse-furniture, and other necessaries brought thither for sale. Many of the shop-keepers were little better than common sutlers; but those who carried on great business were under the protection of some of the principal courtiers, who were the grand dealers in flower and rice; and as they have many supernumerary servants, camels, and mules, they sent them to the distant provinces for rice, which being brought to the camp, sold to a great advantage. But if the shop-keepers or other traders interfered with them in these branches of trade, they generally marked them out for destruction.

The two imperial standards were placed on the right of the square already mentioned: one of them was in

stripes of red, blue, and yellow; and the other of red, blue, and white, without any other ornament; and though the old standards required twelve men to move them, Nadir lengthened their staffs, and made them still heavier, to prevent their being carried off by the enemy, except in an entire defeat. The regimental colours were a narrow slip of silk sloped to a point, some red, some white, and others striped.

Several hours before the moving of the camp, one of the standards was taken down and carried to the place where the new camp was to be pitched, and with it went other tents belonging to the shah and the great men. The bulk of the army frequently marched an hour or two before the shah; for in removing from one camp to another he sometimes galloped the whole way. He had about sixty women, and near the same number of eunuchs, who commonly rode near his person. Before him were his running-footmen, preceded by his chanters, and before them the watch-guard, who were best acquainted with the track the shah was to take: these spread a mile or two before him, and terminating in a kind of angle, gave notice of his approach by crying *Gerric*, or make way, which is sometimes fatal to such as cannot escape from them; for when they meet with people in the shah's route, rivers, precipices, and rocks, are no excuse; they drive at them with their maces, and make all before them fly at their approach.

Whenever Nadir travelled with his women, the army kept at near a mile distance. These women and others of distinction rode on white horses, in the same manner as men; but when they were not in his company they were usually carried on camels, and seated in machines resembling a covered waggon, hung like paniers over a pack-saddle, being entirely concealed under a covering of crimson cloth. Thus they rode one on each side, conducted with the usual pomp. The sick ladies and female servants of the court were always concealed in the same manner; but other women of no distinction rode on horses or mules, and mixed among the crowd: they had a linen veil over their faces, and wore great coats resembling those of the men, but the poorer sort wore a white veil which covered their whole body.

Mr. Hanway, who, at his desire, was permitted to see the horse-furniture belonging to the shah, says, that he had four complete sets, one mounted with pearls, another with rubies, a third with emeralds, and the last with diamonds, most of which were of such an amazing size, as hardly to merit belief; for many of them appeared as big as a pigeon's egg. He observes, that he was equally amazed at their immense value, and at the barbarous taste in which they were set; for some of them did not appear to have any art bestowed on them. That gentleman, on his afterwards visiting one of the ministers, took occasion to mention his surprize at their prodigious value; which, he says, greatly exceeded any thing he had ever formed an idea of in that kind, though the jewels in Europe appear incomparably brighter and neater set; and observed, that if his majesty would trust him with one of those bridles, he would procure a complete horse-furniture to be made in Europe, that should exceed any thing that had yet appeared in the world: but was informed, that the shah had not patience to wait till it could be finished.

The pay given by Nadir to his soldiers was computed at a hundred crowns per annum, one with the other, besides an allowance, which chiefly consisted of rice; but the expensive manner of living in the camp rendered this large pay absolutely necessary. They wear no uniform, but are obliged to buy all their cloaths of the king at an extravagant price, and to keep at their own expence yetims, or orphans, who are considered as their servants; and, when their masters die or fall in battle, supply their place by serving as soldiers.

Eight or ten at a time of the soldiers amuse themselves by galloping before the army, and discharging their pieces at each other with powder. Mr. Hanway observes, that he was much surprized at their being permitted, even in the camp, to fire off their pieces, blow their trumpets, and beat their drums for their amusement. They are seldom exercised, except in shooting with the bow, or with a single ball at a mark, at which they

are very expert. They are no less exact in loading their pieces; for, except it be in time of action, they weigh their powder as well as fit the ball to the bore. But the barrels of these pieces, some of which are match-locks, are so ill tempered, that they will not bear a quick fire. The greatest part of their regular forces carry a musquet and sabre; but there are others in the army not so well provided; some having a spear or a battle-ax, and others a single pistol: but all of them wear sabres, in the use of which they are very dexterous; but as to bayonets they have no notion of them.

Nadir, according to the custom of the Persian kings, says the above author, had the policy to oblige some, and to encourage all his army to use costly furniture: the officers, and even the soldiers, of rank had the bridles of their horses mounted with silver, with a mane-piece of plate, and an ornamented chain. Their sword, belts, and leathern accoutrements, were mounted with the same metal. The handles of their battle-axes were also for the most part studded, or covered with thin silver plates, and in their sashes about their waist they wore a knife, the handle and case of which were also covered with silver. Certain officers and persons of distinction were obliged to wear their knives in gold cases, and some of the great men had silver stirrups.

The armies of Persia are never very large, considering the extent of the kingdom, and the discipline of the troops is as different as possible from that in Europe. As they are not troubled with much artillery, or baggage, they make swift marches, and frequently fall with incredible fury upon an enemy in his camp or quarters, when he least expects such a visit. At other times they will cut off his provisions, and turn the waters from their usual course; and having harassed those who invade them in a long march through a desert country, will sometimes fly till they have drawn them into a disadvantageous ground, and then return to the charge. In their retreat they, like the ancient Parthians, discharge more arrows than when they advance.

When they are apprehensive of an invasion, they constantly withdraw all the people from the frontiers, and destroy the country in such a manner, that the enemy can find no subsistence; for they are said not to leave so much as a tree or a spire of grass upon the ground: but they give the husbandmen time to secure their grain, fruit, and forage, by burying them with most of their utensils in deep pits, which they do in such a manner, that it is almost impossible to discover them, and as the earth is very dry, they receive no damage. The army, having thus destroyed the country, incamp in separate bodies, and, as they see occasion, fall upon their enemies, and distress them in their march: sometimes they attack a quarter of their camp in the night, and sometimes another; and if they are unable by this means to put a stop to their march, they retire farther into the country, driving the people before them, and destroying every thing as before, and by these means they have defeated the greatest armies sent against them by the Turks. When the enemy are retired the people return to their lands, and rebuild their houses with clay or such materials as they find upon the spot.

S E C T. XIV.

Of the Revenues of the Crown, and the Manner of collecting them.

WE shall next take a view of the revenues of the crown, and the manner of collecting them; and here it is necessary to observe, that all the lands of the kingdom are divided into four kinds: the first are those of the state; the second the king's domain lands; the third are the lands of the church; and the fourth those that belong to private persons. Under these classes all the cultivated lands are included; but these make but a small part of the kingdom, of which more than ten parts to one are desert and uninhabited.

The lands of the state contain the far greatest part of what is cultivated. These are in the possession of the governors of the respective provinces, who out of them take

take their own revenue, and assign the rest for the payment of their officers, and the troops they are obliged to maintain.

The domain lands are considered as the Shah's particular estate, out of which are paid the officers of the household, the troops maintained by the king over and above those supported at the charge of the respective provinces: and the remainder is deposited in the treasury.

The church-lands, if we may use the term, are the donations of their princes or private men, and being esteemed sacred, are never taxed or confiscated for any crime whatever.

The lands which belong to private men are held of the crown for the term of ninety-nine years, on paying an inconsiderable annual rent: and at the expiration of that term they are allowed to renew their lease for the same number of years, on advancing only one year's income.

Any person who desires to build upon the uncultivated lands, or to convert any part of them into ploughed fields, or gardens, may procure a grant of the king's officers for ninety-nine years, paying the usual rent. Both the king's officers, and the private owners, let out their lands to husbandmen, upon condition of receiving about a third part of the annual produce. The king and private owners have the same profit from the husbandman's cattle, as they have from his corn; as for instance the third fleece, and the third part of the breed; and as there is less expence in cultivating fruit-trees, than in producing rice and grain, the king has still a greater share of the fruit.

The governors of provinces have the same advantages from the lands of the state, to enable them to pay the officers and troops under their command. Besides, every province frequently sends large presents to court of the best the country affords, whether cattle, silk, fruit, or grain; and these are sent in such quantities as are sufficient for the supply of the king's household.

The king has also the seventh fleece, and the seventh of the breed of the cattle in all the lands not appropriated to his use, which is a great addition to the revenue; for the shepherds of Persia possess vast flocks and herds, on which they constantly attend, living in tents, and removing from place to place as they meet with pasture; for all men are at liberty to graze their cattle upon those lands which are not the property of particular persons, though they are deemed the king's; and this payment of the seventh beast seems to be an acknowledgment of his property in them. In every province is an officer named the chief of the shepherds, who takes the seventh of the sheep, asses, mules, camels, and goats; but as to horses, he is said to have every third colt, and of silk and cotton, one third of all that is produced throughout the kingdom.

Minerals and precious stones belong solely to the king, and the money raised by the waters being let into every person's fields and gardens, is another considerable part of the revenue. All who are not of the religion of the country, whether natives or foreigners, pay the value of a ducat a head; every shop of the working trades pays ten pence, and the rest of the shops twenty pence each.

The customs and port-duties are very inconsiderable, there being no port of consequence, except Gambroon. As for the merchandize carried into Persia or out of it by land, they only pay a small sum for every camel's load, and in proportion for every mule or ox, without examining what are contained in the packs.

A very considerable part of the revenue arises from the confiscated estates, and the presents made by the great lords, the governors of provinces, and other persons, particularly on New-Year's day, when, as hath been before observed, they make presents to the king of every thing esteemed rich and valuable, or that may contribute to the use, the ornament, and the pleasures of life; but in the late reigns the principal revenues of the shah seem to have arisen from the most cruel oppressions; the people in the greatest part of the kingdom have been deprived of their whole substance by the tyranny of their princes, and the insatiable avarice of

their governors. Those in high office make use of the most extraordinary and unaccountable methods of oppression. Mr. Hanway gives a remarkable instance of this in Nadir's brother, who, when governor of Tauris, having a lame mule, asked his groom what he might sell it for? The groom, suspecting his design, and knowing his avarice, answered, "Two thousand crowns," "Oh," says he, a great deal more!" The price was at length fixed at ten thousand, and the groom being armed with authority, demanded of every citizen and villager a certain sum for the mule, in such terms as evidently shewed that a sum was to be levied on them. Some, to avoid being beaten, paid him twenty, thirty, forty, or fifty crowns, till at length he came home with ten thousand; and after all obliged a man to take the mule in good earnest for one hundred and twenty crowns, which is the price of a small one free from blemish. When such amazing exactions as these are used, it is impossible to set bounds to the revenues of the prince or his governors; but by this means they not only have rendered the people poor and miserable, but have forced many thousands to fly with their families into India, and other of the neighbouring countries.

S E C T. XV.

Of the great Officers of State, the Beglerbegs and Khans, or Governors of Provinces.

THE Persians, like the ancient Romans, prefer all men indifferently to posts in the state and army. Men of the law sometimes command as generals and soldiers, and sit as judges in the courts of justice: but the native Persians are generally preferred to civil and ecclesiastical employments; and the inhabitants of Georgia, and other frontier countries, who are proud of being stiled the king's slaves, are frequently preferred in the army. There is seldom much regard paid to a person's birth or fortune in his promotion; but the king disposes of places as he apprehends his subjects qualified for them. These posts they possess during life, and where they have behaved well, the children sometimes enjoy them; and there are instances of a government being continued in a family several generations; but this seldom happens.

When the shah invests a great man with an office, his commission is sent him written on a roll of paper two or three feet long, in a large character, adorned with gold and painting, and put in a purse of gold brocade, and with it is sent a rich habit. When a man of the sword is preferred, he receives, besides the habit, a sabre and poniard with rich hilts.

The first minister is the athemat doulet, or support of the empire. No business of consequence ought to be transacted without his direction; for the shah, being usually bred up in the women's apartment, in intire ignorance of affairs of state, it is thought necessary for the safety of the people, and the preservation of the government, that his orders should be considered by some wise minister before they are put in execution.

The second post in the government is that of the divan begli, whose office has some resemblance to that of our lord chancellor. This great magistrate has the decision in the last resort of all causes civil and criminal, except where the king in person sits in judgment, which seldom happens, and he may command any cause to be removed to his tribunal from any court in the kingdom.

In the third rank are the generals; and first the generalissimo, which is an office that only subsists during a time of war. The next place is possessed by the kurchi bashi, or general of the household troops: and the kuller agasi, or the general of the royal slaves.

The next post is that of secretary of state, who registers the public acts, and has the care of the records. He has a deputy in every province, who transmits to him an account of all important affairs to be laid before the ministry.

The last great officer of state is the mirab or lord of the water. Each province has its particular mirab, who

who takes care that the waters of the rivers and aqueducts are divided in such proportions, that every part of the country may have an equal share.

The officers of the household are the nazir, who appears to be both 1st treasurer and steward, and with him all ambassadors and foreigners transact their affairs; but there is a comptroller, and several other officers that are a check upon him, and no sums are paid out of the treasury, without the order passing under the seals of the prime minister, the nazir, and the divan beghi. The next great officer is the ichucagah bashi, who commands all who attend in the outward palace, and when the king goes abroad, marches before him with a great staff, covered with gold and precious stones. He does not sit before the king as several other officers do of inferior quality, but always stands ready to obey his majesty's orders, and see that they are executed.

The high chamberlain is always a white eunuch, and has great influence at court. He serves the king at table on his knees, tastes his meat, dresses and undresses him, has the inspection of the wardrobe, and the government of all the eunuchs in the palace. He carries a box covered with precious stones, in which are two or three fine handkerchiefs, opiums, perfumes, and cordials, with which he serves his majesty when he calls for them.

The master of the horse and the great huntsman are also considerable officers of the household.

With respect to the government of the provinces, these are either under beglerbegs or khans. The former have the greatest authority: their title signifies Lord of lords, and they have the power of life and death, as have the generals who are on the frontiers. In Nadir's time there were only three beglerbegs; but all of them were as cruel as they were powerful.

The governors of all the provinces have the title of khan, or cawn, as it is usually pronounced: they live in great state: they have all the splendor of sovereign princes, and have under them the same officers as those in the king's court. The governor also commands the militia of the province, and assigns them lands for their maintenance: he reviews them at certain times, and sees that they are fit for service.

When a governor, or any other great officer, returns from his command, which he must not do without express orders, he always attends at the gate of the palace, where having given notice of his arrival, and that he begs leave to throw himself at his majesty's feet, he is usually admitted; but if he has behaved ill in his post, instead of an answer, orders are given to take off his head.

The receivers of the king's revenues usually oppress the people without mercy, under the pretence of the necessities of the state. They generally obtain their places by making presents to the eunuchs, or other favourites at court, and by engaging to encrease the revenue of the province beyond what it had ever been; and in this they usually keep their word. Indeed complaints are often carried to court against them, but by the artifices of the ministers who have obtained a share in the spoils, they are frequently prevented getting access to the king for a considerable time. Indeed the great men dare not openly oppose any person's petitioning the shah; but when the governors perceive that the country sends commissioners to court to represent their grievances, they prevail on their friends to endeavour privately to divert them from it; and if they cannot prevail, their patrons at court are directed to make them large promises of redress, and if possible to send them back without seeing the king. If they find this impracticable, and the people still insist on demanding justice, the courtiers advise the king's receiver to proceed in a milder manner for the future; upon which the complaints against him are generally hushed up.

When the complaint is from a large province, several hundreds of the persons aggrieved usually come up with it to the palace gate, where, with lamentable cries, rending their cloaths, and throwing dust into the air, they demand justice. If they come to petition an abatement of their rents or taxes, on account of a drought or unreasonable weather, they come with branches of

trees, or such as have their leaves devoured by locusts. The king sends to be informed of the occasion, and the people presenting their petition in writing, it is referred to the examination of some great officer.

The receivers are seldom punished with death, unless they have defrauded the king, in which case they infallibly lose their heads.

SECT. XVI.

Of the Laws of Persia, the Manner in which they are administered, and the Punishment of Criminals.

THE laws of the Persians are blended with their religion, agreeably to the grand principle of the Mahometans, that the same person ought to bear the spiritual and temporal swords, and be both king and high-priest: that he should command in war, and administer justice, as well as explain the articles of faith and regulate their ecclesiastical discipline: and with this power both Mahomet and his successors the caliphs were invested during the first five centuries. The Persian doctors maintain, that the civil magistrate ought to have no farther concern in the administration of justice, than in executing the sentences of the priest. But this is now far from being the case, the civil power having in a great measure swallowed up that which antiently belonged to the ecclesiastical.

In Nadir's time the camp and court were the same, and the ecclesiastical as well as civil and military officers always attended. The chief administrators of the law were the mullah bashi, and the naibshah, who are judges both in ecclesiastical and civil concerns. The kashafkar is judge of the army. But in towns the highest ecclesiastic is judge, and tries civil causes under the governor, who generally refers the parties to him; and upon the receipt of his verdict the governor gives a final judgment. Military people, however, have seldom their causes tried by the latter. These governors are often as despotic as sovereign princes; and though they are accountable for all their actions, and have often their ears cut off, their noses slit, and are severely beaten on their backs, bastinadoed on their feet till their nails come off, and frequently strangled by order of the shah; they seldom abstain from acts of oppression.

Their principal book of laws is the Koran; besides which they have a few other religious works, which they have recourse to in the decisions made by the courts. There seems indeed but little occasion to consult them, where either the king or the governors of provinces sit in judgment; for their determinations are entirely arbitrary, and they pay no regard either to the Koran or any other books. Were the Mahometan laws, with the interpretation put upon them by the Imams, strictly observed, Christians would be unable to live in Persia, by their being daily plundered and abused, in pursuance of some precept or passage in the Koran; but both the priests, and the people are become more moderate, and have less of a persecuting spirit than formerly; and the temporal courts take care that these laws are seldom put in execution.

Though the spiritual and temporal courts differ so widely in their determinations, no disputes ever arise between them; for the temporal courts having the government on their side, are never opposed by the spiritual, and indeed each of them have a distinct branch of business assigned them. The ecclesiastical courts meddle chiefly with marriages, divorces, deeds and contracts, the succession of estates, and other litigious matters; while the temporal courts are either employed about criminal causes, or such as are plain and obvious. As the former proceed in an arbitrary and summary way, they generally finish the cause at one hearing; but as the others proceed according to written laws, they are more tedious and expensive.

When a person either cannot or will not pay his debts, he is delivered up to his creditor, who may imprison him in his own house, set him to work, beat him, and treat him as he pleases, so he does not kill or maim him. He may also sell the debtor's estate and goods, and

and even his person, wife, and children, towards the payment of the debt; but they seldom proceed to such cruel extremities.

Facts are proved in the courts of Persia by living witnesses, and no title is given by prescription. A man is allowed at any time to claim his right, and even the party's own deed is of no force, if he can shew that he was imposed upon, or fraud was used in making him sign it. Where there are witnesses, an oath is tendered to the person who denies the charge. Upon this occasion the judge sends for the Koran, which being brought him in a linen cloth, he himself and all the court rise up, out of respect to the sacred book. The judge then taking it in both his hands, kisses it; and touches it with his forehead; and having opened the book, offers it to the person who is to swear, who kisses it in the same reverend manner the judge had done, and putting his hand upon it open, swears to speak the whole truth. When a person of a different religion is to take an oath, the judge sends an officer with him to a priest of the same religion: a Christian swears upon the Gospels, and a Jew on the Old Testament. When they have been thus sworn they return to the court, and offer what they have to say. The reason they do not swear an unbeliever on the Koran, is not only because he does not regard it as a sacred book, but lest he should prophane it, for such are even forbidden to touch its cover.

When a person thinks himself aggrieved, he draws up a petition in such terms as he thinks proper, and presents it to the judge, who writes in the margin an order for bringing the person accused before him; and one of the judge's servants goes with it immediately to the defendant's house, and brings him with him. Being allowed time for producing the witnesses, each party pleads his own cause before the judge, without the assistance of counsel, and frequently with much noise and clamour, so that the judge is sometimes obliged to render them more orderly by causing them to be cudgelled. When the parties have offered what they had to say, and examined their witnesses, the judge proceeds to give sentence.

The women likewise plead for themselves as well as the men, but with much more clamour; but as they are set in a part of the court by themselves, and veiled, this doubtless gives them greater assurance. They have seldom any other business in a court of justice but to sue for a divorce, and they usually plead the impotence of the husband, and make such a crying and howling, that they in a manner deafen the judge, who must not order them to be beaten as he does the men when they grow too clamorous.

There are no public halls erected for trying causes; but every magistrate hears them in his own divan, or some convenient room in his garden, where he has no other assistant but his clerk, who understands the law; and as there are no pleadings in writing after the first petition, abundance of time is saved, and a sentence soon obtained.

The temporal courts usually consist of three persons: these are the president of the divan, the governor of the city, and the nazir, who decide all criminal cases. As there are no public prisons, there are neither sheriffs nor jailors, but every magistrate confines the criminal in some part of his own house, 'till he is brought to his trial, which is generally within twenty-four hours after he is taken; and sentence is no sooner passed than it is executed, the judge's servants performing the offices both of jailors and executioners.

The proceedings in the criminal courts are nearly the same as in the civil. The party aggrieved presents his petition to the magistrate, who sends his servant to apprehend the offender and bring him before him; and when he has been examined, some time the same day, or at farthest the next, he is ordered to prepare for his trial.

The condemnation of a malefactor in Persia is conducted with very little ceremony, nor is the execution attended with any pomp. He is generally conducted to a field or open place near the residence of the judge, and the executioner causing him to kneel, the delinquent pronounces his creed, There is but one God,

Mahomet is his prophet, and Ali his friend; and then, if he is to be beheaded, his head is taken off with the motion of a sabre in a thrusting cut, which in drawing it back compleats the operation.

In cases of rebellion the late princes of Persia have been entire strangers to humanity, and not satisfied with punishing the principals, most, if not all those who were taken in arms, lost their eyes or their heads; and it is impossible to read the accounts given by Mr. Hanway of the cruelties exercised over the people without being struck with terror and compassion. As that gentleman was returning to Astrabad, where a rebellion had been suppressed, in which he was a sufferer, he met several armed horsemen carrying home the wretched peasants whose eyes had been cut out, the blood yet running down their faces. Near the entrance of the city stood two pyramids, one on each side, built of stone, and made full of niches, with a human head in each. These pyramids were about sixteen or twenty feet in diameter at the base, and rose gradually near forty feet to a point, at the top of which was a single head. This being towards the close of the execution, the greatest part of the niches were filled; several of the heads had beards, and being set a little projecting added to the horror of the view.

Criminals of state are also sentenced to wear for a determinate time a heavy wooden collar about their neck, to which one of their hands is sometimes fastened.

If a person has the misfortune to kill another, and the fact be proved before the judges, the offender is not punished by the court, but delivered up to the relations of the deceased for them to put him to death in what manner they please. In this case all the relations and friends of the deceased assemble, and with loud cries demand the blood of him who has murdered their kinsman, which the magistrate seldom fails to promise them. But sometimes the murderer, by his presents to the judge, and to the relations of the deceased, procures his pardon. When the relations will be satisfied with nothing less than his life, the judge thus addresses them: "I deliver you the murderer according to law; make " yourselves satisfaction with his blood for the blood " that he has spilt; but remember that God is merciful." The judge's servants are then ordered to follow the directions of the prosecutors, and guard him to what place they desire; and they follow the criminal, cursing, beating, and abusing him all the way. When he comes to the place appointed, the miserable wretch is delivered to the relations, who sometimes inflict on him the most cruel tortures they can invent; and it is said that the women, who scarce ever appear abroad on any other occasion, will come and imbrue their hands in his blood.

Ordinary crimes, where the parties are men of substance, are usually punished with fines; but where they are poor they bastinado them on the soles of their feet, giving them a certain number of blows, not under thirty, nor exceeding three hundred.

Pick-pockets and pilferers are marked with a hot iron in the forehead, and house-breakers have their right hand cut off. The same punishment is inflicted on those who counterfeit the coin for the first offence; but for the second their bellies are ripped open. This punishment is inflicted in the following manner: the criminal's feet are tied to a camel, with his head hanging down to the ground; his belly is then ripped open, and his bowels falling over his face, he is dragged through the principal streets, an officer marching before him, and, with a loud voice, informing the people of the nature of his crime. Afterwards he is hung up by the heels upon some tree, and they say, that it is sometimes several hours before he expires. They have some other punishments for capital crimes, as impaling, setting them up to the chin in the earth, precipitating a criminal from a high tower, cutting off the hands and feet, and leaving the poor wretch in that condition till he expires.

They sometimes use tortures to extort a confession, as by pinching off the flesh with red hot pinchers; but the most usual way of examining offenders is while they are beating the soles of their feet.

Bakers and victuallers have been sometimes baked and roasted alive, for cheating in their weights, and raising provisions to an exorbitant price: but this is only in time of great scarcity; the usual punishment in these cases is a fine or the bastinado.

Thus we have fully described the government of the once potent empire of Persia, now ruined and laid waste by tyranny and rebellion. In this account the reader, whose heart is sensible of the tender feelings of humanity, and whose bosom glows with a generous love of liberty, must have been frequently shocked and filled with pity and indignation; while his mind recurring back on his native isle, the seat of liberty, he blesses Providence, and rejoices that he is born a Briton. Happy the land, and happy the king, whose hands are tied with the radiant bands of mercy! who, like the Universal Monarch, is guided by justice and clemency! who, as the brightest angel of heaven, is bound by laws sacred and inviolable, and whose supreme delight consists in the happiness of his people! While the tyrants of the East boast of the baleful freedom of doing ill, of the power of imitating Satan, by being the tormentors of their subjects, and glory in being the sovereigns of slaves; let the monarchs of Britain glory and rejoice in the superior dignity of dispensing happiness, and in the nobler titles of being the fathers of their people, the kings of freemen, the guardians of liberty, the protectors of the laws.

S E C T. XVII.

Of the Isle of Ormus, and the Settlement at Gambroon.

BEFORE we take leave of Persia, it is proper to take notice of the isle of Ormus, and of Gambroon, where the English have enjoyed considerable privileges, and which is the only place where we have any settlement on the coast of Persia.

The city of Ormus was seated on an island of the same name, at the entrance of the Persian Gulph, in twenty-seven degrees thirty minutes north latitude, about two leagues from the continent. It is near six leagues in circumference; yet has neither fresh water nor grass upon it, and only a salt sulphureous soil: but formerly its happy situation, and the goodness of its harbour, were considered as such advantages, that the Arabians used to say, that if the world was a ring, Ormus ought to be considered as the diamond of it. A city had been built there by the Persian kings, and it had for some ages carried on a considerable trade, when in 1507 it was taken and fortified by the Portuguese, who obliged the king of Ormus to acknowledge the king of Portugal for his sovereign, and to pay him tribute: after which they engrossed all the commerce of those parts to themselves. At length Shah Abas, provoked at their insolence, and particularly at their having given protection to Gabrieli, an Italian, who had fled from Persia, engaged the English to join with him in reducing the place, which they attacked and carried in 1622; after which the Persians demolished the houses, which amounted to four thousand in number, and contained near forty thousand inhabitants.

The Persians some time after rebuilt the fort, and placed a garrison in it; but they could never restore its trade. It is however still the key to Persia; but the heat of the island is frequently so excessive, that the inhabitants, 'tis said, would be sometimes stifled, did they not for hours together continue up to the neck in water. It is, however, at present almost deserted, for it produces nothing but salt, which sometimes lies two inches deep upon the surface of the earth.

Till the late civil wars, which have so dreadfully laid waste the greatest part of Persia, the English East India company had two considerable factories in that kingdom, one at Ispahan, and the other at Gambroon. The head of each factory was called their agent, and lived in as great state as a nobleman. At the commencement of the civil wars the agent at Ispahan had a retinue of no less than thirty or forty servants, and his house was an elegant building after the manner of the Persian palaces, in the midst of a fine garden. His horses, servants,

and equipage, when he went abroad, resembled those of a prince, and his furniture was covered with gold.

The agent at Gambroon had less grandeur, but equal advantages: the trade there has however suffered greatly by the misfortunes of Persia. But the company still maintain a noble factory, in which all their trade in the Persian empire is carried on.

Gambroon, or Gombroon, is situated in the province of Farfistan, in twenty-seven degrees forty minutes north latitude, and is called by the natives Bander Abassi. It stands in a bay nine miles to the northward of the isle of Ormus.

The English East India company began to settle here about the year 1613, and afterwards, as a reward for the services performed by that company against the Portuguese in the reduction of Ormus, Shah Abas granted them half the customs of Gambroon. This revenue was however reduced to a thousand tomans a year, which in our money amounts to three thousand three hundred and thirty-three pounds six shillings and eight-pence; but even this has been ill paid. The city is two or three miles in compass, and stands on a level ground close to the sea, the country on almost every side rising insensibly for some miles without any considerable hill, except towards the north. Near it is the narrowest part of the gulph of Persia, and opposite to it lies the coast of Arabia at about ten leagues distance. Three leagues behind Gambroon are very high mountains covered with trees, and abounding with water. However, the territory belonging to this city is dry and barren, it consisting only of a moving sand.

The town on the land-side is surrounded by a wall, and it has two small fortresses. The houses are computed at fourteen or fifteen hundred, one-third of which belong to Indian Gentoos, a few of them are inhabited by Jews, and the greatest part are in the possession of the Persians; the rest belong to the English, French, and Dutch companies. The governor of the province usually resides in this city, and not at Neris, the capital, which is ten days journey from thence: he has a pretty large and commodious palace at the end of the town, at the greatest distance from the sea, built with stone taken from the isle of Ormus. The best houses are built with bricks dried in the sun, and stand close to each other, being flat on the top, with a square turret that has holes on each side for the free passage of the air into the houses. Upon these roofs those that stay in the town sleep every night during the summer season. The houses belonging to the English and Dutch are as well built as any in the town, and are so near the sea-side that at high-water the tide comes up to the very walls. Their merchandize is deposited in the lower rooms, and the upper serve for lodgings, on account of their having the advantage of being more exposed to the air. The common people have wretched huts made of the boughs of palm-trees, and covered with leaves. The streets are narrow, irregular, and not kept very clean.

Gambroon has no port, but the road is as large and safe as any in the known world; yet it has one great inconvenience, which is, that the vessels which stay there during the summer are frequently much damaged by the worms.

The water of Gambroon being very brackish is drunk by none but the poor, and is taken out of pits dug three fathoms deep in the sand. People in easy circumstances drink the water of Isfen, a large and fine village at the foot of the mountains; and the common people, who cannot be at the expence of having it brought so far, drink the waters of Mines, a village situated a league from the port.

The air of Gambroon is not only extremely disagreeable, but unhealthful: the wind changes four times a day almost throughout the year. From midnight to break of day it blows from the north and is cold; from break of day till ten or eleven o'clock in the morning, it blows cold from the east; but a hot fourth wind rises about three o'clock, which changes to the west at sunset, and blows hot till midnight. These sudden changes of the air, from cold to hot, produce many diseases fatal to foreigners, particularly the dysentery, the bloody flux, and malignant fevers. In short, the weather is

so exceeding hot and unhealthful, in the months of June, July, and August, that the English factory, during those months, reside at Iffeen.

Gambroon is supplied with plenty of very good provisions, particularly fish, which are brought ashore morning and night; they sometimes catch antelopes and partridges; but the natives live principally on milk and plants, of which there are a great variety.

As it seldom rains here, no grass or herbs are to be seen about the city, except what is produced with incredible labour in the gardens, where they have cucumbers, onions, garlic, chibols, and radishes. The city is chiefly furnished with fruit and pulse from the isle of Kismish, which lies twelve miles to the southward, and is forty-five miles long, and nine broad. In June and the rest of the summer months this island produces oranges, lemons, grapes, peaches, damscenes, quinces, pomegranates, and mangoes; and in October apples, pears, citrons, melons, almonds, pistachios, and several other fruits in such quantities, that they are as cheap at Gambroon, as perhaps in any other part of Persia.

In Gambroon the people of superior rank are dressed after the Persian manner, but the poorer sort of both sexes go naked, except wearing a cloth to cover what decency requires them to hide. There are here people of several different nations, besides the Persians and Europeans, and the Banyans of India are so numerous, that they bribe the governor not to permit any cows to be killed in the city.

As the winter season, when the heats are less violent, lasts from October to May, this is their chief time for trading, and the Persians, Arabians, Banyans, Arme-

nians, Turks and Tartars, come hither with the caravans, which set out from Aleppo, Bagdat, Isfahan, Shiras, and Basflora, under the convoy of guards. The English and Dutch come hither by sea, and besides ready money, bring cloth, and various other European and Indian commodities, which they exchange for Persian tapestry, raw silk, goats wool, cotton, rhubarb, saffron, and rose-water, which is made in vast quantities near Shiras, either by infusion, which they call gullab, or by distillation; and this last they call arekakull, or the sweat of roses. As the Persians have not a single ship, all the navigation of that kingdom is carried on by foreigners.

All bargains at Gambroon are made for shahees, in which the company keep their accounts, reckoning each shahee at four-pence, though that coin is rarely met with; but instead of it the cox and mamooda are every where current. Ten cox, or pice, make one shahee; two shahees are one mamooda; two shahees and five cox are one laree; two mamoodas are one abaslee; four mamoodas are of the value of one Surat rupee; fifty abaslees or two hundred shahees make one toman; and thirty-one or thirty-two shahees are a chequeen.

As to the weights of Persia, one maund tabres is six pound three quarters; one bazar maund tabres is six pound one quarter; one maund copara is seven pound three quarters in the English factory. One bazar maund copara is from seven pound and a quarter to seven pound and a half. One maund shaw is two maund tabres. One miscall is two penny-weights, twenty-three grains, twenty-four decimals.

C H A P. XXV.

Of the CASPIAN SEA, and the ASIATIC TARTARS bordering upon it, and upon the North of PERSIA.

S E C T. I.

Of the Caspian Sea.

BEFORE we take notice of the different nations of Tartars situated near the Caspian Sea, it will be proper to give some account of that vast collection of waters, which is improperly called a sea, as it has no visible connexion with the ocean; nor does it ebb and flow; but it must be acknowledged to be the greatest lake in the known world. It is situated between thirty-six degrees forty minutes north latitude, and between forty-seven degrees fifty minutes east longitude, and is about four hundred miles in length from north to south, and three hundred in breadth from east to west; but in many places it is much narrower. The water is salt, and some distance from the shore Mr. Hanway endeavoured in vain to find a bottom with a line of four hundred and fifty fathoms. The water has risen within thirty years so considerably, that it has made great inroads on the Russian side for several miles, both to the east and west of the Volga, and has rendered the adjacent country extremely marshy. Nor has it been more indulgent to the Persians; for it is said, that in the beginning of the present century, the land for about eight English miles on the side of Langarood river was dry and well inhabited, which is the more probable as the tops of some houses rise above the water. The same thing is reported of Astrabad, where the inhabitants affirm, that fifty years ago the bay was fordable by asses, though it has now two fathoms water.

The neighbouring inhabitants have a tradition, that the waters of the Caspian sea rise during thirty years, and then for the same space of time decrease. But it seems more probable, that the law of nature, which every where else produces a change in this element, by exhaling it in

vapours, that form rain, hail, and snow, not only to refresh and give fertility to the earth, but to supply the springs of rivers must dispose of these waters in the same manner. As this vast lake is the grand reservoir that receives the vast rivers which flow from the mountains and tracts of land by which it is surrounded, it is also the reservoir from which these tracts are watered, and from whence the many great rivers that fall into it are supplied. The great Dr. Halley has demonstrated by very nice experiments and calculations, that the vapours arising from the Mediterranean sea are more than sufficient to supply all the rivers that fall into it. It is therefore highly probable, that the reason why the waters of the Caspian are risen higher than formerly, is from there having been more moderate summers, in which a smaller quantity of vapours has been exhaled.

S E C T. II.

Of the CALMUC TARTARS.

Their Persons and Dress, with the Manners, Customs, and Way of Life, of different Tribes of them.

THE country of the Calmucs, also called by different authors Khalmuck and Kalmucs, is bounded by Siberia on the north, by the country of the Mongols on the east; by Tibet and Usbec Tartary on the south, and by the Caspian sea, and the kingdom of Astracan, which is subject to Russia, on the west. These people are not under any one sovereign, but are divided into several tribes, some of which are so considerable as to appear formidable to the Russians; but the greatest part of them are at peace with that crown, and many of them are tributary to it.

The

The Calmucs are thick and low of stature, their countenances are far from being agreeable; for they have flat faces, small eyes sunk far into their heads, and such short noses, that at a little distance they seem to have none at all. Their beards are thin and straggling, and yet so stiff and long, that the hair seems like that of a horse or goat, and it frequently grows in the middle of their cheeks, where other people have none.

The men wear shirts of a sort of calicoe, their breeches are made of the same, and often of sheep's skins, but they are extraordinary wide, and in the southern provinces they wear no shirts in summer, contenting themselves with a kind of sheep's skin doublet without sleeves, which they put on next their skin with the woolly side outward, tucking their shirts into their breeches, so that the whole arm is left bare up to the shoulders; but in the northern provinces they wear a shirt, and in winter a sheep's-skin-coat over their doublets, which reaches to the calf of the leg, and to keep them the warmer turn the woolly side inwards. These upper skins have sleeves of such a length, that when they are going about any work they are obliged to turn them up. They wear on their heads a little round bonnet, commonly edged with a border of fur, and adorned with a tuft of silk or hair of a bright red. Their boots are excessive wide. The women, in summer, wear no other cloathing than a calicoe shift, and in winter a long sheep-skin gown, with a bonnet like that of their husbands.

Red is the colour in highest esteem among them; and how ill cloathed soever their princes may be, they never fail to have a scarlet robe for state occasions; nor do women of rank think themselves well dressed if a scarlet gown be wanting. Indeed all over the north of Asia a man will do more for a piece of red cloth than for four times its value in silver.

The Calmucs dwell either in tents or huts, made round with great poles of light wood joined together with leathern thongs. For the more easy setting up and removing them, they are covered on the outside with a thick felt for a defence against the cold and rain. In the middle of the roof they leave an opening, which serves both for a window and a chimney, and there are places to sleep on round the hut against the wall. Persons of distinction have those that are larger and more convenient. In summer they have also tents of calicoe, and in winter sheds made of boards and covered with felt, which they can set up and take down in less than an hour's time.

The few fixed habitations of the Calmucs resemble the huts, except the roof being in the form of a dome, the whole consisting of a single room twelve feet high. In some places they have conveniences for sleeping upon, built two feet from the ground, and four feet broad, which run quite round the house, and serve at the same time for a chimney, for they have invented a way of making a fire without on one side of the door, and the smoke encircling the building by means of this chimney, which runs round it, has no passage out but at the other side of the door, which conveying a moderate heat to the place on which they sleep, is very convenient in winter. All their habitations, whether fixt or moveable, have their doors facing the south to avoid the north winds, which are very piercing. Their moveable habitations are carried on waggons.

Jonas Hanway, Esq; gives a description of a small settlement of the Calmucs, in which the huts nearly agree with this description, only the smoke issues out of a hole at the top. The people that gentleman describes are miserably poor, and instead of subsisting on their herds and flocks, live on the fish they take on the Volga, and dry in the summer their winter's provisions. These prefer living on the banks, where the flags and rushes being grown to a great height, are some defence against the rigors of winter. There are seldom seen above seven or eight tents, which contain thirty or forty persons, in a place.

The same worthy author describes another settlement of these people in a valley near Zaritzen, in forty-seven degrees thirty minutes latitude, and observes, that these people continue in friendship with the Russians no longer than they awe them by their power. These are armed

with bows and arrows, and feed on the flesh of horses, camels, dromedaries, and other animals; and eat the entrails, even when the beast dies of the foulest distempers. They throw their dead into the open fields, to be devoured by dogs, many of which run wild, and some are kept for that purpose; and if the body be devoured by a number exceeding six, they think honourably of the state of the deceased, otherwise he is a disgrace to his relations. They worship images, which generally consist of a small bit of wood about a palm in length: the upper part of it being rounded, is adorned with some rude marks in imitation of human features; and the figure, being thus prepared, is dressed up in rags. The many acts of violence committed by these barbarians have at length induced the Russian government to compel them to take up their habitations on the banks of the Volga, below Astrachan, where they have a less field for robbery and murder.

Many tribes of these people move from place to place during the summer, and it is said there are frequently no less than eight or ten thousand of them in a body, driving large flocks and herds before them. They usually begin their march in spring, and as they make easy journies leave scarce any herbage behind them in the country through which they pass. In autumn, when there is a second crop of grass, they generally return the same way they came; and in the winter live in more substantial and warmer huts than they use in the summer; but the people and their cattle frequently live together in the same room.

Though the country through which they pass is situated in as fine a climate as any in the world, they never cultivate the land, but live upon their cattle, which consists of camels, horses, cows, and sheep. Their horses are very good and mettlesome, and their oxen are said to be the tallest in the known world. Their sheep are also very large, with very short tails, buried in a case of fat, but the wool is very long and coarse; they have a bunch upon the nose, and hanging ears like those of the hound.

Their principal food is horse-flesh and mutton; for they seldom eat beef, which they do not think near so good; and as for hog's flesh and poultry they never eat any. Instead of cows-milk they use that of mares, which they think much better and richer; besides the cows in the greatest part of Grand Tartary will not be milked. As soon as they have suckled their calves they will suffer none to draw their teats, and upon being separated from them immediately lose their milk. From mares-milk they prepare a kind of brandy, which they distil from it after it is turned sour; and, in imitation of the Indians, their neighbours, they give it the name of arrack.

The Tartars are in general fond of strong liquors, and when they can get any continue drinking as long as they can stand. When they have a mind to be merry, each brings what liquor he can procure, and they drink night and day till all is spent. This love of tippling prevails among them in proportion as they dwell more to the north; and they are no less fond of tobacco.

They take as many wives as they choose, besides concubines, whom they take from their slaves; and it is said not to be unusual for the father to marry his own daughter. They cease lying with their wives when they are near forty years of age, and from thence-forward consider them only as servants, to whom they give victuals for taking care of the family and attending the young wives who succeed in their places.

The children born of concubines are as legitimate as those of the wife, and as capable of inheriting; but if the father has been khan or chief of some tribe, the issue of the wives succeed before those born of concubines. However, the off-spring of common prostitutes are looked upon with contempt, and seldom succeed their fathers, because it is not easy to know whether the person to whom such a woman lays a child be the real father.

Polygamy is attended with less inconvenience among them than the rest of the Asiatics, their wives being of great service, and little expence to them; for the old manage the family, take care of the cattle, and provide for

for the subsistence of them all, while the husband has little else to do but to sleep and follow his diversions.

Nothing can equal the respect which the children of all ages and conditions are accustomed to pay their fathers, whom they consider as the kings of their families; but they set little value on their mothers, except they are under any particular obligations to them. They lament a father many days, denying themselves all pleasures, and the sons must even abstain for several months from the company of their wives. Nothing is spared to do honour to a father at his funeral, and at least once a year they pay their devotions at his tomb, and call to mind the obligations they owe him.

Mr. Voltaire says, in his History of Peter the Great, that in 1720 was found in this country a subterraneous house of stone, some urns, lamps, and ear-rings, an equestrian statue of an oriental prince, with a diadem on his head, two women seated on thrones, and a roll of manuscripts, which was sent by Peter the Great to the Academy of Inscriptions at Paris, and proved to be in the language of Tibet. "All these monuments plainly shew, says the above author, that the liberal arts formerly resided in this barbarous country, and are a lasting proof of the truth of what Peter the Great said more than once, that those arts had made the tour of the whole world."

In the reign of Peter the Great the Calmucs traded to Astrachan and to Tobolski, the capital of Siberia, bringing with them great quantities of very fine salt, which their country afforded, receiving Russian leather and iron-ware in exchange; but the Czar commanding one of his generals to march into the country of the Calmucs, to take possession of their salt-works, and build a fort there; this was so highly resented, that they forbore to go to the fair of Tobolski, and even choaked up the mouth of the river Duria, which falls into the Caspian sea, to which the Russians used to go in search of gold dust. As this river was likely to prove of considerable advantage to the Russians, both on account of the gold dust, and in settling a trade with the Usbec Tartars and India, the Czar built two forts at its mouth, without any disturbance at first from the Tartars; but his forces marching farther into the country, where they dispersed in search of provisions, they were all surrounded and cut to pieces, with prince Bekewitz, their general, who was a native of Circassia, and the two forts were afterwards surprised and demolished.

SECTION III.

*Of the USEEC, CRIM, KIRGEESE, and LESGEE TARTARS.
Their Customs, Manners, and Way of Life.*

USBEC Tartary is bounded on the north by the country of the Calmucs, on the east by Tibet, on the south by India, and on the west by Persia and the Caspian Sea.

These Tartars, like their neighbours, are at present divided into several tribes governed by their respective princes; when they were united under one sovereign, they were the most powerful of all the Tartar nations, and are still dreaded by Persia and India, into which they frequently make incursions; but their tribes not being very numerous, they satisfy themselves with plundering and ravaging the country, without pretending to make conquests. The principal khans pride themselves on being descended from Tamerlane.

With respect to the persons of the Usbecs, they are said to have better complexions and more engaging features than the Calmucs. Their religion is Mahometism, and in general they differ very little from the people of the northern provinces of India; and from hence that country is furnished with the most serviceable horses, camels, and other cattle.

The capital of the country is called Bokhara, and was once the metropolis of a kingdom of the same name. It is situated in latitude thirty-nine degrees fifteen minutes, thirteen miles from the ancient city of Samarcand, the birth-place of Tamerlane. It is a large and populous place, seated on a rising ground, and encompassed

with a slender wall of earth and a dry ditch. The houses are mostly built of mud, though the caravanserai and mosques, which are numerous, are all of brick. The bazars were once stately buildings, generally built of brick and stone; but the greatest part of them are now in ruins; and here is also a handsome building for the education of the priests. A great number of Jews and Arabians frequent this place; but the khan seizes on their possessions at his pleasure. The produce of the country is cattle, lambs fur, down, rice, and cotton, which they manufacture into calicoe.

The Crim Tartars receive their name from their originally coming from Crimea, the ancient Taurica Chersonesus, a peninsula in the Black Sea. They rove from place to place in search of pastures, in houses drawn on carts: but several miles round the city of Astrachan, where the soil will admit of cultivation, there are regular settlements of them tributary to the Russians. These are a very civil and industrious people. In the summer time they improve their land, the chief products of which are a seed called manna, oats, musk, and water-melons: but their principal treasure consists in their sheep, horses and cows, and in their wives and children. When any of their daughters become unmarriageable, they erect a hut for her covered with white linen, and put a painted cloth on the top, which is usually tied with red strings; they also place a painted waggon on the side of the hut, and these are to be her marriage-portion. Those who propose to marry observe this signal, and the girl is usually given to him who offers the father the most valuable present. Though these people are Mahometans, they do not confine their women in the manner of the Turks and Persians, and, contrary to the practice of the Calmucs, are extremely nice in their burying-places. They dig their graves very deep, and, after lining them with bricks dried in the sun, and whitewashing them on the inside, erect a cover over them. They also raise thick mud walls round each tomb, on the top of which they fix one or more flags, according to the character of the deceased.

The Kirgeese Tartars possess a very extensive tract of land, having the Bashkeert Tartars to the north, the Black Calmucs with the city of Tashcund to the east, the Karakulpac Tartars and the Aral lake to the south, and the river Yaeik to the west. They are divided into three tribes, under the government of a khan, and live in tents covered with felt of camels hair, which they remove with great ease whenever they change their quarters; and they never stay above two or three days in a place.

The Kirgeese Tartars live upon horse-flesh, mutton, and venison, and drink fermented mares milk to such excess, that they are frequently intoxicated with it. They have no grain, nor any kind of bread. When they go upon any expedition, they take a small quantity of a kind of cheese, which, being dissolved in water, is their chief sustenance. Money is hardly known among them; all their riches consist in cattle and the fur of foxes and wolves, which they exchange with their neighbours for cloaths and other necessaries. They profess the Mahometan religion, and their language has a great affinity with that of the Turks. They are a strong robust people, but rude, ignorant, and treacherous; yet are very civil to strangers while they continue under their protection, for they esteem the breach of hospitality a very great crime; but no sooner is a stranger departed from under the roof of a Kirgeese Tartar, than his professed friend and protector will sometimes be the first person to rob him, and then he may think himself happy if he escapes being made a slave.

These people think very favourably of many crimes prejudicial to society, particularly of robbery; for their usual punishment in this case is no more than making restitution, and murder is punished by the loss of the malefactor's goods: indeed, sometimes the criminal and his whole family are delivered up as slaves to the relations of the deceased.

The Lesgee Tartars are a powerful and warlike nation, whose country extends about forty leagues from north to south, and twenty-five from east to west. They are under several different chiefs, named shamkalls, who, in

S f f case

case of danger to their common liberty, unite their forces. A few of them have been occasionally subject to the Persians; but it does not appear that those to the north and west of the Persian dominions, ever submitted to a foreign power. Indeed their situation is such, with respect to the natural bulwarks of the mountains, that while they retain their bravery, they can hardly be enslaved. Olearius mentions the very singular manner in which they choose a sheikall, which is done by a priest throwing a golden apple into a ring, round which the candidates are seated, when the person at whom it stops becomes their chief.

As to their persons, they are well made, of a good stature, and extremely active. Their complexion is swarthy, their features regular, and their eyes black and full of life. They do not all wear their beards, some having only whiskers. Their dress resembles that of the Arabians, many of them wearing the same kind of drawers, which reach down to their ancles.

Their people are able to bring thirty or forty thousand men into the field. They have had frequent wars with the Persians, and in particular with Nadir Shah, who, with fifteen thousand men, pursued a large body of them among their mountains; but, after suffering a very considerable loss, was glad to make his retreat. Several Persians, whom they then took prisoners, they cruelly deprived of their noses, ears, or eyes, and sent to Nadir with messages of defiance.

The Lefgees are frequently guilty of rapine, not only in the low-lands, and in large bodies, but in flying parties, pillaging the Armenians and Georgians, whose trade brings them between Baku and Derbent. Yet if any stranger travelling into their country, or on its borders, seeks their protection, and chooses a guide from among them, let him meet never so strong a party, he is safe if his guide declares that the stranger is his guest: for they are in this case hardly ever known to violate the laws of hospitality.

Their manner of life resembles that of the Persians; they also profess the Mahometan religion, though they talk very lightly of the miracles of Mahomet, who they say was a very artful man; and whether he had any particular interest with the Almighty, will be best determined hereafter. They drink wine without reserve, and are supposed to have once professed the Christian religion, and several books relating to Christianity are said to have been found amongst them.

Their country is for the most part very pleasant; their valleys are extremely fertile, and produce plenty of wheat, barley, and oats, and feed a multitude of sheep. The people are ingenious in several manufactures of wool and camels hair; and none of the neighbouring nations equal them in making fire-arms, which they sell to the Persians. They trade with the Russians, giving madder in exchange for shoes, boots, and cloathing of dressed sheep-skins. The Armenians also bring them dyed calicoes, and other Persian manufactures; also knives, rings, and ear-rings made in Europe; in return for which they receive madder, fire-arms, coarse woollen manufactures, and false Persian money: for as the coin of that empire is made small and thick, it is exactly counterfeited with very little silver. The Armenians, it is said, accept of this counterfeit coin for a quarter of its real value; however, it is certain there are great quantities of this money in Persia, both in silver and gold.

S E C T. IV.

Of ASTRACHAN TARTARY.

With a particular Description of the City of Astrachan, now subject to Russia; of its Gardens; of the Clouds of Locusts with which the Country is sometimes infested; and of the Trade of that City.

WE shall now treat of Astrachan Tartary, which is under the dominion of Russia. The kingdom of Astrachan is bounded by Siberia and Calmuc Tartary on the east, by the Caspian sea on the south, by Circassian Tartary on the west, and by Russia on the north. That part of it which lies between the great river Volga, the

river Jaika, and the Caspian sea, is usually called Nagaia; as is also that part of the country which lies to the westward of Astrachan, and the natives are called Nagaian Tartars.

The city of Astrachan is situated within the limits of Asia, in an island called Dolgoi, in forty-seven degrees latitude, sixty English miles from the Caspian sea. It was for many ages subject to the Tartars, from whom it was taken by the Russians. It contains about seventy thousand inhabitants, among whom are many Armenians and Tartars of various denominations, with a few Persians and Indians. The manners and customs of all those different nations exhibit an epitome of Asia.

Astrachan is about two miles and a half in circumference; but if we include the suburbs, it is near five miles round. It is encompassed by a brick wall in a ruinous condition, being about two hundred years old; it is also defended by a garrison of six regiments of the best Russian troops, and in the adjacent plains are many small batteries, intended to prevent the approach of an enemy.

The houses are of wood, and the greatest part of them very mean; the higher parts afford a fine prospect of the Volga, which here spreads itself near three miles, and contributes to the pleasure and convenience of the inhabitants. The earth is so impregnated with salt, that it appears on its surface; and yet is extremely fertile, it bearing great quantities of fruit, which the common people eat to excess, and on that account are afflicted with many distempers. Their water-melons, which are much esteemed in colour, flavour, and taste, resemble those of Portugal. The city is surrounded by gardens and vineyards, which lie about two miles from it; these produce almost every kind of garden-stuff known in England, except artichokes, cauliflowers, and potatoes; and their orchards furnish them with plenty of cherries, apples, pears, and other fruit; and their grapes are so admired at the court of Russia, that a box of them is sent thither from Astrachan every three days during the season. It is carried by two horses, and supported in the manner of a litter. The grapes are preserved in sand; but at best must be ill worth the expense of being thus conveyed twelve hundred English miles.

As their summers are generally dry, they water their gardens with large wheels, some of which are moved by horses, and others by the wind. The wheels are of a sufficient height to throw the water into the highest part of the gardens, from whence it runs in trenches to the root of every tree and plant. In this manner the gardens and vineyards are generally watered from the middle of May to the middle of September.

In the city is a little temple belonging to the Indian Gentoos, in which they have an idol of a very deformed and ugly appearance. Their Bramins here use beads, incense, prostrations, and offerings; they have also small bells, with other music, and raise their voices in singing with the utmost vehemence.

The Tartars at Astrachan being Mahometans, hold this image worship in the utmost abomination, and are so averse to images, that they will not even carry money which has an impression of man, bird, beast, or insect, into their mosques. Their devotion is in silence and prostrations, only the priest at certain times utters, in an awful tone, an invocation to the Lord of nature.

From the latter end of July to the beginning of October, the country about this city is frequently infested with locusts, which fly in such amazing numbers as to darken the air, and appear at a distance like a heavy cloud. When the cold weather comes on, they are seen in their flight from the north towards the south, and wherever they fall, eat up every thing that is green. In this season, therefore, their gardeners look out for them, and on their first appearance endeavour to keep them off by making as much noise and as great a smoke as possible; but, in spite of all their pains, after flying as long as they are able, they sometimes fall in their gardens, in the streets, and even into the fires kindled to disperse them. Captain Woodrooffe observes, that once in sailing up the Volga to Astrachan, he saw a prodigious cloud

cloud of them coming from the north-west, which is across the river. The wind at that time blew very fresh, and nearly from the same point, when the locusts falling, the water was covered with such prodigious swarms of them, that in some places they greatly obstructed the motion of the boat for ten or twelve fathoms together. He also says, that they live for some time under water, for mounting on each other's backs they formed clusters near three feet in diameter, which rolled along by the force of the wind and the rapidity of the current. In this manner they were driven ashore, where their wings being dried, they got upon the pasture; and very few being drowned, they lay so thick upon the plain for near three days, to the extent of as many miles, that it was impossible to walk without treading on them. On their beginning to fly, they disappeared in less than half an hour, leaving not a single blade of grass on the plain.

The bodies of these insects are very large, compared with the smallness of their wings. Their size is generally from two inches to two inches and a half long; they are about three quarters of an inch in diameter, and their shape is nearly the same as that of the larger sort of green grasshoppers.

The revenue of Astrachan is computed from a hundred and forty to a hundred and sixty thousand rubles, or thirty-three thousand five hundred pounds, of which the greatest part arises from salt and fish. About ten miles below Astrachan is Bosmakoff, a small island remarkable for its large store-houses of salt, which is made about twelve miles to the eastward of it, and being brought thither in boats, is conveyed in large flat-bottomed vessels up the Volga. With this salt all the country is supplied as far as Moscow. They annually dig some millions of poods, the exclusive property of which belongs to the crown of Russia; for the common food of the soldiers and of the bulk of the people is bread and salt.

In this place are large fisheries, to which the neighbourhood of the salt-works is of great advantage. These fisheries extend to the sea, and also a prodigious way up the river, and from them all the country is supplied as far as Petersburg. The vessels are sent away in spring loaded with salt-fish; but as fresh-fish keeps good as long as it is frozen, the winter is no sooner set in, than it is transported by land as far as Moscow and Petersburg. The principal sorts are sturgeon, a large white fish called beluga, and the assotra, which resemble sturgeon.

The commerce of Astrachan is very considerable, tho' it has been greatly injured by the troubles in Persia and the revolts of the Tartars. The foreign trade chiefly consists in red leather, linnen and woollen cloth, and other European manufactures, which they export to Persia, mostly on account of the Armenians. In return they import from Persia silk sashes intermixed with gold, for the use of the Poles, wrought silks and stuffs mixed with cotton, raw silk, cotton, and a small quantity of drugs.

The Nagay Tartars are all Mahometans, resembling in countenance the Calmucs; but are more agreeable, their eyes not being so small: these are driven off to the eastward, and now seldom make any inroads on the Russian frontiers.

There are several other Tartarian nations bordering on the Volga; but these are the most known, and the most worthy of notice; we shall therefore proceed to the west, and give a particular account of the Circassian Tartars.

S E C T. V.

Of CIRCASSIAN TARTARY.

The Bounds and Face of the Country; the Persons, Dress, Food, Manners, and Customs of the Natives.

WE shall now give a description of Circassian Tartary, which towards the east is bounded by Astrachan and the Caspian sea, by Russia on the north, by Georgia and Daghestan towards the south, and by the river Don, the Palus Mæotis, and the Black sea towards the west.

This is a very fine country, and nothing can appear more agreeable than the delightful prospects formed by the variety of mountains, vallies, woods, springs, and rivers; with which it is every where diversified. It produces plenty of barley, oats, and cummin, and great herds of cattle are fed here; but as the natives wander from place to place, they sow no more corn than will just serve for the subsistence of their families; and if there happens to be a bad crop, they are reduced to great distress.

Both the men and women of Circassia are well proportioned; they are of a middle stature; but the men, like most of the other Tartars, have broad flat faces. The women have an easy shape, very agreeable features, according to our idea of beauty, and a very fine complexion. Their hair and eyes are generally black, and there is scarce a crooked person to be found amongst them.

The men wear a vest of coarse grey cloth, and over it a sheep-skin, which they turn to the side from which the wind blows. They wear boots of horse-leather, clumsily made, and on their heads round bonnets of black cloth or coarse felt.

The women wear nothing on their bodies in the summer but a shift open down to the navel; but in the winter they have furred gowns, like the Russians. In the house their head-dress consists of a silk or stuff cap, from which their hair hangs down in two or three tresses; and they are very fond of necklaces, consisting of strings of pearls or coloured glass. The men are not inclined to jealousy, yet the women are veiled when they go abroad.

The Circassians generally feed on mutton, beef, poultry, wild fowl, and venison, of all which they have great plenty; but they prefer a piece of a young colt as a much greater dainty.

Their bread consists of thin cakes, made either of barley-meal or millet, which they bake on the hearth. They are extremely hospitable, and will not permit a traveller to pay any thing for the entertainment of himself, his servants, and horses, but will frequently contend who shall have the honour of treating him. When the natives travel, they take no provisions with them, but behave with as much freedom in every house they come to as their own.

Their usual drink, like that of the other Tartars, is water or mares milk; and both men and women, young and old, smoke tobacco. They sit cross-legged at their meals, and have a carpet, or a piece of Russian leather, spread before them on little wooden tables.

The Tartars have no regular hours either for eating, drinking, or sleeping, but are only guided by inclination and opportunity. When they are making excursions, they are said to pass four or five days together without taking the refreshments of food and sleep; but they no sooner return to their own country, than they indulge themselves in both, and after such a fatigue will sleep two days together without waking. They seldom have any other beds than sheep-skins, on which they lie, and throw others over them.

Their horses are very swift, and finely proportioned. They have waggons for transporting their wives and children, tents and baggage, from place to place, which in some parts of the country are drawn by camels, and in others by oxen; for their horses are only used for riding. The men are good horsemen, and many of them subsist principally by hunting and robbing.

The Circassians make no scruple of selling their children into Turkey and Persia, especially their daughters, who leave their parents without reluctance, from the pleasing tales they hear of those who have arrived at the honour of being sultana in the harrams of the Grand Signior and the king of Persia; and their imaginations being taken up with fine cloaths, jewels, and a luxurious life, they leave their fathers house with joy; and even their mothers are no less pleased with the hopes of their daughters advancement.

As their beauty and innocence are the foundation of all these ambitious prospects, particular care is taken to preserve both: they inoculate their children at four or five years of age, after they have duly prepared them for

for it; they then receive the small-pox without injury to their beauty. The merchants who buy them are generally as careful of preserving their virginity as their mothers, on account of the great value the Mahometan chapmen set upon it.

As to the marriages of the Circassians, they are according to the rites of the religion they profess; those near Turkey consider it, like the Mahometans, only as a civil contract, and have a plurality of wives and concubines; but those who live near Russia, perform it after the manner of the Greek church. There are some Pagans among them who have generally some tincture

of the religion of those countries on which they border, intermixed with superstitions of their own.

There does not appear to be any considerable town in this country, except Terki, situated near the Caspian sea, three or four score miles to the southward of Astrachan. This town is chiefly inhabited by Russians, for the whole nation of Circassians live in tents, or huts, according to the season of the year, removing from one place to another; nor does the country produce any commodities so valuable as to induce foreigners to build or settle among them.

C H A P. XXVI.

Of A R A B I A.

S E C T. I.

Its Situation, Extent, Divisions, Climate, and the Face of the Country in Arabia Felix; with an Account of its Vegetables, and a particular Description of the Coffee-Plant. Of the Animals of Arabia.

ARABIA, including all the countries distinguished by that name, is of very great extent, the most southerly part lying in twelve degrees thirty minutes, and the most northerly in thirty degrees north latitude; and from east to west it extends in the broadest part from thirty-five to sixty degrees longitude from London. Hence it is computed to be thirteen hundred miles in length, and twelve hundred in breadth, where it is broadest; but in the most northern part it is very narrow. This extensive country is a peninsula, bounded on the north-east by the river Euphrates and the Persian gulph; on the south by the Indian and Æthiopic ocean; on the west by the Red Sea, the isthmus of Suez, and part of Syria; and on the north-west by Syria and Diarbec, or Mesopotamia.

Arabia is divided into three grand divisions; Arabia Felix, or Arabia the Happy, which is the most southern, and the much largest part; Arabia Deserta, or Arabia the Desert, which is situated in the middle; and Arabia Petraea, which lies to the north.

In this country there are but few springs, and no considerable rivers, except the Euphrates, which washes its north-east limits. As the tropic of Cancer extends through the middle of it, the air is excessive hot, and in many places unhealthful, particularly in that part which lies upon the coast. The winds are also hot and suffocating, and the sands not only extremely troublesome, but dangerous, they being sometimes driven by the winds in such prodigious clouds, that whole caravans have been buried and lost by a single storm. The wind blows on the southern coasts from the south-west, and varies to the west with hard gusts, and sometimes rain, from the beginning of April to the middle or end of August, and then turns to the eastward, blowing gently from that quarter till the end of March. In some places it never rains more than twice or thrice in two or three years; but the great dews which fall in the night refresh the ground, and supply the few plants which grow there with some moisture.

Even that part of the country distinguished by the name of the Happy, consists, for the most part, of dry barren mountains, or sandy deserts; but some parts of south Arabia being tolerably fruitful, and abounding in corn, herbage, and aromatic gums, it is esteemed a happy land, when compared with the other parts of this desolate country. As the hills for the most part consist of a rocky soil, and are scarce capable of improvement, the natives never strive to cultivate them; their vallies seem equally barren, where water is wanting, and bear scarce

any herbage; but where they can bring water into them, they produce corn, all manner of garden-stuff, herbs, and flowers; and no country upon earth affords more agreeable prospects. The inhabitants draw water in large skins out of their wells morning and evening with oxen, and convey it along little canals, by the sides of which trees and plants are placed; they also cut channels through their corn-fields, into which they let the water run as occasion requires.

By this means they have a great variety of excellent fruits, as peaches, apricots, oranges, lemons, and grapes; but this country is most famous for its coffee and its dates, which last are found scarce any where in such perfection as in this country and in Persia. With coffee a number of ships are annually loaded for Europe and India.

The coffee-shrub grows to the height of eight or ten feet; the twigs rise by pairs opposite to each other, as do the leaves on the twigs, one pair being about two inches distant from another. The leaves are about four inches long, and two broad in the middle, from whence they decrease to both extremities, ending in a point. They are nearly of the form of a bay-leaf, and are smooth and without any incisures on the edges. The shrub has a grey smooth bark; the wood is white, and has not much pith. The fruit hangs on the twigs by a foot-stalk, sometimes one, two, or more in the same place. These shrubs are watered by artificial channels like the other vegetables, and after three or four years bearing, the natives plant new shrubs, because the old ones then begin to decline. The Arabians dry the berry in the sun, and afterwards take off the outward husk with hand-mills. In the hot seasons the Arabians use these husks roasted in the room of coffee-berries, and esteem the liquor impregnated with them more cooling.

Arabia also abounds in balm, frankincense, myrrh, manna, cassia, incense, aloes, olibanum, and other valuable drugs; but they have very few trees fit for timber, and little wood of any kind in the country.

The most useful and excellent animals of Arabia are their camels and horses; their camels are extremely proper for this sandy country, and were doubtless formed by nature to enable the natives to traverse the deserts with which it abounds. Their breed of horses are only fit for the saddle, and are never used for draught or burden. The finest horses in the Persian court are brought from hence, and are admired for their make, as much as for their swiftness and high mettle; they are indeed well known in Europe, and have contributed to improve the breed of those in England. The usual food for camels and horses is barley or barley-meal made into dough. At Muscat, which is situated near the entrance of the Persian gulph, they feed their cattle with putrid fish; for digging in a pit, they throw a great quantity of fish into it, which lie till they are rotten, and turned to a kind of earth, after which this substance is taken up and boiled,

boiled, when having stood till it is cool, they give it their cattle, and it is said to render them very fat.

They have oxen, buffaloes, goats, and venison; but their beef and buffalo's flesh is very coarse. As they are all Mahometans, they never breed any swine.

They have great plenty of fowl and fish on their coasts, but the inland parts have few of either, there being neither wood nor water to be found in several days journey.

Lions, tigers, wolves, bears, jackalls, and other wild beasts, are also found in some parts of Arabia; but there being no cover for them, they are much fewer than in some other places.

S E C T. II.

Of the Face of the Country in Arabia Deserta and Arabia Petræa, with a particular Description of Mount Sinai, and of the Convent of St. Catherine; the Rock of Meribah, and other Monuments of Antiquity.

ARABIA Deserta has its name from the nature of its soil, which is a barren sand. There are, however, large flocks of sheep and herds of cattle near the Euphrates, where the land is good; there are also great numbers of ostriches in the Desert, and in several places a fine breed of camels. This country, in general, differs but little from Arabia Petræa, which is situated to the north of it, and is by far the smallest of the three divisions of Arabia.

We shall now give a description of Arabia Petræa, which has its name from Petræa, its ancient capital, now destroyed, and is famous for the children of Israel wandering there during forty years. People are not there, says the reverend Dr. Shaw, entertained with a view of pastures covered with flocks, or vallies enriched with corn. There are no olive-yards or vineyards; but the whole is a desolate, lonesome wilderness, only diversified by sandy plains, and mountains of naked rocks and craggy precipices. This desolate country is never refreshed with rain, except sometimes at the equinoxes; and the few hardy vegetables seen in the cliffs of the barren rocks, or wildly dispersed on the sandy plains, are shrunk by a perpetual drought; for the dews of the night are in a manner rendered insufficient for the purposes of vegetation, by the scorching heat of the sun during the day. The intense cold of the one and heat of the other, clearly account for the wise provision of Providence in spreading over the Israelites "a cloud to be a covering by day, and fire to give light (and perhaps heat) in the night-season."

Though the land appears so desolate, yet the surface of the Red-Sea, when calm, discovers in some places such a diversity of marine vegetables, that they resemble a forest under water, and the traveller has the additional pleasure of beholding a great variety of stars, urchins, and shells of the most uncommon and beautiful kinds.

The traveller, in traversing these deserts, is frequently offended by little swarms of locusts and hornets; he is also in danger from the vipers; but the reptiles of the lizard kind, from the variety of their shapes and spotted skins, he views with more pleasure and safety.

In travelling, says the above learned and judicious author, the heavens were every night our only covering, a carpet spread on the sand was our bed, and a change of raiment made up into a bundle served for a pillow. Our camels (for horses and mules required too much water to be employed in these deserts) lay round us in a circle with their faces looking from us, while their loads and saddles were placed by us behind them. In this situation they served as guards and centinels; for they are watchful animals, and awake at the least noise.

As in these long and dreary deserts people have no prospect of meeting with the least hospitality, they are obliged to carry along with them every thing necessary for so tedious a journey: travellers, therefore, usually provide a sufficient number of goats skins, which they fill with water every four or five days, or as often as they find it. They provide balls made of the flour of beans or of barley for their camels, and wheat flour bisket, potted flesh, honey, oil, vinegar, olives, and such other things

as will keep, for themselves. They take with them also wooden dishes, and a copper-pot for their kitchen-furniture. When they are obliged to boil or bake, they make use of camels dung, left by some preceding caravan, which, after its being exposed a day or two in the sun, catches fire like touch-wood, and burns as bright as charcoal. No sooner is the food prepared, whether potted flesh boiled with rice, lentil soup, or unleavened cakes served up with oil or honey, than one of the Arabs placing himself on the highest station he can find, calls out three times with a loud voice, to invite all his brethren, the sons of the faithful, to come and partake of it, though none of them are perhaps within one hundred miles of him. This custom the Arabs constantly maintain as a token of their benevolence.

In these deserts the sky is generally clear, the winds blow briskly in the day, and cease in the night. Where these deserts are sandy and level, they are as fit for astronomical observations as the sea, which they nearly resemble. It was surprising to observe, says the above learned divine, in what an extraordinary manner every object appeared to be magnified, for a shrub seemed as big as a tree, and a flock of achbobbas, birds nearly resembling the stork, might be mistaken for a caravan of camels. This seeming collection of waters always advances about a quarter of a mile before the travellers, while the intermediate space appears of one continued glow, from the quivering undulating motion of that quick succession of exhalations raised by the powerful influence of the sun. The violent heat even draws up the moisture from the carcasses of the camels and other animals which lie exposed in these deserts, and prevents their putrefaction, whence they continue there a number of years without mouldering away. To the same cause, added to the coldness of the nights, may be attributed the plentiful dews that frequently wet the travellers to the skin; but the sun no sooner rises, and the air becomes heated, than the mists are dispersed, and the moisture of the sands evaporated.

What is called the desert of Sinai, is a beautiful plain, near nine miles long, and above three in breadth; it lies open to the north-east, but to the southward is closed by some of the lower eminences of mount Sinai; and other parts of that mountain make such encroachments upon the plain, as to divide it in two, each so capacious as to be sufficient to receive the whole camp of the Israelites. That which lies to the eastward of the mount is perhaps the desert of Sinai, properly so called, where Moses saw the angel of the Lord in the burning bush. Over the place, where is said to be this divine appearance, is erected the convent of St. Catherine, which belongs to the Greeks, and is three hundred feet square, and above forty in height. On the spot which they suppose the burning bush stood, is a little chapel, where the monks, in imitation of Moses, put off their shoes whenever they enter it. This, with some other chapels dedicated to particular saints, is included within the church of the Transfiguration, a large beautiful structure supported by two rows of marble columns, and the floor elegantly adorned with a variety of devices in mosaic work, as are also the floor and walls of the presbyterium. Upon the latter is represented the figure of the emperor Justinian, with the history of the transfiguration; and upon the partition that separates the presbyterium from the body of the church is a small marble shrine, in which they pretend to have preserved the skull and one of the hands of St. Catherine.

There is here a tower built by the empress Helena, probably for her own convenience when she came here, as well as the monks: it is situated in the heart of the convent, where the archbishop's lodgings now are; it has three chapels, and is still called St. Helena's tower. This convent is erected on a descent, but the design seems to have been to raise the lower part by a great number of arches, many of which remain, in order to build the first floor on a level, and erect more upon it. The walls and the arches, with the church, are the only ancient buildings; the latter is of a coarse red granite. The walls of the convent are six feet thick, but some parts of them are ruined. There is, however, a walk all round on the top of them, and both at each

corner, and in the middle of each side, are little square towers. The convent itself is very irregular, and ill built of unburnt brick.

The door of this convent is never opened but when the archbishop, who generally resides at Cairo, comes thither to be installed. Pilgrims are admitted by being drawn up near thirty feet high by a windlass, and then taken in at a window, where some of the lay brothers attend for that purpose. These, with all the presbyters, who are commonly called kalores, amount to about one hundred and fifty, and chiefly subsist upon the provision sent them monthly from Cairo. They have mills, bake-houses, and other offices necessary for people who must have every thing within themselves. They live a very austere life, abstaining not only from flesh, but from butter, milk, and eggs. They chiefly subsist on bread, to which is added a portion measured out to each person of olives, oil, vinegar, sallad, and pot-herbs; or of dates, almonds, figs, and parched pulse.

St. Helena caused a stone stair-case to be carried up to the top of the mountain; but as most of the steps are either washed out of their places, removed, or defaced by time, the ascent is very fatiguing, and is frequently imposed upon the monks as a penance. However, at certain distances they have erected several little chapels, as breathing-places, dedicated to different saints, who are always invoked to lend their assistance upon these occasions.

Though no kind of soil is to be found in this part of Arabia, these monks have in a long process of time covered with dung and the sweepings of their convent about four acres of these naked rocks, which now produce as good roots, cabbage, sallads, and all sorts of pot-herbs, as any climate or soil whatsoever. They have also raised a great number of apple, pear, plum, almond, and olive-trees of excellent kinds. The pears in particular are so esteemed at Cairo, that every season a present is sent of them to persons of the first quality in that city. Their grapes are also not inferior, either in size or flavour, to those of any other country. This little garden is an evident proof of the great advantages that may be procured by indefatigable industry in improving nature.

The people shew on the summit of the mountain a print in the rock, where they pretend the body of St. Catherine lay; for they confidently affirm, that she being tied to a wheel at Alexandria, under the reign of the emperor Maxentius, in order to be put to death, the wheel snapped to pieces on which she was beheaded; when her body, in answer to her prayers that it might not fall into the hands of infidels, was carried by the angels to the top of the mountain, from whence the monks brought it to their convent soon after it was erected.

The summit of this mountain appears somewhat conical, and is not very spacious; Mahometans as well as the Christians have a chapel there for public worship. Travellers are there shewn the place where Moses received the law, where he hid himself from the face of God, and where his hand was supported by Aaron and Hur at the battle with Amalek, with several other places mentioned in the Holy Scriptures, and with which they seem as well acquainted as if they had been present when these great events were transacted.

In the plain of Rephidim, down the western side of the mountain, is shewn a block of granite marble about six yards square, said to be the rock of Meribah; it lies tottering and loose, and appears to have once belonged to Mount Sinai, which hangs over this plain in a variety of precipices. The pious and learned Dr. Shaw says, that the waters which gushed out with the stream which flowed down it, have hollowed a channel, across one corner of this rock, about twenty inches wide and two deep. Moss grows in this channel, and all over it are a great number of holes, some four or five inches deep, and one or two in diameter, that appear incrustated over with fur, like the inside of a tea-kettle. The learned Divine just mentioned makes no doubt of this being the very rock struck by Moses, out of which miraculously issued water to quench the thirst of the Israelites; and imagines, that neither chance nor art could be concerned in forming this stone, which, he says, never fails to

fill the mind of every beholder with a religious surprize: but the Rev. and learned Dr. Pococke, who also saw this stone, says, that in one of the roads from the convent of Suez there is exactly such another, with the same sort of openings all down, and the signs where the water ran; and Mr. Norden says in his Travels, that there is shewn in St. Mark's church, at Venice, a square piece of granite marble that was brought from Mount Sinai, and which they pretend to be the very stone struck by Moses; and adds, that many of the like kind are found in Egypt; whence this stone is, perhaps, nothing more than a natural production.

Travellers are also shewn by the monks several other remarkable places about this mountain; they point out the very spot where Aaron's calf was molten; shew the place where the Israelites danced at its consecration, and where Corah and his companions were swallowed up, and even the place where Elias concealed himself when he fled from Jezebel; but the history they give of these and other places is accompanied with the most idle and ridiculous tales.

Dr. Shaw observes, that part of this mountain, which lies to the westward of the plain of Rephidim, is composed of a hard reddish marble like porphyry, from which it is distinguished by the representations of little trees and bushes on every part of it. These impress figures resemble the tamarisk, the most common and flourishing tree of these deserts.

S E C T. III.

A Description of the noble Ruins of Palmyra, with a concise History of that City.

WE shall now take a view of the ruins of Tadmor, or Palmyra, formerly a magnificent city in Arabia, in a part of the deserts of Arabia Pétrea, usually distinguished by geographers by the name of the Desert of Tadmor, or Palmyrene. It is situated in about thirty-three degrees north latitude, two hundred miles to the south-east of Aleppo. In describing these noble ruins we shall follow the description given of them by Mr. Wood, a learned and ingenious gentleman, who, with two others his companions, went thither, properly attended, to examine and take draughts of these curious antiquities, which have since been published in a very pompous manner, and are worthy a place in the libraries of the curious.

The ruins of Palmyra are approached by passing thro' a valley between two mountains, where are still seen the ruins of an aqueduct that formerly conveyed water to that magnificent city; and on each side of this valley are many square towers of a considerable height, which were the antient sepulchres of the inhabitants of Palmyra. The traveller has scarcely passed these memorable monuments, when the valley opening on each side, he is suddenly astonished with beholding a stupendous scene of the ruins of earthly grandeur, in the magnificent remains of the most noble structures that every-where lie before him. No prospect can be conceived more striking and august, and at the same time more romantic, than such a multitude of Corinthian columns, all of white marble, rising on every side with few intervening walls and solid structures.

On the left hand appears a wall which once belonged to the Temple of the Sun; and though a part of it has fallen down, it is still of a considerable length. A row of twelve noble windows still stand together, and farther to the left are two others. Between each of them a pilaster of the Corinthian order supports the entablature.

Through the space broken down the view extends to distant rows of columns; and over the part of the wall still standing rise the ruins of the temple itself. At the end where the portico stood is a square ruinous tower, erected by the Turks, and before these remains of antient grandeur are inclosures of corn and olive-trees, which being planted by the Arabs, are separated from each other by mud walls, while magnificent ruins are scattered all around.

General View of Salina.

THE NEW YORK PUBLIC LIBRARY

The Remains of the Great Temple in Palmyra from the West

W. Dawkins del.

A piece of a very large column stands on its base before the Turkish tower; but the greatest part, with its capital and entablature, have fallen down. The stones around it shew that in this place was a grand edifice. This column is five feet and a half in diameter near the base.

A little to the right of the tower, but at a greater distance, are the ruins of a Turkish mosque, with its minaret; and before it a noble column, of the same dimensions as that broken down, rises to a great height. Somewhat farther to the right is a very magnificent arch, with a postern richly ornamented on each side, and from thence a colonade extends four thousand feet in length, and is terminated by a superb mausoleum. Many of these columns are fallen, and open a view to other ruins, while in other parts the remains of magnificent structures are seen through the intercolumniations. At some distance nearer, before this magnificent colonade, is a small temple, adorned with a noble portico; and still farther to the right is another temple, with its peristyle seen through the intercolumniation. Farther still to the right appears a range of columns, which seem to have belonged to a portico. At some distance nearer there seem to be the ruins of a Christian church; and still nearer, and farther to the right, are four lofty columns, with their superb entablature, the only remains of a grand edifice. A little to the right of these, and at a greater distance, are many columns which support a considerable part of their entablature, and are so disposed, that they resemble the peristyle of a small temple that has been entirely destroyed; and nearer, and more to the right, is a very elegant mausoleum.

The plain is covered with a vast number of scattered columns, some with and some without their entablatures; and on all sides lie rich entablatures, broken columns, capitals, and stones of a prodigious size. The distant prospect is terminated by a range of distant mountains, on one of which is a castle, and on another are the ruins of a Turkish fortification.

All these noble ruins appear at one view in the distant prospect; but, on a nearer approach, the admiration is still kept up, by the size of the columns and the perfection of the workmanship bestowed on the ornamental parts, particularly on the ornaments of the gate, and the beauty of the capitals and entablatures; but nothing can possibly form a more astonishing contrast to all this magnificence, than the miserable huts of the Arabs, of which there are about thirty in the court of the great temple.

Walls flanked with square towers once surrounded these ruins, but in many parts they are entirely levelled. These seem to have been three miles in compass: but the Arabs shew a tract of land raised above the level of the desert, and about ten miles in circumference, which they say was the extent of the antient city, and that ruins are discovered there by digging. Indeed a circuit of three miles must be thought very little for Palmyra in its prosperity, when it is considered that the greatest part of that space was filled by public edifices, which, from their astonishing magnificence, and the many superb sepulchres, incontestibly prove its antient grandeur; and it is probable, that when Justinian fortified it, after its being destroyed, he contracted its bounds.

It ought not to be omitted, that three or four miles within the desert, to the north of the ruins, is probably the valley of Salt, where David smote the Syrians, 2 Sam. viii. 13. This valley still supplies Damascus and the neighbouring towns with great quantities of that commodity: for the earth is so impregnated with salt, that, on digging a place a little more than a foot deep, the water which lodges there raises a fine white salt, which, after the moisture is exhaled by the sun, is gathered and taken away.

The superb remains of this city are so striking, that it is impossible to avoid feeling our curiosity excited with respect to its antient condition; and we are naturally desirous of knowing how a spot, thus divided from the rest of the world by an inhospitable desert, was chosen for the situation of so magnificent a city? who was its founder, and from whence it drew its riches? But history gives us little information, and most of the

knowledge that can be obtained on these subjects, is only furnished by inscriptions.

We learn from John of Antioch, that Palmyra was built by Solomon, on the very spot where David slew Goliath, in honour of that memorable action; but what the Arabian histories relate on this subject, is so fabulous and extravagant as not to deserve our notice: but there may be some truth mixed with fiction, for we learn from the Old Testament, that Solomon erected a city in the wilderness, and called it Tadmor; and Josephus says, that the Greeks and Romans gave it the name of Palmyra, though the Syrians continued to call it by its antient name; and indeed the Arabs of the country still call it Tadmor. They even pretend that these ruins were the works of Solomon. Among other things they shew his harram, and the tomb of his favourite concubines: "Solomon, the son of David, say they, performed those wonders by the assistance of spirits."

But there is no doubt that the buildings erected by Solomon were entirely demolished by Nebuchadnezzar, who is said to have destroyed that city before he laid siege to Jerusalem. If this be true, it is not surprising that Xenophon should take no notice of it in his celebrated retreat, though he is very exact in describing the desert; nor can we be surprized at its not being mentioned in the History of Alexander the Great. No mention is made of it in the Roman History before the time of Mark Antony, who would have plundered it, had not the inhabitants transported their most valuable effects beyond the Euphrates, and defended its passage by their archers. The inhabitants of Palmyra were then merchants, and sold to the Romans the merchandizes of India and Arabia. We may therefore conclude them to be a rich and free people; but it is not known how long they had enjoyed these advantages. It is probable their trade and riches were of some standing, since we find from inscriptions that in less than forty years after their expences and their luxuries were excessive.

At length, when the Romans in the East were in a most distressful situation, Odenathus, king of Palmyra, entered into an alliance with the emperor Gallienus; and collecting the miserable remains of the Roman army, by his valour and activity vanquished Sapor, king of Persia, in several engagements, and even advanced with his victorious troops as far as Ctesiphon, the capital of that empire. Returning from this expedition with the greatest applause, and with considerable treasures, Gallienus declared him Augustus, and his associate in the government of the empire. Afterwards Odenathus defeated Balista, and at length drove out the Goths, who had committed the greatest ravages: but he was soon after treacherously murdered by his kinsman Mæonius, and his son Herodes suffered the same fate. Mæonius was then saluted emperor, but in a short time after was murdered by his own soldiers.

After the death of Odenathus Zenobia, his queen, by whom he had two sons, assumed the reins of government, in the name of her children; and renouncing the alliance with Rome, attacked and defeated Heraclianus the Roman general, by which means she obtained the possession of Syria and Mesopotamia. She then conquered Egypt, and afterwards added to her dominions the greatest part of Asia Minor. How amazing are the vicissitudes of fortune! Zenobia, surrounded by the barren sands of Palmyra, includes Egypt within her dominions to the south, and extends them to the north as far as the Black Sea and the Bosphorus; but this new-raised empire was of short duration, for a few years after the emperor Aurelian recovered the eastern provinces, and obliged Zenobia to shut herself up within the walls of Palmyra. He then invested that city. The queen rejected all negotiations with contempt; and, after a brave defence, resolving to solicit the assistance of the Persians, she set out on a dromedary; but just as she was about to cross the Euphrates, she was taken prisoner by a party of horse sent after her by Aurelian. The inhabitants of Palmyra now surrendering, the emperor spared their lives, and leaving there a garrison of six hundred archers, took a great part of the riches of the city, and marched with Zenobia to Emessa, where the queen stained her glory, and purchased a dishonourable life, by meanly betraying her

her friends, and naming those who had been her advisers ; on which the emperor had the cruelty to sacrifice them to his resentment, while she was reserved to adorn his triumph. Among those who suffered was Longinus, who wrote the excellent Treatise on the Sublime, and had dictated a haughty letter the queen had sent to the emperor ; but the intrepid courage with which he submitted to his fate, shews that his bravery was equal to his genius and learning.

But the misfortunes of Palmyra were not yet at an end. A brave and free people, who from the height of glory are suddenly reduced to the rank of slaves, usually make some desperate efforts to recover their liberty. Thus the Palmyrenes took up arms, and put the Roman garrison to the sword ; but the news of this event no sooner reached Aurelian, who was returning to Rome, than turning back, he took the city, destroyed it, and inhumanly caused most of the inhabitants to be massacred, without regard to age or sex. But afterwards he gave orders for repairing the Temple of the Sun, and appropriated to that use three hundred pounds weight of gold found in Zenobia's coffers, her crown-jewels, and eighteen hundred pounds weight of silver, which he took from the people. Palmyra having thus lost its liberty, continued subject to a Roman governor ; and we find that Justinian repaired and supplied it with water, after it had been for some time almost deserted. This is the last time that Palmyra is mentioned in the Roman History.

None of the inscriptions found there are more ancient than the birth of Christ, nor any so late as the destruction of the city by Aurelian, except a Latin inscription which mentions Dioclesian. Two of the mausoleums have very legible inscriptions ; one of them informs us, that Jamblicus caused that monument to be erected as a sepulchre for himself and his family in 314, which answers to the third year of the Christian æra ; and the other, that Elabelus Manaius caused it to be erected in 414, the hundred and third year after the birth of Christ. The ornaments of both these mausoleums are much in the same taste, though the last is the most elegant, and finished with the greatest care ; and they are both so much in the taste and manner of the other public structures, that it is natural to conclude, that they are not the works of very different ages.

S E C T. IV.

The Persons, Dress, Food, Language, Manners, and Government of the Arabs.

THE Arabians are of a middle stature, thin, and of a swarthy complexion ; and, like other people in the same climate, have black eyes and black hair. Their voices are rather effeminate than strong ; yet they are a brave people, very expert at the bow and lance, and, since they have been acquainted with fire-arms, are become pretty good marksmen.

The roving Arabs wear a kind of blue shirt fastened about them with a white sash, and some of them have over it a fur sheep-skin vest. They have a cap or turban on their heads ; sometimes they wear slippers, but never any stockings. Many of them go almost naked, but the women are generally so wrapped up, that nothing can be discovered but their eyes. The women Mr. Wood saw at Palmyra had good features ; they were veiled, but were less scrupulous about shewing their faces than is usual with the women of the East. They hang rings of gold or brass in their ears and nose ; they colour their lips blue, and the tips of their fingers red. Both sexes appear very healthy, and to be almost strangers to diseases.

Their food is beef, mutton, goats flesh, venison, and the flesh of camels, which they prefer to all the rest, and eat with thin cakes made of flour and water ; but many of them choose dried dates instead of bread. They also eat most sorts of fish, except those which have no scales ; but on whatever animal they feed, they are very careful of draining out all the blood. The people about Muscat

not only abstain from wine, but deny themselves tea and coffee, and other innocent liquors ; nor do they indulge themselves in smoking tobacco : water is their usual drink, and sometimes sherbet, made of oranges, water, and sugar.

The people of the East esteem the Arabian tongue the richest and most copious of any in the world. It is every where considered by the orientals as a learned language ; and even in Persia and India the Koran is never read in any other tongue. But though the Arabs have in former ages been famous for their learning and skill in all the liberal arts, there is at present scarce any country where the people are so universally ignorant as in Arabia.

Though the Arabs are generally considered as only bands of robbers, yet in those places where they are settled, and apply to the cultivation of the earth, to trade, and mechanic arts, they are distinguished by their justice, temperance, and humanity. Captain Say observes, that the Arabians near Muscat are courteous in their behaviour, extremely civil to strangers, to whom they offer no violence or affront, and though they have the highest veneration for their religion, they never strive to force it upon others : that a man may travel several hundred miles without so much as meeting with abusive language ; and if he has a charge of money, he needs no arms to defend it, but may safely sleep with it in his hand by the way-side ; and that though he lived several years in the country, during which he spent much of his time in travelling, he never heard of a single robbery among them. Indeed it is not surprising, that in a country of so great extent, the manners and customs of the people should be very different. It is true, several Arabian princes extort money from the caravans ; but as the country is theirs, they might refuse to let any caravans pass through it, and possibly what they impose upon caravans may be by way of toll ; which is the more probable, as the sums they demand are not so large as to discourage the caravans from passing through their dominions. But after all, there is no doubt but some tribes of the wandering Arabs live chiefly by robbery and plunder. We find that Mr. Wood and his companions, in travelling to Palmyra and Balbec, had an Arabian escort to defend them from a prince of the Bedouins, or wandering Arabs ; and that, on their arrival at Palmyra, they slept in safety in the huts of poor but honest Arabian peasants.

The Arabs who live in towns are very inconsiderable in point of number, compared with those who live in tents, and are called Bedouins. These people have no fixed habitation, but being possessed of large flocks of sheep, and herds of camels and goats, rove from one part of the country to another, where they can find pasture and water for their cattle ; and when they have destroyed all the forage, load their goods and baggage, with their wives and children on their camels, and march on in search of fresh pasture. When they encamp, their tents make a very indifferent appearance, they being usually covered with a coarse stuff made of black, or dark-coloured goats hair. These are the people dangerous to travellers.

The Arabians of the inland country are divided into tribes, and the tribes into families ; every tribe has its sheik el kebir, or great prince ; and every family its sheik or governor. The office of sheik is hereditary ; but when the sheik of a family dies without issue, the family choose another, with the leave of the sheik el kebir, or sovereign ; and if the sovereign himself dies without issue, the whole tribe assemble to choose another. The sheiks, or emirs, near Turkey, are said to be tributary to the Turks ; but, instead of this, they generally receive gratuities for permitting the pilgrims to pass through their country ; and the Grand Signior is always glad to maintain a good understanding with them, as it is in their power to attack the pilgrims in their way to Mecca, as well as to injure his subjects by their excursions and robberies ; while it is very difficult for him to punish them for it.

In Arabia are sovereign states whose monarchs are styled xerifs, and others are named imams, both of them including

including the offices of king and priest, in the same manner as the caliphs of the Saracens, the successors of Mahomet. These monarchs appear to be absolute, both in spirituals and temporals; the succession is hereditary, and they have no other laws than those found in the Koran and the comments upon it.

The usual arms of the Arabs are a lance, or half-pike, a sabre, a dagger, and a bow and arrows; and of late fire-arms have been introduced among them. The Arabs, like the Persians, are excellent horsemen, and harrahs an enemy by their sudden attack, and even defeat them when pursued. They are not very fond of fighting upon equal terms with the scymitar, but trust much more to the fleetness of their horses, and their skill in throwing the lance, firing, and discharging their arrows at those who pursue them.

These monarchs do not appear to have any standing army, or even a regular militia; but they command both the persons and purses of their subjects. Those situated near the coast have rendered themselves formidable at sea, particularly the king of Muscat, whose vessels not only attacked those of the Asiatics, but even the Europeans themselves: they are generally at war with the Danes and Portuguese; and if an English vessel, that is not a ship of force, comes in their way, they will not scruple making a prize of her. Mr. Lockhart says, that when he was at Muscat there were fourteen men of war at that city, besides twenty merchantmen; that one of these ships of war carried seventy guns, and none of them less than twenty: at the same time there were fifteen or sixteen sail of their men of war cruising abroad. Their colours are red, which they display in streamers and pendants at the mast-head, and other parts of the ship, which gives their fleets a gay appearance.

As they have scarce any timber of their own growth fit for shipping, some of them are said to be built in the mouth of the river Indus, and many of them are prizes taken from other nations.

S E C T. V.

Of Pilgrimages to Mecca, the Ceremonies with which they are attended, and a Description of Mecca and Medina.

THE Mahometans of all countries consider it as a duty to go in pilgrimage to Mecca. Those who reside in Africa commonly embark on board vessels, which wait for that purpose at the port of Suez, a small town situated at the most northern extremity of the west gulph of the Red Sea, whence they proceed to Rabbock, about four days sail from Mecca, where stripping off their cloaths, and covering their bodies with only two wrappers, with their heads bare and sandals on their feet, they go on shore, and travel by land to Mecca. The scorching heat of the sun sometimes burns the skin off their backs and arms, and greatly swells their heads; but when their lives are in danger from these austerities, they may put on their cloaths, on condition that on their arrival at Mecca each shall kill a sheep, and give it to the poor. But while dressed in this mortifying habit, it is held unlawful even to cut their nails, or to kill the vermin that bites them. They are likewise to be free from all enmity, to keep a guard over their tempers and passions, to preserve a strict government over the tongue, and to make continual use of a prescribed form of devout expressions. These austerities are continued seven days.

At about the distance of a day's journey from Mecca they are met by persons who come to instruct them in the ceremonies to be used in their worship, who, on their arrival at that city, conduct them into a great street in the midst of the town, which leads to the temple; go with them to the fountains where they are to perform their ablutions, and then take them to the temple, where the pilgrims leaving their sandals with one who attends to receive them, they enter at the door of the court which surrounds it, called the gate of peace, and having proceeded a few paces, their guide holds up his hands towards the sacred edifice, which stands in the centre, and utters several words, which the pilgrims repeat after

him, bursting into tears at the sight of the building. Being led seven times round it, they are conducted back into the street, where they sometimes run, and sometimes walk very quick, the pilgrims imitating their guide with the utmost awe and trembling, performing these superstitions with great seeming devotion; and these being ended, they return and seek out for lodgings.

All the pilgrims esteem it their indispensable duty to improve their time while at Mecca, not only by performing the accustomed duties within the court of the temple, but in spending all their leisure-time there, and, as far as they are able, in continuing to walk round the temple itself, at one corner of which is fastened a black stone framed in with silver, and every time they come to that corner they kiss the stone; and having gone round seven times, they perform two prayers. The people there have a tradition that this stone was formerly white, but that it is rendered black by the sins of the people who kiss it.

Mecca is situated in the latitude of twenty-one degrees twenty-five minutes, in a valley amidst many little hills, and about a day's journey from the Red Sea. It is a place of no strength, it having neither walls nor gates, and the buildings are extremely mean. The hills which encompass the town consist of a blackish rock, and on the top of one of them is a cave, where they pretend Mahomet usually retired to perform his devotions, and say, that the greatest part of the Koran was brought to him here, chapter by chapter, by the angel Gabriel.

This city is rendered famous by the resort of many thousand pilgrims, who annually visit the temple of Mecca, which is a small, plain, square building in the midst of a spacious area, encompassed by a structure which has piazzas on the inside resembling those of the Royal Exchange, in London; but the square is near ten times bigger, and over the piazzas is a range of domes, one on each side, which cover little rooms or cells, inhabited by people who give themselves up to reading and a devout life; and at each corner is a minaret, or steeple, from which the cryers call the people to prayers. In this outer-building are forty-two doors, which open into the square. The area on the inside of the inclosure is covered with gravel, except the paths that lead to the temple, and a small place around it, which are paved with short stones.

The Holy House, or temple, which is in the center of the area, is a square structure, each side of which is about twenty-four paces long, and about twenty feet high, formed of large stones perfectly smooth and plain, without the least carved-work; but is covered all over from top to bottom with a thick kind of silk, and above the middle is embroidered with letters of gold two feet in length. The door is covered with silver plates, and has a curtain before it thick with gold embroidery. This temple is the principal object of the pilgrims devotion, and is opened only two days in the space of six weeks; that is, one day for the men, and the next for the women. On the inside are only two wooden pillars, which stand near the middle to support the roof, with a bar of iron fastened to them, on which hang three or four silver lamps. The walls on the inside are marble, and covered with silk, except when the pilgrims enter. Those who are admitted into this structure scarcely stay ten minutes, because others wait for the same privilege; and while some are going out, others are entering in. All who please have the liberty of thus passing through the temple. The top of the structure is flat and covered with lime and sand; and as it has a long spout to carry off the rain whenever that falls, the people crowd to get under it, that the water which comes from the holy house may fall upon them, which they esteem a singular happiness; and if they can catch some of it to drink, their joy is extreme.

Round the temple is a marble pavement fifty feet broad, on the edge of which are brass pillars twenty feet distance from each other, and near fifteen feet high. Above the middle part of these pillars an iron bar extends from one to the other, with glass lamps hanging to each by brass wires, to give light in the night as in the day.

At the distance of about twelve paces from the temple is a building called the sepulchre of Abraham, who they imagine built the temple, in obedience to a divine command. This sepulchre is inclosed with iron gates, and adorned with an embroidered covering. Near it on the left hand is the well Zemzem, the water of which is esteemed holy, on which account the pilgrims, when they first arrive at Mecca, drink of it unreasonably, by which means it purges them, and makes their flesh break out in pimples. This they term purging of their spiritual corruptions. Many of them carry some of this water home to their respective countries, in small tin pots, and present perhaps half a spoonful of it to each of their friends, who, with abundance of thanks, receive it in the hollow of their hands, and sipping a little of it, rub the rest on their faces and naked heads.

Opposite to each side of the temple is a small edifice raised on pillars, where the Imam and the Mezzins perform their devotions in the sight of all the people. These four structures belong to so many different sects of Mahometans.

The covering of this temple is annually renewed, and sent from Cairo by order of the Grand Signior, when the caravan proceeds with the pilgrims to Mecca. The new covering is carried upon two camels, which are exempted from work for the space of a year after. This covering is received with extraordinary joy by the people, and is put up by the xerif of Mecca himself; and after he has caused the old covering to be cut in pieces, sells them at a high price to the Hadgees.

There are several thousand blue pigeons at Mecca, which none will affright, much less kill them, whence they are so very tame, that they will pick corn out of the people's hands. They are called the pigeons of the prophet, and come in flocks to the court of the temple, where they are fed by the Hadgees.

Before the pilgrims receive the title of Hadgee, they resume their mortified habit, and proceed to a hill called Gihbel el Orphet, or the mount of knowledge, where seventy thousand persons are said to assemble every year, two months and nine days after the feast of Ramadan. Nothing can be more affecting, than to see so many thousand people clothed in their garments of humility, with their heads bare, and their cheeks wet with tears, while with bitter sighs they earnestly beg, in a form of penitential expressions, the remission of their sins, and promise to reform their lives. This is continued for the space of four or five hours, after which they all at once receive the title of Hadgee from the Imam, which they enjoy as long as they live.

They no sooner receive this name, than trumpets being sounded, they leave the hill in order to return to Mecca; but, having proceeded two or three miles, rest for that night. After their devotions, each person gathers forty-nine small stones, and the next morning they proceed to a place called Mina, where they pretend that Abraham went to offer up his son, and having all pitched their tents, every Hadgee throws seven of the stones he had gathered at a small pillar, crying, "Stone the devil and them that please him."

The country people then bring in great flocks of sheep: every one who is able buys one, and having slain it, gives some of the flesh to his friends and the poor: then all of them pulling off their penitential habits, spend three days in festivity and rejoicing. It must be observed, that there are two other pillars, and that on the second day they throw at each of the three seven stones, and the same number the day after.

At the expiration of the three days they all return to Mecca, where they must not stay above ten or twelve days longer, and during that time is held a great fair, in which all sorts of India goods are sold. Most of the people here buy a shroud of fine linen to be wrapped in at their death, on account of the advantage of having it dip in the holy water. In the evening before they leave Mecca, they all take a solemn leave of the holy house, and retiring backwards, hold up their hands, and offer up their petitions with their eyes fixed on the building, till having lost sight of it, they burst into tears, and proceed on their journey.

It is worthy of remark, that this holy house, which the vulgar say was built by Abraham, had long been an idol-temple, but was dedicated by Mahomet to the Unity of God; and that their pilgrimages thither are intended to shew their detestation of all idolatry. As to Mahomet himself, there is said to be now only a faint reverence kept up for his name, even in Arabia his native country; and a judicious author observes, "that the furious zeal of which the first Saracen conquerors made such a parade, and so successfully availed themselves, had not so much a veneration for Mahomet for its object, as the Unity of the Supreme Being, in the invocation of which, if they joined the commemoration of his name, it was purely out of gratitude, for being the missionary of that Unity, and for his destroying the idol-worship, to which Arabia had continued so long under bondage. For the rest they looked upon him as a mere man, subject to all the failings and passions of one, and are so far from addressing him as a saint, that in their mosques and private orisons, they do not pray to him, but for him." Indeed, there are no pilgrimages to his tomb that is at Medina, and is visited by the Mahometans purely out of curiosity, and reverence to his memory, and many of the pilgrims return without seeing it at all.

It is a very great mistake that those who have been at Mecca, may commit crimes with impunity, and must not be put to death; since their being Hadgees does not entitle them to any privilege of that nature: for even on the road to and from Mecca, the pilgrims who commit crimes are punished as in other places; there being a *basha* and a cady in the caravan to try them, and numbers are annually executed both on the road thither, and in returning from thence.

Medina, the place where Mahomet lies entombed, to which he fled when driven from Mecca, and where he was first invested with regal power, is situated in twenty-four degrees thirty minutes north latitude, about eighty miles to the eastward of the Red Sea, and two hundred miles to the north of Mecca. It contains about a thousand houses built of brick and stone, which cannot be very lofty, as they are raised but one story from the ground.

In this city are several noble mosques, the principal of which is named *Mos a Kibu*, or the most holy. It stands in the middle of the town, and is a square building one hundred paces in length, and eighty in breadth, supported by many columns. It is said to have no less than three thousand lamps; but Mr. Pitts, who was there, maintains, that there are not above one hundred. Mahomet's tomb stands in this temple, covered with a dome, and encompassed with iron rails: the tomb itself is surrounded by a silver grate, and enclosed like a bed by curtains of rich silk. None are permitted to enter within the grate; for this is only allowed to those who go in to light the lamps, which burn by night.

Some pretend, that Mahomet's coffin is suspended by the attractive virtue of a load-stone fixed to the roof, but there is not the least foundation for this opinion; for the curtains that cover the tomb are not half so high as the dome; it is therefore impossible that the coffin should hang there, and the Mahometans never pretended that it did.

SECTION VI.

A concise Description of Mocha, with an account of the Trade of that City, and of the Coins, Weights, and Measures in use there.

WE shall now give a concise description of Mocha, the principal trading town of Arabia Felix, situated on the Red Sea, in thirteen degrees north latitude, and in the forty-fifth degree of east longitude from London. The neighbouring country is under the government of an Arab prince, who resides at a place two hundred miles to the east of Mocha. Aden was formerly the sea-port of his dominions; but that being very inconvenient, he removed it fifteen leagues farther to Mocha,

cha, which was then only a fishing town; but trade has rendered it a considerable city. It stands close to the sea in a large dry and sandy plain, that affords neither fruits nor water, except what is brackish, and so unwholesome, that it is said long worms breed in the legs and feet of those who drink it. The inhabitants have, however, very good and wholesome water from Mofa, which lying at the distance of twenty miles, and the water coming by land-carriage, is as dear to the inhabitants as small beer in England. But notwithstanding this inconvenience, Mocha is large, pretty well fortified, and makes a fine appearance from the sea. The buildings are lofty, and their markets well furnished with provisions, as the flesh of camels and antelopes, beef, mutton, goats-flesh, lamb, and kid: their common fowls are Guinea hens, partridges, and pigeons. The sea also affords variety of fish, but they are not well tasted, which proceeds from the extreme saltness of the seawater, and the nature of the aliment. All the year round the town is well supplied with good fruit, as peaches, apricots, grapes, and quinces, of which they make marmalade, both for their own use and for exportation; though near the town there is not a tree or shrub to be seen, except a few date-trees. They have seldom more than two or three showers in a year, and sometimes no rain for two or three years together; but among the mountains, at about twenty miles distance, there is generally a moderate shower every morning, which render the vallies between them very fertile, particularly in fruit, wheat, and barley.

Since Mocha was made a free port, it is become a place of great trade. It has a factory belonging to the English East India company, another belonging to the Dutch, and a considerable commerce is carried on by vessels from Bassorah, Persia, and Muscat in Arabia Petraea. The country itself produces few valuable commodities, except coffee, and some drugs, as myrrh, olibanum, or frankincense, from Cossin; aloes socco-

trina from Soccotra; liquid storax, white and yellow arsenic, gum arabic, with some balm of Gilead that comes down the Red Sea. The coffee trade brings in a continual supply of gold and silver from Europe; for though other goods and merchandize may be bought and sold on credit for a certain time, coffee is always bought for ready money. The ships from Europe are said to take in annually at Mocha about twenty thousand tons, and from other countries about as much more. The Dutch obtain here great advantages over other nations by their possessing the monopoly of spices, which being consumed here in great quantities, enables them to purchase coffee at easier rates than their neighbours; yet their trade at Mocha is continually sinking, from the vast quantities of coffee cultivated in their own colonies at Batavia, Amboyna, and the Cape of Good Hope, though the Dutch themselves acknowledge that there is no comparison between the flavour of the coffee raised in their own plantations and that brought from Mocha.

The coins current at Mocha are dollars of all kinds, which with them ought to weigh seventeen drams, fourteen grains; for all their coins are taken by weight, and valued according to their fineness. The gold coins current there are ducats of Germany, Venice, Turkey, and Egypt. The comassées are a small coin taken at the price the government sets upon them; but they keep their accounts in cabears, an imaginary coin, eight of which make a dollar.

The weights used at Mocha are the bahor, which amounts to four hundred and twenty pounds English: the frassel, or twenty-eight pounds, fifteen of which make a bahor: the maun, ten of which go to a frassel: the fakea, forty of which make a maun; and the coffila, ten of which make a fakea.

Their dry measures are the medeeda, which contains three English pints; and cloth and silk are measured by their cubit of twenty-four inches.

S E C T. I.

Of its Situation, Extent and Divisions.

TURKEY in Asia, which once formed a great part of the Eastern empire, and was most of it enlightened by the knowledge of Christianity, extends from the twenty-eighth degree of north latitude to the forty-fifth, and from the twenty-seventh degree of east longitude from London to the forty-sixth. It is about a thousand miles in length from east to west, and about eight hundred in breadth from north to south. This extensive country is bounded on the north by the Black Sea and Circassia; on the east by Persia; on the south by Arabia and the Levant, or south-east part of the Mediterranean Sea; and by the Archipelago, the Hellespont, and Propontis, which separate it from Europe, on the west.

As to the grand divisions of this part of the Turkish empire, these consist of the following provinces: on the east are Eyraca Arabic, or Chaldaea; Diarbec, or Mesopotamia; a part of Curdistan, or Assyria; Turcomania, the antient Armenia Major; part of Georgia, including Mingrelia, Imaretta, and part of Circassia; Syria, and Palestine. The western division consists of Natolia, the antient Asia Minor, which is divided into Natolia Proper, Amasia, Aladulia, and Carmania.

As several of these provinces have been separate kingdoms, and still enjoy advantages and disadvantages of

soil and climate peculiar to themselves, we shall consider them separately, and not attempt to give a general description of the whole, that can only be true in part, and must be liable to many exceptions.

The Turks, who possess the country, are indeed every where the same, and therefore by describing them here, we shall avoid many repetitions that would appear irksome and tedious to the reader; and, by seeing whatever is worthy of notice in relation to their persons, dress, manners, and customs placed before him in one view, he will be better able to form a just idea of that people, than he could obtain from our mixing them with the particularities and customs of the original inhabitants of different provinces.

S E C T. II.

Of the Persons and Dress of the Turks.

THE Turks in general are pretty well made: those in the cities have a tolerably fair complexion; but the peasants, and such as are obliged to be much in the sun, are swarthy. Their hair is commonly black, or of a dark chestnut, and they have commonly black eyes. The men are tolerably handsome when young, but tho' the women are very beautiful they arrive very early at maturity, and soon fade; and, in general, they look old by the time they reach thirty.

Some

Some of the old men dye their beards, and the old women their hair of a red colour with henna, which gives them a very whimsical appearance; and many of the men strive to conceal their age by dying their beards black.

Few of the Turkish ladies paint, for this is almost peculiar to the common prostitutes; but they usually black their eye-brows, or rather make artificial ones, with a composition which they call hattat. From a principle of strengthening the sight, as well as an ornament, it is a general practice among the women to black the inside of their eye-lids, by applying a powder called timed; this is a mineral substance that resembles a rich lead-ore, and is prepared by roasting it in a quince, apple, or truffle; it is then levigated with the oil of sweet almonds on a piece of marble, and if intended to strengthen the sight they frequently add flowers of oil-banum, or amber. They perform this operation with a cylindrical piece of silver, steel, or ivory, about two inches long, and of the size of a common probe. This they wet with water, in order that the powder may stick to it, and applying the middle-part horizontally to the eye, shut the eye-lids upon it, and drawing it through between them, it blackens the inside, leaving a narrow black rim round the edge. This is sometimes practised by the men, but is then esteemed foppish. Singular as this custom may appear, it has been practised throughout the East for many ages; and it was a custom not unknown to the beauties of antient Greece and Rome.

The women have another singular method of adorning themselves, which is, by staining their feet and hands with henna, which is brought in great quantities from Egypt chiefly for that purpose. The common way is to dye only the tips of the fingers and toes, and some few spots upon the hands and feet, and leave them of a dirty yellow, the natural tincture of the henna, which has a very disagreeable appearance to an European; but it is more polite to have the greatest part of the hands and feet stained in the form of roses, and various figures, with a dye that is of a very dark green. But after some days this begins to change, and at last looks as disagreeable as the other.

The women in some of the villages, and all the Arabs, wear a large gold or silver ring through the external cartilage of their right nostril; and some of these rings are at least an inch and a half in diameter. It is likewise usual for these people to mark their under lip, and sometimes their breasts and arms, with a blue colour, by pricking the part with a needle, and then rubbing it with a certain powder which leaves an indelible mark.

As a slender waist is far from being admired by the Turks, and is rather considered as a deformity in the ladies, they use all their endeavours to render themselves plump. The Turkish habit appears very graceful: next the skin the men wear a pair of drawers, and over them a shirt and a doliman of satin, taffety, or other neat stuff, which reaches to their heels, like a close-bodied cassock. In winter this is quilted, and this they gird very tight round the waist with a sash, in which they frequently wear two daggers, the handles and sheaths of which are sometimes adorned with gold and silver. Persons of distinguished rank have them ornamented with precious stones. In this girdle they also carry their money and their pouch for tobacco. Over the doliman they wear a kind of night-gown, which those who are able line with furs in the winter. Their stockings are of cloth, footed with red or yellow leather; and their shoes are of the same colour. On their head they wear a crimson velvet cap, round which they wrap a red or white turban, which is a scarf of linen or silk many ells long.

Upon particular occasions the Janizaries wear a sercola or cap of ceremony, which hangs down behind, and has a pipe of gilt leather half a foot long that reaches to the middle of the forehead; but they usually wear a turban of white, red, or other silk. The Turks shave their heads, and say, "The devil nestles in long hair;" but they are fond of a venerable beard.

In describing the dress, the manners, and customs of the Turkish ladies, we shall follow the account given

of them by a lady, who was of a rank sufficient to gain her admittance into the harrams of the great; and was herself distinguished by uncommon learning, and those great qualifications which add dignity to the highest stations. This truth requires, for little credit ought to be given to the account travellers have given of ladies whom they were never permitted to see, and to their description of customs which they cannot know. The only objection that can be made, is, that her observations were made at Constantinople, and that we are describing the customs of the Turks in Asia; but as the manners of these people are every where the same, this can produce no other alteration, except, perhaps, some abatement in point of splendor.

"The first part of my dress, says the lady Wortley Montague, when ambassador at Constantinople, is a pair of drawers, very full, that reach to my shoes, and conceal the legs more modestly than your petticoats. They are a thin rose-coloured damask, brocaded with silver flowers. My shoes are of white kid leather embroidered with gold. Over this hangs my smock of a fine white silk gauze, edged with embroidery. This smock has wide sleeves, hanging half way down the arm, and is closed at the neck with a diamond button; but the shape and colour of the bosom is very well to be distinguished through it. The antery is a waistcoat, made close to the shape, of white and gold damask, with very long sleeves falling back, and fringed with deep gold fringe, and should have diamond or pearl buttons. My castan, of the same stuff with my drawers, is a robe exactly fitted to my shape, and reaching to my feet, with very long, strait, falling sleeves. Over this is the girdle, of about four fingers broad, which all that can afford it have entirely of diamonds or other precious stones; those who will not be at that expence, have it of exquisite embroidery on satin; but it must be fastened before with a clasp of diamonds. The curdee is a loose robe they throw off or put on, according to the weather, being of a rich brocade, (mine is green and gold) either lined with ermine or fables; the sleeves reach very little below the shoulders. The head-dress is composed of a cap, called talpoc, which is in winter of fine velvet embroidered with pearl or diamonds; and in summer of a light shining silver stuff. This is fixed on one side of the head, hanging a little way down, with a gold tassel, and bound on either with a circle of diamonds, (as I have seen several) or a rich embroidered handkerchief. On the other side of the head the hair is laid flat; and here the ladies are at liberty to shew their fancies; some putting flowers, others a plume of herons feathers, and, in short, what they please; but the most general fashion is, a large bouquet of jewels, made like natural flowers, that is, the buds of pearls, the roses of different coloured rubies, the jessamines of diamonds, the jonquils of topazes, &c. so well set and enamelled 'tis hard to imagine any thing of that kind so beautiful. The hair hangs at its full length behind, divided into tresses braided with pearl or ribbon, which is always in great quantity."

The same admirable writer observes, that the Turkish ladies do not commit one sin the less for not being Christians, and that they are far from wanting the liberty ours enjoy. No woman, let her rank be what it will, is permitted to go into the streets without two murlins, one that hides the whole dress of her head, and hangs half way down her back, and another that covers her face all but her eyes. Their shapes are also entirely concealed by a serigee, which no woman of any fort appears without; this has long sleeves that reach to their fingers ends, and wraps round them like a riding-hood. This in summer is of plain silk, or stuff, and in winter of cloth. By this means they are so disguised that the greatest lady cannot be distinguished from her slave, and it is impossible for the most jealous husband to know his wife when he meets her, and no man dare touch or follow a woman in the street.

Their thus appearing in masquerade affords them the liberty of following their inclinations without danger of discovery. Their most usual method of intrigue is sending

ing an appointment for the lover to meet them at a Jew's shop, where the most valuable goods are to be purchased. The great ladies seldom let their gallants know who they are; and it is so difficult to discover them, that they can seldom guess the lady's name with whom they have corresponded above half a year together. Hence the number of faithful wives is perhaps small, since they have nothing to fear from the indiscretion of a lover.

The Turkish women, the above ingenious lady observes, notwithstanding all that has been said to the contrary, are perhaps more free than any other in the universe, and are the only women in the world that lead a life of uninterrupted pleasure, exempt from cares; their whole time is spent in visiting, bathing, or the agreeable amusement of spending money, and inventing new methods of adorning their persons. A husband would be thought mad that exacted any degree of oeconomy from his wife, whose expences are only limited by her fancy. 'Tis his business to get money, and hers to spend it; and this prerogative extends to the meanest of the sex. Indeed these have no places of resort but the bagnios, and there can only be seen by their own sex; however, they are fond of dress, and take great pleasure in frequenting the baths.

Those Turks who are not afraid of shewing that they are rich live well, and are far from being so abstemious as many people imagine. As soon as they rise in the morning they breakfast on fried eggs, honey, cheese, leban, &c. At about eleven o'clock in the forenoon in winter, and rather earlier in summer, they dine. They have a round table, which, as well as their dishes, is made either of copper tinned, or, for persons of high rank, of silver. This is placed upon a stool about twelve or fourteen inches high, and a round piece of cloth is spread under the table, upon a carpet, to prevent its being soiled. A long piece of silk is laid round to cover the knees of those who sit at the table, which has no covering but the victuals. Sallads, pickles, small bassons of leban, bread, and spoons, are placed in order round the edge, and the middle of the table is for the dishes, which, among the great, are brought in one by one: and, after each has ate a little, they are changed. Their fingers, as in other parts of the East, serve for knives and forks; but for liquids they make use of spoons made of wood, horn, or tortoise-shell; for gold or silver they are not permitted to use by their religion.

Their usual bread is of wheat-flour not well fermented, made into thin flat cakes ill baked, and for the most part ate soon after it comes out of the oven; besides these there are a variety of rufks and biscuits, most of them strewed over the top with the seeds of sesamum, or fennel-flour. The first dish is generally a kind of broth, or soup, and the last pillaw. The intermediate dishes, which are frequently numerous, consist of mutton cut into small pieces, roasted or stewed with herbs, stewed fowls, pigeons, or other birds, which are commonly stuffed with rice and spices. A whole lamb stuffed with rice, almonds, raisins, pistachos, &c. and stewed, is a favourite dish. Pastry, both with meat and of the sweet or fruit kind, they would make very well, if the badness of their butter did not in most places spoil it. A large pillaw, with a dish of sweet starch, which they sometimes eat with it, comes last, except a very thin syrup, with dried apricots, raisins, pistachos, slices of apples, pears, or the like, swimming in it; of this each person takes a large spoonful, with spoons brought in with it on purpose; and thus finishes the repast.

Water is their liquor at table, and after dinner they drink coffee. Most of their dishes are greasy either with fat or butter, and pretty high-seasoned with salt and spices; many of them are made sour with verjuice, pomegranate, or lemon-juice; and onions and garlic frequently complete the seasoning.

The lady Wortley Montague says, that, for the first week, their cookery pleased her extremely: but then growing weary of their table, she desired her cook might add a dish or two after our manner; but, at the same time, acknowledges, that this might be owing to custom, and that she was ready to believe that an Indian, who

had never tasted of either, would prefer their cookery to ours.

The Turks sup at about five o'clock in the winter, and six in the summer, in much the same manner as they dine; and in winter they frequently visit each other and sit up late, when they have a collation of several sweet dishes. Besides dinner and supper, they frequently eat, within the compass of the day, several sorts of fruit, according to the season.

The common people have not this variety. Bread, dibbs, leban, butter, rice, and a very little mutton, are their principal food in the winter; as rice-bread, cheese, and fruits, are in the summer. Their principal meal is in the evening, when they return home from performing the business of the day.

Though wine and spirits are supposed to be only drank by the irreligious and licentious, yet their number is more than one would imagine from their appearance; for as these liquors are prohibited by their religion, they are commonly drank in secret at their gardens, or privately in the night; and whenever they can come at liquor, if they once begin, they generally drink to great excess. There are, however, others who drink wine with moderation, and say in excuse, that all the creatures of God are good and designed for the use of man; however, that the prohibition of wine was an act of wisdom, and designed for the common people, among whom it would be the source of infinite disorders: but that the prophet never intended to restrain those that knew how to use it with discretion; nevertheless, scandal ought to be avoided, and therefore they never drink it in public. This indeed is the general way of thinking among the sensible part of the people, very few of whom make any scruple of drinking wine that are able to afford it.

Coffee made very strong, without milk or sugar, is a refreshment highly esteemed by every body; and a dish of it, preceded by a little wet sweet-meat, which frequently consists of conserve of red roses, sharpened with lemon-juice, and a pipe of tobacco, is the usual entertainment at a visit; but if they choose to use less ceremony, they omit the sweet-meat. When the Turks would shew an extraordinary degree of respect, they also present sherbet; sprinkle rose or other sweet-scented water; and perfume their visitor with the smoke of the wood of aloes, which is brought in a censer, and generally serves for an intimation that it is time for the stranger to take his leave.

This is thought an entertainment sufficient for any person, let his rank be ever so great; and if it be a visit of ceremony from a basha, or other person in power, a fine horse, sometimes with furniture, or some other valuable present, is made him at his departure.

After mentioning the entertainments of the Turks, it cannot be amiss to observe, that though we are apt to esteem these people as no better than barbarians, yet politeness and hospitality are their distinguishing characteristic. On a traveller's addressing the governor of a province for his protection, and making him, according to the custom of the East, a handsome present, a pipe, coffee, sweet-meats, and perfume, are successively presented; and he will tell him, that the land he commands, and all that is in it, are at his service. "In no instances, says the ingenious Mr. Wood, do the oriental manners shew these people in so amiable a light, as in their discharge of the duties of hospitality: the severities of Eastern despotism have indeed been always softened by this virtue, which so happily flourishes most where it is most wanted. The great forget the influence of power to the stranger under their roof, and only preserve a dignity so tempered by humanity, that it solely commands that grateful respect which is otherwise scarce known in a country where inferiors are oftener taught to fear than to love. But avarice, he adds, is as much an Eastern vice as hospitality is an Eastern virtue. The most sordid instances among the former we found among the great, and those in public employments, while we experienced extraordinary instances of generosity in private life. We would therefore be cautious of charging to the character of a people, what this government

“ seems to require : for amidst the uninterrupted series
 “ of shameless venality, which regulates the discharge
 “ of every private duty, from the prime vizier down-
 “ wards, and which, in the true spirit of despotism,
 “ stops only at the wretch who is too low to make re-
 “ prials ; every subaltern in power must submit to that
 “ portion of the common prostitution which belongs to
 “ his rank, and which therefore seems rather the vice
 “ of the office than of the man.”

But, notwithstanding the general character of politeness, courtesy, and hospitality, by which the great are peculiarly distinguished, the Mahometans, in private life, assume a superiority over all who are of a different faith, which is best perceived by those who dwell for a considerable time among them. This generally increases among the people in proportion to their vicinity to Mecca : thus the inhabitants of Aleppo have a much greater share of it than Constantinople, Smyrna, and other places at a farther distance, though it greatly declines ; and, even in Syria, several bathas have conferred many public honours on the Europeans, that would formerly have caused great popular discontent. Among the common people an affected gravity, with some share of dissimulation, is too much their characteristic. And though they are much addicted to quarrelling and abusive language, none are less guilty of fighting. However, though they are so prone to anger on the most trifling occasions, no people upon earth can be more calm when it is for their interest : yet there are people who deserve a much better character, for some of them are possessed of the utmost honour and integrity.

SECTION III.

Of the Amusements and Diversions of the Turks ; particularly their Smoking, their taking Opium, their Riding, Sleeping, and Games. Their Dancing, Wrestling, and Music.

THE men smoke tobacco to great excess, as do many of the women ; and the labourers, or handicraft tradesmen, have generally a pipe in their mouths, if they are able to be at the expence. These pipes are made of the twig of the cherry-tree or rose-bush, bored for that purpose ; and those of superior rank are five or six feet long, and adorned with silver. The bowl is of clay, and often changed, though the pipes themselves last for years. Many in affluent circumstances adopt the Persian manner of smoking with the caaleen already described. They use the Persian tobacco, which has an agreeable flavour, with this instrument ; and what is smoked this way, is said to be attended with this advantage, that neither the taste nor smell of it remain after washing the mouth.

The practice of taking opium is not so general in Turkey as is commonly imagined, few using themselves to it. By the debauchee, it is taken in various quantities, or confessions, in which it is mixed with aromatics ; and some use it pure. The consequences that result from this ill habit are the person's looking old and besotted, like those who in Europe have ruined their constitutions by hard drinking. And though they are seldom carried off by dropxies, or those other diseases that are the usual consequences of an habit of drunkenness, they seldom live to old age : but, having first lost their memory, and most of their intellectual faculties, decline like those who sink under the weight of years.

The Turks have no notion of the benefit of exercise, either for the preservation of health, or curing of diseases ; and laugh at the Franks or European Christians for taking a walk, esteeming it ridiculous to walk merely for the sake of amusement. Indeed, it is with reluctance that they use much exercise, either for business or pleasure. To walk or ride to their gardens, where they are situated at a small distance, once or twice a week at the proper seasons, is as much as most of them care to do.

We must, however, except people of rank, who, though they are not fond of walking, are very active on horseback, and in throwing the jareed, a short staff, which they dart very dexterously on horseback ; and a mock-fight with this weapon is a common entertainment.

It is surprising to see with what dexterity they manage their horses upon these occasions, so as to avoid running against each other when numbers are galloping seemingly in the greatest disorder. This, however, is but seldom practised, the greatest part of their time being spent in the indolent indulgence of lolling on their divans.

As the Turks in most parts of their Asiatic dominions have no coaches, persons of rank ride on horseback, and in the cities have a number of servants walking before them, according to their rank, which, though it may be less convenient in bad weather, has a more manly, if not a grander appearance, than our sedans and coaches. The ladies of the greatest distinction are obliged to walk on foot, if they go only a moderate distance ; but in journeys, the women of rank are carried by mules in a litter close covered up, and those of inferior circumstances are generally stowed one on each side of a mule in a kind of covered cradle.

Most of the natives go early to-bed, and rise betimes in the morning. They sleep in their drawers, and at least in one or two waistcoats ; and some of them in winter in their furs. Their beds only consist of a matras laid on the floor and over it a sheet, and in winter a carpet or some other woollen covering, the other sheet being sewed to the quilt, which is thrown over them. A divan-cushion often serves them for a pillow and bolster ; but some have a bolster and pillow like ours. When the time of repose approaches they seat themselves on this matras, and smoke till they find themselves sleepy, then lying down they leave their servants to cover them when asleep ; and many of the people of rank are lulled to rest by soft music, or stories told out of the Arabian Nights Entertainment, or some other book of the same kind. If they happen to awake in the night they sit up, fill their pipe, have a dish of coffee made, and sometimes in the long winter-nights eat some of their sweet pastry, and thus sit till they drop asleep again. In the southern provinces their beds are made in summer in their court-yard, or on the house-top ; and in the winter they choose for their bed-chamber the smallest room on the ground-floor. They have always a lamp burning, and when the weather is cold have frequently one or two pans of charcoal, which is sometimes of ill consequence even to them, and would suffocate such as had never been accustomed to it.

Their principal amusements within doors are playing at chess, at which they are very expert, and a kind of back-gammon, both borrowed from the Persians : their other diversions are playing at draughts, mankala, tabudue, and the play of the ring, as they term it, with which the great frequently amuse themselves in the winter evenings. This diversion consists in guessing under what coffee-cup a ring is hid, out of a number of cups placed on a large salver. Several engage in this play on each side, and those who win have the privilege of blacking the faces of those who lose, or of putting fools caps on their heads, and obliging them to stand before them, while they sing extempore songs in their own praise, and in derision of the losers. But they treat none in this manner but their servants, or their inferiors, some of whom, especially if they have any turn for buffoonery, are always of the party. These games are only used by the Turks for amusement ; for they never play for money, though they will sometimes go so far as to play for an entertainment.

Dancing is far from being reckoned an accomplishment among people of fashion, and is scarce ever practised among any of the vulgar, except such as make a trade of it. Their dexterity consists less in their agility, than in the motion of their arms and body ; putting themselves in different attitudes, and using gestures which, particularly among the female dancers, are none of the most decent.

Wrestling is also sometimes a part of their entertainment at their festivals. The wrestlers anoint their naked bodies, and have nothing on but a pair of breeches. At their entrance they strut and boast so much that people might expect great matters from them ; but they greatly fail in the performance. Among their amusements they have likewise buffoons, who constantly attend all merry-makings, in order to keep up the mirth of the company.

The

The music of this country consists of two sorts, one for the field and the other for the chamber. The first is performed before the bashas and the other great military officers, and is also used in their garrisons. It consists of trumpets, cymbals, hautboys, shorter but shriller than ours, and large drums, the upper head of which is beat upon with a heavy drum-stick, and the lower with a small switch. Besides these they have small drums, which are beat after the manner of our kettle-drums; this music has a pretty good effect at a distance.

Their chamber music consists of a guitar, an Arab fiddle, a dulcimer, the dervises flute, which is blown in a very particular manner, a couple of small drums, and the diff. This last instrument chiefly serves to beat time to the voice, which is frequently the worst of all their music; for many of them bellow so hideously, as to spoil what would be otherwise harmonious. This diff is a hoop, over which a piece of parchment is extended, and sometimes pieces of brass are fixed in it to make a jingling. It is beat with the fingers, and is the true tympanum of the antients, as is evident from its figure in several relievos representing the rites of Cybele and the orgies of Bacchus. They have likewise a kind of flute, which resembles the ancient syrinx; but as few can play upon it, it is not much used. Besides these instruments they have a kind of bagpipe, which many idle fellows play upon in the streets of Aleppo, in order to obtain money from the passengers.

The Turks are acquainted with the different measures used in music, and have names for them; but, being unacquainted with the method of writing music by notes, they are obliged to learn entirely by the ear; however, when several persons play together, they keep exact time, all playing the same, for they have neither bass nor any other parts in music.

Some authors have said, that the Turks have no music but what is shocking to the ear; but they probably never heard any but what is played in the streets, and, as an ingenious lady whom we have already quoted observes, their account is just as reasonable as if a foreigner should take his ideas of English music from the bladder and string, or the marrow-bones and cleavers. Their music is indeed extremely pathetic, and many of the women have fine voices.

SECT. IV.

Of the Bagnios; the Manner in which the Men are washed; with an Account how the Women spend their Time there: of the Introduction of a Bride, and the Manner in which a Woman is treated after her Lying-in. Of Coffee-Houses, and the Dwelling-Houses of the Turks in general.

IN all the great towns are a number of public bagnios, frequented by people of all sects and conditions, except those of a very distinguished rank, who have generally baths in their own houses. On entering a bagnio you come into a large lofty room, in the midst of which is usually a fountain with a basin. This apartment is surrounded with sofas, and here the people dress and undress; the air not being influenced by the heat of the bath, except just at the door, which opens into a small room that is pretty warm, and from thence into a larger that is very hot. About the sides of these two rooms are usually placed round stone-basins, about two feet and a half in diameter, with two cocks, one of hot and the other of cold water, so that it may be tempered at pleasure; and there are copper-bowls for pouring it upon the body. In the corners of the inner room are small retiring places, in one of which is frequently a cistern of warm water, about four feet deep, and large enough for bathing the whole body. All these rooms are covered with domes, and the inner receive their light from small openings in the dome covered with glass. A few bagnios are solely for the use of the men; others are appointed for the women only: yet most of them admit both sexes, that is, the men in the morning, and the women in the afternoon.

When a man enters the hot room he first applies the dewa, a medicine for taking off the hair from the pubis

and arm-pits; this remains till the hair is quite loose; and then is washed clean away with great care. After this one of the servants of the bagnio begins with chafing or kneading violently, first the tops of the shoulders, and then by degrees the whole body. On his coming to the hands he pulls the joints of the fingers so as to make each crack separately; then laying the person on his back, with his arms across his breast, he raises him forcibly by the back part of the neck, making the greatest part of the vertebrae crack. Then having chafed the back a little more, he throws a quantity of warm water over the whole body, and rubs him hard with a bag of coarse cloth drawn over his hand. He is next rubbed over with a soap lather, and this being washed clean off, the person puts one towel round his middle, another round his head, and a third perhaps over his shoulders; then returning to the great room, he generally smokes a pipe, drinks coffee, and perhaps eats some fruit before he dresses.

The reader cannot fail of being highly pleased at seeing here an account of the manner in which the ladies spend their time at the bagnios, extracted from the only author capable of giving him information. The right honourable lady, from whose letters we have already borrowed some curious particulars, entered one of the public baths at the city of Sophia, in her way to Adrianople: she was then in her travelling habit, which was a riding-dress: and though this must appear very extraordinary to the Turkish ladies, none of them shewed the least surprize, but received her with all the obliging civility possible: and the noble writer observes, that she is acquainted with no European court where the ladies would have behaved in so polite a manner to such a stranger. There were about two hundred women, and yet none of those disdainful smiles and satirical whispers that never fail in our assemblies, when any body appears that is not exactly dressed in the fashion. They only repeated over and over, *Uzelle, pek uzelle*, "Charming, very charming." Round the room were two rows of sofas covered with cushions and rich carpets, on which sat the ladies, and on the second their slaves behind them, all in the state of nature, without any beauty or defect concealed; yet there did not appear the least wanton smile, or immodest gesture. They walked and moved with the majestic grace with which Milton describes our general mother. Many among them were as finely proportioned as ever any goddess was drawn by the pencil of a Guido or Titian, and most of their skins of a shining white, only adorned by their beautiful hair, divided into many tresses, hanging on their shoulders, braided either with pearl or ribbon, perfectly resembling the figures of the Graces.

This illustrious lady observes, that she was here convinced of the truth of a reflection that she had often made, "That were it the fashion to go naked, the face would hardly be observed;" for the ladies who had the most delicate skins, and finest shapes, had the greatest share of her admiration, though their faces were sometimes less beautiful than those of their companions. They were in different postures, some in conversation, some drinking coffee or sherbet, others working, and many negligently lying on their cushions; while their slaves, who were mostly agreeable young women of about seventeen or eighteen, were employed in braiding their hair in several pretty fancies.

This, in short, is the womens coffee-house, where all the news of the town is told. They usually take this diversion once a week, and stay there at least four or five hours; but it is surprising they do not get cold by immediately coming out of the hot-bath into the cool room. It must not be omitted, that it is death for any man to get admission to those bagnios when the ladies are there.

We shall now give the reader a description of the reception of a Turkish bride, from another of the letters of the same noble and learned lady. The ceremonies observed on that occasion, she says, made her recollect the epithalamium of Helen by Theocritus. All the female friends, relations, and acquaintance of the two families newly allied meet at the bagnio, and others going out of curiosity, there were near two hundred women

men present. Those that were or had been married placed themselves round the rooms, on the marble sofas; but the virgins hastily threw off their cloaths, and appeared without other ornament or covering than their own long hair, braided with pearl or ribbon. Two of them met the bride at the door, conducted by her mother and another grave relation. She was a beautiful maid of about seventeen, very richly dressed and shining with jewels, but was presently reduced to the state of nature. Two others filled silver gilt censers with perfume, and began the procession, the rest following in pairs to the number of thirty. The leaders sung an epithalamium, answered by the others in chorus, and the two last led the fair bride, her eyes fixed on the ground, with a charming affectation of modesty. In this order they marched round the three large rooms of the bagnio. 'Tis not easy, says our author, to represent the beauty of this sight, most of them being well proportioned and white skinned; all of them perfectly smooth, and polished by the frequent use of bathing.

The bride was then led to every matron round the rooms, and by each was saluted with a compliment and a present, some of jewels, others of pieces of stuff, handkerchiefs, or little gallantries of that nature, which she thanked them for by kissing their hands.

Dr. Russel, who for a long time practised physic at Aleppo, observes, that the first time a woman of the country, whether Christian, Turk, or Jew, goes to the bagnio after child-bearing, she is seated in one of the washing-places of the inner room, and the midwife rubs her over with a composition of ginger, pepper, nutmegs, and other spices made into a kind of electuary with honey. In this manner she sits for some time, while the other women express their joy by singing. The lady is afterwards washed clean, and this finishes the ceremony. This they imagine is very strengthening, and prevents many disorders which would otherwise ensue after delivery; and they likewise use it after recovering from any severe fit of illness.

In the great towns are coffee-houses for the men; but they are generally frequented by none but the vulgar. The master usually provides for the entertainment of his customers a concert of music, a story-teller, and particularly at the feast of Ramadan an obscene kind of puppet-show; and sometimes tumblers and jugglers.

The Turkish houses are, in general, composed of apartments on each of the sides of a square court all of stone, where it can be conveniently had; but in many places they are only built of wood. These structures consist of a ground floor, which is generally arched, and an upper story flat on the top, and either terraced with hard plaster, or paved with stone. The ceilings are of wood neatly painted, and sometimes gilded, as are likewise the pannels of some of their rooms, the cupboard doors, of which they have a great number, and the window shutters, which taken together have a very agreeable effect. Over the door and windows within the houses of the Turks are inscribed moral passages out of the Koran, or verses either of their own composing, or taken from some of their most celebrated poets.

The court formed by the four sides of the house is neatly paved, and has generally a basin with a fountain in the middle, and on one or both sides is a small spot left unpaved for a kind of garden, which frequently does not exceed two or three yards square. The verdure here produced, with the addition of flowers in pots, and the fountain playing, would be a very agreeable sight to the passenger, were there openings to the street through which these might be seen; but they are entirely shut up with double doors, so contrived, as that when opened, none can look into the inner court, and there are no windows to the street, except a few in the upper rooms, so that nothing is perceived but dead walls, which give the streets in all the Turkish towns a very disagreeable appearance to the Europeans. Most of the houses of people of distinguished rank have an arched alcove within this court, open to the north and opposite to the fountain. This alcove has its pavement raised about a foot and a half above that of the yard to serve for a divan. Between it and the fountain the pavement

is generally formed of Mosaic work of various coloured marble, as is also the floor of a large hall, which has a cupola roof, and frequently a fountain in the middle, or at one end.

SECT. V.

Of the Learning of the Turks, and their little Skill in the Sciences.

THE Turks are extremely ignorant with respect to all kinds of literature: many bashas, farmers of the customs, and considerable merchants, can neither read nor write; their youth are, however, now better taught than formerly, though their education seldom extends farther than reading the Turkish language, and a little of the Koran, and writing a common letter, except those who are bred to divinity and the law, which are here closely allied; and the professors of both generally pretend to have likewise some skill in physic. A few of the Turks understand astronomy, so far as to be able to calculate the time of an eclipse; but the number of these being very small, they are looked upon as extraordinary persons. However, there are great numbers who pretend to understand judicial astrology, in which the Turks have great faith.

They have a considerable number of colleges, but little is taught in them; for as they are frequently erected by the founders, partly as an atonement for the acts of oppression by which they obtained their wealth, and partly to secure some of it to their descendants, whom they appoint curators of these endowments, these frequently apply to their own private use what seemed intended for the benefit of the public, and the school soon runs to decay. Several of these have a library; and a few private men among the learned have some books, but they seldom make much use of them.

The Turks believe in predestination, and yet are persuaded that as God has afflicted mankind with diseases, he has also sent them remedies proper for their recovery, and therefore those who practise physic are very numerous, and well esteemed.

The doctrine of predestination has, however, such an effect, that during the plague, which sometimes rages very violently, the markets are all open, and there is as great a plenty of provisions as at any other time. The streets, though not quite so much crowded, are pretty full of people; and the generality of the Turks visit the sick, and attend their funerals as at other times.

Their physicians are native Christians, and a few Jews; for the Turks seldom make this their profession. However, most of the physicians of this country are egregiously ignorant; for they have no colleges, in which any branch of physic is taught; and as the dissection of human bodies is not allowed, and that of brutes is never thought of, they have a very imperfect idea of the situation of the parts, or their distinct offices. They are also totally ignorant of the use of chemistry in medicine.

They have the works of some of the Arabian writers, particularly Ebenesina, whose authority is indisputable with them. They have also some translations of Hippocrates, Galen, Dioscorides, and a few other Greek writers; but their copies are generally very incorrect. Hence the state of physic in this country, as well as every other science, is at a very low ebb, and far from being in a way of improvement.

SECT. II.

Of their Marriages and Funerals.

THE tender passion of love can here have very little share in promoting matrimony. Most of the women are married from the age of fourteen to eighteen, and often sooner; but the young folks never see one another till the ceremony is performed.

The marriages of the Turks, as among other eastern nations, are usually brought about by the ladies. The mothers

mothers, in order to find a proper wife for their sons, take all opportunities of introducing themselves into company where they expect to see young women who are disengaged, and when they meet with one they think will be agreeable, make the proposal to her mother. Upon this the girl's family enquire into the character and circumstances of the young man, and if affairs are likely to be adjusted, his father makes a formal demand of her, the price is fixed that the man is to pay for her, and a licence is procured from the cady for their marriage. Each of the young folks then appoint a proxy, who meet the imaum and several of the male relations, and after examining witnesses, to prove that those proxies are regularly appointed, he asks the one if he be willing to purchase the bride for such a sum of money, and the other if he be satisfied with the sum; when, being answered in the affirmative, he joins their hands, and the money being paid, the bargain is concluded with a prayer out of the Koran.

After this, the bridegroom may take home his bride whenever he thinks proper, and the day being fixed, he sends to let her family know it. The money he paid for her is laid out in furniture for one chamber, with cloaths, jewels, and other ornaments for the bride, whose father makes some addition, according to his circumstances, and all are sent with great pomp to the bridegroom's house three days before the wedding. He at the same time invites all his friends and acquaintance, and if a man in power, many others; for all who are invited send presents whether they go or not: and a kind of open house is kept for several days preceding the wedding. On the day appointed, the women go from the bridegroom's house, and bring home the bride, accompanied by her mother, and other female relations, when each sex makes merry in separate apartments till night. The men, having dressed the bridegroom, introduce him to the door of the women's apartment, where his own female relations meet him, and proceed singing and dancing before him to the stairs foot of the bride's apartment, when she is brought half way down stairs to receive him, veiled with a piece of red gauze, and he having conducted her up stairs, they are left to themselves.

Any woman that dies unmarried is thought to die in a state of reprobation. To confirm this belief, they say, that the end of the creation of woman is to encrease and multiply; and that she is only properly employed in the works of her calling, when she is bringing forth children, or taking care of them, which are all the virtues that God expects from her: and indeed their way of life, which excludes them from all public commerce, does not permit them any other. Hence many of those who are most superstitious, are no sooner widows than they marry again as soon as they can, for fear of dying in the wicked state of an useless creature. But those that like their liberty, and are not slaves to their religion, content themselves with marrying when they are afraid of dying. This, says our author, is a piece of theology, very different from that which teaches nothing to be more acceptable to God than a vow of perpetual virginity.

Among the Turks it is a greater disgrace to be married and not fruitful, than it is with us for a woman to be fruitless before marriage. They have a notion that whenever a woman leaves off bringing forth children, she is too old for it, whatever her age says to the contrary. This opinion, says the ingenious lady whose letters we have so often quoted, makes the women so ready to make proofs of their youth, that not contenting themselves with using the natural means, they fly to all sorts of quackeries to avoid the scandal of being past child-bearing, and often kill themselves by them. They are respected according to the number they produce, and therefore when they are with child, it is common for them to say, they hope God will be so merciful as to send them two this time; and when I, the above lady adds, have asked them sometimes, how they expected to provide for such a flock as they desire; they answer, that the plague will certainly kill half of them; which, indeed, generally happens, without much concern to the parents, who are satisfied with the vanity of having brought them forth. What appears most wonderful, is

the exemption they seem to enjoy from the curse entailed on the rest of the sex: for the ladies see company on the day of their delivery, and at the fortnight's end return visits, decked out in their jewels and new cloaths.

The Turks keep their wives at home as much as they can; but the husband, let him be ever so jealous, is obliged to suffer them to go frequently to the bagnio; and Mondays and Tuesdays are a kind of licensed days for their visiting the tombs of their deceased relations, which affords them an opportunity of walking abroad in the gardens or fields.

Upon the death of a Turk, the women immediately burst forth into shrieks, which they continue till the body is interred, which is done as soon as possible. They first wash the corpse upon a large table, and having stopped all the natural passages with cotton, to prevent any moisture oozing out, which would render the body unclean, they wrap it in cotton cloth, and lay it in a kind of coffin nearly in the form used by us, only the lid rises with a ledge in the middle, and at the head stands up a wooden battoon about a foot long, on which the proper head-dress of the deceased is placed if it be a man; but if it be a woman a head-dress is placed upon it flat on the top like a trencher, and over it is thrown a handkerchief. The middle part of the pall has a small piece of the old covering of the Holy-house at Mecca; but the rest is of no particular stuff or colour. Upon the pall are laid some of the best cloaths which belong to the deceased.

In carrying the corpse to the grave a number of sheicks with tattered banners walk first, then come the male friends, and after them the corpse, carried with the head foremost upon mens shoulders. The bearers are often relieved, for on such solemn occasions every passenger thinks it meritorious to lend a helping hand. The nearest male relations follow the body, and the women close the procession with dreadful shrieks, while the men are all the way employed in singing prayers out of the Koran. In this order they proceed to a mosque, where the bier is set down in the court-yard, and a service is said by the imaum; after which the corpse is carried in the same order to the burying-place, which is generally in the fields.

The graves, which lie east and west, are lined with stone, and the corpse being taken from the bier is put in a posture between sitting and lying on the right side, with the head to the westward, and the face towards Mecca. Some earth being placed behind the body to keep it steady, the grave is covered with long stones, which go across and prevent the earth they throw over them from falling in upon the corpse. The imaum throws on the first handful of earth, saying at the same time the following words: "O man, from the earth thou wert at first created, and to the earth thou dost now return. This grave being the first step in thy progress to the mansions of the other world, if in thy actions thou hast been benevolent, thou art absolved by God: but if, on the contrary, thou hast not been so, the mercy of God is greater than all things. But remember, what thou didst believe in this world, That God is thy Lord, Mahomet thy prophet, and in all the prophets and apostles, and pardon is extensive." Every one present then throws on a handful of earth, saying, "God be merciful to the deceased." At each end of the grave is set up a stone, upon which is commonly wrote some prayer, and it is usual to place a pillar with a carved turban at the top of it at the head of the grave; and as their turbans, by their different shapes, shew the quality or profession of the wearer, it is in a manner putting up the arms of the deceased. These stones continue a long time; for on no occasion are they ever removed. The sepulchres of particular families are railed in, and the burying-places take up a considerable space round the cities.

The nearest relations pray at the grave on the third, seventh, and fortieth days after the interment; and also that day twelvemonth after the person's decease, and on each of those days a quantity of provisions is dressed and given to the poor. Every Monday or Tuesday the women dress the tomb with flowers, or green leaves, and

with the appearance of the deepest grief frequently expostulate with the deceased on his unkindness in leaving them, when they did all in their power to render his life agreeable. This, however, is much censured by the men, who generally acquiesce with the greatest patience in the loss of their nearest relations, and under every other misfortune behave with a firm and steady fortitude.

The men wear no mourning; but the women dress in their gravest coloured cloaths, and wear a head-dress of a dark brick-dust colour. Their jewels and all other ornaments are laid aside for the space of twelve months when they mourn for a husband; and six months if it be for their father. These periods are not, however, very strictly observed upon all occasions; but before the widow can marry again, she must mourn for forty days, without leaving the house or speaking to any person more than is absolutely necessary; and this prohibition extends even to her nearest relations.

S E C T. VII.

Of the Religion of the Turks.

WE shall not here enter into a particular description of the doctrines of Mahometism, of which we have already given a pretty long account in treating of Persia; and have there also shewn in what the difference between the religion of the Persians and the Turks principally consists. Mahometism is said to be divided into as many sects as Christianity, and the first institution appears to be as much neglected and obscured by interpretations. A fondness for mysteries, and a love of novelties, as well as the different formation of the human mind, and the various lights in which subjects appear to the understanding, have been there, as well as among us, the source of the widest differences in religion; and the Turks behave with as much zeal in the support of their opinions as the Christians in Europe, though it has not been attended with all the dreadful effects which has been produced among the Christians by a persecuting spirit. The most prevailing opinion among the Turks at present is said to be that of plain deism; but there are none there who set up for wit, either by declaring that they believe there is no God, or by blaspheming him, and treating with familiar contempt his sacred name.

Charity is enjoined in the strongest terms in the Koran, and the Turks are remarkable for acts of benevolence to the poor and the distressed, and are even careful to prevent the unfortunate being reduced to necessities. They repair highways, erect cisterns of water for the convenience of travellers, build kanns or caravanferas for their reception, and some devout people, it is said, erect sheds by the way-side, that the weary traveller may sit under the shade and take his refreshment. In chap. iv. of the Koran are the following injunctions: "Shew kindness to thy parents, to thy relations, to orphans, to the poor; to thy neighbour who is related to thee, and to thy neighbour who is a stranger; to thy familiar companion, to the traveller, and to the captive whom thy right hand has taken: for God loveth not the proud, the vain-glorious, the covetous, or those who bestow their wealth in order to be seen of men."

They name their children as soon as they are born, when the father putting some grains of salt into their mouths, and lifting them on high, as dedicating them to God, he cries out, "God grant, my son Solyman, that his holy name may be as savoury in thy mouth as this salt, and that he may preserve thee from being too much in love with the world." As to the infants who die young before they are circumcised, they believe they are saved by the circumcision of their father.

Their children are not circumcised like those of the Jews at eight days old, but at eleven or twelve, and sometimes at fourteen or fifteen years of age, when they are able to make a profession of their faith. On the day fixed for this ceremony, the boy is set on horseback, and

conducted, with music, about the town; and on his return is circumcised in his father's house.

The imam or priest makes a short exhortation, and causes him to make his profession of faith, by saying, "There is no God but God, and Mahomet is his prophet," then orders the surgeon to place him upon a sofa, and perform the operation. Two servants hold a cloth spread out before the child's face, and the surgeon having drawn the fore-skin as low as he can without prejudice, holds it with his pincers while he cuts it with a razor; and shewing it to the assistants, cries, "God is great." The child cries out with pain; but every one comes to congratulate him on his being admitted into the rank of a mussulman, or believer; and on this occasion a feast is made for all the relations and friends, who are very merry, and spend their time in dancing and singing; and the next day those who are invited make presents to the child. Some are admitted to circumcision at seven or eight years old; but this is only upon extraordinary occasions. In case of poverty, it is usual to stay till they are fourteen or fifteen; and then if the parents are unable to defray the expence, they wait till the son of some rich person is circumcised, on which occasion the rich make presents to the youths that are circumcised with their sons, and give liberal alms to their poor neighbours, that by their prayers the divine grace may descend upon their child and his family. When any renegado Christian is circumcised, two basons are usually carried after him, to gather the alms which the spectators freely give. Those who are uncircumcised, whether Turkish children or Christians, are not allowed to be present at their public prayers; and if they are taken in their mosques, they are liable to be impaled or burnt.

We have already given an account of the fast of Ramadam, which the Turks observe exactly in the same manner as the Persians, and shall here describe the feast of Bairam, which begins with the next new moon after that feast, and is published by firing of guns, bonfires, and other rejoicings. At this feast the houses and shops are adorned with their finest hangings, tapestries, and sofas. In the streets are swings ornamented with festoons, in which the people sit and are tossed in the air, while they are at the same time entertained with vocal and instrumental music performed by persons hired by the masters of the swings. They have also fire-works; and during the three days of this festival many women, who are in a manner confined the rest of the year, have liberty to walk abroad. At this time they forgive their enemies, and become reconciled to them; for they think they have made a bad Bairam, if they harbour the least malice in their hearts against any person whatsoever. This is termed the Great Bairam, to distinguish it from the Little Bairam, which they keep seventy days after. They have also several other festivals, on all which the steeples of the mosques are adorned with lamps placed in various figures.

They regularly pray five times a day, and are obliged to wash before their prayers and every time they ease nature. As they eat chiefly with their fingers, they are likewise under the necessity of washing after every meal, and the more cleanly also do it before meals. Besides, every time they cohabit with their women, they must go to the bagnio before they can say their prayers; thus they are almost all day long dabbling in water.

By the Mahometan law a man may divorce his wife twice, and if he afterwards repents, he may lawfully take her again; but Mahomet, to prevent his followers from divorcing their wives upon every slight occasion, or merely from an inconstant humour, ordained, that if any man divorces his wife a third time, it is not lawful for him to take her again, till she has been married and bedded by another, and divorced from that husband. This precaution has such an effect, that the Turks seldom divorce their wives; and scarce any who have the least sense of honour will take a wife again on this last condition.

There are a few monasteries of dervises, whose devotions and religious acts are performed in a very whimsical manner. These fellows are permitted to marry, but

but have an odd habit, which only consists of a piece of coarse white cloth, or a loose frock, wrapped about them, with their legs and arms naked. Their order has few rules besides performing their fantastic rites every Tuesday and Friday, when meeting together in a large hall, they all stand with their eyes fixed on the ground, and their arms across, while the imaum, or preacher, reads part of the Koran from a pulpit placed in the midst; and when he has ended, eight or ten of them make a melancholy concert with their pipes, which are no unmusical instruments. He then reads again, and makes a short exposition on what he has read; after which they sing and play till their superior, who alone is dressed in green, rises, and begins a sort of solemn dance. They all stand about him in a regular figure, and while some play, the others tie their robe, which is very wide, fast round their waist, and begin to turn round with an amazing swiftness; and yet, with great regard to the music, moving slower or faster as the tune is played. This lasts above an hour, without their shewing the least appearance of giddiness, which is not to be wondered at, as they are used to it from their infancy, most of them being devoted to this way of life from their birth. There are amongst them some little dervises of six or seven years old, who whirl round too, and seem no more disordered by that exercise than the others. At the end of the ceremony they cry out, "There is no other God but God, and Mahomet is his prophet;" and then kissing the superior's hand retire. The whole is performed with the most solemn gravity: for nothing can be more austere than the appearance of these people, who never raise their eyes, and seem devoted to contemplation.

We shall defer giving an account of the Turkish government, which is in the highest degree tyrannical, till we treat of Turkey in Europe; and shall therefore now proceed to the several provinces belonging to the Turks in Asia.

S E C T. VIII.

Of CHALDEA, called by the Turks EYRACA ARABIC. Its Situation and Fertility; with a Description of the Cities of Bagdat and Boffora.

HAVING given an account of the Turks in general, we shall proceed to describe the provinces of that great empire, and shall begin with Chaldea, or Ey-raca Arabic, which is situated between the rivers Tigris and Euphrates, and is bounded by Diarbek, or Mesopotamia, on the north, by part of Persia towards the east, by the gulph of Persia and part of Arabia Deserta on the south, and by another part of Arabia Deserta on the west.

The hot sulphurous winds already mentioned in treating of Persia seem more fatal in this country than in any other. These blow from the south-east, and it is said those who breathe the fiery blasts instantly fall down dead.

In this country once stood the city of Babylon, the metropolis of the Babylonian empire, which is represented by all the ancient authors as the largest, the most magnificent, and the most populous city that ever was erected; but the prophecies mentioned in the Old Testament relating to this city, once the wonder of the whole earth, are literally fulfilled: "Babylon is fallen, and become the den of wild beasts;" nor is there any remains either of its antient grandeur, or of its ruins, to shew the exact spot on which it stood.

The capital city of this province is Bagdat, or Bagdad, which is situated upon the river Tigris, in thirty-three degrees fifteen minutes north latitude, and forty-three degrees east longitude from the meridian of London. It is about fifteen hundred paces in length, and half as many in breadth, including only that part of the city which stands on the eastern side of the Tigris; but the suburbs on the western side of that river are very considerable. On the north-west corner of the city stands the castle, which is of white stone; and the place is also

encompassed by brick walls, strengthened by large towers, and a wide and deep ditch. It has only four gates, one towards the river, and the other three towards the land, and is usually defended by a garrison of three or four thousand horse and foot. Below the castle, by the water-side, is the palace of the viceroy, and there are several summer-houses on the river, which make a fine appearance. The houses of the city are generally ill built; but their bawars, in which the tradesmen have their shops, are tolerably handsome. These were erected by the Persians when they were in possession of the place, as were their bagnios and every thing worthy the notice of a traveller. In the city are five mosques, two of which are well built, and have handsome domes covered with varnished tiles of several colours.

The cady has here an authority almost equal to that of the musti at Constantinople. There is also a treasurer who collects the revenues, and a reis effendi, who signs all acts of state, and is sometimes called secretary and sometimes chancellor. In the hands of these officers is lodged the civil government of the province, and they also are of the viceroy's council.

This was the capital of the Saracen empire, till it was taken by the Turks in the thirteenth century; since which time it has been taken several times by the Persians and Turks, and last by the Turks in 1638, who have been in possession of it ever since, Nadir Shah having laid siege to it in vain.

This city has a considerable trade, it being supplied with all the merchandize of the East by the way of Boffora, which is situated towards the mouth of the united streams of the Tigris and Euphrates, and is annually visited by the caravans from Smyrna, Aleppo, and the western part of the Turkish empire, by which means it is furnished with the produce of those countries.

The next considerable city of Chaldea is Boffora, or Bussarah, which is situated in thirty degrees twenty minutes north latitude, about forty miles north-west of the gulph of Persia, between the river Euphrates and the Desert. The east end stands by the side of the river, and a canal, which runs from it, and extends from one end of the city to the other, divides the city into two parts, and over it is a bridge of boats to keep up a communication between them. The town is encompassed with a wall of earth upwards of twelve miles in circumference, but within this space are included many void spaces, and others filled with date-trees. The houses are generally two stories high, flat on the top, and built with bricks dried in the sun; but the buildings in general are very mean. Its situation is pleasant and very advantageous on account of trade, and the ground about it is extremely fertile. The port is safe and commodious, so that large vessels may come up to the end of the canal without danger. The trade of this city was once very considerable; but in 1691 it was visited by the plague, which destroyed eighty thousand of the inhabitants, and the rest deserted the place; but it was afterwards re-peopled by the Arabs, who were soon after brought under the subjection of the Turks. It is at present governed by a basha, and has a garrison of three thousand Jani-faries.

Canals are cut through all the country between Bagdat and Boffora, that are about two hundred and fifty miles asunder, which give it the resemblance of Holland. This country is one of the richest under the dominions of the Grand Signior; no finer meadows and pasture-grounds can any where be seen, and these are covered with flocks and herds, and more particularly with buffaloes. Hither the Grand Signior annually sends a treasurer with a body of horse to collect his duties, who make the people pay a piafter and a quarter for every ox or buffalo, two piasters for every horse or mare, and ten pence for every sheep, which would amount to an immense sum, did not the rustics keep back a part, and sometimes refuse to pay any, which occasions a petty war between them and the treasurer's guards; but the government rather chuses to wink at some frauds, than to provoke them to revolt by too rigorous exactions.

S E C T. IX.

ASSYRIA, called by the Turks CURDISTAN.

Its Situation, Soil, and Produce; the Manners of the wandering Curds, and a Description of their Tents. No other Remains of Nineveh but Heaps of Ruins. Of the Town Cherafoul, Amadia, and Betlis.

WE shall now take a view of Turkish Kurdistan, for the most easterly part of that country is subject to the Persians. This province is bounded on the north by Armenia or Turcomania, on the east by Persian Kurdistan; by Chaldea on the south, and by Diarbec or Mesopotamia on the west.

This country, which comprehends great part of ancient Assyria, enjoys a fruitful soil agreeably diversified with hills and valleys, the former covered with fruit-trees, the finest oaks, and a variety of other timber; while the valleys being well watered, wherever they are cultivated, bear excellent grain: but being under the dominion of the indolent Turks, or rather a frontier country between Turkey and Persia, a very small part of the land is improved by agriculture. However, the pastures support vast flocks and herds, whose owners live in tents like the wandering Arabs.

The governing part of the country are Mahometans; but the common people are said to be a kind of Christians, and yet are represented by travellers, as being no less guilty of plundering the caravans than the wandering Arabs: but this is the less surprising, as they are situated upon the frontiers of two great kingdoms that are in perpetual enmity.

Their tents are large and of an oblong square, about the height of a man. They are encompassed with cane lattices, covered with thick brown coarse cloth, and lined with good mats. When they march they fold up these moveable tenements, and place them with their wives and children upon oxen and buffaloes, and thus wander from mountain to mountain, staying wherever they find good pastures. The men are all well mounted on horseback, and are armed with lances.

The principal produce of the soil is said to be galls and tobacco; though it seems capable of producing any other vegetables. There are few towns and villages; but the houses, where they are to be found, are dispersed at the distance of a musquet-shot from each other; and though the people make no wine, there is scarce a house which has not a vineyard; but they dry their grapes.

In this country once stood the famous city of Nineveh, the capital of the Assyrian empire, which was situated on the eastern bank of the river Tigris, opposite the place where Moussul now stands: but at present there is only to be seen heaps of ruins, which extend about three miles along that river. At the distance of a mile and a half from the Tigris is a little hill, on the top of which stands a mosque over the place, where, according to tradition, Jonas was buried.

The present capital of Kurdistan is Cherafoul, which stands to the eastward of Nineveh, in the thirty-sixth degree of north latitude. It is a large place formed after a singular manner, the houses being hewn out of a rock on the side of a hill for near a mile together, and up to them is an ascent of fifteen or twenty steps, and sometimes more. In this city resides the beglerbeg or viceroy of the province, who has several sangiackships or governments under him.

The other towns of Kurdistan are Amadia, which is seated to the northward of Nineveh in thirty-seven degrees north latitude on the top of a mountain, so high that it takes up an hour in ascending to the town. It is, however, a place of pretty good trade, and in the middle of it is a bazar, where the merchants keep their shops.

To the eastward of Cherafoul is Arbela, and near that town is a plain fifteen leagues in extent, where Darius was defeated by Alexander. In the midst of this plain is a little hill about half a league in circumference, covered with fine oaks, and at the top of it are the ruins of a

castle, in which, according to tradition, Darius stood to see the success of that celebrated battle.

Near the lake Van in the north part of this province is the city of Betlis, situated in thirty-seven degrees some odd minutes north latitude. The bey or prince of this place is said to have still preserved his independency, and to be subject neither to the Turks nor the Persians. As his country is very mountainous, and almost inaccessible, he is able to interrupt the trade between Aleppo and Tauris whenever he pleases; whence it is the interest of both the Turks and Persians to keep fair with him. On approaching Betlis the traveller is obliged to proceed a whole day among high steep mountains, from whence, in the rainy season, there fall prodigious torrents. The way up to the city is cut through a rock, and is so narrow that there is but just room for a camel to pass. It is built round the hill, which is in the form of a sugar-loaf; and there is no method of ascending up to it, but by winding round the mountain. On the top is a plain, on which is erected the castle, and there the bey has also his palace. He is said to be able to raise twenty-five thousand horse, and a considerable body of foot out of the shepherds of his country.

S E C T. X.

Of MESOPOTAMIA, called by the Turks DIARBEC.

Its Situation, Produce, and Face of the Country. With a Description of the Cities of Beer, and Orfa; and an Account of the Well of the Handkerchief. Of the Cities of Moussul and Diarbec, or Diarbekar.

DIARBEC, or Diarbekar, is situated between the rivers Tigris and Euphrates, which bound it on the east and west; it is also bounded by Turcomania or Armenia Major on the north, and by Chaldea on the south.

The north part of this province appears as fertile as any part of the Turkish empire, and affords plenty of corn, wine, cattle, wild fowl, and all manner of provisions; but the southern part of it is much less fruitful. The country is diversified with a pleasing variety of hills and vallies, and besides the rivers just mentioned, by which it is almost enclosed, it is watered by several other streams.

The principal towns are Bir, Orfa, Moussul, and Diarbec.

Bir, or Beer, as it is pronounced, is situated on the eastern bank of the river Euphrates, in a little more than thirty-seven degrees north latitude, and is the great pass into Mesopotamia. It is built on the side of a hill, at the top of which stands a castle erected upon a rock, where the governor resides; and from thence is a way cut under ground to the river. In the castle Mr. Maundrell was shewn a room filled with old arms, as cross-bows of a prodigious size, and beams which seemed designed for battering rams, also Roman saddles, and large head-pieces. Two fine streams run along the top of the hill, and flow down into the town, and in the side of the hill is a cave cut in the rock, the roof of which is supported by fifteen large pillars. The city has a good wall; but the houses are very indifferently built. The inhabitants have, however, a desirable climate, plenty of provisions, and good water. The garrison is composed of six or seven hundred men, commanded by an aga. The city is within the territories of the basha of Orfa.

To the eastward of Beer is the city of Orfa, supposed to be situated in the place where anciently stood the city of Edessa. Orfa, the capital city of Mesopotamia, stands in the thirty-sixth degree north latitude, and, according to tradition, is seated in the place where Abraham dwelt. There is here a large fountain, the springs of which are under the foundations of the principal mosque in the city. The Christians there pretend that this was the place where Abraham prayed before he went to sacrifice his son Isaac, and say, that two springs of water rose from the spot on which he kneeled, and feed the above fountain: so sacred is this place esteemed, that no person is suffered to enter the grotto where they rise, without pulling off his shoes. Many of the inhabitants

inhabitants are Armenian Christians, and are permitted the free exercise of their religion. Here are also shewn several antient tombs of the Christians in grottoes of the neighbouring mountains.

The walls of this city are of free-stone with towers at proper distances; but the town is meanly built, and has several void and uninhabited places. It is governed by a basha, and has a garrison of six or seven hundred spahies or horsemen, and about two hundred janizaries; the horse being of great service in opposing the incursions of the Arabs, who frequently cross the Euphrates in hopes of plunder. Near the walls are several pleasant gardens watered by artificial channels, and the soil produces good wine; but Orfa is principally famous for its manufacture of yellow Turkey leather.

The castle, which stands on the south side of the city, is defended by a broad deep ditch cut in the rock, and on the top of the castle is a small square turret, where they say Elias formerly dwelt. They also shew a well on the south side of the town, which they call the well of the handkerchief, and say that Abgarus, king of Orfa, sent messengers to our Saviour, beseeching him to come and heal him, and with the messenger sent a painter to draw the picture of Christ: that our Lord answered the messengers he could not go with them because his passion drew nigh; but observing the painter taking his picture, he threw a handkerchief over his face, which immediately receiving the impression of his countenance, he gave it them to carry to their prince. But as they were returning they were attacked by robbers near the city of Orfa, when the person who had the handkerchief dropt it into a well, in order to conceal it, and escaping to the town related the accident. Upon which the king went the next day, accompanied by all his people in procession to the well, where finding the water risen to the brim, and the handkerchief floating upon it, the king took it in his hands, and was instantly cured of his leprosy; upon which the king and his subjects became Christians. They add, that they kept this miraculous picture many years; but at length it being stolen by some Franks, or European Christians, they carried it to Rome. Hence they suppose that the water of this well has the property of curing lepers.

On the western bank of the river Tigris, opposite the place where Nineveh is supposed to have stood, is the city of Moussul, in thirty-five degrees thirty minutes north latitude. It is a large place surrounded with high walls; but the houses are ill built, and in several places are gone to ruins; however, it has a strong castle and a citadel. It has a good trade, from its being seated on the road from Aleppo to Persia, and its having a communication with Bagdat and the Persian gulph, by means of the Tigris. It is chiefly inhabited by Armenians, Nestorians, Greeks, and Maronite Christians; but the established religion is that of the Mahometans. The garrison usually consists of three or four thousand horse or foot. A great trade is carried on for galls, produced in the neighbouring country.

The city of Diarbec is situated about six days journey to the north-east of Orfa, in thirty-eight degrees north latitude, and stands on a rising ground, where the Tigris forms a half moon. It is encompassed with a double wall, in the outermost of which are sixty-two towers, and three gates, on each of which is an antient Greek inscription, not now intelligible, though the name of Constantine is several times repeated. In the town are two or three handsome bazars, and a magnificent mosque, which was formerly a Greek church. About a league from the city is a canal cut from the Tigris, which supplies the town with water, and in this water all the red Turkey leather made at Diarbec is washed. This leather is remarkable for excelling all others in the beauty of its colour; and in this manufacture, at least one fourth of the natives are employed. The city is so populous, that it is said there are about twenty thousand Christians there, two thirds of which are Armenians, and the rest Nestorians and Jacobites. The basha is beglerbeg or viceroy, and has several governments under him, in which it is said he can raise twenty thousand horse, who hold of the crown by military tenures.

SECT. XI.

Of ARMENIA MAJOR, called by the Turks, TURCOMANIA:

Its Situation and Climate, with a Description of the Plain and City of Erzerom; of the Cities of Van and Cars. The Religion of the Armenian Christians, their Marriages, and Funerals.

THE province of Turcomania is bounded by Georgia and Natolia towards the north; by Aderbeitzen, or Media, a province of Persia, towards the east; by Diarbec and Curdistan to the south; and by another part of Natolia towards the west.

The climate of this country is pretty cold, from its having a chain of mountains frequently covered with snow in the middle of June. At the foot of these mountains is situated the city of Erzerom or Arzerom, in forty degrees latitude, about five days journey to the southward of the Black Sea, at the end of a fine plain, which is fruitful in all manner of grain; but their harvest is very backward, it being seldom before September. The sudden alteration of the weather from excessive cold to extraordinary heat, with the scarcity of wood and other fuel, are great disadvantages with respect to the city of Erzerom; for they have no wood nearer to it than within two or three days journey, and in all the neighbouring country there is not so much as a tree or bush to be seen: hence their ordinary fires are made of cow-dung, with some other disagreeable mixture, which cause an offensive smell, and give a taste to the milk, as well as to the meat they dress with it, which is otherwise very good; and the country abounds with cattle. The best fruit to be met with there is brought from the neighbouring country of Georgia, where they have earlier summers.

From the hills near Erzerom fall very small rivulets, which serve the town, and water the adjoining fields; but their wine and spirits are the worst in all Turkey; and yet the most difficult to be procured, there being no place where the Turks see the prohibition against drinking them more strictly observed.

The city is enclosed with double walls strengthened by towers; but the ditches are neither deep nor well kept, and are about two miles in circumference. The viceroy of the province resides in an ill-built palace, and the aga of the janizaries, who is independent on him, lives in a castle, which stands rather above the town. There are computed to be in Erzerom about eighteen thousand Mahometans, and six thousand Armenians, and in the province there are said to be sixty thousand of the latter, and ten thousand Greeks. Most of the Turks in the city pass under the name of janizaries, who are very numerous in the other parts of the province; but are mostly tradesmen, who are so far from receiving the pay of janizaries, that the principal part of them give the aga money to purchase the privilege of being deemed of that body, and to obtain the power of insulting the rest of their people; and those in superior circumstances are forced to enlist themselves, to prevent their being exposed to the violence of their neighbours; for the janizaries insult the rest of their fellow-subjects with impunity.

Near Erzerom are said to be mines both of silver and copper, and among the latter are found some lapis lazuli; but in small quantities.

The other cities of Turcomania are Van and Cars. Van is a large city seated by a lake, to which it gives its name, in thirty-eight degrees thirty minutes north latitude, and has a strong castle erected on a mountain, in which is always kept a numerous garrison. The town is populous, and is under the government of a beglerbeg, who has nine fangiaks or lesser governments under him. The lake of Van abounds with excellent fish, with which the neighbouring countries are supplied, and is represented by some travellers as eight days journey in circumference, while others say it is only four; it, however, receives several rivers, and has no discharge.

The city of Cars or Kars is situated on a river of the same name, in forty-one degrees thirty minutes north latitude. It is of an oblong figure, and is encompassed

by a double wall about two miles in compass; but is very thinly inhabited. The castle stands on an almost inaccessible rock next the river, and has a numerous garrison commanded by an aga. The Turkish officers in this city are said to make intolerable exactions on travellers, and especially on the Franks, who find great difficulty in passing through this town into Persia.

Before we leave Armenia we shall give a particular account of the Armenian Christians, who not only inhabit this country, but are dispersed over the Turkish and Persian empires, and even into India, where the Armenian merchants are the greatest traders in the world. The Armenians were, they say, converted to the Christian religion by St. Gregory, and differ both from the Latin and Greek churches. They have two patriarchs, who have under them many archbishops and bishops, priests, and an order of recluses called the monks of St. Basil, who are the only part of their clergy that are prohibited marriage. A priest, however, is not suffered to perform divine service for the first seven days after his marriage; and if after the death of his first wife he marries again, he can never after perform that office. Their clergy are frequently ordained at eighteen years of age. But both the clergy and laity observe so many fasts, that seven months of the year is spent in abstinence from all manner of flesh and fish, and at those times they eat nothing till the evening. These fasts are not to be dispensed with on the most urgent necessity. No occasion whatever can excuse them, if they touch any thing more than mere herbs or roots, without oil and plain bread; which on these occasions is their constant diet. One of the interpreters of the English ambassador at Constantinople, was brought so low by the severity of his fasts, that his life was despaired of: yet neither his master's commands, nor the entreaties of the doctors, who declared that nothing else could save his life, were powerful enough to prevail on him to take two or three spoonfuls of broth.

Gemelli informs us, that he went to hear divine service in a great Armenian church, in which he says there was but one altar; that the choir was raised several steps above the body of the church, and the floor of both of them covered with rich carpets; for the Armenians put off their shoes when they enter into the church. The service was said by the archbishop, assisted by two bishops, and during the service a great number of lighted candles stood on the right side of the altar. After reading the Gospel, some little bells were rung, and the whole congregation, clergy and laity, sung to the music.

They do not believe in transubstantiation; but give the bread dipped in wine to all the congregation, and even to infants; nor do they mix water with their wine, because, as they alledge, our Saviour himself drank it pure and unmixed when he instituted this sacrament. The bread is without leaven, and made in little round cakes.

With respect to baptism, their first care, 'tis said, is to provide a godfather, after which some woman carries the child to church, and puts it into the hands of the priest, who plunges it three times naked into a vessel of water, pronouncing much the same words as are used among us. He then anoints the infant with holy oil on the head, the mouth, the stomach, neck, hands, and feet. This oil is made of several sweet flowers and aromatic drugs, by their patriarchs; and as no baptism can be duly performed without it, it is sold at an high price to such bishops and priests as are subordinate to them. When the child is thus anointed, it is wrapped in its cloaths and carried to the altar, where the sacrament is put into its mouth. The godfather then takes the child in his arms, covering it with a kind of mantle, which he presents it on this occasion; and then returns with the child to its father's house, preceded by several priests carrying the cross and lighted tapers in their hands, singing the Gospel to the sound of certain musical instruments, and having delivered the child to the mother, the rest of the day is spent in eating, drinking, and making merry with their relations.

The Armenian church rejects the doctrine of purgatory; but the people believe that after death the souls of the just remain in a state where they shall know neither joy nor sorrow till the resurrection, except that which proceeds from a reflection on their past lives; but they are said to believe, that the wicked are sent immediately to hell. They give great faith to some fabulous traditions; and say that the holy Virgin, being with child, was accused by her sister Salome of incontinency, when the Virgin bidding her lay her hand upon her belly, a fire issued from it, which consumed half of Salome's arm; but the Virgin bidding her lay the remainder of her arm upon it again, it was restored whole as at first. They also relate, that Judas, despairing of pardon for having sold his Lord, resolved to hang himself, because he knew he would descend into hell and deliver all the souls he found there; but that the devil, being informed of this contrivance, held Judas by the feet till our Saviour was gone, and then let him fall in. The Armenians have no idea of what is called the hypostatic union; but believe that the divine and human nature of Christ are united in his sacred person, as the soul and body are in man.

What appears most singular, is their great festival of the Baptism of the Cross, in remembrance of our Saviour's Baptism. The Armenian bishops and clergy go in procession on this occasion to some river, or other great water, with a cross carried before them; and having read prayers suitable to the occasion, and sung several anthems to the sound of the country music, the bishop plunges the cross several times into the water; after which happy is the person who is sprinkled by it. This ceremony begins before day-break, at about four in the morning, when there are scaffolds erected on the river or some large pond for that purpose. This is esteemed the best opportunity of baptizing their children, who are plunged three times into the consecrated water.

The children of the Armenians are usually married in their infancy, to prevent their being carried into the harrams of the great men: but though they are frequently contracted at four or five years of age, the marriage is seldom celebrated till they are eight or ten; and in the mean time the bridegroom sends the bride every Easter a vest suitable to her quality. Every thing relating to marriages is under the direction of the parents, and the young people are never asked for their consent till they are brought to church.

On the day appointed for this ceremony the bridegroom, richly dressed, mounts his horse, and, in company with his nearest relations, rides to the house of the bride's father, where she also mounts dressed in the finest silks, and, attended by her friends, proceeds with her face covered with a veil to the church; their friends and relations holding lighted torches in their hands. When the bridegroom and bride have dismounted, they walk up to the altar, where standing pretty close together, face to face, the bishop rests his book upon their heads, while he reads the service, and having received their consent gives them his blessing; upon which the drums and trumpets sound, and the softer music plays, while they return in the same order to the bridegroom's house; except they stay to attend divine service and receive the sacrament, as they frequently do. The guests upon these occasions are splendidly entertained; but the men and women neither eat nor drink in the same room. In the evening the new-married couple are conducted to the bridal chamber, and the company retire, after a thousand wishes for the happiness of the new-married pair.

A few days after the wedding the portion given with the bride is sent to the husband's house. It consists of fine cloaths, jewels, gold, and silver, according to the rank of the parties, to which they usually add some fruit and sweet-meats, all which are carried in fine cabinets and boxes, attended by music; but this is sometimes deferred till the birth of the first child, when a rich cradle is provided, and all necessaries proper for the new-born infant.

At the death of an Armenian, a person whose office it is, washes the body with consecrated water, and puts
upon

upon it a new white shirt and other linen; then sewing the corpse up in a linnen bag, it is carried to church on a bier, without a coffin, attended by the priests and relations, holding lighted tapers in their hands; and having placed it before the altar, a priest reads the service appointed, and then the body is left in the church all night, with candles burning about it. In the morning, after divine service, it is carried to the gate of the archbishop, or bishop, who says a prayer for the repose of the soul of the deceased; it is then taken to the burying-place, the bishop and priests singing their prayers till it is laid in the grave. The bishop then takes up a handful of earth, and throwing it upon the corpse, says three times, "From earth thou didst come, and to earth shalt thou return; remain there till the coming of our Lord." They then fill up the grave, and the relations and friends return to the house of the deceased, where they find a dinner provided; and, if the relations are people of substance, are splendidly entertained for several days successively.

S E C T. XII.

Of GEORGIA, or GURGISTAN.

Its Situation, Climate, and Produce; the Persons, Dress, Manners, and Religion of the Inhabitants; with a Description of Teflis, the Capital.

GEORGIA is a considerable province of Asia, part of which belongs to Persia, and part to the Turks. It is bounded on the north by Circassia, on the east by Shervan and the Tartars of Daghistan, on the south by Turcomania, and on the west by the Black Sea. It is said the Greeks gave the people the name of Georgoi, which in their language signifies Husbandmen; others derive the name from Kurgia, which they say the country received from the river Kur. It has many woods and mountains that inclose large and beautiful plains; but the middle part, which is watered by the river Kur, the antient Cyrus, is the most fertile.

The air of Georgia, which is very dry, is hot in summer and cold in winter; but though the fine weather does not begin till the month of May, it lasts till the end of November. Hence the inhabitants are obliged to water the earth, by which means it is rendered so fertile as to produce all sorts of grain and fruit in the greatest profusion. The bread is said to be as good as any in the world, and the fruits excellent; no part of Europe produces better apples and pears, nor any part of Asia more excellent pomegranates.

The cattle of this country are not only extremely numerous but very good, particularly the wild boars. The common people live almost entirely upon pork, swine being seen all over the country, and their flesh is said to be not only extremely palatable, but very wholesome; besides, the river Cyrus, which runs through Georgia, affords the inhabitants great plenty of fresh-water fish.

The vines of this country grow about the trees, and produce most excellent wine, of which the inhabitants drink great quantities, and also send it into Armenia, Media, and Persia; it being so cheap that a horse-load of the very best sort, which is three hundred weight, sells in the country for about the value of eight shillings. Georgia also produces a great deal of silk, which is exported to Turkey and the neighbouring countries.

The Georgians are said to be the handsomest people, not only in the East, but in the whole world. Sir John Chardin says, he never saw an ordinary person of either sex in this country, and he has observed some that have been quite angelical, nature having given most of the women such graces, that it is impossible to behold without loving them. They are tall, easy, and genteel, but injure their beauty with paint, which they use as an ornament, just as among us are worn rich cloaths and jewels.

The habit of the Georgians nearly resembles that of the Poles: they wear the same sort of bonnets. Their vests are open at the breast, and fastened with buttons and loops. Their covering for the legs and feet resem-

bles that of the Persians, and the habit of the women is entirely Persian.

The natives have naturally much wit, and, had they a proper education, might be distinguished by their learning and their skill in the arts and sciences; but the want of instruction and the force of ill example render them ignorant, dishonest, and lewd. With the greatest effrontery they will deny what they have said and done, and assert the most notorious falsehoods. They are indeed not easily displeased, and are never exasperated without just cause of anger; but then they are irreconcilable in their hatred, and never forgive. They are addicted to drunkenness and luxury, which are not esteemed crimes; the churchmen get drunk as well as the laity, and keep beautiful slaves for concubines, which is so general a custom, that it gives no offence. The above author observes, that the catholicos, or patriarch, of Georgia used to say, that he who did not get drunk at the great feasts of Christmas and Easter ought not to be esteemed a Christian, and deserved to be excommunicated.

The women are equally vicious with the men, their desires are warm, and they are at least as blameable as the other sex for the torrent of impurity that overflows the country.

The Georgians are, however, in many respects civil, friendly, and have the appearance of great gravity. Their manners and customs are a mixture of those of most of the nations by which they are surrounded, which is probably owing to the commerce they carry on with many different countries, and from the liberty every one enjoys in Georgia of living according to his own religion and customs, and of freely defending them. Here are Persians, Turks, Muscovites, Indians, Tartars, Greeks, and Armenians. The latter are even more numerous than the Georgians themselves; they are also richer, and fill most of the inferior posts in the state: but the Georgians are more powerful, vain, and ostentatious, and the difference between their dispositions, manners, and belief, has produced a reciprocal hatred.

All the public edifices and the houses of the great are erected on the same models as those in Persia. They build cheap, for they have stone, lime, and wood in abundance. They also imitate the Persians in their manner of sitting, eating, and lying.

The nobility exert the most tyrannical power over their vassals, whom they oblige to work for them as often as they please, and even whole months together, without allowing them either money or food for their labour. They think they have a right to their substance, liberty, and lives: they seize their children and sell them, or keep them as slaves; but seldom dispose of any of the fair sex who are above twenty years of age. Hence the Georgians marry their daughters as soon as possible, and even in their infancy.

Most of the Georgian lords make an outward profession of the Mahometan religion, some to gain posts or pensions from the court, and others to obtain the honour of introducing their daughters into the service of the Grand Seignior or the king of Persia.

The Georgians are extremely ignorant of the principles of religion, and the prince, though a Mahometan, commonly fills the vacant sees, and generally gives the bishopricks to his own relations. The churches in the towns are kept in decent order, but in the country they are very dirty. These people have a strange custom of building their churches on the tops of mountains, in distant and almost inaccessible places. They see and salute them, at three or four leagues distance; but seldom go near them. They build them, and then abandon them to the injuries of the weather, and to the birds. As to the religious opinions and ceremonies used by the Georgians, we have no particular account of them.

Teflis, the capital of the province, is situated at the foot of a mountain by the side of the river Kur, in the forty-third degree of north latitude. This city is surrounded by strong walls, except on the side of the river, and has a large fortress on the declivity of the mountain, which is a place of refuge for criminals and debtors, and the garrison consists of native Persians. Teflis has fourteen churches, six of which belong to the Georgians, and the

the rest to the Armenians. The cathedral, which is called Sion, is an ancient stone building situated on the bank of the river. It has four naves and a large dome in the middle, supported by four massy pillars, and the inside is filled with Greek paintings so wretchedly executed, that it is difficult to discover what they are intended to represent. The Mahometans have no mosques here, for fear of offending the people; for the Georgians being naturally brave, mutinous, and fickle, and being situated near the Turks and Persians, their masters are unwilling to come to extremities with them, and therefore allow them the free enjoyment of their religion: hence they use bells in their churches, sell pork in the market, and wine at the corners of the streets.

The public buildings of this city are of stone, and make a handsome appearance, particularly the bazars and caravanseras. The prince's palace is one of the principal ornaments of the city. It has grand saloons, which open upon the river, and face very extensive gardens. It has also aviaries filled with a great number of birds of different kinds, and a very noble falconry. Before the palace is a square, in which may be drawn up a thousand horse; it is encompassed with shops, and opposite the gate of the palace is the grand bazar, from the end of which the square and the front of the palace appear in a beautiful perspective. The inhabitants, who are chiefly Christians, amount to about twenty thousand, and are Georgians, Armenians, Papists, and a few Mahometans. In the neighbourhood of the city are many pleasant houses and fine gardens.

SECT. XIII.

Of the ancient COLCHIS, now called MINGRELIA.

Its Boundaries and Extent, Climate, Produce. The Persons, Dress, Food, Manners, Customs, and Religion of the Natives; with a concise Account of the Principality of Gurriel, and the little Kingdom of Imeretta.

COLCHIS or Mingrelia is bounded on the east by mount Caucasus, and the little kingdom of Imeretta; on the south by part of Georgia; on the west by the Black Sea; and on the north by Circassia: it is about one hundred and ten miles in length, and sixty in breadth; but the ancient Colchis was of much larger extent, it reaching on one side to the Palus Mæotis, sometimes called the sea of Afopb, and to Iberia on the other. Its principal rivers are the Corax and Phasis, now called the Codaurs and Rione; and its capital, named Colchos, was anciently situated at the mouth of the Phasis.

This country is very uneven, it being full of hills and mountains, vallies and little plains. It is covered with woods, except the manured lands, which are but few, and abounds with rivers, which descend from mount Caucasus, and fall into the Black Sea.

The air of Mingrelia is temperate with respect to heat and cold; but as it rains almost continually, the moisture and warmth of the climate breed in the summer pestilential diseases. The soil is, in general, bad, and produces little corn, and the fruits, which grow there, are tasteless and unwholesome; their vines, however, thrive well, and produce most excellent wine. The vines encompass the trunks of the trees, and rise to their very tops. In seed-time they sow their wheat and barley without plowing; and alledge, that were they to break up the earth, it would become so soft as to be unable to support the stalk. They plow their land for their other corn, with wooden plough-shares, which, in this moist soil, make as good furrows as iron.

Their common grain is gomm, which resembles millet; and of this they make a paste, which they use for bread, and is both wholesome, agreeable to the palate, cooling, and laxative. They have also great plenty of millet, and some rice; but wheat and barley being very scarce, people of quality eat wheaten bread as a rarity; but it is never tasted by the poor.

Mount Caucasus produces a multitude of beasts, as lions, tigers, leopards, jackalls, and wolves; which last enter into Mingrelia, and make great havock among the

cattle, frequently disturbing the inhabitants in their houses with their dreadful howlings. The people have great numbers of very good horses, almost every man keeping several of them; for they cost little or nothing, as they neither shoe them, nor feed them with corn.

The men are well shaped, and the women are extremely handsome, and yet paint their faces, and particularly their eyebrows.

All the men, except the ecclesiastics, permit but little of their beard to grow. They shave the crown of the head, and leave only a little hair over the forehead and down to their ears, and even that is clipped short. They wear a bonnet of fine felt, which in winter they line with fur; but they are generally so poor, that when it rains they put it in their pocket, to prevent its being spoiled, and go bareheaded. Those in mean circumstances are almost naked, and usually wear only a covering of strong felt of a triangular form, at one end of which is a hole, through which they put the head; and this covering they turn to the side on which blows the wind or rain. Under this they have a shirt, which tucks into a straight pair of breeches: but it is usual for them to have only one shirt and one pair of breeches, which last them a year, during which they seldom wash the shirt above three times: however, they commonly shake it once or twice a week over the fire. Their sandals are made of the raw skin of a buffalo untanned, tied round the foot, and fastened with thongs of the same skin: but when the earth is covered thick with snow, they wear a kind of snow-shoes, which spreading much farther than the feet prevent their sinking into it.

The women dress themselves in as ornamental a manner as they can, wearing a Persian habit and curling their hair.

The ordinary food of the inhabitants is beef and pork. Of the last they have great plenty, and it is esteemed the best in the world. Their venison is the hart and fallow-deer. They have likewise wild boars and hares, all which are excellent food; but their goats-flesh is lean and ill-tasted. They have a great number of pheasants, partridges, and quails; with some river-fowl and wild pigeons, which are very good, and as large as crammed chickens. They take a great number of those pigeons during the summer in nets.

The whole family, both males and females, without distinction, eat together: the king with all his train to the very grooms, and the queen with her maids and servants. In fair weather they dine in the open court, and if it be cold make a large fire, for wood is so plentiful that it costs nothing. Upon working-days the servants have nothing but gomm, and the masters pulse, dried fish, or flesh; but on holidays, or when they make entertainments, if they have no venison, they kill a cow, an ox, or a hog. Both the men and women drink to excess, and at their feasts are solicitous to make all their friends drink as much as possible. Their wine is drank unmixed, and beginning with pints they proceed to greater quantities. At these merry-meetings the men discourse on their wars and robberies, and the women tell of their amours.

As to the character of people of both sexes, the women are witty, civil, and full of compliments; but are, at the same time, proud, cruel, deceitful, and libidinous. The men have qualities equally prejudicial to society, but the vice they most practise is theft and robbery, in which they even glory. They vindicate the lawfulness of having many wives, by saying they bring them many children, which they can sell for ready money, or exchange for necessary conveniences: yet when they have more than they can support, they think it a piece of charity to destroy their new-born infants, and to put a period to the lives of such persons as are sick, and, in their opinion, past recovery, because by this means they free them from misery. In Mingrelia adultery and incest are scarce considered as crimes; and when a man surprises another embracing his wife, he may oblige him to pay a hog: he seldom takes any other method of revenge, and all three commonly sit down to feast upon it.

Their nobility spend their whole time in the field in hawking, and they take particular delight in flying the falcon

falcon at the heron, which they catch only for the sake of the tuft upon his crown, in order to put it upon their bonnet; and when they have cut it off, they let him go again, that it may grow afresh.

The houses of the Mingrelians are built with timber, of which they have great plenty; but the poorer sort never raise them above one story, nor the rich above two. The lower room is always furnished with beds and couches to lie down or sit upon: but these buildings are inconvenient, from their having neither windows nor chimnies; and as they have frequently only one room for a whole family, they all lie together, and at night have also their cattle with them.

They have no cities nor towns, except two by the seaside; but their houses are so scattered over the country, that you can hardly travel a mile without seeing three or four of them. There are nine or ten castles in the country, the chief of which is that where the prince keeps his court. This castle has a stone wall, but is so small and ill built, that it might be battered down with the smallest piece of artillery. It has, however, some cannon, which the other castles have not.

These castles are built in the following manner: in the midst of a thick wood the people erect a stone tower, thirty or forty feet high, capable of containing fifty or sixty persons. This is the place of strength where all the riches of the lord, and of those who put themselves under his protection, are shut up. Near this tower are five or six others of wood, which serve as magazines for provisions, and as places of retreat for the wives and children of the people in case of an attack. There are also several huts made of wood, others of branches of trees, and others of canes and reeds. The area in which they are inclosed is encompassed by a close hedge, and by a wood so thick that it is impossible to find these retreats but by the way cut to them, which is stopped up by trees whenever there is reason to apprehend the approach of an enemy.

The gentlemen have full power over the lives and estates of the tenants, and even sell or dispose of their wives and children in what manner they please. Besides, every husbandman is obliged to furnish his lord with as many cattle, and as much corn, wine, and other provisions as is in his power. Thus the riches of the great consist in the number of their vassals. They are the judges of all the disputes that arise between them; but when they themselves are at variance, they determine their quarrels by force of arms, and therefore all of them go armed with a sword, a lance, and bow. Mingrelia is but thinly peopled, which is owing to their wars and the vast numbers sold by the nobility to the Turks and Persians.

All their trade is carried on by way of barter, for their money has no settled value. The current specie are said to be piasters, Dutch crowns, and abassis, which are coined in Georgia, and bear the Persian stamp. The revenues of the prince of Mingrelia do not exceed twenty thousand crowns a year, which are raised by customs and goods exported and imported, by selling of slaves, and by fines and impositions. But for this he has little use; for his slaves serve him without pay, and his vassals furnish his court with more provisions than he can spend. He is not able to raise more than four thousand men fit to bear arms, and those are chiefly cavalry. The soldiers are not distributed either into regiments or companies; but each lord and gentleman leads his men to battle without order, and they follow him as well in flying as in charging the enemy. Upon solemn festivals the prince's court consists of two hundred gentlemen, but upon other days it does not amount to above a hundred and twenty. The prince of Mingrelia pays a tribute to the Grand Signior of sixty thousand ells of linen cloth made in that country.

The religion of the Colchians was antiently the same with that of the Greeks and Romans; but, according to ecclesiastical historians, they were converted to Christianity by a slave, in the reign of Constantine the Great. The Mingrelians however assert, that St. Andrew preached among them at a place called Pigaitas, where a church now stands, to which the catholicos, or archbishop, goes once in his life to make the holy oil used in baptism. However, these people are utterly unworthy of the name

of Christians; for they have fallen into such an abyss of ignorance, that, according to Sir John Chardin, they look upon every thing most essential in Christianity as mere fables, and yet practise some outward forms and ceremonies of religion. Their clergy perform scarcely any duties belonging to their office; for few of them can read, and they have in a manner lost the method of performing divine service. They make a public profession of foretelling future events, and as soon as a Mingrelian is sick the priest is sent for; not to pray with him, but to look in his book to see whether he will die of that disease. The priest opens the book, which he takes care to bring with him, and having with great gravity turned over the leaves, pronounces, with the voice of an oracle, that the Cati, for thus they call their images, being offended, has inflicted upon him that disease, and if a good present be not made him the patient will die. This present usually consists of a cow, a hog, a goat, or the like, which the poor wretch, terrified at the apprehensions of death, immediately gives the priest to be offered to the image.

The catholicos of Mingrelia has a great revenue; for he has four hundred vassals who furnish his house with all the necessaries, and many of the superfluities of life. He sells the children of these people to the Turks, and when he visits the places in his diocese, it is not to reform the clergy, or instruct the people, but to enrich himself. It is said he will not consecrate a bishop for less than six hundred crowns, nor say mass under a hundred. His sanctity consists in abstinence from flesh and wine in Lent; and he is generally so ignorant, that he can hardly read his Breviary and Missal. He has six bishops under him, who pay little regard to the souls of the people, and never visit their churches and dioceses; but suffer the priests to live in ignorance, and the people to commit the greatest crimes. They are chiefly employed in feasting and getting drunk. Their principal revenues arise from the oppression of their vassals, and selling their wives and children. However, like the Greek bishops, they abstain from flesh, and seem to think that this is almost the only duty they are obliged to perform. Their cathedrals are adorned with images, which they embellish with gold and jewels, and by this means fancy they satisfy the divine justice and atone for their sins. They are clothed in scarlet and velvet, and differ from the seculars in wearing long beards, and bonnets that are black, high, and round.

The common priests are numerous, and miserably poor. They cultivate their own grounds and those of their lords, and are as great slaves as the seculars; nor have they any respect shewn them, except when they bless the food at meals or say mass. As their parish churches have no bells, they call the people together by knocking with a great stick upon a board. Their churches are commonly kept as nasty as stables; and though the images are foul, broken, and covered with dust, the worship paid them is in the highest degree idolatrous. They indeed worship those most that are finest adorned, or most famed for their cruelty; and when they swear by one of these, they never break their oath. One of their most formidable images is named St. Giobas, whom they dare not approach nearer than to the place where they can just see him, and there they leave their presents, for they imagine he kills all who venture to approach him.

For none of the Romish saints have they any value, except for St. George, to whom both they and the Georgians pay the highest reverence. Their mass resembles that of the Greeks. Their chalice is a wooden goblet, and their patten a wooden dish. They never say mass in Lent but on Saturdays and Sundays, because they think the communion spoils their fasting. They consecrate either leavened or unleavened bread, without any difference, and mix no water with the wine, except it be very strong.

Sir John Chardin says, that while he was in Mingrelia he was invited to two christenings, which were performed in the following manner: the priest being sent for at about ten in the morning, went into the buttery, where they kept the wine, and sitting on a bench began to read an half torn octavo volume, running on very fast, in a

low voice, and in the most careless manner. In about a quarter of an hour the father and godfather brought in a boy about five years old, when the godfather fixed up a small candle against the cabin door, and scattered a few grains of incense upon some hot embers. The priest still continued reading with the same inattention, breaking off to speak to every body that came in; while the father and godfather were all the time walking in and out, and the little boy did nothing but eat. In about an hour's time a bucket full of warm water was got ready, and the priest having put into it about a spoonful of the oil of walnuts, bid the godfather undress the child, which he had no sooner done than he was set on his feet in the water, and the godfather washed his whole body very well. The priest then taking a small quantity of the oil of uncton out of a leather purse that hung at his girdle, gave it to the godfather who anointed the child on the crown of the head, the forehead, the ears, the nose, the cheeks, the chin, the shoulders, the elbows, the back, the belly, the knees, and feet: while the priest continued reading, till the godfather had dressed the child; when the father bringing in boiled pork and wine, they sat down to table with the family, and soon got drunk.

The same author says, that every other religious act is celebrated by the Mingrelians with the same indecent irreverence; and informs us, that one day as he was passing by a church, the priest, who was saying mass, heard him ask the way of some people who were standing at the door, and cried out from the altar, "Stay, and I'll shew you." A moment after he came to the door, muttering the mass as he walked; and having asked whence he came, and whither he was going, he very civilly shewed him the way, and then returned to the altar.

They observe nearly the same fasts as the Greeks, for they keep the four great Lents, the first before Easter, which is forty-eight days; that before Christmas, which is forty days; St. Peter's fast, which lasts near a month; and the fast observed by the Eastern Christians in honour of the Virgin Mary, which continues fifteen days. Their prayers are all addressed to their idols for temporal benefits, as for their own prosperity and the ruin of their enemies. They abstain from work only at the festivals of Christmas and Easter, which they celebrate only by eating and drinking in their houses to excess; but their greatest festivals are when the image of a saint is carried through their country; upon which occasion they dress in their best cloaths, make a great feast, and offer their presents to the idol.

These people have certain monks, of the order of St. Basil, who wear black bonnets, eat no flesh, and suffer their hair to grow; but pay no regard to religion, except observing their fasts, with great exactness. They have also nuns of the same order, who observe their fasts, and wear a black veil; but they have no nunneries, nor are under any vows, but quit the order whenever they please.

In their marriages the parents of the girl agree upon the price with the person who desires her; and here they pay less for a woman who has been divorced, more is demanded for a widow, and still more for a maid. When the agreement is made, the young man may keep company with her till the money is paid, and it is no scandal if she prove with child by him.

In mourning for the dead the women rend their garments, tear their hair, and flesh, beat their breasts, and make terrible lamentations. The men tear their cloaths, and shave their heads and faces. The mourning lasts forty days; on the ten first of which it is accompanied with the most extravagant signs of grief, which then gradually diminishes till the fortieth, when they inter the body. A feast is then made for all who come to weep, and the bishop, after having said mass, lays claim to every thing which belonged to the deceased, his horses, arms, cloaths, money, and every thing of the like kind; for, among the Mingrelians, death is the ruin of families; but when a bishop dies, the prince says the mass for the dead on the fortieth day of mourning, and takes all his moveable goods.

On the confines of Mingrelia lie the little principality of Guriel and the kingdom of Imeretta. The former borders upon Imeretta on the north, upon Mount Caucasus on the east, upon the Black Sea on the south, and upon Mingrelia on the west. The inhabitants are of the same disposition, and have the same irregularity of manners as the Mingrelians, being addicted to robbery, murder, and lewdness.

Imeretta, which is something larger than the country of Guriel, is encompassed by mount Caucasus, Mingrelia, the Black Sea, the principality of Guriel, and part of Georgia. Like Mingrelia it is covered with woods and mountains, but the vallies are more pleasant and more fertile; they producing cattle, corn, pulse, and a variety of herbs. There are some iron mines, and some money current among the people; and this is coined in the kingdom. They have likewise several towns; but their customs differ but little from those of the Mingrelians. All these nations were once subject to the emperor of Constantinople; but, after they had freed themselves, became involved in continual wars, till calling in the assistance of the Turks, they were made tributary to them.

SECT. XIV.

Of SYRIA, called by the Turks SURISTAN.

The Face of the Country, Climate, and Seasons; their Vegetables, and method of Husbandry; their Beasts, Birds, Reptiles, and Insects.

HAVING taken a view of the Turkish empire in Asia, from Arabia to its most northern extremity, we shall lay before the reader an account of the countries situated to the east of Arabia; and, beginning with Syria, Phœnicia, and Palestine, shall proceed to Natolia, or Asia Minor, and the Asiatic islands subject to the Turks.

Syria is bounded on the north by Diarbek and Natolia; on the east by Diarbek and the Desarts of Arabia; which also, together with Judea, bound it on the south; and on the east by the Mediterranean Sea.

The coast is in general bordered by very high mountains, except near Seleucia, and from Mount Pieria to Mount Cassius, which is ten or fifteen miles, where it is level, and opens a passage for the river Orontes to discharge itself in the Mediterranean. These mountains are covered with trees, shrubs, and a number of plants, which do not, like those in the plains, lose their verdure during the heat of summer. As they abound with springs, these form small rivulets, which, in some places on the side next the sea, unite into rivers, and refresh the plains between them and the sea-shore. Behind them on the land-side are generally extensive plains, that also receive great benefit from the streams that descend from the mountains, near which they are covered with myrtle, oleander, and other shrubs. But the opposite boundaries of those plains are chiefly low, rocky, barren hills; but behind them are other large plains, which, though only watered by the rains that fall in winter, are exceeding fertile. This intermixture of rocky eminences and plains extends about sixty or seventy miles within land.

The Orontes is the only river of any note in Syria. It rises on the land-side of the above high mountains, and from thence winding round falls into the sea: the rest of the rivers, which are few and inconsiderable, are absorbed by the thirsty plains through which they pass. Even the Orontes, though swelled by a number of brooks from the lofty mountains behind which it runs, and also from the lake of Antioch, seems as considerable many miles above that city, as where it discharges itself into the Mediterranean.

The seasons are here extremely regular, and the air so pure and free from damps, that, from the end of May to the middle of September, all the inhabitants, of whatever rank, sup and sleep exposed to the air in their courtyards, or upon the house-tops. The natives reckon that the severity of winter lasts only forty days, beginning from the twelfth of December, and ending at the twentieth

twentieth of January. During this time the air at Aleppo is very piercing, even to strangers who have just come from a cold climate: yet, during the thirteen years Dr. Russel resided there, the ice was not above three times of sufficient strength to bear a man, and that too with caution, and only in a situation sheltered from the beams of the sun. In ten years of that time the snow never lay on the ground above a day: even in the depth of winter, when the sun shines and there is no wind, the weather is warm, and sometimes almost hot. Hence narcissuses are in flower during all this season, and violets, at the latest, appear before it is quite over. As February advances, the fields, which were before partly green, become entirely covered with an agreeable verdure, by the springing up of the latter grain; and though the trees continue in their leafless state till about the beginning of March, yet the almond, when latest, is in blossom before the middle of February, and being quickly succeeded by the apricot, peach, &c. the gardens assume an agreeable appearance.

The spring is extremely pleasant, but is of short duration; for as March brings it on with rapidity, so April with equal haste advances towards summer; and the agreeable livery worn by the fields during these two months, and indeed through most of the winter, fades before the middle of May; and, ere that month is closed, the whole country has so parched and barren an aspect, that one would scarce think it capable of producing any thing besides the few hardy plants that are still able to resist the extreme heats. From this time no refreshing shower falls, and scarce a friendly cloud appears to shelter the inhabitants from the excessive heat of the sun, till about the middle of September, when a little rain generally falls, and greatly refreshes the air. There is an interval of between twenty and thirty days from these first rains till the second, during which the weather is serene, temperate, and extremely delightful, and if the rains have been plentiful, though but of a few hours duration, the country speedily assumes a new face. After the second rains the weather becomes variable, and winter approaches; but by such slow degrees, that the greatest part of the trees preserve their leaves till the middle of November, and people of the most delicate constitutions never have fires till about the end of that month.

The country about Aleppo has seldom any hard gales of wind; the coldest in winter blow between the east and north-west, and the nearer they approach to the former point, the colder they are during that season and part of the spring; but from the beginning of May to the close of September, the winds blowing from the very same point, resemble the air issuing from the mouth of a hot oven. The only remedy against them is to shut all the doors and windows; for though they are not fatal in Syria, as in other countries, they are extremely troublesome, affecting most people with a painful languor and a difficult respiration. However, many summers pass without them; and, during Dr. Russel's stay in the country, in no summer were there more than four or five days of them; for though the northerly and easterly winds reign most in the winter, yet Providence has wisely ordained the westerly winds to be most frequent in the summer, without which the intense heat of the rays of the sun, with their reflection from a bare rocky tract of ground, would render the country scarce habitable.

With respect to the vegetables of this country, they sow in the fields Turkey wheat, barley, beans, a green kind of kidney-beans, Turkey millet, lentils, hemp, cotton, musk-melons, water-melons, a small cucumber, bastard saffron, and several others. Near Aleppo tobacco is planted in the gardens; but in the villages, at about ten or fifteen miles distance, a large quantity is planted in the fields, and all the hills from Shogre to Latachia produce such plenty of it, that this vegetable makes no inconsiderable branch of trade, particularly with Egypt.

The harvest begins with cutting the barley about the beginning of May, and both that and the wheat are generally got in by the twentieth of the same month. As soon as it is cut down, or plucked up, (which is the more usual method), it is carried to a neighbouring spot of hard even ground, where it is separated from the husk

by a machine like a sledge, that runs upon two or three rollers, drawn by horses, oxen, or asses. In these rollers are fixed low iron wheels, notched like the teeth of a saw, which being pretty sharp, at once cut the straw and separate the grain. Their granaries are subterraneous caverns, entered by a small hole like a well, frequently in the high way; and as they are commonly left open when empty, they render riding in the night not a little dangerous near the villages.

The olives produced about Aleppo are little more than sufficient to serve the inhabitants for pickling; but at Edlib, about thirty miles to the south-west, and in the neighbouring villages, there are large plantations, which afford abundance of oil, with which, and the ashes brought by the Arabs from the Desert, a considerable quantity of soap is annually made. The vineyards round Aleppo produce pretty good grapes; but the wine made by the Christians and Jews is pressed from grapes brought from some distance. Their white wines are palatable, but thin and poor, and seldom keep sound above a year. The red wine is deep-coloured, strong, and heady, but without any flavour; and, instead of producing mirth, and elevating the spirits, bring on sleep or stupidity.

From raisins, usually mixed with a few aniseeds, they draw a strong spirit, which they call arrack, of which the Christians and Jews drink pretty freely.

Among the fruits of this country there are only two or three sorts of apples, and those very indifferent. They have apricots, peaches, indifferent good pears, quinces, pomegranates of three sorts, black and white mulberries, oranges, and lemons; figs of four sorts, walnuts, hazel nuts, pistachio nuts, &c. All these trees are standards, planted promiscuously and but little improved by culture. There are also several kinds of forest trees, as the white poplar, the plane, the hornbeam, the ash, the turpentine-tree, a few oaks, the tamarisk, and many others: there are likewise a great variety of garden plants and flowers.

As to the beasts of Syria, there are a few black cattle, which are chiefly used for the plough and in drawing water for the gardens. Most of those employed for that purpose are very large, with remarkable long legs and great bellies. In some parts of Syria are abundance of buffaloes; but near Aleppo there are very few, and those chiefly kept for their milk.

They have two sorts of sheep, the one resembling the larger kinds in Britain, only their tails are rather bigger and thicker; the others are the most numerous, and have tails that are very broad and of an extraordinary size, terminating in a small appendage that turns back, and is of a substance between fat and marrow; it is not eaten separately, but mixed with lean meat in many of their dishes, and is also often used instead of butter. These tails usually weigh upwards of fifteen pounds; but those which belong to sheep of the largest breed, and that have been fattened, sometimes weigh fifty pounds. Those in Aleppo being kept up in yards, are in no danger of injuring their tails; but in other places, where these sheep feed in the fields, the shepherds are obliged to fix a piece of thin board to the under part of the tail to prevent its being torn by the bushes, thistles, and rocks, it not being covered underneath like the upper part with thick wool; some have also wheels to facilitate the dragging of this board after them, whence they have been represented by travellers as having carts to carry their tails.

They have two kinds of goats, one that resembles those in Britain, and the other remarkable for the length of their ears. These are only a little larger than ours, and yet their ears are frequently a foot long, and broad in proportion: they are chiefly kept for their milk, which is sweet and well tasted. In the beginning of April they are brought to Aleppo, and great numbers are driven through the streets every morning, and their milk sold as they pass till September.

Syria abounds with two sorts of antelopes, of which that of the mountains is the most beautiful. Its back and neck are of a dark brown, and the antelope of the plain is neither so swift, nor so well made; yet both sorts are so extremely fleet, that the grey-hounds, though very good ones can seldom come up with them, without the assistance of a falcon, unless in soft deep ground.

There

There are plenty of hares, but none of the natives, except the Arabs, are fond of them. The method of dressing them is very extraordinary. They dig a hole in the earth, which they fill with light brushwood, and set it on fire; when thoroughly lighted, the hare, with the skin and entrails, just as it was taken, is thrown into it, and after the flame has ceased, they cover up the hole with the loose earth taken out of it, which at first had been laid round the edge to grow hot. Thus it is left till they imagine it is sufficiently roasted; when taking it out, they throw a handful of salt over it, and eat it without any other dressing.

Of the beasts of burthen here are three sorts of camels, these are the Turcoman camel, the Arab camel, and the dromedary.

The Turcoman camel is much larger, stronger, more hairy, and of a darker colour than any of the others. Their common load is eight hundred pounds; but they sometimes carry much more. These cannot bear heat, and therefore they are never worked in the months of June, July, and August.

The Arab camel is much smaller, less hairy, of a lighter colour, and seldom carries more than six hundred pounds weight; but can bear heat and thirst much better than the Turcoman. There is no need of these camels being fed with barley flour, or chopped straw; for the very thistles and other plants, which grow in the desert, are almost all the food they require. Dr. Russel says, that he remembers an instance, where, in a caravan from Bassora, the camels, which were of this sort, travelled without water for fifteen days; but the quantity they drank, as soon as they came at it, proved fatal to many of them.

The dromedary appears to be only a high breed of the Arab camel, from which they are only distinguished by their being of a lighter and handsomer make, and instead of the solemn walk to which the others are accustomed, they pace, and are generally said to go as far in one day as the others in three.

The other beasts of burthen are horses, which are here well broke, and taught to set off in full speed, and suddenly to stop. There are two sorts of asses, one very large with remarkable long ears, and the other small, and resembling those in England; there are likewise some mules.

Among the rocky hills, and in the mountains, are hyænas. Some authors have pretended, that this animal will imitate the human voice, and even learn the names of the shepherds, in order to call them out and devour them; but this is far from being true, for they are fonder of the flocks than of the shepherds, and never attack men but in their own defence, or through excess of hunger; yet they will rob the graves whenever they can come at them.

Foxes and wolves are found in the plains, but they are smaller than those in Europe, and the jackalls are so numerous, that every evening they pass in full cry, like a pack of hounds, through the gardens of Aleppo, and not only give great disturbance by their noise, but make free with the poultry.

The country affords the turkey, goose, and duck, the dunghill-cock and hen, the Bagdat fowl, which is of a large breed, the rumkin, or cock and hen without rumps. Among the game are wild geese, plenty of wild ducks and mallards, several kinds of widgeon, spoon-bills, and various sorts of teal, water-hens, and water-rails. In autumn the becca-fegos and wit-walls are both in season, and the former are esteemed great delicacies. Here are also the bustard of two kinds; the red legged partridge, the frankolin, the flesh of which is delicious; the common sky-lark, the wood-lark, the crested lark, and several others, particularly several species of pigeons, among which is the carrier formerly used by the Europeans, for conveying expeditiously the news of a ship's arrival at Scanderoon: but this has been disused for many years.

The pigeon employed on these occasions was one that had young at Aleppo. Dr. Russel enquiring into the method of training them was informed they were sent to Scanderoon in an open cage, and as soon as let go, would fly back to Aleppo, but others said, they were brought to this by letting them return from shorter distances on

the Scanderoon road. All agree, that if the pigeon had been a fortnight at Scanderoon, it was not afterwards to be trusted to fly back, lest forgetting its young, it should not be so eager to get home. A small piece of paper, with the ship's name, the day of its arrival, and the most material circumstances, contained in a narrow compass, was fixed under the wing, to prevent its being destroyed by wet. They also bathed the pigeon's feet in vinegar, in order to keep them cool, that it might not settle to wash itself, which would destroy the paper. An English gentleman, who remembered this practice, said he had known one of them arrive in two hours and a half, tho' the distance is no less than seventy miles.

Besides the birds used for food and sport, the country produces the black vulture, the cormorant, the stork, a few pelicans, the owl, a kind of jay, with feathers beautifully variegated with blue, green, and brown; two sorts of the crane, one a fine bird, which the natives often keep tame in their houses; the heron, the flamingo; and the black-cap, a kind of gull, of which there are a great number in Aleppo, during the winter, so tame, that the women call them from the house-tops, throwing up pieces of bread, which they catch in the air.

Among the reptiles are serpents of various kinds, and many of them extremely venomous; but as they all fly from man, and from the barren fields in summer, when alone they are abroad, there is but little danger of accidentally treading upon them. However, large white snakes are often found in the houses; but it does not appear that they do any mischief. The scorpion and scelopendra indeed often sting the natives in their houses, which causes great pain for several hours, but is attended with no other ill consequence. In the gardens are tree frogs, and over the whole country are various kinds of lizards.

Of the useful insects, there are only silk-worms, which produce a considerable quantity of silk; and bees, which make excellent honey. Among those which are prejudicial are the locusts, which sometimes appear in such incredible numbers, as to destroy all the verdure wherever they pass: but this seldom happens.

S E C T. XV.

A Description of the City of Aleppo and the neighbouring Country; of the Inhabitants, and particularly of the Customs of the Christians, with an Account of the Marriages of the Maronites, and of the Europeans in that City. The Manner in which they spend their Time, and the epidemic Diseases which prevail at Aleppo.

THE city of Aleppo, the present metropolis of Syria, called by the Turks Haleb, is situated sixty miles from the sea, in thirty-six degrees twelve minutes north latitude, and in thirty-seven degrees forty minutes east longitude from the meridian of London, and with respect to its buildings is inferior to no city in this part of the Turkish empire.

This city with its suburbs is built on eight small hills, none of which is of a considerable height, except one in the middle of the city, upon which the castle is erected. This is of a conic form, and seems in a great measure artificial, and raised with the earth thrown out of a broad deep ditch with which it is surrounded. The city is encompassed by a wall now much decayed, and a broad ditch, in most places converted into gardens. It is about three miles and a half round; but including the suburbs, which lie chiefly to the north-east, the whole is about seven miles in compass.

The houses are built of stone; but as the streets are generally narrow, and the houses have no windows that look into them, except a few in the upper rooms, nothing is to be seen but dead walls, which give them a disagreeable appearance. The streets are, however, well paved, and kept remarkably clean.

The mosques are numerous, and some of them magnificent. Before them is a square area, in the middle of which is a fountain for the appointed ablutions before prayers; and behind some of the larger mosques is a small garden.

There

There are also many large caravanferas, each consisting of a spacious square court, on all sides of which are erected on the ground-floor, a number of rooms occasionally used for stables, chambers, or ware-houses. Above stairs is a colonade on each of the four sides, to which open several small rooms, wherein the merchants, as well natives as strangers, transact most of their business.

In the city are also a number of public bagnios, which are frequented by people of all religions, and of all ranks; except those in high stations, who generally have them in their houses.

The bazars, or market-places, are here, as in other parts of the east, long, narrow, covered streets, with shops on each side, just sufficient to hold the tradesman, and perhaps one or two more, with all his commodities about him, the buyer being obliged to stand without. A particular bazar is allotted for each trade, and these and the streets are locked up an hour and a half after sunset, and many of them earlier. It is remarkable that though their doors are mostly cased with iron, yet their locks are of wood.

The natives in their common buildings make use of a white gritty stone, that is every where in plenty about the city: it is easily cut, but grows hard by being exposed to the air. But in the gates, pillars, and pavements of their noblest structures, they employ a yellow marble, capable of a tolerable polish. This is also the produce of the country, and is often intermixed, by way of ornament, with red, white, and coarse black marble, brought from other places: but when they are in want of the red, they give their own yellow marble that colour, by rubbing it over with oil, and then putting it into a moderately hot oven, in which it continues for several hours.

At about the distance of five miles are several springs that supply the city with good water, by means of an aqueduct, which is said to have been built by the empress Helena. This water is sufficient for the necessary purposes of drinking and cookery. Almost every house has also a well; but that water being brackish, is only employed for washing their yards, and filling the reservoirs for the supply of the fountains. Indeed the river Caic, the ancient Singas, which is no more than six or eight yards broad, runs by the western part of the city, within a few yards of the walls; but it barely serves to water a narrow slip of gardens on its banks, that extend from about five miles north, to about three miles south of the town. Besides these gardens, there are a few more near Bab Allah, a village about two miles to the north-west, which are supplied by the aqueduct. The rising grounds above the gardens, to which the water cannot be conveyed, are in some places laid out in vineyards, interspersed with olive, fig, and pistachio trees, as are also many spots to the eastward, where there are no gardens. But inconsiderable as this river and these gardens may appear, they contain almost the only water, and all the trees to be met with for twenty or thirty miles round; for the villages have no trees, and most of them are only supplied with the water the inhabitants save in their cisterns.

The fuel used in the houses of Aleppo is wood and charcoal; but for heating their bagnios they burn the dung of animals, the parings of fruit, and the leaves of plants, all which people are employed to gather and dry for that purpose.

The ground, at least four or five miles round Aleppo, is very stony and uneven, with a number of small eminences, most of which are as high as any part of the city; and from the west-south-west to the north-west by west, this uneven country extends at least twenty miles; but is, however, interspersed with many small fertile plains.

Plenty of lime-stone is found near the city, that affords good mortar for their buildings, which they carry on with great ease and dexterity; and at a few hours distance is found the gypsum, in small quantities, of which plaster of Paris is made. This is chiefly used in cementing the earthen pipes, used in conveying water, and for a few other purposes about their best buildings.

At the distance of about eighteen miles south-east of Aleppo is a large plain called the valley of salt, bounded by low rocky hills, which form a kind of natural basin, that retains the rain descending from the rocks, together with the water that rises from a few springs in the neighbourhood, and cause the whole to be overflowed in the winter. The extent and unevenness of the surface prevents this water from being of any great depth; so that it is soon evaporated by the sun, when it leaves a cake of salt in some places half an inch thick; and with this the whole enclosed plain is covered. The soil of this plain is a stiff clay strongly impregnated with salt. In the month of April a number of people are employed in gathering this salt, which is not only very good, but sufficient to supply all this part of the country.

The inhabitants of the city and suburbs of Aleppo are computed at about two hundred and thirty five thousand, of whom two hundred thousand are Turks, thirty thousand are Christians, and the remaining five thousand Jews. But though they are of such different religions, they seem to be nearly the same people, nor are the Christians much superior to their neighbours in virtue. The greatest number of them are Greeks, the most numerous next to them are Armenians, next to them the Syrians, and then the Maronites; each of whom have a church in a part of the suburbs, where most of them reside.

The vulgar language is Arabic; but the Turks of rank use the Turkish: most of the Armenians can speak Armenian; many of the Jews understand Hebrew; but few Syrians can speak Syriac; and scarce one of the Greeks understand a word of either ancient or modern Greek.

There are also a people named Chinganas, who, like the Arabs, wear a large silver or gold ring through the external cartilage of their right nostril. These people are esteemed the plague of Aleppo; they resemble the Arabs, and, like some tribes of them, live in tents; but are not acknowledged by them. As they are extremely poor, a few of them, who are constantly encamped round the skirts of the city, hire themselves for labourers, and other menial offices; but the greatest number come thither from all parts in the spring, to assist in reaping the corn.

We have already given a sufficient description of the manners of the Turks of this city, in describing those of Asia in general, and shall here therefore only take a view of the customs and manners of the Christians who compose so considerable a part of the city.

When the Christian women go abroad, they are as closely veiled as those of the Turks; but they are seldom allowed to go any where but to church, to their physicians, to the bagnio, or now and then to visit a relation. A few women are permitted by their husbands to go two or three times a year to their gardens; but others, though they are not a mile from their houses, never saw a garden in their lives.

The women in general have such easy labours, that those of the most delicate constitutions are seldom confined above ten or twelve days, and those of the villages are commonly able to go the next day about their usual employments. Women of all ranks suckle their own children, and seldom wean them till either the mother is again with child, or they are three or four years of age.

As to the marriages of the Christians they are generally contracted when children, by their parents, and as there is no material difference between the nuptial ceremonies of the different sects, a description of those of the Maronites may serve as a specimen of all the rest.

The bride having been demanded, the bridegroom's relations are invited by the bride's father to partake of an entertainment, in order to fix the wedding-day; for the young folks themselves have no vote in these affairs, in which they are so nearly concerned. On the afternoon of the day appointed, they again go to the bride's house, and after supper is over, return to that of the bridegroom, who has not yet appeared; for he is obliged by custom to hide himself, and is not to be found, till they have made a seemingly strict search for him. He is brought out dressed in his worst clothes, when great noise

noise and rejoicings are made on their finding him, and he and the bridegroom, after being led several times round the court in a noisy procession, are conducted into a room where their wedding clothes are laid out in form. A priest then says a long prayer over them, and being dressed, they are led back into the court with the same ceremony as before. At midnight, or a few hours after, the relations, accompanied by all of both sexes who have been invited to the wedding, return in procession to the house where the bride lives, with music playing before them, and each holding a candle. On their coming to the door, it is shut against them, and when they knock and demand the bride, they are refused admittance. Upon this a mock fight ensues; but the bridegroom's party are always conquerors. The women then conduct the bride out of her chamber covered all over with a veil, and she is carried in procession to the bridegroom's, accompanied only by one or two of her sisters, or nearest female relations, and being seated at the upper end of the room, among the women, continues veiled with red gauze, and must neither speak nor move, except rising to every person who comes into the room, of which she is informed by one of the women, who constantly sits by her; for she must not open her eyes. Few retire to rest, and the remainder of the night is spent in mirth by each sex in their separate apartments, there being no want of wine, arrack, fruit, and sweetmeats.

At about nine the next morning, the bishop or a priest comes to perform the ceremony. At his entrance all the women are veiled, and the bride stands entirely covered, supported by two women. The bridegroom dressed in a gaudy robe, entering with the bishop, is placed on the bride's left hand with his bridegroom by him, and a short service being performed, the bishop puts a crown first on the bridegroom's head, and then on the heads of the bride, the bridegroom, and bridegroom. Afterwards joining the hands of the bridegroom and bride, he continues the service, and at length puts a ring on the bridegroom's finger, and delivers another to the bridegroom to be put on that of the bride. Near the conclusion of the service he ties a piece of tape or ribbon round the bridegroom's neck, and in the afternoon a priest comes to take it off.

The ceremony being concluded, the bridegroom and all the men return to their own apartment, where they drink coffee and sit very gravely while the bishop stays, which is not long, for dinner being immediately served up for him and a few others, he dines and takes his leave, on which they instantly resume their mirth. Great quantities of provisions being dressed, several tables are covered both for dinner and supper, and there is generally plenty of arrack, wine, coffee, and tobacco.

About midnight the bridegroom is led in procession to the bride's chamber, when presenting her a glass of wine, she drinks to him, and he having returned the compliment, is conducted back with the same ceremony. The music, during the whole time, continues playing, buffoons and other of their diversions are going forwards, and the house is usually full of company till the next day in the afternoon, when all take their leave, except a few intimate friends, who sup with the bridegroom, and about midnight leave him heartily fatigued, to retire to the bride's chamber.

All who are invited to the wedding send presents, and for several days after the marriage is consummated, flowers are sent to the bride by all her female acquaintance. On that day seven-night the bride's relations come to visit her, and an entertainment is provided for them. But it is not thought decent for a bride to speak to any person for at least a month, except a few words to her husband, and this the Armenians are so unreasonable as to extend to a year. The old women generally give them a strict charge about this, and particularly enjoin them not to talk too soon even to the husband.

Few women are allowed to sit at table with their husbands, but wait upon them as servants, and though they have no guards about their apartments, yet the people of fashion are never permitted to appear unveiled before men, except they are their near relations, their servants, priests, or physicians. The Maronites are the least strict

in this respect, for some of them will appear before particular strangers, and are permitted to sit at table with their husbands. Their confinement, however, proceeds less from jealousy of their conduct, than from the fear of the bad consequences that might attend their being seen by a Turk, should he take a liking to them.

The Europeans, or Franks, who reside at Aleppo, are chiefly English and French. Of the former there were in the year 1753 the consul, the chancellor, the chaplain, the physician, ten merchants, and an officer who walks before the consul with a staff tipped with silver, he is also employed as a messenger, and takes care of letters.

The French have a consul, and the other officers, with the druggermen, or interpreters, and double the number of merchants and clerks. The French have likewise under their protection three convents in the city, and a college of Jesuits. The Dutch have a consul; but no other person of their country resides there. There are likewise a few Venetian merchants and Italian Jews. The greatest part of the European merchants live in caravanseras in the principal quarter of the city, in which the ground-floor serves for their warehouses, and the upper story is fitted up for their dwellings by buildings between the pillars of the colonnade, forming a long corridor; opening on which are a number of rooms, so that they nearly resemble cloisters; and as these merchants are unmarried, and their communication with the people of the country is almost solely on account of trade, their way of life nearly resembles that of the monastic. They formerly wore the Turkish habit, retaining only the hat and wig, by way of distinction; but of late years most of them continue in their proper dress.

The Europeans have their provisions dressed after their own manner, and the evening being the chief time of entertaining their friends, they eat more animal food for supper than is customary in England. At table they commonly drink a dry white wine and red wine brought from Provence. The English in summer generally drink before dinner and supper a draught of weak punch, which is found so very refreshing, that now most of the other Europeans, several of the Eastern Christians, and some Turks, follow their example.

All the English keep horses, and three or four times a week ride out for an hour or two in the afternoon. On Saturdays, and frequently on Wednesdays, they dine abroad under a tent, in spring, autumn, and during the fine weather in winter. In the month of April, and part of May, they generally live at the gardens near Baballah; and in the heat of summer they dine at the gardens. Those who love hunting and hawking usually go abroad twice a week after the second rains, till the weather grows too warm; besides, in the evening they usually take a walk on the house-top. The rest of the time is spent in the computing-house.

The Europeans at Aleppo have no reason to complain of the behaviour of the Turks. Their capitulations with the Porte prevent their being subject to the oppressions of the government; and the bashas and people of distinction usually treating the consuls with civility and respect, others follow their example; so that they live in great security in the city, and can even travel abroad unmolested by the Arabs and Curds, where the natives dare not venture. This is partly owing to a small present annually sent to the prince of the Arabs, and the civil treatment the Curds sometimes meet with at Scanderoon; and partly to their travelling with no more money than is absolutely necessary to defray their expences, so that they would get but little by robbing them. And, besides, an insult of this nature would be made a pretence by the Turkish government for chastising them severely.

The epidemical distempers which prevail most in Aleppo are fevers of several kinds, dysenteries, quinsies, rheumatisms, pleurisies, and peripneumonies; to which may be added the plague: they have also a cutaneous disease, by some thought peculiar to this place, whence it is called the Aleppo evil.

S E C T. XVI.

Of the Cities of Alexandretta, or Scanderoon; Antioch, now called Anthakia; Laodicea, now called Latakia; with a Description of the Catacombs, and other Antiquities near that City: and also of the Cities of Jebilee, antiently called Gabala, and of Arka.

ALEXANDRETTA, or Little Alexandria, is said to have been repaired and embellished, if not built, by Alexander the Great, after a victory he obtained near it over Darius; and it received its name to distinguish it from Alexandria in Egypt. This city, which is now called Scanderoon, is situated at the extremity of the Mediterranean Sea, in thirty-six degrees thirty-five minutes north latitude, and is the sea-port town of Aleppo. It stands on a marshy ground, in so unhealthy a situation, that it is now only a confused heap of wretched houses, most of them built of wood, and others of boughs of trees interwoven, and plastered over with clay; and is inhabited chiefly by Greeks, who entertain all the sailors and ordinary travellers that come thither; while the merchants and persons of rank generally lodge with the consuls of their own nation, where they meet with better accommodations; for these have handsome houses a mile or two from the town, where the place resembles a little city. During the excessive heats, when Scanderoon is most unhealthful, many of the inhabitants retire to the neighbouring villages, particularly to Balain, which is situated at ten miles distance among very high mountains, where there is excellent water and also delicious fruit.

Scanderoon has an old castle, defended by a small garriſon, under the command of the governor. The people used formerly to send pigeons with letters to inform the merchants of Aleppo of the arrival of any ship; but we have already observed, that this custom is now laid aside.

About twenty-two miles to the south of Scanderoon are the remains of the antient and celebrated city of Antioch, now called Anthakia, once the capital of Syria; but now a ruinous place, the channel where vessels used to ride being choaked up. It is situated on the river Orontes, now called Aſſi, and has been in the possession of the Turks ever since the year 1188. It was formerly called by the Greeks Epidaphne, from the grove and oracle of Apollo adjoining to it; and there the disciples of our Lord were first called Christians.

A little farther to the south is Laodicea, now called Latakia. This city is situated in thirty-five degrees thirty minutes north latitude, and was originally built by Seleucus Nicanor, who gave it the name of Laodicea in honour of his mother. It was antiently a place of great magnificence, but was afterwards reduced to a low condition; but being rebuilt, is now become one of the most flourishing towns on the coast.

Among the ruins of this antient city are still standing several rows of columns formed of porphyry and granite, with part of an aqueduct, the same, perhaps, which Josephus says was built by Herod; this last is a massy structure, without arches. The principal monument of the antient grandeur and magnificence of this city is a large triumphal arch; supported by pillars of the Corinthian order. The architrave is adorned with trophies, shields, battle axes, and other military weapons, while the rest of the entablature is extremely bold and noble. This structure now forms part of a mosque. A furlong to the westward of the city are the ruins of a beautiful cothon, in the form of an amphitheatre, and so capacious as to be able to contain the whole British navy. Its mouth, which is about forty feet wide, is defended by a small castle; but it is at present so choaked up with sand and pebbles, that half a dozen small vessels are all that can be conveniently admitted at one time.

About two furlongs to the northward of the city, near the shore, are the antient catacombs, in which are several stone coffins, some of which have preserved their covers, and are adorned with beautiful decorations of shells and foliage; or the busts of men and women, satyrs, and the heads of oxen; others are pannelled, and have their

covers supported by pilasters of the Ionic and Corinthian orders.

The catacombs in which these coffins are found are formed in the rocky ground, and consist of a number of sepulchral vaults, from ten to thirty feet square, and upon the front and side-walls of each stair-case are curious designs in basso relievo, answering to those of the coffins. Along the sides of these vaults are narrow cells, wide enough to receive one of these coffins, and long enough for two or three. One of these vaults is held by the Greeks in great veneration. It is called St. Teckla, in commemoration of some acts of penance and mortification said to have been performed there by the first virgin martyr. In the middle of it is a spring supposed to produce extraordinary cures and miraculous visions; and here they bring those afflicted with the jaundice and other distempers; and, after several ceremonies, they return with a steady faith in their cure. Here also the aged and decrepid pretend to receive warnings of their approaching death; while the young foresee a long train of events which, they imagine, are to happen within the future course of their lives.

Farther to the south is Jebilee, antiently called Gabala, which stands close to the sea, in a fruitful plain. It now makes but an indifferent appearance, though it was once a bishop's see. Among the ruins of the antient city are many pillars of granite, with capitals of white marble highly finished: but the greatest monument of its antient splendor is the remains of a noble theatre, by the north gate of the city. The walls are not above twenty feet high, and part of them have been blown up by the Turks, who have taken from thence a great quantity of marble, to adorn the mosque and bagnio of this city. All that is now standing is the semi-circle, which is a hundred yards in diameter. In this part is a range of seventeen round windows, just above the ground, and between these were raised large massive pillars, standing on high pedestals; but these are broken to pieces. On the west side the seats of the spectators remain entire. The outward wall is three yards and three quarters thick, and built with very large and firm stones.

Still farther to the south, near a rivulet called the Serpent Fountain, are several remarkable antiquities, particularly a large bank, with the sides sloping, and stairs formed out of the rock from the top to the bottom. This bank extends above a furlong, with stairs running in right lines all along the sides. Beyond it is a court fifty yards square, cut in the rock, the sides of which rise about three yards high, supplying the place of three walls; for it lies open to the northward. In the center of the area a part of the rock rises three yards high, and is five yards and a half square. This serves for a pedestal to a kind of throne erected upon it, composed of four large stones, two at the sides, one at the back, and another over the top, in the manner of a canopy, with a handsome cornice round it. This structure is about twenty feet high, and was perhaps an idol temple, and the pile in the middle the throne of the idol.

About a mile farther to the southward are two towers, under which are several sepulchres hewn out of the solid rock.

About five miles to the southward are other sepulchres covered with pointed cylindrical buildings, where the situation of the country has something in it so romantic and peculiar to itself, that it never fails to fill the mind with an agreeable mixture of melancholy and delight. The uncommon contrast of woods and sepulchres, rocks and grottos; the medley of sounds and echoes from the beasts, birds, cascades, and water-falls; the distant roaring of the sea, and the composed solemnity of the place, says Dr. Shaw, naturally remind us of the beautiful groves and retreats of the rural deities described by the poets.

Opposite the northern extremity of Mount Libanus are still to be seen the remains of the antient Arka, the city of the Arkites, in a most agreeable situation, having a prospect to the northward of an extensive plain, diversified by a variety of castles and villages, ponds and rivers: to the eastward the sun is seen rising over a long and distant chain of mountains, and to the westward setting in the sea. Here beautiful Thebaic columns and rich entablatures

entablatures attest the antient splendor of this city. Arka was erected on the summit of a mount, and by its situation must have been in a manner impregnable. This mount is in the form of a cone, and seems to be the work of art. In a deep valley below the city is a swift stream, more than sufficient to supply the place; yet it was thought most proper to bring the water from Mount Libanus, which was effected by an aqueduct, whose principal arch could not be less than a hundred feet in diameter.

SECT. XVII.

Of those Cities of Syria in the Part antiently called Phœnicia, particularly Tripoly, Balbec the ancient Heliopolis, Damascus, Tyre, and Sidon.

THE antient Phœnicia, now included under the general name of Syria, was bounded on the north by Syria Proper, already described, on the east by Arabia Deserta, on the south by Palestine, and on the west by the Mediterranean Sea; and is comprehended partly under the beglerbeglic of Damascus, and partly under that of Syria. Though this is but a small territory, it has made a considerable figure in history, on account of the ingenuity of its inhabitants, to whom are generally attributed the invention of letters, the art of navigation, the making of glass and many other useful discoveries. In navigation they particularly excelled, and by their commerce not only became a wealthy people, but established colonies in Europe, Asia, and Africa. It is remarkable, that the name of Phœnicia is not to be found in the Hebrew text of the holy scriptures, though it is in the Greek version, it being always called in the sacred books, Canaan, and the inhabitants Canaanites.

The principal places in this district are Tripoly, Balbec, Damascus, Tyre and Sidon.

Tripoly, called Tripolis of Syria, to distinguish it from Tripoly in Barbary, received its name from its being antiently formed of three cities at a small distance from each other, one of which belonged to the Aradians, or antient kingdom of Arad, the second to the Sidonians, and the third to the Tyrians, perhaps as a common mart to those maritime powers. The present town of Tripoly is built at the distance of a mile and a half from the other, upon the declivity of a hill facing the sea, in thirty-four degrees fifteen minutes north latitude, and in thirty-six degrees fifteen minutes east longitude from London. It is surrounded with walls, fortified with seven high strong towers, and a castle, all of Gothic architecture; but the streets are narrow, and the houses low. The most extraordinary building in the place is an aqueduct, with its reservoirs, some of which are twenty or thirty feet high, and being placed at proper distances in the town, supply most of the houses to the second or third stories with water. A small river also runs through the town, and serves to water the gardens, few of which are without a fountain or cascade; it likewise turns several mills, and over it is a stone bridge. Here is a large and handsome mosque, which was formerly a Christian church: the Christians have some monasteries and neat chapels, among which is that of the capuchins, who are chaplains to the French, and the jesuits have likewise a handsome college. In the sea opposite the town is a sand bank, which encloses so much, that it is thought it will in time choke up the harbour, which is two miles west of the town, and formed by a round piece of land united to the continent by an isthmus. On each side is a bulwark, in which are an hundred janizaries, and some great guns to defend the entrance.

The city contains about eight thousand houses, and near sixty thousand inhabitants, consisting of Turks, Christians, and Jews. The basha, who resides in the castle, where there is a garrison of two hundred janizaries, governs the adjacent territory, in which there is plenty of fruit, and a great number of mulberry-trees, which enable the inhabitants to carry on a silk manufacture, from which they draw considerable profit.

We shall now proceed to the south-east, and view the remains of antient magnificence, visible in the ruins of

Balbec; which, like those of Palmyra already described, both astonish and bumble the spectator, and shew, that, with respect to architecture, we are far from rivalling the antients.

In describing the ruins of Balbec, we shall follow the ingenious and learned Mr. Wood. The valley of Bocat, in which Balbec is situated, that author observes, might be rendered one of the richest and most beautiful spots in Syria, it being more fertile than the celebrated vale of Damascus, and better watered than the rich plains of Rama and Eldraelon. It at present produces corn and some good grapes; but though shade is an essential article of oriental luxury, there are few plantations of trees.

This valley extends in length from Balbec almost to the sea, and its breadth from Libanus to Anti-Libanus appears in few places less than six miles, or more than twelve. It is watered by the rivers Litane and Bardouni; the first rises from Anti-Libanus, a little to the north of Balbec, and is greatly increased by a fine spring close by the city walls. The Bardouni rises from the foot of Libanus, and joins the Litane in the plain. These streams, which are increased by several constant rills from the melting snow of Libanus, might be improved to all the purposes either of agriculture or pleasure. These rivers being joined, form the Casimiah, under which name they enter the sea near Tyre.

Balbec is agreeably situated upon a rising ground near the north-east extremity of this plain, between Tripoly of Syria and Damascus, in thirty-five degrees twenty-five minutes north latitude, and there is not the least doubt of its being the Heliopolis of Cœlosyria, sometimes called the Heliopolis of Phœnicia. It now contains about five thousand inhabitants, a few of which are Greek and Maronite Christians, and some Jews; but the people are poor, and without trade and manufactures.

When we compare the ruins of Balbec, says the above author, with those of many ancient cities we have visited in Greece, Egypt, and Asia, we cannot help thinking them the remains of the boldest plan that appears to have been ever attempted in architecture.

The traveller, on taking a view of this city from the south, sees the present town encompassed with its wall, and at the east end the most considerable ruins of the ancient Heliopolis, particularly the remains of its magnificent temple. The portico which formed the grand front of that structure is so noble, that no ornaments seem wanting to render it complete; but it is disfigured by two Turkish towers erected on its ruins. Behind it an hexagonal court, into which the portico leads, is adorned with the most magnificent buildings now in ruins; but enough still remains to give an idea of their ancient grandeur. The walls are adorned with pilasters of the Corinthian order with niches for statues; the doors are finely ornamented, and the entablature, which surrounds the building above the pilasters, is richly adorned with festoons; but the colonade, which surrounded these edifices, has scarce any thing remaining but the pedestals, and the whole court is covered with broken columns, capitals, and other parts of the buildings.

This opens into a quadrangular court, in which are also the remains of magnificent buildings much in the same taste. The portico was crowned with an Attic course, which was carried through the two courts, and seems to have been adorned with statues.

On passing through the portico and the two courts, the traveller comes to the great temple. Little more of this structure remains than nine lofty columns, which support their entablature. It is very remarkable, that the shafts of these columns consist of three pieces, exactly joined without cement, which is used in no part of these buildings; they being only strengthened with iron pins, received into a socket cut in each stone. Most of the bases have two such sockets, one square and the other circular, corresponding to two others of the same shape and dimensions in the under part of the shaft. On measuring some of the largest of those that were circular it was found, that the iron pin which they received must have been a foot long, and above a foot in diameter; and by the sockets in all the fallen fragments of this temple, it appears, that each stone was fastened in the same manner. How greatly this contributed to the strength of the building

General View of Ball's

Shaker & Co.

ing is seen in another temple, which is more entire, where a column has fallen against the wall with such violence, as to beat in the stone it fell against, and break part of the shaft, while the joinings in the same shaft have not been in the least opened by the shock.

The most entire temple is placed irregularly with respect to the former, and is erected upon a much lower horizontal plan. It has still a peristyle of eight columns in front, and fifteen in flank, which continue to support their entablature, though the Turks have made several attempts to destroy them, in order to get the iron used in strengthening this noble building. The arch of the portico is divided into compartments by the richest carved work and mouldings cut in the solid stone. These compartments are in an alternate succession of one hexagon, and four rhombs enclosing figures and heads in alto relievo. The rhomboid pannels contain heads of gods, heroes, and emperors; the hexagons likewise contain the head of the same subjects, and sometimes entire figures relating to the ancient mythology, as a half length of Diana, Leda and the Swan, Ganymede riding on the back of an eagle, &c. On the inside of the temple a row of fluted Corinthian columns rise to the top of the building, and support a rich entablature. Between each column is a niche finely ornamented, and above each niche a tabernacle or opening answering to it, supported by small columns. The roof is fallen in, and many shrubs grow out of the ruins of the entablature.

To the west of these noble remains of antiquity is a magnificent circular temple. This structure is on the outside of the Corinthian order; within of both the Corinthian and Ionic; and the shafts of all the columns are of one piece. The front of this temple is disfigured by Turkish houses and modern additions erected against it, and on the inside, the lower, or the Ionic story, is converted into a Greek church, and for that purpose is separated from the Corinthian story above.

At the south-west end of the city, where a small part of the foot of Anti-Libanus is enclosed by the walls, is a single Doric column of considerable height; but nothing in its size, proportion, or workmanship appears so remarkable, as its having on the top of its capital a little basin, which has a communication with a semicircular channel cut five or six inches deep down the side of the shaft. It is said that water was formerly conveyed down from the basin by this channel; but how the basin itself was supplied is at present unknown.

The small part of the city now inhabited is near the circular temple, and to the south and south-west of it; and within this compass are several mosques with their minarets. The city walls seem like the confused patchwork of different ages. The broken entablatures, pieces of capitals, and reversed Greek inscriptions, which appear in going round them, shew that they were repaired after the decline of taste, with such materials as lay nearest at hand.

At a small distance from the walls of the city is a quarry of free-stone, from which probably the immense stones employed in the body of the great temple were taken, while the more ornamented parts of those buildings were supplied by a quarry of coarse white marble at a greater distance to the west of the city. There are still remaining in the first quarry some vast stones cut and shaped for use. One of those stones thus shaped, but not entirely detached from the quarry at the bottom, is seventy feet long, fourteen broad, and fourteen feet five inches deep, and consequently contains fourteen thousand one hundred and twenty-eight cubic feet, and, were it Portland stone, would weigh about two million two hundred and seventy thousand pounds averdupois, or about eleven hundred and thirty-five tons.

All the inhabitants of this country, both Christians, Jews, and Mahometans, confidently maintain, that both Balbec and Palmyra were built by Solomon. Indeed the ruins of both, says our ingenious author, answer our ideas of his riches and power, and it is not difficult to discover his love of pleasure in the former, and his wisdom in the latter. It is probable that his character as a wise and yet voluptuous prince, may have given rise to an opinion, which, with respect to Balbec at least, seems to have scarce any other foundation; for no where could

an eastern monarch enjoy a more luxurious retirement than amidst the streams and shades of Balbec. The natives tell many stories of the manner in which he spent his hours of dalliance in this retreat: a subject on which the warm imagination of the Arabs is apt to be too particular.

It may be more reasonably enquired, whether the Phœnicians did not erect these temples in the neighbourhood of their capital; for it is pretty certain that the sun was worshipped here in the flourishing times of that people, when this plain was probably a part of their territory. According to Macrobius, the city obtained both its name and worship from Heliopolis, in Egypt; and he observes, that the statue of Heliopolitan Jove was brought from thence to this city. "This divinity, says he, was both Jupiter and the Sun, which appears both by the rites of the worship, and by the attributes of the statue, which is of gold, representing a person without a beard, who holds in his right hand a whip, like a charioteer, and a thunderbolt with ears of corn in his left, all which point out the united powers of Jupiter and Apollo; and the temple excels in divination."

But, instead of consulting the Jewish and Phœnician history for buildings of the Corinthian and Ionic order, it may be thought more proper to search for them during the time when this country was in the possession of the Greeks: but we do not find them mentioned from the period when it was conquered by Alexander, to that when it was subdued by Pompey. Hence it is reasonable to conclude, that they were works of a later date; and indeed John of Antioch, surnamed Malala, observes, that Antonius Pius erected a temple to Jupiter at Heliopolis, near Libanus, in Phœnicia, that was one of the wonders of the world. This is the only historian who takes notice of the building of a temple in this place.

We shall now proceed to Damascus, at present called Sham, at a small distance from which the river Barrady, which supplies that city and its gardens with water, pours down in a stream near twenty yards broad from the mountains, which are cleft asunder to give it admission into the plain below. From a precipice on these mountains the traveller has a most perfect view of Damascus, and no prospect in the world can appear more delightful. It stands in a level plain of such extent, that the mountains which encompass it on the farther side can scarcely be discerned, and is only two miles distant from the place where the river Barrady breaks out from between the mountains, to which its gardens almost extend. The city is about two miles in length; it is thick set with mosques, and the gardens, by which it is on all sides encompassed, are said to be no less than thirty miles in compass: whence it resembles a noble city seated in the midst of a vast wood. These gardens are filled with fruit trees, kept fresh and verdant by the waters of the Barrady; and from amidst the trees rise many minarets, obelisks, summer-houses, and turrets.

A considerable part of the beauty of this prospect arises from the river; which, on its issuing from between the clefts of the mountain, separates into three streams: the middlemost and largest runs through the city, where it supplies all the cisterns and fountains; while the two others encircle it, one to the right, and the other to the left, dispersing a multitude of little currents through the gardens, where they are improved into fountains and other water-works, which are peculiarly charming in a country where the heat of the climate renders a profusion of water one of the greatest luxuries.

On a nearer approach, the garden-walls appear of a singular structure, they being built of bricks dried in the sun, of an extraordinary size, and being two yards long, one broad, and half a yard thick. Two rows of them placed edge-ways, one upon another, form in this dry country a durable wall expeditiously built at a small expence.

Damascus is situated in thirty-three degrees north latitude. The streets, as in other hot countries, are narrow, and all the houses built of no better materials than either sun-burnt brick, or Flemish wall coarsely daubed over; whence, upon any violent showers, the whole city is rendered by the washing of the houses an

entire

entire quagmire; yet the gates and doors of those structures are adorned with marble, carved and inlaid with great beauty and variety, and nothing can appear more surprising than to see such a mixture of mud and marble, meanneſs and grandeur. On the inside there is generally a large court, encompassed by splendid apartments, beautified with marble fountains, and floored with variegated marble in Moſaic-work. The ceilings are, after the Turkish manner, richly painted and gilt, and the carpets and cushions are extremely beautiful.

In this city is the church of St. John Baptist, which the Turks have converted into a mosque. This is a very noble structure; the gates, which are extremely large, are covered with brass, and before it is a spacious court about a hundred and fifty yards long, and eighty or a hundred broad, paved all over. On the three sides of this court is a double cloister, supported by two rows of granite columns of the Corinthian order, which are exceeding beautiful and lofty. In this mosque the Turks pretend to have the head of St. John, and some other relics; and they here maintain, that at the day of judgment Christ will descend into this mosque, as Mahomet will into that of Jerusalem.

The castle is a good rustic building, three hundred and forty paces in length, and somewhat less in breadth. In it is deposited a great quantity of armour and arms taken from the Christians.

In this city is a large coffee-house, capable of entertaining four or five hundred people under the shade of trees. It has two quarters for the reception of guests, one fit for the summer, and the other for the winter. That designed for the summer is a small island, washed by a large swift stream, and shaded over head with trees and mats. Here a multitude of Turks resort, there being nothing which they behold with such delight as the shade of green trees and water; to which, if a beautiful face be added, they say, that all three will banish the most obstinate melancholy.

They shew here a small grotto, in which is a Christian altar, and a Turkish oratory, near each other: this grotto, according to their tradition, was the house where Ananias restored St. Paul to his sight.

The Turks will not suffer a Frank to ride on horseback when he goes to see the gardens or other curiosities without the city; but he must either walk on foot, or ride upon an ass, there being always asses standing ready in the streets equipt and ready for mounting. The rider has no occasion for either whip or spur, for the master of the ass, or his servant, follows him wherever he goes, and forces him along with a goad.

At two or three hours distance from Damascus is a high hill, which, according to tradition, is the place on which Cain and Abel offered sacrifice, and where Cain slew his brother.

Damascus is a place of great trade. One of the principal manufactures carried on there is the making of sword-blades, knives, and other utensils of iron and steel; the water here being esteemed excellent for tempering their metal. The making of damasks is another manufacture in which they excel. They also make great quantities of soap. The principal merchandizes brought from hence, besides the above, are rose-water, made of the damask-roses, which grow plentifully here, raw and wrought silks of several kinds, wine, and prunes.

Sidon, called by the Turks Sayd, is situated upon the coast to the southward of Tripoly, in thirty-three degrees thirty-three minutes north latitude. It was anciently a place of great strength, and had a very extensive trade; but though it is still populous, it has fallen from its ancient grandeur, as the many beautiful columns found in the gardens without the present walls sufficiently prove. It is still a place of some trade, and has a pretty well frequented harbour. The city is defended by an old castle, and near it is an ancient unfurnished palace, where the basha resides.

About twenty miles to the south of Sidon stands the ancient Tyre, called by the Turks Sur. This city is situated in thirty-three degrees north latitude, and was once famous for a shell-fish which produced a most beautiful purple, thence called the Tyrian-dye. This place is now nothing but a heap of venerable ruins. It has

two harbours; that on the north side is extremely good, and the other is choaked up by the ruins of the ancient city. The present inhabitants are only a few poor fishermen, who live in vaults and caves. The adjacent country is naturally fertile, being watered by a number of springs, but is now neglected.

SECT. XVIII.

Of JUDEA, or PALESTINE.

Its Situation, Names, Extent, and Climate. A remarkable Ignis Fatuus seen there by Dr. Shaw. Of the rocks of Judea, and the natural Productions given to Travellers as Petrefactions and sacred Relics. Of the River Jordan and the Dead Sea; an Account of the bituminous Matter which rises in that Lake; and of an extraordinary Kind of Pebbles found on the Shore. Several superstitious Opinions refuted. The ancient Fertility of Palestine proved even from its present State; with an Account of its Vegetables and Animals.

PALESTINE is bounded on the north by Mount Libanus, which separates it from that part of Syria antiently called Phœnicia; on the east by Mount Hermon, which separates it from Arabia Deserta; on the south by Arabia Petræa; and on the west by the Mediterranean. This country received the name of Palestine from the Philistines, who dwelled on the sea coast; it was called Judea from Judah, and is termed the Holy Land from its being the spot where the antient prophets first resided, where our Saviour himself received his birth, preached his holy doctrines, confirmed them by miracles, and laid down his life for mankind. This country is only about a hundred and fifty miles in length, and generally eighty in breadth, though in some places it is wider, and in others narrower; it is situated in the fourth and fifth climate, between thirty-one and thirty three degrees thirty minutes north latitude, and the longest day is about fourteen hours and a quarter.

The climate of Palestine differs but little from that of Barbary, except in its being hotter. The easterly winds are usually dry, though they are sometimes tempestuous; and those which are westerly are attended with rain. Though the heat from the situation of the country with respect to the equator might be expected to be excessive, yet Mount Libanus, from its uncommon height, is covered all the winter with snow. The Rev. Dr. Shaw observes, that in travelling by night through the vallies of Mount Ephraim, he and his company were attended for above an hour by an ignis fatuus that assumed a variety of extraordinary appearances; it was sometimes globular, then resembled the flame of a candle; but instantly it would spread itself, and involve the whole company in its pale inoffensive light; then contracting itself, it would instantly disappear; but in less than a minute would again become visible as before; or, moving from one place to another, would expand itself, at particular intervals, over two or three acres of the adjacent mountains. It is remarkable that in the preceding evening the atmosphere had been uncommonly thick and hazy, and the dew unusually unctuous and clammy.

The first rains, as they are called, generally fall about the beginning of November; and the latter rains sometimes in the middle, and sometimes towards the end of April. In the country round Jerusalem, if a moderate quantity of snow falls in the beginning of February, and the brooks soon after overflow their banks, it is thought to promise a fruitful year; and the inhabitants make rejoicings upon this occasion, like the Egyptians upon the cutting of the Nile: but this country is seldom refreshed with rain during the summer season.

The same learned author observes, that in Judea he saw the barley in full ear in the beginning of April, and in the middle it began to turn yellow in the southern districts. He found it as forward near Jericho at the end of March, as in the plains of Acre a fortnight after; but in either of those places there was little wheat in the ear, and the stalk was scarcely above a foot high in the fields near Jerusalem and Bethlehem.

The rocks of Judea are in many places covered with a soft chalky substance, in which is inclosed a great variety of shells and corals. The greatest part of the mountains of Carmel, and those of Jerusalem and Bethlehem, are also covered with a white chalky stratum. In the former are gathered many stones, which, being in the form, as it is pretended, of olives, melons, peaches, and other fruit, are imposed upon pilgrims not only as those fruits petrefied, but as antidotes against several diseases. Indeed the olives, which are the *lapides judaici* of the shops, have been an approved medicine against the stone and gravel; however, little can be said in favour of their peaches and melons, which are only round flint stones of different sizes, beautified on the inside with sparry knobs, that are made to pass for seeds and kernels. The waters of Jordan and Siloam; the roses of Jericho; beads made of the olive stones of Gethsemane; the chalk-stone of the grotto near Bethlehem, called the Virgin's milk; the little round calculi, called her pease; and other curiosities of the like nature, are presents which the pilgrims usually receive in return for their charity.

With respect to the rivers of this country, the Jordan is not only the most considerable, but, next to the Nile, is by far the largest to be found either in the Levant or in Barbary. Dr. Shaw says, that though he could not compute it to be more than thirty yards broad, it is so deep; that even at the brink he found it to be nine feet. If we take this, says he, during the whole year, for the mean depth of the stream, which runs about two miles an hour, then Jordan will daily discharge into the Dead Sea about six millions ninety thousand tons of water. So great a quantity of water daily received, without increasing the limits of that sea, or lake, has made some conjecture, that it is carried off by subterraneous cavities, or absorbed by the burning sands; but if the Dead Sea is, according to the general computation, seventy-two miles long, and eighteen broad, by allowing, according to the observation of the great Mr. Halley, six thousand nine hundred and fourteen tons of vapour for every square mile, there will be daily drawn up in clouds, to refresh the earth with rain or dews, eight millions nine hundred and sixty thousand tons, which is almost one-third more than it receives from this river. With respect to the bitumen, for which this lake has been always remarkable, it is said to rise at certain times from the bottom in large hemispheres, which, on their touching the surface of the water, and being acted upon by the external air, burst with a great noise and smoke, and disperse themselves in a thousand pieces. This is said, however, only to happen near the shores; for in greater depths the irruptions are supposed only to discover themselves by the columns of smoke which arise from the lake. This bitumen is probably accompanied on its rising with sulphur, as both are found promiscuously on the shore. The latter exactly resembles native sulphur, and the former is brittle, and yields a fetid smell upon friction, or on its being set on fire; it is also as black as jet, which it exactly resembles in its shining appearance.

The Rev. Mr. Maundrel found on the shore a black sort of pebbles, that burn on being held to the flame of a candle, yielding a most offensive smell; but though they lose their weight in burning, they do not decrease in bulk. These stones are common on the neighbouring hills, and are capable of being carved and polished to as great a perfection as marble.

It has been commonly reported, that all the birds that attempt to fly over this lake drop down dead into it, and that neither fish nor any other animal can live within these deadly waters; but this is so far from being true, that birds fly over the lake without any visible injury, and on the shore are the shells of fish resembling those of oysters cast up by the waves. The water is very limpid, and not only salt, but very bitter and nauseous; and the last mentioned reverend gentleman being desirous of trying its strength, went into it, and found that it bore him up in swimming with uncommon force. As to the apples of Sodom, mentioned by several authors, these are also a fiction, for nothing of that kind is either seen or mentioned near this lake; nor

is there any tree from which such kind of fruit might be expected.

Our modern unbelievers have dwelt much on the rocks of Palestine, the barrenness of the country, and the disagreeableness of the climate, in order to invalidate the accounts given in Scripture of the fertility of that land of Promise, which is represented there as flowing with milk and honey; but the Rev. Dr. Shaw, who seems to have examined the country with an uncommon degree of accuracy, and was qualified by the soundest philosophy to make the most just observations, says, that was the Holy Land as well cultivated as in former times it would be more fertile than the very best parts of Syria and Phœnicia, because the soil is generally much richer, and, every thing considered, yields larger crops. Thus the cotton gathered in the plains of Zabulon, Esdraelon, and Ramah, is more esteemed than that produced near Tripoly and Sidon; and it is impossible for pulse, wheat, or any other grain, to exceed what is commonly sold at Jerusalem. Therefore, the barrenness, says he, of which some authors complain, does not proceed from the natural unfruitfulness of the country, but from the want of inhabitants, the indolence which prevails among the few who possess it, and the perpetual discords and depredations of the petty princes who share this fine country.

Indeed the inhabitants can have but little inclination to cultivate the earth. "In Palestine, says Mr. Wood, "we have often seen the husbandman sowing, accompanied by an armed friend to prevent his being robbed of the seed;" and, after all, whoever sows is uncertain whether he shall ever reap the harvest. As the parts about Jerusalem in particular have been described as rocky and mountainous, it has thence been rashly concluded, that it is barren; but this is so far from being the case at present, that, notwithstanding the want there has been for many ages of a proper culture, the plains and vallies, though as fertile as ever, are almost entirely neglected, while every little hill is crowded with inhabitants. It cannot here be urged, that the inhabitants enjoy more safety than in the plains; for they have no walls or any fortifications to secure either their villages or encampments; and as there are few places of difficult access, both lie equally exposed to the ravages of an enemy: but they find sufficient conveniences for themselves, and much greater for their cattle, which feed upon a richer herbage; and both are refreshed by springs of excellent water.

Corn, wine, and oil, with milk and honey, were both the food and the principal dainties of the early ages. These were once the produce of this country, as they might be still in the greatest plenty, only by using proper care. The plenty of wine alone is at present wanting; yet, from the goodness of the little still made at Jerusalem and Hebron, we find that these rocks, barren as they are improperly called, might yield a much greater quantity, did but the Turk and Arab encourage the cultivation of the vine. The wild-honey, once part of the food of St. John Baptist, shews there was plenty of it in the deserts of Judea; and by taking the hint from nature, and enticing the bees into hives, the quantity might be vastly increased. As in some places the mountains abound with rosemary, thyme, sage, and such aromatic plants as are chiefly sought by the bees; so others are as well stocked with shrubs, and a delicate short grass, of both which the cattle are more fond than of the plants common to meadows and fallow ground. The milk of the cattle thus fed is not only far richer, but their flesh is more sweet and nourishing.

These mountainous districts have been also valuable on other accounts; they seem to have been formerly well planted with olive-trees, one acre of which, if properly improved, is more valuable than twice the extent of arable ground; and several parts of Palestine, no less than Idumea, which lies contiguous to it, are represented by the ancients as abounding in date-trees.

In the beginning of March the plains between Jaffa and Ramah, and other places in the road to Jerusalem, are particularly distinguished by beds of tulips, scutillaries, and other plants of the same class. The balsam-tree, however, is no longer found in this country, and

and the dudaim, or mandrakes, mentioned in the Scriptures, are equally wanting. What the Christian inhabitants of Jerusalem take for that fruit are the pods of the jelathon, a leguminous plant peculiar to corn-fields. The boccora, or early-fig, is not ripe before the middle or latter end of June; but no sooner does it draw near to perfection, than the kermes, or summer-fig, sold by the grocers, begins to be formed, and is seldom ripe before August, when it frequently puts forth another crop, usually of a much larger shape, and of a darker colour, that hangs ripening on the tree even after the leaves are shed, and if the winter proves mild, is gathered as a delicious morsel in the spring; and as the fruit of this plant always precedes the leaves, when our Saviour saw one of them in full vigour having leaves, he might, according to the common course of things, justly "look for fruit, and haply find some," of the former or latter kind.

Every part of the country abounds with plenty of game, as antelopes, hares, and rabbits; and of the winged kind, woodcocks, partridges, teal, snipes, and several others, which are all caught by hawking and the chase. The hawks are usually of the nature and size of our goshawks, and so strong as to bring down a bustard and stop an antelope in full career. Among the uncommon animals is the daman Israel, which signifies Israel's lamb; this is the saphan of the Scriptures, and is common both in Mount Libanus and in other places of this country. It is of the size of a rabbit, but is of a browner colour, with smaller eyes, and a more pointed head. The fore-feet are short, and those behind very long in proportion to them. These animals usually shelter themselves in holes and clefts of the rocks, but sometimes burrow in the ground.

S E C T. XIX.

Of the principal Places of Palestine, with a particular Description of Jerusalem, and of the Ceremonies performed in the Church of the Holy Sepulchre and in that City: with the most remarkable Places in the neighbouring Country usually visited by Pilgrims.

ACRA, antiently called Accho, situated in thirty-two degrees forty minutes north latitude, is one of the places from which the Israelites could not expel the antient Canaanites. In after times it being enlarged by Ptolemy I. he, from his own name, called it Ptolemais; but it has since resumed some resemblance of its antient name. This city was the scene of many obstinate disputes between the Croisaders and the Saracens. In the year 1191 it was taken by Richard I. king of England and Philip of France, and given to the knights of St. John of Jerusalem, who kept possession of it an hundred years; when the Turks, after a long siege, took and razed it to the ground, in order to prevent such slaughter for the future. Its situation is as advantageous as possible; on the north and east it is encompassed by a spacious fertile plain, on the west it is washed by the Mediterranean, and on the south by a large bay which extends from the city as far as Mount Carmel; it, however, contains little more than a few cottages, and prodigious heaps of ruins, that only serve to shew its former strength.

The remains of the following structures distinguish themselves from the general heap by evident marks of magnificence and strength: the cathedral of St. Andrew, which rises higher and is more conspicuous than the rest; the church of St. John; the convent of the knights hospitallers; the palace of the grand master of that order, and some remains of a large church, that once belonged to a convent, of which the Christians there tell the following remarkable story: the Turks, after a long siege, took the city by storm in the year 1291, when the abbess of the convent dreading lest she and her nuns should be treated, as is usual in such cases, assembled them, and exhorting them to mangle their faces, as the only means of preserving their virginity, instantly, with an heroic courage, set them the example, which the nuns boldly followed, by cutting off their

noses, and disfiguring their faces in such a manner as rendered them more adapted to excite horror than lust. Hence the soldiers soon after breaking into the convent, were so disappointed at seeing, instead of a number of blooming beauties, such dismal objects, that they cruelly put them to the sword.

The city appears to have been formerly encompassed by a double wall defended with towers: and without the walls are ditches, ramparts, and a kind of bastions faced with stone.

To the south of Acra is Sebastia, the ancient Samaria, the capital of the ten tribes after their revolt from the house of David; and it being rendered by Herod a very magnificent city, he gave it the name of Sebastia in honour of Augustus Cæsar. It is seated on a long mount, of an oval figure, which rises in a fruitful valley, surrounded by a range of hills, and is now entirely converted into gardens, having no other remains of its being once a famous city, but a large square encompassed with columns, and the ruins of a great church said to be erected over the place where John the Baptist was imprisoned and beheaded. In the body of the church is a staircase into the dungeon, where they say his blood was shed. There are here a few poor families of the Turks, who have a great veneration for this prison.

A little farther to the south is Naplosa, the ancient Sychem, which stands in a narrow valley between mount Ebal on the north, and Gerizim on the south. The Samaritans, whose chief residence is at Sychem, have a small temple upon mount Gerizim, to which they still repair at certain seasons, for religious worship, and it is said assemble once a year to offer sacrifices there. Upon one of these mountains God commanded the children of Israel to set up great stones plastered over, inscribed with the body of the law, and to erect an altar and offer sacrifices, fasting and rejoicing before the Lord, Deut. xxvii. 4. But whether Ebal or Gerizim was the place appointed for this solemnity, is not easily determined; as the Hebrew Pentateuch, and ours from it, assert, that mount Ebal was appointed for that use, while the Samaritan says that it is Gerizim.

Mr. Maundrell, who visited the chief priest of the Samaritans, discoursed with him about this and other difficulties, when the chief priest asserted, that the Jews, out of hatred to the Samaritans, had altered the text, putting Ebal for Gerizim, because the Samaritans worshipped in the latter mountain, which, for that reason, they would not have to be the true place appointed by God for his worship; to confirm which he alledged, that Ebal was the mountain of cursing and naturally unpleasant, while Gerizim was pleasant and fertile, and the mountain of blessing appointed for religious festivals. However, he acknowledged that none of the great stones, which Joshua was directed to set up, were to be found on Gerizim.

At a small distance from Naplosa is Jacob's well, most famous for our Saviour's conference with the woman of Samaria. Over this well there once stood a large church built by St. Helena, of which none but the foundation now remains. The well is at present covered with an old stone vault, into which pilgrims are let down thro' a freight hole, when removing a broad flat stone, they discover the mouth of the well, which is dug in the firm rock; it is about three yards in diameter, and thirty-five in depth, about five of which are filled with water. This, says Mr. Maundrell, proves the falshood of the story told by travellers, that it is dry all the year round, except on the anniversary of the day when Christ sat upon its side, at which time they pretend that it bubbles up plenty of water.

Jerusalem is encompassed with hills, so that the city seems as if situated in an amphitheatre; but no place affords a distant view of it: that from the mount of Olives, which is the best, and perhaps the farthest, is so near, that when our Saviour was there, Dr. Shaw observes, he might be said almost in a literal sense, to weep over it. There are, however, few remains either of that city as it appeared in our Saviour's time, or as it was afterwards built by Adrian, its very situation being changed; for mount Sion, the highest part of the ancient Jerusalem, is now almost entirely excluded; while the places adjoining

joining to mount Calvary, where Christ suffered without the gate, are at present almost in the center.

This city, which is about three miles in circumference, is situated in the thirty-first degree, fifty minutes of north latitude, and in the thirty-sixth degree of east longitude from London, on a rocky mountain, on all sides of which are steep ascents, except towards the north; and is surrounded by a deep valley, which is again encompassed with hills. The walls are not strong, nor have any bastions; but towers are erected upon them, after the old method of fortification, and on one side only it is defended by an inconsiderable ditch. The city has six gates; these are that of Bethlehem, mount Sion, Sterquilina, or the dunghill gate, St. Stephen's, Herod's, and that of Damascus, besides the golden gate, which is shut up.

The private buildings are mean, the streets are narrow, and this ancient city but thinly inhabited. The resort of pilgrims thither, and accommodating them with necessities, seems the principal business of the inhabitants. A Turkish basha resides there in order to preserve good order, and collect the grand seignior's tribute from the pilgrims and the priests who live there, and also to protect them from the Arabs, when they visit the holy places in the adjacent country.

No French or European Christian is allowed to enter the city till the governor is informed of his arrival, and he has paid the duties required, nor are any permitted to enter on horseback or with arms, except they come with some public minister or consul. The Europeans, whether papists or protestants, always go to the Latin or Popish convent, where they are entertained by the guardian and friars for their money, though some distinction is made between those who travel thither out of devotion, and those who only come out of curiosity.

The pilgrims are indeed treated with peculiar marks of respect. The druggerman, or interpreter, with some others deputed by the convent, usually meet the pilgrims without the gate of the city, where they pay the duties, and bring them to the cloister, where they are handsomely entertained, and an apartment is assigned them, where their feet are washed. Some time after they are conducted to the chapel, to which the father guardian comes with all his monks, and having made the pilgrims sit on a couch of crimson velvet, washes their feet in vessels of water mixed with roses, and kisses them; and after the guardian has done, the same ceremony is performed by all the monks, who in the mean while sing hymns and anthems. At the conclusion of this ceremony, each of the pilgrims receives a wax taper, and they all make a procession about the cloister, singing *Te Deum* for bringing them in safety to the holy city, and this they perform at three altars, that is, the high altar, dedicated to the Holy Ghost; at the altar of our Lord's last supper; and at the altar of Christ's appearing to St. Thomas after his resurrection.

One of the principal places visited by the pilgrims, is the church of the holy sepulchre upon mount Calvary, which is about one hundred paces long, and sixty wide. In order to lay the foundation of this church, the founders were obliged to reduce the top of the mount to a plain area, by cutting down several parts of the rock, and raising others; but they say that care was taken that no parts of the hill more immediately concerned in our Saviour's passion should be altered, and therefore that part of the mount, where Christ was fastened to the cross, is left entire, and at present stands so high above the common floor of the church, that there are twenty-one steps to go up to the top; and the holy sepulchre, in which our Lord's body was laid, which was originally a cave hewn in the rock, is now a grotto above ground, the rock being cut away from it.

This church, with many others throughout Palestine, is said to have been founded by the empress Helena, the mother of Constantine the Great. At the west end of it is a square tower or steeple, which appears somewhat ruinous; but the edifice in general is kept in good repair, and has a sumptuous appearance. The body of the church is round, and has two circular galleries above each other, supported by large square pillars, formerly faced with white marble; and here are several mosaic pictures in niches, representing prophets, apostles, and

among the rest, Constantine, the first Christian emperor, and his mother Helena. This part of the church is covered with a dome of a prodigious size, supported by rafters of cedar, with an opening at the top, through which it receives sufficient light. Exactly underneath this aperture is the holy sepulchre, which rises considerably above the pavement: and the rock on the outside is hewn into the form of a chapel, adorned on the outside with ten beautiful columns of white marble, adjoining to the wall, and supporting a cornice. People are obliged to stoop very low in entering the door, which does not exceed a yard in height; but within it is about eight feet square, and as much high, all cut out of the solid rock, and lined with white marble. The tomb in which they say our Lord was laid is raised in the form of an altar, almost three feet from the floor, extending the whole length, and half the breadth of this little chapel, so that there is not room for more than three persons to kneel without great inconvenience. The multitude of lamps here kept continually burning, render the place extremely hot, the smoke of which escapes through vent-holes cut through the roof, over which is a small canopy covered with lead, supported by six double Corinthian columns.

The choir has some resemblance to that of our cathedrals; and is separated from the body of the church by a wall, which has a door opposite to that of the holy sepulchre; terminating to the east in a semicircle, where the high altar stands, which is richly gilt, and hung round with the pictures of several saints, painted full-faced, after the manner of the Greeks, to whom the choir belongs.

Though the church of the sepulchre is less than one hundred paces in length, and not more than sixty in breadth, it is supposed to contain twelve or thirteen places consecrated by some action relating to our Saviour's death and resurrection. As the place where the soldiers derided him; where they divided his garment; where he was confined while they dug the hole in which they erected the cross; where he was nailed to it; where the cross was erected; where the soldiers stood who pierced his side; where his body was anointed in order for burial; where it was deposited in the sepulchre; where the angels appeared to the women after his resurrection; where Christ himself appeared to Mary Magdalen; all which, and many others, are supposed to be contained within the narrow limits of this church, and are all adorned with so many altars.

Anciently every Christian nation had a small society of monks, who resided in the galleries about the church, and the little buildings annexed to it; but the greatest part of them have forsaken these apartments on account of the heavy rents imposed upon them by the Turks, and none remain but the Latins, Greeks, Armenians, and Copts. Every fraternity had also their altars and a sanctuary for their separate use, from whence other nations were excluded. The several sects have contended to have the holy sepulchre as their own property, and in particular the Greeks and Latins have so warmly disputed the privilege of saying mass there, that they have sometimes come to blows, and wounded each other at the very door of the sepulchre: however, by the interposition of the French king, it was put into the hands of the Latins, who have the sole privilege of saying mass in it, though the Christians of all nations may enter it, and perform their private devotions there.

Ten or twelve Latins, with a president over them, always reside in the church, and are daily employed in trimming the lamps; and every day they also make a solemn procession, in which they carry tapers and crucifixes to the several sanctuaries, singing at each a little hymn, relating to the subject of the place. But in the holy week before Easter, when the pilgrims usually flock to Jerusalem, this is performed with greater solemnity than at other times. On the evening of Good-Friday, as soon as it begins to grow dark, all the friars and pilgrims assemble in the chapel of the Apparition, a small oratory on the north side of the holy grave, in order to go in procession round the church; but before this begins one of the friars preaches a sermon in Italian, on the darkness at the crucifixion, and he has no sooner begun

begun, then all the candles are put out, to give a more lively image of that darkness; and thus they continue without light, till the preacher having concluded his discourse, every person present has a large lighted taper put into his hands, and the crucifixes and other utensils are put in order for the procession. Among the rest is a large crucifix, which bears the image of our Lord, as big as the life, fastened on with great nails. This image, which is well painted, and crowned with thorns, is carried at the head of the procession, first to the pillar of Flagellation, a large piece of which they pretend to have in a little cell just by the chapel of the Apparition. They there sing an hymn, and preach in Spanish on the scourging of our Lord. From hence they proceed to the prison, where, they say, Christ was secured, while the soldiers prepared for his crucifixion: here also they sing an hymn, and a third friar preaches in French. They next proceed to the altar of the division of Christ's garments, where they only sing an hymn. From thence they go to the chapel of Derision, where they sing an hymn, and have another sermon in French. From this place they go to Calvary, leaving their shoes at the foot of the stairs. Here are two altars, one where Christ was nailed to the cross, at which they lay down the great crucifix, and act the part of the Jews in nailing our Saviour to it; and after the hymn, one of the friars preaches another sermon upon the crucifixion. At the other altar is a hole in the rock, in which they pretend the foot of the cross stood, and here they set up their cross with the bloody image upon it, and leaving it, sing an hymn, after which the father-guardian, seating himself before it in a chair, preaches a passion sermon, in Italian. In this manner Mr. Maundrell saw it performed.

About four feet from the hole in which they fix the foot of the cross, is a cleft in the rock, said to be made by the earthquake, which rent the rocks at the death of Christ. It has the appearance of a natural breach about a span wide at its upper part, and the sides of it answer each other, running in such intricate windings as seem above the power of art to imitate. The chasm is about two spans deep, after which it closes; but again opens below, as may be seen in another chapel by the side of mount Calvary, where it runs down to an unknown depth.

After this sermon, two friars representing Joseph of Arimathea and Nicodemus, go with a grave and solemn air to the cross, draw out the nails, and take down the pretended body, which is so contrived that the joints are flexible as if it was really flesh and bone, and the stranger is surprised to see them bend down the arms, which were before extended, and lay them upon the body, which is received in a large winding-sheet, and carried down from mount Calvary, while all the company attend it to the stone of unction, which, they say, is the place where Christ was anointed and prepared for burial; and here they cast over the fictitious corpse sweet powders and spices, and in the mean while sing an hymn, after which a friar preaches a funeral sermon in Arabic. The pretended body is then carried away, and laid in the sepulchre, where it is shut up till Easter Monday.

There is another ceremony observed in this church, which is too singular to be omitted. This is a pious fraud performed by the Greek priests, who pretend that upon every Easter-eve a miraculous flame descends into the holy sepulchre, and kindles all the lamps and candles there. The Easter of the Greeks happening a week after that of the Latins, when Mr. Maundrell was at Jerusalem, he went on the evening before their Easter Sunday to this church, which he found crowded with a distracted mob, making a hideous clamour, and with difficulty pressing through them, got into the gallery next the Latin convent, where he had a view of all that past. The people ran with all their might round the holy sepulchre, crying, "Huia, huia;" "this is he, this is he." And having at length, by their running round and their vociferation, almost turned their brains, they acted the most antic tricks imaginable, sometimes dragging one another along the floor, and carrying others upon their shoulders round the sepulchre: sometimes they carried men with their heels upwards, with such indecency, as to expose their nudities; and sometimes

they tumbled round the sepulchre, like tumblers on a stage; and, in short, nothing can be more rude and extravagant than their behaviour upon this occasion. This frantic tumult lasted from twelve to four in the afternoon; and then the Greeks set out in a procession round the sepulchre, followed by the Armenians, encompassing it three times, dressed in their embroidered habits, and carrying crucifixes, standards, and streamers. Towards the end of the procession a pigeon came fluttering into the cupola over the sepulchre, at which the people redoubled their shouts and clamour. The Latins observed to the English gentlemen, that this bird was let fly by the Greeks to deceive the people into the belief that this was a visible descent of the Holy Ghost. After the procession the suffragan of the Greek patriarch, and the principal Armenian bishop, approached the door of the sepulchre, cut the string with which it was fastened, and breaking the seal, entered in, shutting the door after them, all the candles and lamps within having been before extinguished in the presence of the Turks. As the accomplishment of the miracle drew nearer, the exclamations were redoubled, and the people pressed with such violence towards the door, that it was not in the power of the janizaries who stood to guard it to keep them off with the severest blows. This crowding was occasioned by their desire to light their candles at the holy flame, as soon as it was brought out of the sepulchre.

The two bishops had not been above a minute in the sepulchre, before a glimmering of the holy fire was seen through some chinks of the door, at which the mob behaved with the most extravagant kind of phrenzy. Soon after the two bishops came out with blazing torches in their hands, which they held up at the door, while the people thronged about them to light their tapers at the divine flame, though the Turks endeavoured to keep them off with their clubs, and laid on without mercy. Those who got the fire instantly applied it to their faces and bosoms, pretending that it would not burn like an earthly flame; but none of them would try the experiment long enough to make good this pretension. However, such numbers of tapers were presently lighted, that the whole church seemed in a blaze, and this illumination concluded the ceremony.

The Latins take great pains to expose this ceremony as a shameful imposition and scandal to the Christian religion. Mr. Thevenot observes, a flint and steel would soon produce fire were there none in the sepulchre before; and, according to him, the Turks have discovered the cheat, and would have punished them for it; but the patriarch represented, he could not pay them the money required of him if they took from him the profit of the holy fire: they are therefore suffered to continue the juggle, and the priests have acted the cheat so long, that they are now in a manner compelled to stand to it, for fear of endangering the apostacy of the people.

The zealots among these bigots smear pieces of linen with the melted wax which drops from these tapers, and lay them up for winding-sheets for themselves and their friends, imagining, says the Rev. Mr. Maundrell, that nothing can be a better security against their suffering by the flames of hell.

The Armenians have a spacious convent on a pleasant spot of ground, which, with the gardens, covers all that part of Mount Sion which is at present within the city walls; and they assert, that their church is built over the place where St. James, the brother of John, was beheaded. In this structure are two altars richly adorned, and in the middle of the church stands the pulpit covered with tortoise-shell and mother of pearl, with a beautiful cupola over it of the same fabric; and, it is said, that the tortoise-shell and mother of pearl are so exquisitely mingled and inlaid, that the workmanship greatly exceeds the value of the materials.

The Armenians have a chapel in the convent where they say the house of Annas stood, and on the inside they show a hole in the wall to point out the place where one of the officers of the high priest smote our Saviour. In the court before the chapel is an olive-tree, to which they pretend that Christ was chained by order of Annas, to prevent his escape. They have also another small chapel on the spot where the house of Caiaphas stood, and

and under the altar they pretend is the stone that lay at the door of our Saviour's sepulchre, which they say the Armenians stole from the church of the sepulchre and brought thither, though it is two yards and a quarter long, one yard broad, and a yard thick. It is plastered over; only about five or six places are left bare to receive the kisses of the pilgrims. In this chapel is also shewn a small cell, said to be our Lord's prison, till the morning when he was carried before Pilate.

Just without Sion-gate is the church of the Cænaculum, where they say Christ instituted his last supper; but this being converted into a mosque, the Christians are not permitted to enter it. Near it are the ruins of a house in which the Virgin is supposed to have died; and at some distance from it is a place where they say a Jew arrested her body as they were conveying it to the grave; but the hand with which he seized the bier was withered.

At the bottom of Mount Sion, without the city, is shewn Bathsheba's pool, where she was washing herself when David saw her from the terrace of his palace. At a small distance from thence is the Potters-Field, afterwards called The Field of Blood, but now named *Campo Sancto*: this piece of ground is only about thirty yards long and fifteen broad, one-half of which is taken up by a square building erected for a charnel house. It is twelve yards high, and bodies are let down into it from the top, where five holes are left open for that purpose, through which they may be seen under different degrees of putrefaction. A little below the Campo Sancto is a cave, consisting of several rooms one within another, where the disciples are said to have hid themselves when they forsook their master.

On Mount Olivet they shew several caves cut with intricate windings, called the sepulchres of the prophets, and twelve arched vaults, where it is pretended the apostles compiled their Creed; and at the top of the Mount they shew the place of our Saviour's ascension, where there was antiently a large church, but all that remains of it is an octagonal cupola about eight yards in diameter, which is said to be over the place where our Lord set his last footsteps on earth; and upon a hard stone under a cupola is shewn the print of one of his feet. This chapel of the Ascension is in the custody of the Turks, who use it for a mosque.

On another side of the mountain they shew the place where Christ beheld the city and wept over it, and near the bottom is a great stone, upon which the blessed Virgin dropt her girdle after her assumption, in order to convince St. Thomas; and there is still to be seen a small winding channel upon the stone, which they say is the impression of the girdle when it fell. A little lower is shewn Gethsemane, an even piece of ground between the foot of mount Olivet and the brook Cedron. It does not exceed fifty-seven yards square, but is well planted with olive-trees, which the people are so credulous as to believe are the same which grew there in our Saviour's time; and the olives, stones, and oil produced from them are purchased at a high price by the Spaniards: and yet Josephus observes, that Titus cut down all the trees within a hundred furlongs of Jerusalem.

At the upper part of this garden is a flat ledge of naked rocks, said to be the place on which Peter, James, and John fell asleep during our Saviour's agony; and by it is a cave, in which, it is said, he underwent that bitter part of his passion. Near it is a narrow piece of ground, twelve yards long and one broad, said to be the path on which Judas walked up to Christ, and saying, "Hail master," kissed him. This narrow path is distinguished by a wall on each side, as a *terra damnata*, which was done by the Turks, who, as well as the Christians, detest the ground on which that infamous piece of treachery was acted. They also shew the place where the palace of Pilate stood; but upon this spot is now only an ordinary Turkish house, from the terrace of which people have a full view of the spot on which the temple stood; and, it is said, that a fitter place for an august building could not be found on the whole earth; but no Christian is permitted to enter within the borders of that ground. In the middle of the area stands a mosque of an octagonal figure, said to be erected on the

spot where formerly stood the Holy of holies. In the above pretended house of Pilate they shew the room where Christ was mocked with ensigns of royalty, and buffeted by the soldiers. On the other side of the street is a room, which belongs to a weaver's shop, where it is said our Saviour was scourged. In what is called the dolorous way, they shew the place where Pilate brought out our Lord to the people, saying, "Behold the man;" where Christ fainted twice under the cross; where the Virgin Mary swooned at this tragical sight; where St. Veronica presented him a handkerchief to wipe his bleeding brows; and where the soldiers compelled Simon to bear his cross.

They shew many other places in the city of Jerusalem, and its neighbourhood, distinguished by some action of our Saviour or his apostles; so that there is not the least circumstance relating to his behaviour either recorded in the Holy Scriptures, or believed as traditions, but they can point out the very spot where it was performed, with much greater exactness than those who lived when those events were performed. We shall now lead our reader to a few of those places at a distance from Jerusalem, celebrated on account of the events performed there.

We shall begin with Bethlehem, which is famous for being the birth-place of our Saviour. It is seated two miles to the south of Jerusalem, on the ridge of a hill, in thirty-one degrees thirty minutes north latitude; but at present is only an inconsiderable place, though it is much visited by the pilgrims. It has, however, a church erected by Helena, which is yet entire, and in the form of a cross. The roof is of cedar, supported by four rows of columns, ten in each row, made of one entire block of white marble, in many places beautifully speckled. The walls are covered with large squares of white marble almost to the top, and the rest is adorned with Mosaic painting. Over the midst of the chancel is a handsome cupola, covered with lead and adorned with figures in mosaic work. Under the church, in a cave hewn out of the rock, is the chapel of the nativity, in which they pretend to shew the manner in which Christ was laid, also cut out of the rock, and now encrusted with marble. An altar, with the representation of the nativity, is erected here, and lamps kept burning before it. Here is also the chapel of St. Joseph, the supposed father of our Lord, and of the Holy Innocents. The place is chiefly inhabited by a few poor Greeks, and at a small distance is a monastery of Franciscan friars.

Near Bethlehem they shew the place where the shepherds were watching their flocks when they received the glad tidings of Christ's birth, and at a small distance is the village where they dwelt.

The Wilderness of St. John, though very rocky, is well cultivated, and produces plenty of corn, vines, and olive-trees. In this wilderness they shew a cave and fountain, where they say the Baptist used to exercise his austerities. Between this wilderness and Jerusalem is the convent of St. John, which is a large, square, and neat modern structure; and its church is particularly beautiful. It consists of three isles, and at the upper end of that to the north is a descent of seven marble steps to a splendid altar, erected on the place where the Baptist is said to have been born. This church has a handsome cupola in the middle, under which is a pavement of mosaic work that is said to equal, if not exceed, the finest works of the kind among the antients.

Nearer to Jerusalem is a neat convent of the Greeks, that takes its name from the holy cross. It stands in a delightful situation; but what is most extraordinary, is the reason they here give for its name and foundation; for they ridiculously pretend, that here is the earth which nourished the root that bore the tree of which the cross was made. Under the high altar they shew a hole in the ground, where the stump of the tree stood, and many pilgrims are so blindly superstitious as to fall down and worship it. Here the father guardian washes the feet of all the pilgrims who come thither, while the whole society stand round singing hymns; and when the guardian has finished his office, the pilgrims feet are kissed by every friar.

Nazareth is now a small village, situated in a kind of round concave valley on the top of a high hill, in thirty-two degrees thirty minutes north latitude. The church of Nazareth is partly formed by a cave, where it is said the Virgin Mary received the message from the angel, "Hail, thou that art highly favoured, &c." This structure is in the form of a cross, and is fourteen paces long and six over, running directly into the cave, having no other arch over it but that of the natural rock. The transverse part, which is erected across the mouth of the cave, is nine paces long and four broad; and where these join are two granite pillars, one supposed to stand where the angel, and the other where the Virgin stood, at the time of the annunciation. The pillar of the Virgin has been broken, and eighteen inches in length taken away between the pillar and its pedestal, and yet it touches the roof, to which it probably hangs, though the friars maintain that it is supported by a miracle. In this village they shew the house of St. Joseph, where Christ lived near thirty years in subjection to his supposed father. Near it they point out the place where stood the synagogue, in which Jesus preached the sermon by which his countrymen were so exasperated. At each of these last places are the ruins of a handsome church erected by Helena.

The next place we shall mention is Mount Tabor, a high, round, and beautiful mountain near Jerusalem, thought to be that on which our Saviour was transfigured. People are near an hour in ascending to the top, where they find a most fruitful and delicious plain of an oval form, about two furlongs in length, and one in breadth. It is every where surrounded with trees, except towards the south, and was antiently encompassed with walls, trenches, and other fortifications, many remains of which are still visible. In several places are cisterns of good water, and near the plain are three caves, formed to represent the tabernacles Peter proposed to erect; when, beholding the glory of the transfiguration, he cried out, "Lord, it is good for us to be here, let us make 'three tabernacles, &c.'" The top of this mountain has a most delightful prospect. The north-west affords a view of the Mediterranean, and all round are the fine plains of Galilee and Esdraelon. To the eastward is Mount Hermon, and at the foot is seated Nain, famous for our Lord's restoring the widow's son to life. Due east is the sea, or rather lake of Tiberias; and close to it a steep mountain, down which the swine ran and perished in the water. Towards the north is what they call the Mount of the Beatitudes, a small rising from which Christ delivered his sermon; and near this little hill is the city of Saphet, standing upon a high mountain, which, being then in view, our Saviour may be supposed to allude to it when he says, "A city set on a hill cannot be hid;" and to the southward is a view of the mountains of Gilboa, fatal to Saul.

Mr. Maundrell observes, that it is pretty extraordinary that almost every thing represented to be done in the Gospel is said by the people who shew the places to be done in caves, even where the circumstances of the actions themselves seem to require very different places: thus those of the birth of the Virgin Mary, of the annunciation, of Mary's salutation of Elizabeth, of the nativity of Christ and John the Baptist, of the transfiguration, and of St. Peter's repentance, are represented as being done under ground.

SECT. XX.

Of NATOLIA, or ASIA MINOR.

Its Names, Situation, Extent, Climate, Soil, and Rivers; with a particular Description of the Euxine or Black Sea. The Divisions of the Country; with a concise Account of Caramania, Aladulia, and Amasia; which contain the antient Provinces of Lydia, Pamphylia, Pisidia, Lycania, Cilicia, Cappadocia, Pontus Cappadocius, Pontus Polemoniæ, and Pontus Galaticus.

NATOLIA, or Anatolia, formerly called Asia Minor, is the most westerly part of Turkey in Asia: it received its name of Anatolia, or Natolia, from

its eastern situation with respect to Europe, and on the same account is called the Levant. This country is a very large peninsula, that extends from the river Euphrates as far as the Archipelago; which, with the sea of Marmora, the streights of Galipoli, and of Constantinople, separate it from Europe on the west; and it is bounded on the north by the Euxine or Black Sea, and by the Mediterranean and Syria on the south, extending from thirty-seven to forty-one degrees thirty minutes north latitude, and from twenty-seven to forty degrees east longitude. Its utmost length from east to west is computed to be about six hundred miles, and its breadth from north to south about three hundred and twenty. This country is usually divided into four parts, Caramania, Aladulia, Amasia, and Natolia Proper.

The air is healthy, and the whole country has a rich and fertile soil, though the tyranny of the Turkish government has almost reduced it to a desert; for, notwithstanding the fields are naturally rich and well watered, they lie for the most part uncultivated, and are over-run with brambles and weeds. The few plains improved by agriculture yield excellent corn of several sorts, and a variety of fruits, as exquisite grapes, olives, citrons, oranges, lemons, figs, and several others; besides plenty of coffee, rhubarb, galls, balsam, opium, and other valuable gums and drugs.

This country is watered by a considerable number of rivers, the principal of which are the Porteni, Zagari, or Sangarius, the Aitoesu, Ali, Hali, or Otmigiut, and the Iris, or Cafalmach, which discharge themselves in the Euxine Sea; the Jechel-Irma, or Green River, that falls into the Kara, or Black River, which discharges itself into the Euphrates; the Satalia, the Cydnus, or Carafu, and the Xanthus, or Sirbis, which runs into the Mediterranean; the Madre, antiently the Mæander, the Granicus, the Cayster, or Carafou, the Samander, or Scamandra, and the Hermus, now Sarabat, which receives the Pactolus, and the Caicus, the Castri, or Girmakli, and falls into the Archipelago.

As the Black or Euxine Sea washes the northern coast of Natolia, it is proper here to give a particular description of it. It lies between Europe and Asia, and is bounded on the north by Tartary; on the east by Mingrelia, Circassia, and Georgia; on the south by Natolia; and on the west by Romania, Bulgaria, and Bessarabia, extending from the forty-second to the forty-sixth degree of north latitude, and from the twenty-ninth to the forty-fourth degree of longitude, its form being generally compared to that of a bended bow. It is entirely surrounded by the Turkish dominions, who have the sole navigation of it. The Russians have indeed attempted to trade upon this sea; but by late treaties, they have been obliged to give up all their fortresses on its coast, and consequently to abandon its navigation.

This sea has been denominated black, not from the colour of its water, or of its sand, but from the furious tempests said to rage here; though it has not more frequent nor more violent storms than other seas. But probably some particular persons being lost there, when navigation was much less understood than it is at present, the people are taught to entertain terrible apprehensions of it; which being improved by Ovid, and other poets, it is no wonder that it was at length called Black, or Terrible.

We shall begin with Caramania, which lies contiguous to the province of Syria, and is under the government of a beglerbeg. This province contains the antient Lycia, Pamphylia, Pisidia, Lycaonia, and Cilicia.

Lycias, at present called Mentifeli, is bounded on the north and east by Phrygia Major and Pamphylia; on the south by the Mediterranean, and on the west by Caria. The mountains which branch out of Taurus surround it on three sides, as does the sea on the fourth. The river Xanthus divides it into two, and several lesser streams run across it; which once rendered it very rich and fertile; but at present it is entirely neglected. It has a remarkable mountain named Chimæra, about six miles from the sea; which has been celebrated by Virgil for its volcano, near which the Lycians built a city called Hephæstia, and dedicated it to Vulcan. From its having

having lions at the top, goats about the middle, and snakes at the bottom, it is said the poets feigned the monster Chimæra, which they represent as having the head, body, and hind parts of those animals.

This country had anciently several considerable cities, but the face of things is entirely changed, and it does not appear that any considerable remains are left to proclaim their former grandeur.

Pamphylia is bounded on the north by Pisidia; on the east by Cilicia; on the south by the Mediterranean; and on the west by Lycia. The inland country is extremely mountainous, and abounds with large flocks of goats, and the natives make excellent camblets of their hair; but towards the sea-coast the country is naturally fertile. The principal town is Attalia, now called Sattalia, which has a pretty good harbour, but the entrance is difficult, and it is defended by a castle, which is considered in that part of the world as a fortification of considerable strength. There is also the city of Perga, which was anciently famous for its temple dedicated to Diana.

Pisidia, another division of Caramania, lies to the north of Pamphylia, and consists of a fruitful plain entirely surrounded by mountains, which affords some minerals, pasture, and great quantities of wood. Antioch, called Antiochia Pisidiæ, to distinguish it from the city of the same name in Syria, was the capital of this province when it was under the Roman government, and was likewise called Cæsarea; but like the other places of Asia, it is now reduced to a very mean town.

Lycaonia, or Isauria, is situated to the eastward of Pisidia, and is a fine champaign country. Its principal town is Iconium, now Cogni, which is the capital city, not only of Lycaonia, but of all Caramania, where the beglerbeg himself resides. It is situated about an hundred miles north of the sea-coast, near a fresh water-lake. The other towns are Lysra, where the people attempted to offer sacrifices to St. Paul and Barnabas; Derbe, which is towards the south part of the country; and Isauria, which once gave name to the province, but is now entirely destroyed.

Cilicia extends near two hundred and fifty miles along the coast of the Mediterranean, having Syria on the east, and Pamphylia on the west; but does not exceed fifty miles in breadth from north to south. On the north and east the country is rocky and mountainous, and the passes between the mountains exceeding narrow; but the plain country is very fruitful. The principal towns are Issus, now called Lajazzo, or Aiazza, which is situated on a bay to which it gives its name, and is remarkable for the victory obtained by Alexander over Darius among the mountains in its neighbourhood. Tarsus, the capital of the province, at present called Therasia; Sole, or Pompeopolis; Philadelphia, Seleucia, Trachea, and Silenus.

The next grand sub-division of Natolia, called Aladulia, extends eastward to the river Euphrates, and contains all the ancient Cappadocia. This is a country of very great extent, which formerly abounded in corn, wine, and fruits, of which it is not destitute at present; but as the Turks cultivate no more land than they want for their own private use, and export nothing from hence, it is impossible that the face of the country should appear so delightful, or that it should enjoy such plenty as formerly. A large ridge of hills runs across the country, and these contain mines of silver, copper, and allum; there is here also a good breed of horses, and plenty of oxen, buffaloes, sheep, deer, and wild fowl.

The principal towns are Cæsarea, now Caifar, which was the capital of Cappadocia when it was under the dominion of the Romans. It is situated on a rock at a small distance from the river Melus, and is a pretty handsome city well peopled. Marosch, antiently called Melita, is seated near the banks of the Euphrates, and is a large town in which the beglerbeg resides.

The next division of Natolia is Amasia, which contains Pontus Cappadocius, Pontus Polemoniac, and Pontus Galaticus.

Pontus Cappadocius is bounded by Georgia on the east, by the Euxine or Black-Sea on the north, by Armenia Minor on the south, and by Pontus Polemoniac on the west. The principal town is Trebisond,

which is situated on the Black Sea, in forty degrees forty-five minutes north latitude, at the foot of a little steep hill by the sea-side. The walls, which are very lofty, are supposed to stand upon the ancient foundations, because the town is still an oblong square: they have high battlements, and are evidently built out of the ruins of ancient buildings, as appears from inscriptions found on pieces of marble in several parts of them. The town is large, but not very populous; for it has more groves and gardens than houses, and these are only one story high. The castle is large and situated on a flat rock, in which the ditches are cut. The port is at the east end of the town, and was formerly so commodious, that it occasioned a very great trade; but it is now almost destroyed, and cannot be entered by vessels larger than the Turkish faïques. The suburbs, which are much bigger than the city, are chiefly inhabited by Greeks and Armenians, who are allowed the free exercise of their religion. Neither the hills nor the vallies about the town are so fertile as in other parts of Natolia, on which account provisions are neither so cheap, nor so good as in other places: they have flesh in their markets but few months in the year, and fish is still scarcer. The country produces excellent oil, but their wine is not extraordinary.

The Greek and Roman emperors were masters of this city by turns. In 1209 the emperor Alexis Commines, surnamed the Great, usurped the sovereignty of it with the title of duke; and John Commines, his successor, is said to be the first who permitted the Greeks to stile him emperor of Trebisond; a title which its princes enjoyed till 1460, when Mahomet II. carried David Commines prisoner to Constantinople, where he was some time after put to death, and this place has ever since been under the dominion of the Turks.

Pontus Polemoniac is situated to the westward of Pontus Cappadocius. Its principal town is Neocæsarea, now Tocat, which is the capital of the province, and the seat of the beglerbeg. This is a handsome city built at the foot of a very high mountain, and encompasses a round rock, which rises in the midst of the town, and has a castle at the top of it. The streets are narrow, but the houses pretty well built, and one of the mosques is very magnificent. The city is inhabited by Mahometans, Greeks, Armenians, and Jews, and for fourteen or fifteen leagues round Tocat the country is chiefly inhabited by Armenian Christians, who work in several mechanic branches of trade, particularly in copper, all manner of vessels of that metal being made here, and exported to Constantinople and Egypt. They have also a great manufactory of Turkey leather. The wine is excellent, and they have almost all sorts of fruit in great plenty; and as this is one of the greatest thoroughfare towns of the east, they have better accommodations for merchants and travellers than in most other places. Here the caravans lodge which come from Constantinople, Smyrna, Persia, Diarhec, and Bagdat. About a mile from the city is a river over which is a beautiful stone bridge. This river waters a very large and fertile plain, that produces great quantities of saffron, which is extremely profitable, it being sent to the Indies, where it is purchased at a high price, and used by the natives in their food.

S E C T. XXI.

Of Natolia Proper, its Extent and Divisions; particularly Pontus, Paphlagonia, Galatia, Phrygia Major, Lydia, Doris, Caria, Ionia, Æolis, Mysia, Phrygia, Bithynia; with the Cities in each, and a particular Description of Smyrna, and of the Camelcons near that City.

NATOLIA Proper extends from the Archipelago, that is, from twenty six degrees thirty minutes east longitude to almost the thirty-fifth, where it is bounded by the beglerbeglies of Amasia and Aladulia, and extends from the coast of the Black Sea on the north, to the government of Caramania on the south; that is, from thirty-seven to forty-one degrees twenty minutes north latitude, and is by far the largest division of Natolia. It

contains many fine provinces; these are, Pontus, Paphlagonia, Galatia, Phrygia Major, Lydia, Doris, Caria, Ionia, Æolis, Mysia, Phrygia, and Bithynia.

Pontus and Paphlagonia are usually joined together, and have the Euxine Sea on the north, Cappadocia on the east, Galatia on the south, and Bithynia on the west. The name of Pontus was formerly given to the whole coast of the Euxine Sea, which from thence was called Mare Ponticum; but what we now treat of, is only a small part of it. The chief towns are,

Amastris, now Semastro, a sea-port at the mouth of the river Parthenius.

Heraclea Ponti, now Penderachi, a sea-port in the north-west part of the country.

Claudiopolis, now Castromena, an inland town.

The principal city in that part of this division named Paphlagonia is, Cinope, which is situated upon the isthmus of a peninsula about six miles in circumference. This city Mithridates, king of Pontus, made the capital of his dominions, and Lucullus added it to the Roman conquests. The whole peninsula consists of pleasant fields and gardens, and the city has a double wall, with triangular and pentagonal towers; but the castle is run to ruin, and has only a small garrison. The city is inhabited only by the Turks; for the Greeks and Jews are forced to live in the suburbs. There are some little remains of the ancient grandeur of this city to be seen in the modern buildings, particularly pieces of marble columns are interspersed among the other stones in the walls; and in the Turkish burying-place are a prodigious number of pedestals, bases, and capitals, which the Turks have carried thither to erect and adorn their tombs. The adjacent country produces good corn, wine, and oil.

Galatia is bounded by Cappadocia on the east, by Pamphylia on the south, by Phrygia on the west, and by Paphlagonia on the north.

The principal city of Galatia is Ancyra, now called Angouri, which is situated on the river Melus, and is one of the best cities of Natolia. The streets abound with old marble columns, among which some are of a kind of reddish porphyry, veined with white; and there are found some pieces of white and red jasper. Though the houses of the city are mostly built with clay, there are frequently fine pieces of marble used to adorn them; and though the city walls are low, they are composed of pieces of the shafts of columns, bases, capitals, and entablatures: but these are most frequently found in the gates and towers. The castle has a triple wall composed of large pieces of white marble, and of stones resembling porphyry, on which are several inscriptions; but at present most of these are not legible.

The inhabitants of this city are said to amount to about forty thousand Mahometans, four or five thousand Armenians, and a thousand Greeks. The Armenians have seven churches here, and the Greeks two.

In the adjacent country are said to be the finest breed of goats in the world; they are perfectly white, and their hair, which is as fine as silk, is curled, and eight or nine inches long. Of this hair they make fine stuffs, which are the chief manufactures of the country, and in which the inhabitants carry on a great trade. These goats are only to be found within four or five days journey from the city; for the breed degenerates if they are carried farther.

The next province we shall mention is Phrygia Major, now called German, formerly a fruitful and pleasant country, but now in a great measure uncultivated. It is bounded on the north by Bithynia, on the east by Galatia, on the south by Pamphylia, and on the west by Mysia. The rivers Meander, Sangarius, Hemus, and Marcius, have all their sources in this district. The principal towns are,

Caneum, now Chintia, a considerable town, the seat of the beglerbeg, and once of the Turkish emperors, before the taking of Constantinople.

Gordium, where Gordius king of Phrygia is said to have tied the famous knot in Apollo's temple, of which it was foretold, that the person who untied it should be emperor of the world; but Alexander finding great difficulty in ac-

complishing it, cut it with his sword, and by that means performed the task.

Coloss, now Chonos, is seated on the south side of the Mæander. To the inhabitants of this city St. Paul wrote his epistle to the Colossians.

Apamia, is situated near the conflux of the Mæander with the Marcius, and was formerly a place of good trade. Hieropolis, now Bamboukale, seated in the frontiers of Lydia, and at present famous only for its noble ruins and hot spring.

Lydia, or Mæonia, is a fruitful country watered by some considerable rivers, particularly the Pactolus, Caius, Hemus, and Caistratus, and is bounded by Phrygia Major on the east, by Caria on the south, and by Æolis and Mysia on the west. The wealthy Cræsus was formerly king of this country. The principal towns are,

Sardis, which was once its capital, but is now a poor village on the river Pactolus, about seventy miles to the eastward of Smyrna. This was one of the seven churches of Asia, but was destroyed by an earthquake; there are, however, still some noble ruins, which afford a proof of its ancient grandeur.

Laodicea, or Eskihisar, was situated on the eastern boundaries of Lydia; it was also one of the seven churches, and was a large city, as appears from its ruins, among which are three theatres of white marble almost entire, and a noble circus; but it is now uninhabited.

Philadelphia, or Alachsheyer, another of the seven churches, is situated in a fruitful plain, but is fallen much from its primitive grandeur; however, according to some travellers, it has still two thousand Christian inhabitants, who have four churches.

Thyatira, another of the seven churches, now called Akhisar, stands about thirty miles to the north-west of Philadelphia, near the south bank of the river Hemus, where are seen the ruins of several ancient marble structures, though the modern houses are only built with clay. It, however, carries on some trade for corn and cotton.

Magnesia, now Gusehisar, situated on the river Mæander, was anciently a considerable city, as appears from its ruins, and is still a pretty large walled town, which trades to Smyrna in cotton and yarn.

Doris and Caria are usually joined together under the name of Adinelli, and are bounded by the river Mæander on the north, and by the sea on the south and west. The chief towns in Doris are,

Myndus, a sea-port situated on a small bay called Iaficus Sinus, and is the seat of a Turkish batha.

Halicarnassus, once the capital of Caria, but now a heap of ruins. It was famous for the tomb built by queen Artemisia, in honour of Mausolus, her husband, which was so superb a structure, that it was esteemed one of the wonders of the world; and from thence all magnificent tombs have obtained the name of Mausoleum.

Miletus, now Palatshia, was anciently a large city, and had a magnificent temple dedicated to Apollo; but is now only an inconsiderable village, consisting of shepherd's cottages.

Æolis and Ionia are likewise usually joined together, and form a long tract of country extending from north to south, and bounded on the west by the Archipelago or Ægean Sea. The ancient capital of Æolis was Cuma, which, with Phoea, and some other ancient towns, lie opposite to the island of Lesbos.

Ionia lies to the southward of Æolis, and had several towns famous in history; these were,

Clazomene, a maritime town about twenty-eight miles to the south-west of Smyrna, and is now called Urla. It was a considerable city in the time of the Romans, but is now a mean village.

Colophon lies about thirty miles to the south of Smyrna, and claims the honour of being the birth-place of Homer.

The celebrated city of Ephesus was situated in a pleasant country fifty miles to the south of Smyrna, but is now only a poor village of twenty or thirty houses; though it is near a fine haven, and under the Romans was

was the metropolis of Asia Minor. This city was famous for the temple of Diana, esteemed one of the wonders of the world, it being four hundred and twenty-five feet long, two hundred and twenty broad, and supported by a hundred and twenty-seven marble columns seventy feet in height; but was destroyed by Erostratus, from no other motive but to eternize his name, who set it on fire the very night in which Alexander the Great was born. St. Timothy was the first bishop of this city, and St. Paul honoured the Ephesians with an epistle. There are still the remains of a Roman circus, a theatre, an aqueduct, and heaps of magnificent ruins.

That part which is at present inhabited is bounded on the east by a large plain that extends as far as the sea, and on the sides by high hills. The most remarkable building in this part is the old church of St. John the Evangelist, which had antiently four gates, but two of them are walled up. On the inside the roof is supported by four columns of porphyry, the shafts of which are twelve feet and a half in circumference, and thirty-six feet in height. It has two domes, and is covered with lead. As the Turks have converted it into a mosque, they have added a minaret, and adorned it after their manner; but its greatest ornaments, when it was a church, were carried to Constantinople to adorn the mosque erected there by Sultan Soliman; so that on the outside it makes but an indifferent appearance.

The largest and richest city at present in Asia Minor is Smyrna, or Iſmir, which is situated in thirty-eight degrees twenty-eight minutes north-latitude, about a hundred and eighty-three miles west-by-south of Constantinople; and the goodness of its harbour has caused it to be rebuilt several times after it had been destroyed by earthquakes. This was one of the seven churches to whom St. John addressed himself in his Apocalypse. The town runs about half a mile along the shore, from whence it rises gradually on the side of a hill facing the sea. The houses of the English, French, and Dutch consuls are handsome structures; these, with most of the Christian merchants, are washed on one side by the sea, forming a street, named Frank-street, from its being solely inhabited by European Christians. The port is one of the finest of the Levant, it being able to contain the largest fleet; and indeed there are seldom fewer than an hundred ships of different nations.

A castle stands at its entrance, and commands all the shipping which sail in or out. There is likewise an old ruinous castle, near a mile in circumference, which stands in the upper part of the city, and, according to tradition, was built by the empress Helena; and near it is an antient structure said to be the remains of a palace where the Greek council was held when Smyrna was the metropolis of Asia Minor. They also shew the ruins of an amphitheatre, where it is said St. Polycarp, the first bishop, fought with lions.

The city is about four miles in circumference, and nearly of a triangular form; but the side next the mountain is much longer than the others. The houses are built low, and for the most part with clay-walls, on account of the earthquakes to which it is subject; but the caravanseras and some other of the public buildings have an air of magnificence. The streets are wide, and almost a continued bazar, in which great part of the merchandize of Europe and Asia is exposed to sale, with plenty of provisions; though these are not so cheap as in many other parts of Turkey, on account of the populousness of the place, and the great resort of foreigners. It is said to contain fifteen thousand Turks, ten thousand Greeks, eighteen hundred Jews, two hundred Armenians, and two hundred Franks. The Turks have nineteen mosques, two churches belong to the Greeks, one to the Armenians, and the Jews have eight synagogues. The Romans have three convents, one of the Jesuits, another of the Franciscans, and a third of the Recollects. There is also one of the fathers Della Terra Santa. Here resides an archbishop of the Greek church, a Latin bishop, who has a salary from Rome, with the title of bishop of Smyrna *in partibus infidelium*, and the English and Dutch factories have each their chaplain.

The walks about the town are extremely pleasant, particularly on the west side of Frank-street, where

there are several little groves of orange and lemon-trees, which being always clothed with leaves, blossoms, and fruit, regale several of the senses at the same time. The vines which cover the little hills about Smyrna afford both a delightful prospect and plenty of grapes, of which good wine is made. These hills are agreeably interspersed with fertile plains, little forests of olives and other fruit-trees, and many pleasure-houses, to which the Franks usually retire during the summer. In the neighbourhood of Smyrna is great plenty of game and wild-fowl, particularly deer and wild hogs, and the Franks frequently take the diversions of hunting and shooting. The sea also abounds with a variety of good fish. The European Christians are likewise allowed all imaginable liberties in the city, and usually clothe themselves after the European manner.

The chief commerce of this city consists in raw silk, silk stuffs, programs, and cotton yarn.

However, the unhealthfulness of the situation, and more especially the frequent earthquakes, from which 'tis said they are scarce ever free two years together, and have been felt forty days successively, are an abatement of the pleasure that might otherwise be taken here. A very dreadful one happened in June 1688, which overturned great part of the houses; and the rock opening where the castle stood, swallowed it up, and no less than five thousand persons perished on this occasion.

Near Smyrna are a great number of cameleons, an animal which has some resemblance to a lizard, but hath his back gibbous like a hog, and its feet have two claws before and three behind, which are not separated from each other till near the ends. It has a long tail like a rat, and is commonly as big, but it has very little or no motion with its head. The cameleons are in great abundance about the old walls of the castle, where they breed and lie in holes and heaps of ruins. Sir George Wheeler kept two of them twenty days, during which he made the following observations: their colour was usually green, darker towards the back, and lighter towards the belly, where it inclined to a yellow, with spots that were sometimes reddish and at others whitish; but the green often changed into a dark colour like that of earth, without any appearance of green; and the whitish spots often vanished; but sometimes turned into the same dirt colour, and at others into a dark purple. Sometimes from being green all over, they would be spotted with black; and when they slept under a white woollen cap, they would commonly, when uncovered, be of a white or cream colour; but they would also turn white under a red cap, for they never turned either red or blue, though they often lay under those colours; but being placed upon green they would become green, and upon the dark earth would change so as exactly to resemble it.

As our author was walking by the side of the hill near the old castle, he saw many that had changed themselves so as to resemble the colour of the speckled stone-wall, and were grey with spots like moss. He found one on the top of a green bush, which, when he first observed it, was of a bright green; but it no sooner perceived that he saw it, than it immediately dropped to the ground; he then lost sight of it; but searching, he observed it creeping away to a hole in the rock, it being changed to a dark brown, exactly like the earth; which was then, after a shower of rain, of that colour.

The power of thus changing its colour is given it by nature for its preservation; for it moves very slowly, lifting up its legs high, and not quick, as if it searched for hold to climb upwards, which it can do very well up a tree, a bush, or wall. When it saw itself in danger of being caught, it opened its mouth, and hissed like a snake.

The eyes of the camelon are no less wonderful than the variation of the colours of the body: they are large in proportion to the size of its head, being generally bigger than a pea, and covered all over with a skin of the same substance with the body, the grain being in circles just to the centre, where there is an hole no bigger than a small pin's head, by which it receives light, which must make the angle of its vision very acute. The head being immoveable, it cannot immediately turn to ob-

ject; but to remedy this inconvenience it cannot only move its eyes backward and forward, upward and downward, but one forward and the other backward, or one upward and the other downward, one fixed on one object, and the other moving according to the motion of some other object.

The tongue is a kind of little trunk of a gristly substance, about half an inch long, and hollow, joined to its throat by a strong membranous and fleshy substance, in which it is sheathed when in the mouth. It will dart this above an inch out of its mouth, smeared with a glutinous substance to catch flies, which stick fast to it as to birdlime, and so are brought into the mouth. These flies are their ordinary known food, but, like many other animals of the same cold nature, as lizards and serpents, they will live a long time without sustenance.

Its tail is of very great use in climbing, for it will twine about any thing so fast, that if its feet slip, it will sustain and recover its whole body by it. Our author put one he caught into a glass so deep, that it could not reach near the brim with its fore-feet, nor could take any hold with its claws; and yet it got out, and almost escaped from him, as he afterwards saw, by standing upon its fore-feet, and raising itself up backwards, till it caught hold of the brim of the glass with its tail, by the help of which it lifted out its whole body.

Myfia and Phrygia Minor are bounded on the north by the Propontis, or Sea of Marmora; towards the east by Bithynia and Phrygia Major; on the south by Lydia; and on the west by the Egean Sea, or Archipelago. The principal river in this district is that which was anciently called the Granicus, which rises in the mountains of this country, and after running fifty or sixty miles from south to north falls into the sea of Marmora. This river is famous for the battle fought upon its banks by Alexander and Darius. In this province is also situated Mount Ida, where the poets represent Paris giving judgment between the goddesses. The chief towns were,

Troy, or Ilium, which was situated near the sea opposite the island of Tenedos, and rendered famous by Homer and Virgil for its ten years siege: but Mr. Wood observes, that there is not a single stone to shew its exact situation.

Troas Alexandria was seated to the southward of Troy, and was once the metropolis of the province, though it is now a ruinous place.

Pergamus is seated in a plain near the banks of the river Caicus. It was another of the seven churches, and was anciently a noble city. Parchment and tapestry are said to be first invented here; and here Galen received his birth; but it is now a very indifferent town, it having only one Christian church and a mosque.

Abydus, or Avido, a fortress opposite to Sestus, at the mouth of the Hellespont, is celebrated by the poets for the loves of Hero and Leander, and for the obstinate resistance made by the inhabitants against Philip of Macedon, who, when they could no longer defend the place, destroyed themselves. It is now the southern castle of the Dardanelles, thus named from Dardanus, a little town that lies to the southward of it.

Bithynia, now called by the Turks Beccangil, is separated from Europe only by the Thracian Bosphorus, and is so near Constantinople that Scutari, which stands on the Asian side, is esteemed only a suburb to that city. The principal towns are the following.

Nicomedia, or Ischmit, is situated at the bottom of a bay, in forty degrees forty-six minutes north latitude, fifty miles south-east of Constantinople. It received its name from Nicomedes, king of Bithynia, who enlarged it, and was once reckoned the capital of that kingdom. It was formerly a very large place, and the ruins of its ancient buildings and fine palaces are very considerable. However, it is still a place of consequence, and contains thirty thousand inhabitants, who consist of Greeks, Armenians, Turks, and Jews. The Turks have twenty mosques; the Christians have also some churches, and it is the see of a Greek archbishop; the Jews have likewise two synagogues. Most of the ships of Constanti-

nople are built here, and the inhabitants carry on a considerable trade in silk, cotton, glass, and earthen ware.

Chalcedon, which stood two miles from the place where Scutari now stands, was once a flourishing city, but is now reduced to a poor village.

Nice, or Inic, was anciently a noble city, and is famous for the great general council assembled there in 325, who endeavoured to suppress the doctrines of Arius; and from its being the residence of the Greek emperors when Constantinople was taken by the Latins. It is situated in forty-seven degrees fifteen minutes north latitude, seventy-five miles south-east of Constantinople, in a pleasant country fertile in corn and excellent wine. The present city is large and pretty well peopled, the Jews inhabiting the greatest part of it: but there are now no remains of its ancient splendor, except an aqueduct.

Piusa, by the Turks called Bursa, is the capital of Bithynia, as it was of the Ottoman empire before the taking of Constantinople. It is situated in thirty-five degrees fifty-three minutes north latitude, seventy-five miles south of Constantinople, upon several little hills at the foot of Mount Olympus, from which it is not above two or three leagues distant, and at the edge of a large and fine plain, full of mulberry and other fruit-trees. It is watered by so many springs, which descend from Mount Olympus, that almost every house has a fountain. The most considerable of these springs issues in a stream as large as a man's body, and being conveyed to the town by a marble aqueduct, is dispersed to every part of the city.

Bursa is about half a league in length, and is still surrounded by the ancient wall it had when in the possession of the Christians, but is much out of repair, it being in several parts broken and ruinous. The mosques, which are very fine, are covered with lead, and adorned with domes. These structures are said to amount to above thirty. The caravanseras are magnificent and commodious. The bezeftine, or exchange, is a large structure full of ware-houses and shops, containing all the commodities of the East, besides their own manufactures of silk. This city is in general very pleasant, and the quarter of the bazars is particularly neat and well paved. The city contains above forty thousand Turks, who alone are permitted to dwell within the walls; but the suburbs, which are vastly finer and better peopled, are filled with Jews, Armenians, and Greeks, of which there are said to be five hundred families of Armenians, four hundred of Jews, and three hundred of Greeks. The Jews came hither from Granada, in Spain, and it is said, still speak good Spanish. Here are the best workmen in all Turkey, and excellent imitators of the tapestry of France and Italy.

The grand Seignior's palace in this city is situated on a high rock, and enclosed with a double wall; but it is in a ruinous condition. Here they shew the sepulchres of the first Turkish emperors, and their sultanas, in small chapels covered with domes.

The baths of Calypso are a little more than a mile from the city, and are very handsome structures covered with domes, like those we have already described, and are so famous for the cures they have effected, that people come a hundred miles to receive the benefit of them.

Mount Olympus, which is situated in the neighbourhood of the city, is of a prodigious height, and the top of it barren and covered with snow; from thence Constantinople is supplied with it, though it is at one hundred miles distance. The middle of the mountain is planted with firs, and other trees, and the vallies beneath abound with a variety of fruits, particularly apples, grapes, mulberries, melons, and nuts. Flesh, fish, and fowl are no where more plentiful than at Bursa, and the fields around it would produce all manner of corn were they cultivated; but the tyranny of the Turkish government makes them sow little more corn than is necessary for their own immediate use.

Thus we have given a view of the whole continent of Asia, the great scene of action in the first ages of the world, and once the seat not only of the most mighty empires, but of the arts and sciences. From the ruins that

that have been described, and from the antient histories of these countries we may form some idea of the magnificence of their cities and temples, which exceeded in splendor every thing of the kind produced by the moderns in Europe; but this splendor and magnificence is no more, and while we judge of it from its ruins, we have reason to be humbled when we consider the instability of all human affairs, which involves in it not only the destruction of arts, but of cities erected with the most durable marble, that seem to have been founded with the expectation of continuing their grandeur to the latest ages, and of empires raised by valour, and supported by the utmost efforts of human policy.

The arts and sciences are now removed to Europe, and some of them are arrived to much greater perfection than ever they were known in the East. May these ever flourish! and while they are protected by moderate govern-

ments, founded on reason, and conducted by humanity and virtue, we may justly flatter ourselves they will never decay. It is not the religion of Mahomet or of Paganism that has banished the arts, depopulated countries, and converted the most fertile lands into barren deserts and uncultivated wilds; but savage ignorance, the lawless tyranny of despotic power, the lust of ambition, and those national vices, that degrade the human mind, and call down the resentment of offended heaven.

Indeed, governments founded on the mild laws of Christianity have a more solid basis; and where it shall prevail in all its purity, liberty and the arts shall go hand in hand; the thrones of princes will be as immoveable as the rocks and mountains; ambition will be confined within the bounds of equity; mankind will consider each other as brethren, and the law of nations will be the invariable law of nature and humanity.

C H A P. XXVIII.

Of the ASIATIC ISLANDS subject to the TURKS.

S E C T. I.

Of the Island of CYPRUS.

Its Situation, Extent, Climate, and Produce; with a concise Account of the Revolutions that have happened in its Government; of its most considerable Cities, and the Poverty of its Inhabitants.

THE island of Cyprus has been famous in all ages for the fertility of its soil, the excellence of its climate, and the advantages of its situation. It lies between the thirty-fourth and thirty-sixth degree of north latitude, and between the thirty-third and thirty-fifth degree eight minutes east longitude. It is sixty-nine miles south of the coast of Caramania or Cilicia, and thirty-six west of the coast of Syria. This island stretches from the south-west to the north-east, and is about one hundred and fifty miles in length, and seventy in breadth in the broadest part.

This island was in ancient times consecrated to Venus, who was stiled by the poets the Cyprian goddess, probably from the wantonness of its inhabitants. The longest day is fourteen hours and a half, and the weather in summer is extremely hot, so that sometimes their brooks and even their rivers are dried up. It is said, that in the reign of Constantine the Great, this island had no rain for thirty-six years together, on which account it was in a great measure deserted.

It abounds with corn, wine, oil, sugar, honey, cotton, allum, wool, verdigris, turpentine, all sorts of metals, and most excellent salt. They have likewise several kinds of earth fit for the use of the painters, particularly red, yellow, and black; but with these advantages they are subject to swarms of locusts, which visit them in the hot season, appearing at a distance like clouds; and were they not driven into the sea by a north wind, which happens about that time, would devour all the fruits of the earth: they have also great plenty of flesh, fish, and fowl.

This island was antiently governed by kings, and it had nine of them when it was reduced by Cyrus, who rendered them all tributary to himself. Long after this the island was conquered by Alexander the Great, and upon the division of his empire, it fell to the share of Ptolemy king of Egypt, under whose successors it remained, till the Romans, without any colour for invading it, sent Portius Cato to reduce it under their power, which he accomplished and brought back to Rome the spoils of the island, which amounted to seven thousand talents. After the division of the Roman empire, it belonged to the Greeks; from whom it was taken by the

Saracens, but was recovered from them and governed by dukes or princes. In 1191 it was conquered by Richard I. king of England, who putting in here for fresh water in his voyage to the Holy Land, met with a very hospitable reception; in return for which he subdued the island, and transferred his right to it to Guy Lusignan, the titular king of Jerusalem, whose family held it for many generations. Under these princes it was divided into twelve counties, containing forty-eight great towns, and upwards of eight hundred villages. The Venetians obtained the possession of it in 1473, and kept it almost an hundred years; but it was at last taken from them by Soliman II. emperor of the Turks, after a long and brave defence.

The capital of the island, named Nicosia, was formerly the residence of their kings, as it is now of the beglerbeg or viceroy. It stands near the middle of the country, and is about three miles in circumference; but is fallen to decay since its being in the power of the Turks. The cathedral, which was dedicated to St. Sophia, is converted into a Turkish mosque. In the city are three or four Greek churches, and it is still the see of an archbishop, who has three suffragans under him; these are the bishops of Larneza, Cerenes, and Batto. The Latins and Armenians have also several churches there.

The other towns most worthy of notice are, Famagusta, the antient Salamis, a port town on the east part of the island. It had a good harbour defended by two forts, which are opposite to each other; but it is now almost choaked up, and has consequently lost its trade. In the year 1570 it was taken from the Venetians by the Turks after a vigorous defence, and a siege which lasted six months; when, though the place surrendered on honourable conditions, the cruel conquerors, barbarously slayed the Venetian governor alive, and murdered the inhabitants in cold blood.

Paphos, now called Baffo, is situated at the west end of the island, and is a large and agreeable place. There are considerable ruins near the port, particularly some broken columns, which probably belonged to the temple of Venus.

In short, though this island has several good ports; and though it affords all the commodities that can be desired for carrying on a great trade, it is at present thinly peopled, and not half cultivated. Long ago a Turkish basha destroyed all the sugar-canes, to prevent the Cypriots growing too rich; an evil which there is now no reason to fear; for at this day it affords the clearest proof how much a bad government can defeat the kind intentions of nature; since, in spite of all the advantages that a country can possibly have, there never was a more dismal

mal or defolate place than this island is at present. From having some millions of people, it has now scarce thirty thousand : from a climate that produced a perpetual spring, it is become both unwholesome and unpleasant : from cities and towns that extended to each other, there are only villages and heaps of ruins ; and from the greatest affluence, the inhabitants are reduced to penury. Thus the face of modern Cyprus seems to refute all that the ancients have said in its favour. Such are the dire effects of an arbitrary and despotic government !

S E C T. II.

Of the Island of RHODES.

Its Situation, Extent, Climate, Soil, and Produce : with a Description of the City of Rhodes, the Capital of the Island, and of the famous Colossus.

WE shall next proceed to Rhodes, which is situated between the thirty-sixth and thirty-seventh degrees of north latitude, about two hundred and fifty miles to the westward of Cyprus, and not above twenty to the south-west of Natolia. It is about forty miles in length, and fifteen in breadth, and has formerly had the names of Ethræa, Asteria, Corymbia, and some others.

The air is good, and the soil fertile ; but, as in other places subject to the Turks, is badly cultivated. The country is exceeding pleasant, and is cloathed with trees and herbage always green ; a day scarce ever happens in which the sun does not shine out. Their wines are much admired, and the country affords such plenty of almost every thing that can render life agreeable, that it gave occasion to the fiction of its having golden showers. It does not indeed abound with corn, but then the inhabitants are well supplied with it from the neighbouring continent of Natolia.

This island was subject to the Greeks, from whom it was taken by the Saracens ; but in 1309 the knights hospitallers of Jerusalem took it from them and held it above two hundred years, during which they resisted the whole Turkish power : but at last it was taken by the Turks under Soliman II. in 1522, by the treachery of Andrea d'Amaral, chancellor of the order ; who, being displeased at not being chosen grand-master at a late election, informed the Turks of their weakness by a letter shot to them on an arrow.

In the island is one town of the same name, and several villages that are well inhabited. The city of Rhodes is situated on the north-east part of the island, and has two harbours ; but that called the great port is not very safe when the wind is easterly. On the right at the entrance of this port is a tower, built by the Turks, in the place where the old tower of St. Nicholas stood. It is well furnished with cannon, has a curtain which reaches to the walls of the town, and a bastion behind it. Opposite to this tower is the castle of St. Angelo, which is somewhat ruinous.

This castle and tower were erected in the place where stood the feet of the great Colossus, one of the seven wonders of the world, which was so large that a ship under sail might pass between its legs. This statue, which was of such an enormous size as thus to straddle fifty fathoms, represented Apollo, and was cast entirely of brass by Chares of Lyndus, a town in the isle of Rhodes, who was twelve years in making it ; it was seventy cubits high, and every part being in proportion, the thumb was as thick as a man could grasp in his arms ; every finger was of the size of an ordinary statue, and, for the direction of vessels into the harbour at night, he held a light-house in his hand. This prodigious statue was thrown down by an earthquake fifty or three score years after its being erected, and is said to have lain on the ground till the Saracens made themselves masters of Rhodes, who having beaten it to pieces fourteen hundred and sixty-one years after it was made, sold it to a Jew ; who having carried it by sea to Alexandria, in 954, there loaded nine hundred camels with the metal. But after all, Du Mont has endeavoured to prove, that it is probable, the story of the Colossus is a fable ; some other authors have been of the same opinion, and indeed the

extravagant dimensions ascribed to it, and such a quantity of brass being suffered to lie on the ground for so many ages, would tempt the most credulous to doubt the truth of the relation.

The port of the galleys, which is covered by the castle of St. Erme, is a good harbour ; but its mouth is so narrow, that only one galley can enter at a time. On the sides of this port is a piazza, with some trees and a fountain, and at the bottom of it is the arsenal, where the galleys and saics are built. A little above the port is a burying-place, in which are fifteen or twenty domes of free-stone, well built, and most of them supported by four arches. These were the sepulchres of the beys, or other persons of distinction in Rhodes, who had been killed in the wars.

Part of the city stands on the rising of the hill, and it is three miles in circumference. It has high walls planted on the top with salions, and below are port-houses for great cannon. It has three gates ; one to the sea where corn is sold, and two on the land-side. The streets are broad, straight, and well paved with small stones, and for the most part covered on each side with penthouses ; but the largest is paved in the middle from one end to the other with marble. It has several handsome buildings, among which is St. John's church, which is turned into a mosque. There are still to be seen the apartments of the knights of St. John of Jerusalem, and the palace of the grand master ; but they are very much decayed. This palace is seated on the highest part of the hill, and is now converted into a prison.

The inhabitants consist of Turks, Jews, and Christians ; but the latter have only shops within the walls, and are obliged to have their dwellings without the city, and to retire there every night.

S E C T. III.

Of the Island of LESBOS, or MYTELENE.

Its Situation, Extent, Climate, and Produce. Of Castro, its present Capital, and of the great Men who have rendered this Island famous.

THE island of Mytelene, antiently called Lesbos, is situated in the Archipelago, and extends from thirty-seven to thirty-nine degrees fifteen minutes north latitude, and is about fifty miles in length and twenty-five in breadth. Part of it is mountainous, cool, and covered with trees ; and there are many fertile plains which produce good wheat, excellent oil, the best figs in the Archipelago, and its generous wine, which was commended by Aristotle and Horace, still preserves its reputation. The sea affords plenty of fish, especially oysters, which are sent from hence to Smyrna.

This was a very considerable island in the time of the Romans ; for Cicero and Vitruvius speak much of its magnificence ; and indeed fragments are every where to be seen of its antient grandeur, as broken columns, chapiters, bases, friezes, and the like, of the finest marble, curiously wrought, and interspersed with inscriptions.

The women of the island have always been noted for their freedom and the looseness of their manners ; but, though they are not now so bad as they were formerly, they go with their breasts quite naked.

The chief town, named Castro, and antiently Mytelene, is situated on a rocky promontory in the north part of the island, and has two ports. The town is neither large nor well built, but has a castle, with a strong garrison for the defence of the island against pirates, who are very numerous in these seas ; and there are above a hundred villages in the country.

Few islands have produced men of greater genius ; but all their lectures of philosophy, it seems, were far from reforming the morals of the people ; for it was a proverbial saying in Greece, when speaking of a profligate fellow, that he lived like a Lesbian. Theophrastus and Phanios, the disciples of Aristotle, and the famous Arion, who is said to charm the dolphins with his music, with Pittacus, one of the seven wise men of Greece, and Sappho, the celebrated poetess, were natives of this island.

The famous Epicurus read public lectures here; and Aristotle, with other great men, resided here a considerable time. It is now subject to the Turks, and a cadi, who resides at Castro, has the civil administration of the government, while an aga of the janizaries has the command of the soldiers.

SECT. IV.

Of the Island of CHIOS, or SCIO, called by the Turks SAKI SADUCI.

Its Situation, Extent, Soil, and Produce. The Persons, Dress, and Manners of the Inhabitants. Of the city of Scio, and its being taken from the Turks by the Venetians, and conquered back from them by the Turks; on which the Latins, being charged with favouring the Venetians, were deprived of their Privileges. Of the other Towns and Villages, with the Manner of extracting Mastic from the Lentisk-Tree. An Account of Neamoni, a rich Monastery of Greek Monks. Of the pretended School and House of Homer.

CHIOS, or Scio, is one of the most beautiful and pleasant islands in the Archipelago. It is situated near the coast of Naxos, to the north-east of Samos, and to the south of Mytelene, and extends from thirty-eight degrees eight minutes to thirty-eight degrees thirty-seven minutes north latitude. It is thirty-two miles in length, and fifteen in breadth.

The isle of Chios is very subject to earthquakes; it is extremely mountainous and stoney, and has so little rain, that every spring the Greeks, Latins, Jews and Turks make processions in order to obtain it: yet it has been called the Paradise of Greece; for the mountains, which are now pretty bare, were formerly covered with woods, and in some places they still abound with abundance of citron, orange, olive, mulberry, myrtle, and pomegranate trees, without reckoning mastic and turpentine.

The country produces corn, but not sufficient for the inhabitants, who therefore import it from time to time from the continent; but as for wine, Chios has enough and to spare, and therefore considerable quantities are exported to the neighbouring islands. It is pleasant and stomachic, and Athenæus says, that the wines of Scio help digestion, are wholesome, and exceed all other wines in deliciousness of taste.

The inhabitants, says Tournesfort, plant their vines on the hills: they cut their grapes in August, and having suffered them to dry for seven or eight days in the sun, they press them, and let them stand in tubs to work; the cellars being all the while close shut. In making the best wine they mix among the black grapes a sort of white one, which smells like a peach kernel; but in making nectar, which is so called even to this day, they make use of another kind of grape somewhat stypitic.

In short, there is such plenty, that every thing is extremely cheap, and excellent partridges may be had for a trifle, as they keep them tame, and have keepers who drive them out in the morning, and whistle them in at night, which call they always obey.

The men are tall and well shaped, but have very disagreeable countenances: but their women are beautiful, and their faces extremely fair. Mr. Thevenot, however, observes, that their breasts are scorched with the sun; which, he says, is the more surprising, as they take as little care of the face as of the breast. They are neat in their dress, wearing very white linen; and the finest stuffs they can get; but are not permitted to wear gold, silver, or jewels.

Their vivacity, wit, and good humour, are great additions to their natural charms. They are extremely talkative, and both sexes are fond of dancing: on Sundays and holidays they dance promiscuously all night, both in the cities and villages, and freely allow strangers to join with them. They are so far from being jealous, that the women stand at the doors and talk with the men who pass by, and will be as merry and familiar with strangers as if they had been long acquainted. Even the women of distinction go to market to buy provisions, and carry them home openly through the streets.

The city of Scio is large, and the best built of any in the Levant. The houses are handsome and commodious; some of them are terraced, and others covered with tiles: for the Chiots have retained the Genoese method of building; that people having embellished all the towns of the East where they have been settled.

The castle is an old citadel, built on the edge of the sea, and is said to be garrisoned by fourteen hundred Turks. It is defended by round towers, and an indifferent ditch; and on the inside there are only some clusters of houses inhabited by the Turks, and a neat mosque.

The port of Scio is a place of rendezvous for all the ships that either sail to Constantinople, or from thence into Syria and Egypt; yet the harbour is none of the best, for at present it has only a very indifferent mole, built by the Genoese, level with the surface of the water. The entrance is narrow and dangerous on account of the rocks, which are but just covered, and could scarcely be avoided, was it not for a light-house.

Before we leave this city, it is proper to observe, that Antonio Zeno, captain-general of the Venetian army, came before the town on the twenty-eighth of April, 1694, with fourteen thousand men, and attacked the castle from the sea, the only place of strength in the island, when it held out no more than five days, though it was defended by eight hundred Turks, supported by above a thousand men well armed, who might have thrown themselves into it without the least opposition on the land-side: but the next year the Venetians lost it with as much expedition as they had before obtained it. Their terror was so great, that they left behind them their ammunition and cannon; and their troops fled in such disorder, that it is a common saying in the island, that the soldiers took every fly for a turban.

The Turks entered it as a conquered country, and the Greeks throwing all the blame on the Latins, they were from thenceforward forbid to wear hats, and obliged to quit the Genoese habits, which they had worn till that time: they were likewise ordered to alight from their horses at the city gate, and to salute with the greatest respect the meanest Mussulman. Before this event the Romish priests bore the host to the sick in full liberty at noon-day; the procession of Corpus Christi was made with all its formalities, the clergy walking in their proper habits, under canopies, and bearing censers in their hands; in short, the Turks used to call this island *Little Rome*: for, besides the churches in the country, the Latins had seven in the town: but, upon this change, the cathedral, and the church of the Dominicans were converted into mosques; the church of the Jesuits was turned into an inn: those of the Capuchins and the Recolects, the lady of Loretto, and that of St. Anne, are all pulled down. The Capuchins had also within five hundred paces of the town the church of St. Roch, and this has shared the same fate with the rest. The Latin bishop was forced to fly to the Morea, and the priests who remained behind were made subject to the capitation-tax, but were afterwards exempted on the application of the French.

The Greek bishop remains in the same circumstances as before the enterprise of the Venetians, having no less than three hundred churches under him, and the island is full of chapels; their monasteries and nunneries also enjoy large revenues. The most considerable of the former is that of Neamoni, or the New Solitude, which is situated above five miles from the city, and annually pays five hundred crowns capitation-tax to the Turks. This monastery is very spacious, and built in the form of a castle. No woman is allowed to enter it. There are commonly a hundred and fifty Greek monks under the government of an abbot, and they are never to exceed two hundred. When any places are vacant, those who are willing to supply them must pay a hundred piasters, and come with their whole estates into the convent, where they may enjoy them for life, and then the estates must be left to the convent, unless any one has a kinsman who will become a monk, in which case one-third may be given to him, on condition that at his death that must also go to the convent. They there live every day upon black bread, bad wine, and rotten cheese; and if they have any thing else, they must procure it for themselves;

selves; and indeed some live well on their estates, and keep a horse to ride out for pleasure. However, on festivals and Sundays they eat all together in their hall or refectory. This monastery is said to be endowed with an eighth part of the revenue of the whole island, and some say much more, having no less than fifty thousand crowns annually paid them in money.

This monastery stands on a little hill in a very solitary place, surrounded by rugged mountains and precipices; the Greeks always pitching upon such situations for their religious houses, quite contrary to the Catholics, who place their monasteries in the most desirable situations. The church of this convent is, however, esteemed one of the best in the Levant, and is said to be adorned with thirty-two columns, whose shafts and capitals are of jasper dug in the island. It has also many paintings; but they are badly executed, and make a very disagreeable appearance, in spite of the gilding with which they are covered.

As to their nunneries, they are very different from those of the Christians in Europe. Mr. Thevenot entered one of them, where he saw both Christians and Turks; and having entered the chamber of one of the sisters, he says he found her kind even beyond the bounds of Christian charity. These nuns purchase a chamber on their being admitted into the house: they go abroad when they please, and may leave the convent if they think fit. They are usually employed in embroidery in gold, silver, or silk, in which the Greeks are very skilful, and the flowers they work upon their handkerchiefs and purses are very beautiful.

The island of Chios, besides the capital, contains sixty towns and villages, the principal of which, named Cordomolo, has about five hundred inhabitants. The country round it is very fertile and well watered, yielding annually about a hundred and seventy tons of wine.

At five miles distance is a fine valley, half a mile long, where is a spring of water to which there was a descent of twenty-five beautiful marble steps, but these are all removed; and at the end of the valley was formerly a temple of fine ash-coloured marble, but it has been pulled down, and the stones broken, only for the sake of the iron and lead used in joining them together.

Beyond this valley is Vichi, a village inhabited by three hundred persons; and beyond it is Cambia, which has an hundred inhabitants, and is surrounded by rocks, hills, and woods of wild pine-trees, which they sell for timber to build galleys.

In a valley below this last village arises a rock that is almost inaccessible, and on the top of it is a small castle, opposite to which is the Mount of St. Elias, the highest place in the island; for it may be seen from Tenedos, which is above an hundred miles distant. On its top is a church dedicated to St. Elias, which is usually covered with mist and snow; and in the middle of the mountain is a large spring that waters the surrounding fields, which are planted with a variety of fruit-trees.

Volisso is a considerable village, seated on a hill, and contains about three hundred houses. It has a castle built by the famous Belisarius, general to the emperor Justinian, who was forced on shore by a storm. The adjacent country is very pleasant and fertile, and the inhabitants annually raise five thousand pounds weight of silk.

There are twenty-two villages in the island that cultivate lentisk trees, from whence mastic is produced. They begin to make incisions in those trees on the first of August, cutting the bark cross-ways with very large knives. Next day the nutritious juice distils in small tears, which by little and little form the mastic grains; for they harden on the ground, and are carefully picked up from under the trees. The height of their harvest is in the middle of August. They indeed make other incisions towards the end of September; but the trees then afford mastic in smaller quantities. They sift this gum, to clear it from the dust. These villages are said to produce about one hundred thousand chests of mastic, of which three hundred chests of one hundred weight each are annually paid to the Grand Signior. This mastic is allowed to be the best in the world. It is a white gum

which enters into the composition of many ointments, and is chewed by the Greeks to whiten their teeth and sweeten their breath. The sultanas consume the greatest part of that designed for the seraglio; they chew it by way of amusement, and to give an agreeable smell to their breath, especially in a morning fasting; they also put some grains of mastic in perfuming-pots, and into their bread before it goes to the oven. In short, it is esteemed beneficial in distempers of the stomach; it stops bleeding, and fortifies the gums.

The principal of these mastic towns is Callimacha, which has two gates, six Greek churches, and a nunnery. It is well peopled, and round it are said to be thirty churches belonging to the Greeks.

After mentioning the mastic, it will be proper to take notice of the turpentine tree, which grows here without culture on the borders of the vineyards, and by the highway side. It is about as tall as the lentisk tree, and has a reddish leaf. They wound the trunk with a hatchet, between the months of July and October, on which the turpentine flows down on a flat stone set under the trees to receive it. This liquor is an excellent natural balsam, and a noble stomachic.

Of their figs they make a kind of brandy, of which they export great quantities to the neighbouring islands.

The olives of Scio, when they have a very good crop, do not produce above two hundred hogheads of oil.

Their silk is a more valuable commodity, for they annually raise from the worm about thirty thousand pounds weight of silk, which is most of it used in the island in the manufactures of damask, taffety, satin, velvet, and other silk stuffs, with some of which they mix gold and silver. With these they carry on a considerable commerce to Egypt, and the maritime cities of Natolia and Barbary: but they are said to be so very sharp and dishonest in their dealings, that a stranger ought to have all his wits about him to avoid being cheated.

This island has produced many extraordinary men, and the Chiois not only pretend that Homer was their countryman, but still shew his school, which is at the foot of mount Epos, by the sea-side, about four miles from the city of Scio: it is a flat rock, in which they have hewn a kind of round basin, twenty feet in diameter, the edge made so as to sit upon. From the middle of this basin rises a square stone about three feet in height, and two feet eight inches broad, on the sides of which were antiently carved certain animals, which are now so disfigured that it is impossible to know what they were designed to represent, though some fancy they bear the resemblance of lions. Upon this square stone the master was supposed to sit in the midst of his scholars.

Besides Homer's school they shew his dwelling-house, where he composed most of his poems, which, no doubt, must be in a very ruinous condition, as Homer lived nine hundred and sixty-one years before the birth of Christ. It stands in a place which bears that poet's name, in the north part of the island, near the fields which produce the wine called nectar. But it is very uncertain whether Homer was a native of Scio, as seven great cities contended for the honour of his birth, which he seems to have industriously concealed.

Learning is, however, now out of use, and the people in general are involved in the most profound ignorance. Those in affluent circumstance sit whole days talking under the trees. They are also fond of pleasure, and are apt to drink to excess.

In the whole island there are not above ten thousand Turks, and three thousand of the Latins: but the Greeks are said to amount to one hundred thousand.

With respect to the government of the island, it is in time of peace under a cady, or civil magistrate; but in war the forces are commanded by a basha. An aga of the janizaries, with an hundred and fifty men of that body, also resides there in time of peace, and with double that number in time of war.

There are three degrees of Greeks in this island, who are differently taxed; those of the first rank pay annually ten crowns a head, the next three crowns, and the meanest two crowns and a half a head. The Greeks are allowed to chuse twelve of their own number in the city,

city, to regulate the other taxes, and to preside over the community; and in each village there are six chosen, who decide most of their differences, so that they seldom refer their affairs to the decision of the cady.

S E C T. V.

Of the Isle of SAMOS.

Its Situation, Extent, Climate, Soil, Minerals, Vegetables, and Animals. The Number of the Inhabitants, and the Nature of their Government.

THE island of Samos is situated in the Archipelago over-against Ephesus, and not above six miles from the continent of Natolia. It extends from thirty-seven degrees forty-five minutes to thirty seven degrees fifty-seven minutes north latitude, it being about thirty-two miles in length and fifteen in breadth.

The air of this island is generally healthful, except in the low marshy grounds; and it is observed here, as in most other islands of the Levant, that they have seldom any rain, thunder, or tempestuous weather, except in the winter; while in our climate we have most thunder, and the heaviest showers in summer. A chain of mountains extends through the middle of the island from east to west. These were formerly called Amphelos, from most of the mountains being of white marble; but they are covered with a strata of earth of such depth, as to produce trees and plants, and are watered by fine springs. The most considerable of these streams is that of Metelinous, which flows southward into the sea. In the low lands are iron mines, oker, and emery.

The port of Vati on the north part of the island is so capacious as to be able to receive a large fleet, and is justly esteemed the best in the island.

The port of Seitan is on the west coast, and that of Tigani on the south. This last was the port of the ancient city of Samos.

This island is incumbered with mountains, rocks, and precipices, but the plains are fertile and pleasant; and the mountains are covered with two sorts of pines, the one a beautiful kind which rises to a great height, and is fit for masts, and yields a great quantity of turpentine. The others are of the common sort.

The country produces corn, and abundance of excellent muscadine grapes, apples, melons, pomegranates, olives, mulberry-trees, lentils, kidney-beans, and white figs, four times as large as the common sort, but not so well tasted: their silk is very fine, and their honey and wax admirable.

The horses and mules of Samos are serviceable, but are not admired for their beauty. The inhabitants have considerable herds of oxen, sheep, goats, and hogs, with hares, and other game in great plenty.

This island also abounds with wild fowl, as woodcocks, snipes, partridges, turtle-doves, wood-pigeons, wheat-eats, and thrushes; besides which their poultry are excellent.

The present inhabitants of Samos are computed to amount to twelve thousand men, almost all of whom are Greeks, except the cady, the aga, and his lieutenant, who are chiefly concerned in levying the Grand Seignior's duties; for with respect to the civil government and the administration of justice, the Greeks of the several towns and villages are allowed to choose their own magistrates. The Samians live at their ease, and enjoy greater freedom than the Christians in any other part of the Turkish dominions. There are about two hundred papas or priests in the island, and a much greater number of monks, who have three monasteries. There are also four nanneries and above three hundred private chapels. The bishop of the island resides at Cora, and has a revenue amounting to about two thousand crowns per annum.

The chief town is Cora, which is situated on the south side of the island within two miles of the sea, adjoining to the ruins of the antient city of Samos. It stands in a fertile pleasant country, but is not very healthful, because

the waters, which formerly discharged themselves into the sea, now stagnate in the plain. This town contains about six hundred houses, but many of them are uninhabited.

The city of Samos is entirely destroyed. The north part of it stood upon a hill, and the other ran along the sea-shore from port Tigani, which is two miles from Cora, to cape Juno. Tigani was the galley port of the antients, and was built in the form of an half-moon; on the left horn of which was the famous pier, which Herodotus esteems one of the three wonders of Samos, it being twenty fathoms in height, and carried above two hundred and fifty paces into the sea. From this port begins the walls of the upper town on the declivity of a rugged mountain. The ruins of these walls shew that they were very magnificent, they being ten or twelve feet thick, with marble towers at proper distances.

The brow of the mountain next the sea was covered with buildings in the form of an amphitheatre, and a little lower may still be seen the place where the theatre stood.

On descending from the theatre towards the sea, you see a multitude of broken columns, some fluted and others plain, lying in such order as evidently shew that they once supported temples, or formed porticos.

The city appears to have taken up in breadth all the fine plain between Cora and the sea, which is upwards of two miles in length, and to have extended as far as the river which runs beyond the ruins of Juno's temple, which, according to Strabo, was filled with pictures and statues, among which were the ives of Jupiter and Juno. Water was brought to the city from the head of the river Metelinous, by a noble aqueduct cut through a mountain with great labour and art.

The most considerable town in the island next to Cora, is Vati, already mentioned, which is situated on the north side of the island, on the descent of a mountain, within a mile of the port, and contains about three hundred houses, with five or six chapels, all of which are very ill built. Besides, there are several large villages scattered through the country.

Besides these towns there are several large villages, the chief of which are Polcocaastro, Maratrocampo, Carlovassio, Castania, Fourni, Pyrgos, Platano, and Comaria.

S E C T. VI.

Of NICARIA, or ICARIA, and STANCHIO, or ISOLA LONGO, formerly called Coos.

Their Situation, Extent, and the Face of the Country. Their Produce and Antiquities.

OPPOSITE to Samos is the little island of Nicaria, antiently called Icaria from Icarus, the son of Dædalus. It extends from twenty-seven degrees to twenty-eight degrees forty minutes north latitude, and is full of rocks, in which the inhabitants dwell in caverns. These, who are very poor and ill clothed, are of the Greek communion, and amount to about three thousand. They apply themselves to swimming and diving for sponges, and for such goods as are lost by shipwrecks. The richest men in the island, says Mr. Thevenot, give their daughters to the best divers, who are tried before the maid and her father, and he who remains longest under the water wins her. The Grand Seignior's tribute is paid in sponges. They have vineyards among the rocks, and of the grapes make a sort of white wine as clear as water, which passes by urine as soon as it is drank. With this wine, and with wax and honey, they trade to Chio. The inhabitants are strong and well-shaped, but the same author adds, the women are mistresses; and as soon as the husband arrives from any place in his boat, the wife goes to the sea-side, takes the oars and carries them home, after which the husband can dispose of nothing without her leave.

The Greek emperors of Constantinople banished those persons of quality who had offended them, to this island.

Stanchio, or Isola Longo, formerly called Coos, is situated to the north-west of Rhodes about seventy miles to the south of Samos, in thirty-seven degrees twenty-seven minutes north latitude, and is about eighty miles in circumference.

This island affords an agreeable prospect on approaching it; for it is in general a fine level country, rising gradually into hills towards the east, from whence several small rivulets fall into the plain, and render it extremely fertile. The wines of this island were admired by the persons of nice taste in antient Rome. Here are also a great number of cypress and turpentine trees, with many other beautiful and medicinal plants.

Mr. Thevenot mentions a cypress-tree in this island of such prodigious extent, that two thousand men might shelter themselves under its branches, which were supported by pillars, and under their shadow were barbers shops, and places of refreshment where people met to regale themselves in the open air.

Stanchio has one large town, which is of the same name

with the island: it has a good harbour, and is defended by a castle. Here the Turkish gallies frequently lie, and here their ships touch in their passage from Constantinople to Egypt.

In this island there antiently stood a temple dedicated to Æsculapius; and it was also famous for giving birth to Hippocrates, Arifton, and several other eminent physicians and philosophers; and particularly to that celebrated painter Apelles, who drew the famous picture of Venus rising naked from the sea, which being placed in one of the principal temples in the island, was from thence carried to Rome and dedicated to Cæsar; that goddess being esteemed the mother of the Julian family, and on this account, it is said, the Coans were freed from a great part of their annual tribute.

Most of the present inhabitants are Greeks, except the garrison of the town and castle, who are Turks.

These are all the islands worthy of notice in this part of Asia; and having now as fully considered that grand division of the earth as the nature and proposed length of this work will admit, we shall carry our readers to Africa, which will afford new subjects of useful entertainment and geographical knowledge.

A N E W
S Y S T E M
O F
G E O G R A P H Y.

B O O K I I.

Of A F R I C A in general.

A F R I C A, one of the four principal divisions of the earth, is a peninsula of a prodigious extent, joined to Asia only by the narrow isthmus of Suez, between the Red Sea and the Mediterranean. It is bounded on the north by the Mediterranean Sea, which separates it from Europe; on the east by the Red Sea, which, with the above isthmus, divides it from Asia, and by the Eastern Ocean; on the south by the Southern Ocean; and on the west by the great Atlantic Ocean, which separates it from America.

Africa is generally represented as bearing some resemblance to the form of a pyramid, whose base, from the isthmus of Suez to Tangier, is about two thousand miles; and its length, from the Cape of Good Hope, the top of the supposed pyramid, to the most northern part, is about three thousand six hundred miles; and in the broadest part of the base, from Cape Verd to Cape Guardafey, it is three thousand five hundred: the whole extending in length from twenty-eight degrees south to thirty-five degrees north latitude, and in breadth from thirty-three degrees east to seventeen degrees west longitude from London.

As the equator divides this extensive country almost in the middle, and the far greatest part of it is within the tropics, the heat is in many places almost insupportable to an European; it being there greatly increased by the rays of the sun from vast sandy deserts. The coasts, however, are generally fertile, and most parts of this region are inhabited, though they are far from being so populous as either Asia or Europe. From what has been said, the reader cannot expect to find here a variety of climates. In few parts of Africa snow ever falls in the plains, and it is generally never found but on the tops of the highest mountains; and the natives would as soon expect that marble should melt, and flow in liquid streams, as that water by freezing should lose its fluidity, be arrested by the cold, and ceasing to flow, become like the solid rock.

The arts once flourished in Egypt, at Carthage, and in several other places in the north of Africa; but they are fled, and scarce in any place but Egypt is a stone left to proclaim the magnificent buildings that did honour to their skill in architecture. In the north of Africa commerce carried the blessings of nature to distant regions, and secured a friendly intercourse of arts, of manufactures, and of the superfluities of each country; but little commerce now remains, and the ships and galleys, instead of being employed in trade, are sent out in search of prey,

to strip the honest merchant of his treasures, and enslave those whom they plunder. In short, these unhappy people, instead of being humanized by Christianity, which once spread its mild influence over a considerable part of these countries, hate the name of Christian, and among them barbarity, superstition, and all the miseries that flow from tyranny and despotic power, prevail.

All this, however, only relates to the north of Africa; all the rest of that continent was long unknown to the moderns. The discoveries antiently made by the Carthaginians were forgotten, and the Portuguese, who discovered the western coast of Africa, were about sixty years employed in that task before they reached the Cape of Good Hope in 1487, before which time it was entirely unknown to the Europeans; and indeed the inland parts of Africa are still in a great measure undiscovered.

The principal rivers in this part of the earth are the Nile, which dividing Egypt into two parts, discharges itself into the Mediterranean, the Marbea, Gondet, Barodus, Taflet, Niger, Senegal, Gambia, the river of the Elephants, and several others which fall into the Atlantic Ocean; the river of St. Christopher, of the Holy Ghost, St. Jago, Zebec, Magadoxa, and some others of inferior note, which empty themselves into the Eastern Ocean; besides several inland streams. Its principal lakes are those of Dambea, Zafsan, and Zambre, or Zaire.

Africa has, however, a great scarcity of water, some large districts being entirely destitute of that necessary element; and in some parts are vast tracts of light and barren sands, which the wind sometimes blows in such prodigious quantities, as to bury whole caravans, and suffocate the unfortunate traveller.

Africa has likewise many high and extensive mountains, the most remarkable of which are, 1. The Atlas, which had its name from a king of Mauritania, a great lover of astronomy, who used to observe the stars from its summit, on which account the poets represent him as bearing the heavens on his shoulders. These mountains extend from the Western Ocean to Egypt. 2. The mountains of the Moon, called by the Spaniards Montes Claros, which are still higher than those of Atlas. 3. Those of Sierra Leona, or the mountain of the Lions, which divide Nigritia from Guinea, and extend as far as Ethiopia. These were stiled by the antients The mountains of God, on account of their being subject to thunder and lightning; and 4. The Pike of Teneriffe, which

is

is said to be still higher than any of the rest, and is situated on an island of the same name near the coast.

The whole continent of Africa is divided into the following states and kingdoms. On proceeding from north to south along the eastern side are,

- I. Egypt.
- II. Abyssinia, or Upper Ethiopia, comprehending Nubia.
- III. The coast of Abex and Anian.
- IV. Zanguebar and Sofala.
- V. Terra de Natal, and Caffraria, or the country of the Hottentots, which furrounds the Cape of Good Hope.

To the north of Caffraria, within land, are the countries of,

- I. Monomotopa, and
- II. Monomugi.

On doubling the Cape, from south to north, are,

- I. Mataman.
- II. Benguela.
- III. Angola.
- IV. Congo.

- V. Loango.
- VI. Benin.
- VII. Guinea.
- VIII. Nigritia, and Zaara, or the Desart.
- IX. Biledulgerid.
- X. Morocco.

On the North Coast, called the coast of Barbary, are,

- I. Algiers.
- II. Tunis.
- III. Tripoly, and
- IV. Barca.

The African Islands are divided into several classes.

On the east coast of Africa are Zocotra, Babelmandel, the Comora Islands, Madagascar, Mauritius, and Bourbon.

The principal islands on the west of Africa, are St. Helena, the Cape Verd Islands, the Canary Islands, the Madeiras, and a few other islands of less note.

CHAP. I.

OF EGYPT.

SECT. I.

Its Name, Situation, Extent, and Divisions. Its Climate and Soil; with a particular Description of the River Nile, the Cause of its overflowing, and an Account of its Cataracts.

EGYPT, according to the poets, derived its name from Egyptus, the brother of Danaus, once sovereign of the country. By the Hebrews and Arabs it is called Misraim. It has also been known by the name of Coptus, the capital city of Upper Egypt; and by the Turks it is called El-kebit, or the over-flowed country.

Egypt being situated on the north-east part of Asia, is bounded on the north by the Mediterranean; on the east by the isthmus of Suez and the Red Sea, which divide it from Asia; on the south by Nubia; and on the west by the Desart of Barca and the unknown parts of Africa. It is seated between the twentieth and thirty-second degrees of north latitude, and between the thirtieth and thirty-sixth degrees of east longitude from London; and is therefore about five hundred and fifty miles in length from north to south, and a hundred and twenty-five in breadth where broadest.

Egypt is generally divided into Lower, Middle, and Upper Egypt. The greatest part of Lower Egypt is contained in a triangular island formed by the Mediterranean Sea and the two great branches of the Nile, which dividing itself five or six miles below Old Cairo, one part of it flows to the north-east and falls into the sea at Damietta, the ancient Pelusium; and the other branch runs towards the north-west, and falls into the sea at Rosetto.

We shall give a full account of these divisions when we come to treat of the principal towns and antiquities of each.

The climate is in summer very hot, from its being situated between two ranges of mountains, and from the sandy soil, on which the sun shines with almost perpendicular rays at the summer solstice; and even in winter the sun shines with great heat towards the middle of the day, though the nights and mornings are then very cold; the sharpest time is about the beginning of February. Near the sea are sometimes great rains from November to March; but at Cairo they have seldom any rain, except in December, January, and February, and then have only small showers for about a quarter of an hour. In Upper Egypt they have scarce any rain; and Dr.

Pococke says, that when he was there, he was informed that it had been known to rain but twice very hard for half an hour in eight years. But rain in Egypt is esteemed prejudicial, for the people imagine it produces scarcity, the water of the Nile being alone sufficient for all the purposes of vegetation. They have thunder in summer without rain; and though earthquakes seldom happen, three great shocks were felt in January 1740, which overthrew several mosques and houses.

The west and the north-west winds are those that bring the rain; but the most frequent winds are those from the north and south: the south-east winds are sometimes so excessively hot as to resemble the air of an oven, and when they blow, people are obliged to retire to their vaults, and to shut themselves close up. This wind generally begins about the middle of March, and continues till May. It also sometimes blows very hard from the south-west, when it raises the sand so as to darken the air and obscure the light of the sun, and the dust then enters the chambers, beds, and chests, though shut ever so close.

The north, antiently called the Etesian wind, begins to blow in May, just before the rising of the Nile, and greatly refreshes the air, rendering the heat supportable, and bringing with it health and happiness. It continues till November, and without this wind there would be no sailing up the Nile after it rises, on account of the rapidity of the currents.

Egypt has generally a sandy soil, except where covered by the adventitious earth it has received from the overflowing of the Nile. The hills which bound it on the east and west are of free-stone; but those eminences on which the pyramids of Giza stand, are full of petrified shells; and there are some low hills east of the Nile which consist of heaps of large oyster-shells, some petrified, and others in their natural state.

The soil of Egypt is full of nitre, which, Dr. Pococke observes, occasions vapours that render the evening air cold and unhealthy. On the small lakes in the low grounds a cake of salt is left on the surface after the water has evaporated, which they carry away for domestic uses. This nitre, and the sediment of the water of the Nile, renders Egypt so fruitful, that they sometimes find it necessary to temper it with common sand. For within a mile of the mountains the country is sandy, and lies upon an easy ascent, which the Nile never reaches, and on the edge of it are many villages: but where the mountains extend four or five miles from the Nile,

Nile, there are villages in the mid-way between them and the river, built on eminences raised by art; and these being surrounded by water, during the flood, resemble so many islands.

The river Nile, or Abanchi, which in the Abyssinian tongue signifies The Father of Rivers, is generally agreed to have its sources in eleven or twelve degrees of north latitude, and runs a course of about fifteen hundred miles for the most part from south to north, and a little below Cairo, as hath been already observed, divides itself into two branches, one inclining to the east, and the other to the west, and falls into the Mediterranean, the mouths being an hundred miles distant from each other. While the river is contained within the bounds of the ordinary channel, it is said to be no broader at Old Cairo than the Thames at London; and in the driest season of the year is in many places fordable.

The water is thick and muddy, especially when the river is swelled by the heavy rains which constantly fall within the tropics in the beginning of our summer, which are doubtless the principal cause of its annually overflowing the low lands of Egypt. The antients, who were unacquainted with the climates in those latitudes, were much perplexed when they endeavoured to account for this annual deluge. But this periodical inundation is far from being peculiar to the Nile, since this is the case with all the rivers which have either their rise or course within the tropics: they annually break their bounds, and overflow the lands for many miles before they reach the sea, particularly in Bengal, Tonquin, and Siam. They likewise leave a prolific mud, which, like that of the Nile, fertilizes the land; and though the waters of these rivers are also very thick, yet when they have stood for some time, they are neither unpalatable nor unwholesome. Besides, the north winds, which begin to blow about the latter end of May, drive in the water from the sea, and keep back that in the river in such a manner as to raise the waters above.

The Egyptians, and especially the Coptis, are persuaded that the Nile always begins to rise on the same day of the year, and indeed it generally begins to rise on the eighteenth or nineteenth of June. From accounts of its rise for three years, Dr. Pococke observes, that he found it rise the first six days from two to five inches every day; for the twelve next days, from five to ten inches; and it thus continues rising, till it has risen to the height of sixteen cubits, when the canal of Cairo is cut: after this it continues rising six weeks longer; but then it only rises from three to five inches a day; for spreading over the land, and entering the canals, though more water may descend than before, yet its rise is less considerable; for after the opening of that canal, the others are opened at fixed times, and those that water the lower grounds the last. These canals are carried along the highest parts of the country, that the water may be conveyed from them to all the lower parts.

This river has, however, one thing that seems peculiar to itself. Other rivers being supplied by rivulets, the ground is lowest near the banks: but as no water flows into the Nile in its passage through Egypt, and as it is necessary that this river should overflow the land, the country of Egypt is generally lower at a distance from the Nile than it is near it; and in most parts the land seems to have a gradual descent from the Nile to the foot of the hills, that may be said to begin at those sandy parts already mentioned, as being a mile or two distant from them, which, rising towards the mountains in a gentle ascent, are never overflowed.

Some of the most remarkable particulars in relation to the Nile, are its cataracts in Upper Egypt. Dr. Pococke and several other authors have visited some of them; and the last mentioned divine, on approaching the first, says, that he never saw nature discover so rough a face as appeared in the country. On the east side of the river nothing is to be seen but rocks; on the west the hills are either of sand or black rocks; above to the south there seems to be a high rocky island; higher up appear rocky cliffs on each side; and below, to the north, are so many rocks, that little of the water could be seen. The bed of the Nile is crossed by rocks of granite, which in three places, at some distance from each other, divide the

stream, and make three falls at each. The first he came to was the least, and appeared not to exceed three feet: the second, which is a little lower down the river, winds round a large rock, or island, forming two streams. This island is to the north about twelve feet high, and it is said that at high-water the Nile runs over it; but supposing the river to be then five feet higher below the rock, the fall will not exceed seven or eight feet. Farther to the west are other rocks, and a third stream, which has a greater fall than any of the others.

This account can enable us to form no idea of those cataracts described by the antients, and even by some of the moderns, who inform us, that, under the twenty-third degree of latitude, the water of the Nile issues from several huge openings of a high rock into its bed below, falling two hundred feet with such prodigious noise as to exceed that of the firing of cannon, or the loudest claps of thunder. The water in its fall resembles a large white sheet about thirty feet in breadth, which in its rapid descent forms a kind of arch, under which people may walk without being wet; and this seems, says our author, to have been formerly the amusement of the neighbouring people, there being several niches and seats in the rock for the convenience of sitting down. There is also under the arch made by the water-fall a kind of platform, and some subterraneous grottos, into which people used to retire in order to cool themselves; but these are now become inaccessible by the breaking in of the water from some fresh gaps of the rock. It is also observable, that the water in its fall below raises a thick mist, which at a distance resembles a cloud; and yet Lucas, who says he saw this cataract, tells us, that the natives shoot it with rafts. This last circumstance appears very improbable: however, the description he has given of it is conformable to the description of the antients, and particularly of Lucan.

“Who that beholds thee, Nile, thus gently flow,
“With scarce a wrinkle on thy glassy brow,
“Can guess thy rage, when rocks resist thy force,
“And hurl thee headlong in thy downward course?
“When spouting cataracts thy torrent pour,
“And nations tremble at the deafning roar;
“When thy proud waves with indignation rise,
“And dash thy foamy fury to the skies.”

The accounts of the cataracts given by the learned Dr. Shaw agree with the descriptions of the judicious Dr. Pococke and Mr. Norden, and seem to discredit every thing that is marvellous in this relation: for Dr. Shaw assures us, that they are only ordinary falls of water like those we frequently meet with in great rivers, where the stream is a little confined: but may not the cataracts farther up the Nile be much higher, and more agreeable to the descriptions of the antients than those visited by these gentlemen? This at least seems highly probable.

S E C T. II.

Of the Methods of Culture used by the Egyptians, and the Manner in which the Water of the Nile is raised up to the Land where it is higher than the Inundation. Of the Vegetables of Egypt; the Beasts, Birds, Reptiles, and Fishes; with a particular Description of the Crocodile.

MR. Norden observes, that the authors who have given descriptions of Egypt, contented with saying that its fertility is solely derived from the annual inundation of the Nile, have by their silence given occasion to think, that Egypt is a paradise on earth, where the people neither plow nor sow, but every thing is produced as it were spontaneously after the draining of the waters; though there is scarce a country where the land has greater need of culture.

Where the land lies higher than the inundation rises, the people have been taught by necessity to form various methods of raising the water. At Rosetta and Damietta, where the Nile, when at its height, is not much below the surface of the earth; this is done by means of a wheel made with boxes round its circumference, which

receive the water, and as the wheel turns round the boxes, empty themselves at the top into a trough made for that purpose. Where the water is too deep to be raised in this manner, they put a cord round the wheel that reaches down to the water, to the end of which are fastened earthen jars that fill as it goes round, and empty themselves at the top in the same manner as the other; both being turned by oxen. But where the banks are high, the most common way is to make a basin upon them, and fixing in the ground a pole forked at the top, they place another pole by an axle to the top of it. To one end of this last pole they tie a heavy stone, and at the other a rope and a leathern bucket. Two men draw down the bucket into the water, and the weight brings it up, the men directing it, and turning the water into the basin. This basin is frequently made on the side of the bank, and running into another is raised up higher with the same labour; and in Upper Egypt there are sometimes seen five of them, one higher than the other, the uppermost only serving to water the fields.

However, in Lower and Middle Egypt, where canals have been dug, they have no occasion for all this labour. The water is conveyed by opening sluices, or breaking down banks, through canals cut for that purpose, into large reservoirs, which are made to supply the lower lands as occasions require.

Egypt naturally produces few vegetables, most of the tender plants being destroyed by the heat and inundation; but where the Nile has overflowed, and the land is plowed and sown, it yields a great increase. Egypt, which was antiently the granary of the Roman empire, still produces great quantities of wheat, rice, barley, beans, and other kinds of pulse, with which the neighbouring countries are supplied; besides sugar-canes, of which some sugar is made; and likewise melons, dates, figs, cucumbers, and other vegetables, which the people eat in hot weather as a cooling food. Upper Egypt supplies most parts of Europe with fenna, and coloquintida grows wild in the sandy grounds: but as Egypt has no common grass, they supply the want of it by sowing the land with clover, without plowing.

The spring corn and vegetables are sown in November and December as soon as the Nile is fallen, and sooner where that river does not naturally overflow the ground. This corn consists of wheat, lentils, and barley that has six rows of grain in one ear; and with this they feed their horses, for they have no oats. They sow beans for their camels, and these the people also eat green both raw and boiled. They have a kind of vetch little inferior to peas, with one large grain in each pod; they also plant an herb called nil, of which they make a kind of indigo blue.

Egypt seems to have few or no trees that have not been transplanted from other countries: those in their gardens are doubtless exotics, as the coud, or cream-tree, apricots, oranges, lemons, pomegranates, cassia, mosch, a delicious fruit, and the cotton-tree.

The following are the most common trees in Egypt, the sount, which bears a key or pod used instead of bark in tanning of leather, the tamarisk, Pharaoh's fig, the sycamore of the antients, the palm, or date-tree, and another species of the palm called the dome-tree.

There is no great variety of four-footed beasts, the cows are large and red, with short horns: the natives make use of their oxen to turn the wheel with which they raise the water, and to plow the land. They have also large buffaloes, which are so impatient of heat, that they will stand in the water with only their noses out to breathe; and when this convenience is not to be had, they will lie all day like swine, wallowing in mud and water.

With respect to the beasts of burthen, they have a great number of camels and dromedaries, and the Turks eat the flesh of the young ones as a most delicate dish; but will not permit it to be eaten by the Christians, probably that the breed may not be destroyed. The horses, particularly those of Upper Egypt, are very fine ones; but their necks are too short. They never trot, but walk well, and gallop with great speed, turn short, stop in a moment, and are extremely tractable; but they cannot perform long journies, and are only fit to walk in travel-

ling. During the heat of summer, when there is no clover-grass, they are fed with chopped straw and barley. In Cairo all but the great ride on asses, of which they have a fine large breed; and there are said to be no less than forty thousand of them in that city.

About Alexandria are great numbers of antelopes, which have longer horns and are more beautiful than those in other countries. The hares and foxes are of a light colour, but the former are not very common. The tyger and the hyena are seldom seen; however, there are some near Alexandria.

Among the feathered race the ostrich deserves the preference; it is called in Arabic ter-gimel, or the camel-bird, because in its head, neck, and walk, it resembles the camel. This bird is common in the mountains south-west of Alexandria; its fat is sold by the Arabs, and used as an ointment for the rheumatism, palsy, and all cold tumours.

They have here a kind of large domestic hawk, of a brown colour, with a very fine eye. These frequent the tops of houses, where they may be seen with pigeons standing close by them; but though they are not birds of prey, they eat flesh wherever they find it: the natives never kill them, for they, as well as their ancestors, seem to entertain a veneration both for these birds and for cats.

The ter-chaous, or messenger-bird, would be thought very beautiful were it not so common. It is almost as large as a dove, and is not only finely speckled, but has on the top of its head a tuft of feathers which it spreads when it alights on the ground. They have also a beautiful white bird, called by the Europeans the field-hen; it resembles a stork, but is not half so large, and is seen about the fields like tame-fowl. They have likewise a large white bird, with black wings, shaped like a raven; but it is very ugly, and not at all shy: these last live in the same manner as the tame hawk, and are called Pharaoh's hens.

On the islands in the Nile are great numbers of the ibis which were held in great veneration by the antient Egyptians, on account of their delivering the country from the multitude of serpents that breed in the ground after the retreat of the Nile. They resemble the crane, and are of a greyish colour, with the wings and tail black.

The Mahometans have the stork in the highest esteem and veneration, it being as sacred among them as the ibis was among the Egyptians, and no less profane would that person be accounted, who should attempt to kill, or only to hurt and molest it. The great regard paid to these birds was at first, perhaps, less occasioned by the service they are of to moist fenny countries, in clearing them of a variety of reptiles and insects, than from the solemn gesticulations they are observed to make whenever they rest upon the ground, or return to their nests: for they first throw their heads backwards, as it were in a posture of adoration; then strike, as with a pair of castanets, their upper and lower bill together, and afterwards prostrate their necks in a suppliant manner quite down to the ground; constantly repeating three or four times the same gesticulations.

In Egypt are also great flocks of wild geese of several kinds, wild ducks, woodcocks, snipes, quails, and among the birds of prey are eagles and vultures.

Here are several sorts of yellow lizards, among which is the wortal, which is said to be affected by music; Dr. Shaw says he has seen several of them keep exact time and motion with the dervises in their circulatory dances, turning when they turned, and stopping when they stopped. This animal, which is of the lizard kind, is four feet long, eight inches broad, and has a forked tongue, which it puts out like a serpent, but it has no teeth, and is a harmless animal, living on lizards and flies. It frequents the grottos and caverns in the mountains on the west of the Nile, where it sleeps in winter, and is only found during the hot weather.

The vipers of Egypt, which are much esteemed in physic, are of a yellowish colour like the sand in which they live, and are of two species, one with a kind of horns, which have some resemblance to those of snails, but are of a horny substance; and the others like ours.

There

There are no shell-fish in the Nile, nor perhaps any sort of fish found in the rivers of Europe, except eels and mullets, which last, with some others, come at certain seasons from the sea. Of those most esteemed are the ray, which resembles a carp, but is said to be sometimes two hundred pounds weight. The most delicate fish is the kesser, which is only caught in Upper Egypt; it has a long narrow snout, and so small a mouth that one would imagine it can only live by sucking the juice out of the weeds or the ground. In Upper Egypt is a small fish called the gurgur, about a foot long: its head is armed with a strong bone; the fin on the back, and those on each side under the gills are also armed with bone. This fish the inhabitants imagine kills the crocodile.

The hippopotamus or river horse, seems to be a native of Ethiopia in the upper parts of the Nile, and the present race of the Egyptians are entirely unacquainted with it. Nay, the crocodile so rarely appears below the first cataracts, that the sight of it is as great an object of curiosity as to the Europeans.

The crocodile was formerly thought peculiar to this country; but there does not seem to be any material difference between it and the allegators of India and America. They are both in the form of a lizard; are amphibious animals, which grow till they are about twenty feet in length, and have four short legs, with large feet armed with claws. They have a flat head; their eyes are indifferently large, and their back is covered with hard scales, impenetrable by a musket ball.

It is observed of this animal that he has no tongue; he has, however, a fleshy substance fixed all along the lower jaw, which may serve to turn his meat. He has two long teeth at the end of his under jaw, and answering to them are two holes above to receive them. It is remarkable that the upper jaw is only moveable, and the under one fixed. These animals are very quick-sighted; for our author observes, that on making a circuit to come behind them, they always began to move gently into the water, there being a kind of channel in the head behind each eye, by which the view of objects are conveyed to them from behind. When the crocodile is on land, he is always seen on the low banks of sandy islands near the water, with his head towards it, and if he is disturbed, he walks slowly in and disappears by degrees.

They make a hole about two feet deep in the sand above the water, and in it lay their eggs, and cover them over; often going into the place, and taking care of their young, which are no sooner hatched than they run immediately into the water. They lay about fifty eggs, not much larger than those of a goose, which are twenty-five or thirty days in hatching. The people search for the eggs with an iron spike, in order to destroy them.

It need scarcely be intimated, that the tears and alluring voice ascribed by the antients to the crocodile, to draw persons to him in hopes of devouring them, is a mere poetical fiction. Nor is there any foundation for the story, that the little bird trochileus lives on the meat it picks from the crocodile's teeth; or for what is said of the ichneumon's destroying the crocodile, by jumping into the crocodile's mouth, and eating his way out again through his belly. These are traditions of which the learned, who have visited Upper Egypt, can obtain no information.

If a man or beast stands by the river, the crocodiles leap out of the water and seize him with their fore paws; but if the distance be too great, they make a spring, and endeavour to beat down their prey with their tails.

The most common method of killing them is said to be by shooting them in the belly, where the skin is soft and not covered with scales like the back. The natives destroy the crocodiles by making some animal cry at a distance, and when a crocodile comes out, they thrust a spear to which a rope is tied, into his body; then letting him retire into the water to spend himself; they afterwards draw him out, run a pole into his mouth, and leaping upon his back, tie his jaws together. The people say they cannot seize a man in the water, and therefore frequently cross the Nile by swimming, both by themselves and with their cattle, even above the first cataract, where the crocodiles are pretty numerous.

In that part where the people are much more savage than in Lower Egypt, Mr. Norden observed several odd methods of crossing the Nile, which they perform without the least apprehension of falling a prey to the crocodiles. Two men were set on a truss of straw, while a cow swimming before, one of them held in one hand her tail, and with the other guided the beast by a cord fastened to her horns. The other man who was behind, steered with a little oar, by means of which he kept at the same time the balance. The same day he likewise saw some loaded camels crossing the river. A man swimming before held the bridle of the first camel in his mouth; the second camel was fastened to the tail of the first, and the third to the tail of the second; while another man brought up the rear, and took care that the second and third camels should follow in a row. These simple expedients give us some idea of the manners of the most early ages, before the introduction of arts, or man had learned to form vessels to sail upon the water, and cross rivers, lakes, and seas.

S E C T. III.

Of the Persons, Dress, Manners, Customs, Education, and Religion of the Inhabitants.

THE Egyptians are an ill-looking people, for though many of the young children are fair, the sun soon renders them swarthy. They are also very dirty and slovenly, especially the Coptis, who after washing their hands when they have eaten, wipe them publicly on the great sleeves of their shirts. These Coptis are the descendants of the first Christians of this country, who are said to have been called Coptis from their retiring to Coptus, and the adjacent places, during the first persecutions. The Coptic tongue is a corruption of the ancient Egyptian, and is now a dead language.

The natives are generally inclined to indolence, and take great delight in sitting still and hearing tales, and indeed appear to have been always more fit for a quiet than an active life. This probably may be owing to their being enervated by the heat of the country. They are also envious and mischievous; which prevents their uniting and setting up for themselves. The Mahometan inhabitants are either original natives, who live in the villages, or of the Arab race. The latter are divided into those who are also settled in the villages, and are generally an honest harmless people; and those who live in tents, and chiefly subsist on their cattle, which are principally camels and goats, that feed on small shrubs. The Turks, who are thus named to distinguish them from the Arabs and the original natives of the country, are those sent by the Grand Seigneur, and the slaves. These are the governing party, and are remarkable for being most avaricious, and fondest of power. These distinguish themselves from the others by wearing what is strictly the Turkish dress.

Most of the children in the country go naked in summer, and many of them do so all the year round.

The most simple dress of the natives has some resemblance to that worn by the ancient Egyptians, who were clothed in linen, and over it had a woollen garment; and it probably, says Dr. Pococke, resembles the primitive manner of cloathing. They wear a long shirt with wide sleeves, commonly tied about the middle. The common people have over it a brown woollen shirt; and those of superior rank a long cloth coat, and over that a long blue shirt; but in the dress of ceremony, they wear a white shirt instead of a blue one, which in Upper Egypt they put on upon festival days, and when they visit their superiors. In the lower parts of the country they use a garment of the same form made of black woollen, which is sometimes left open before, and the people of rank have them of cloth adorned with furs. Most of them also wear under all a pair of linen drawers; but do not put the shirt into them.

It is almost a general custom among the descendants of the Arabs, and the native Mahometans, to wear in winter a white or brown blanket, and in summer a blue
and

and white cotton sheet. This the Christians in the country also constantly use, wrapping it round their bodies over the left shoulder, and under the right arm, which is left free; and in some parts of the country young people and the poorer sort wear no other cloathing.

The Christians of the country, with the Janizaries, the Arabs, and the Egyptians, wear slippers of red leather, while those of the Jews are blue. Within doors the Turks and Christians, out of frugality, wear a kind of wooden clogs, some of which are made very fine. People, in short, are distinguished by the drefs of their head and feet; and are fined if they do not follow the custom: hence none but foreign Christians are permitted to wear yellow slippers. The drefs for the head is either the turban, or red woollen cap that fits close to the head, which is worn by the ordinary people among the Coptis and the Arabs.

The women have their drawers, and most of their other garments of silk; all but their outward drefs are shorter than the mens, and their sleeves hang down very low. They wear on their heads a white woollen skull-cap, and over it an embroidered handkerchief, round which their hair is plaited. Over all they have a large black veil. As it is esteemed indecent to shew too much of the face, they generally cover the mouth and one eye, if not the whole face. Women of ordinary rank have a large garment like a surplice, of blue linen or cotton, and before their faces hang a kind of bib joined to their head-drefs by a tape over the nose; thus hiding all the lower part of the face, and leaving the eyes uncovered, which gives them a very odd appearance. The women among the vulgar, especially the blacks, wear rings in their noses adorned with glass beads, and have ear-rings three inches in diameter, that come round their ears, and are adorned with stones: they likewise wear stone rings on their fingers, which among the ordinary people are of lead, while those in better circumstances have them of gold. The bracelets are generally of wire, but some are of plain iron or brass, but others have them of gold finely jointed. The women among the vulgar paint their lips, and the tip of their chin with blue, and those of superior rank paint their eye-lids black, and their nails and feet yellow.

Education in Egypt chiefly consists in learning to read and write, which the Coptis generally obtain, together with book keeping; but few of the Arabs and native Mahometans can read, except those bred to the law, or educated for some post. The best education is given to the slaves, who often understand Arabic and Turkish, and frequently write both. They are also well skilled in riding, shooting, and throwing the dart; which are esteemed great accomplishments.

With respect to the religion of Egypt, the Coptic is that of the native Christians. The Greeks are also very numerous at Cairo and in Dalmatia; but there are not many of them in the other parts of the country, except a few merchants in the principal towns. The Christian religion would be at a still lower ebb, did not the people find it convenient to have Coptic stewards, who are well acquainted with business and very expert at keeping accounts, which they do in a sort of Coptic characters that none but themselves understand. They are the protectors of the Christians in every village.

The Coptics, however seem extremely irreverent and careless in their devotions; yet they spend the night before Sundays and festivals in their churches, which they no sooner enter than they pull off their slippers and kiss the pavement. They pass their holidays in sauntering about, sitting under shady trees in summer, and under their walls in winter. They seem to imagine that religion consists in repeating their long services, and in the strict observance of their numerous fasts. They use the liturgies of St. Basil, St. Gregory, and St. Cyril; but the first being shortest, is oftentimes read. However, both the priests and people are extremely ignorant with respect to the doctrines of their religion; the former perform the service in the Coptic language, which they generally understand very imperfectly, but they have books of their liturgy with an Arabic interpretation.

The Coptis are said to fast seven months in the year. The children are espoused at seven or eight years of age,

and consummate at eleven or twelve; and a little before that time they are circumcised. They easily procure divorces on account of adultery, long sickness, or disagreement; and, at their desire, the patriarch, or bishop, gives them leave to marry again: but if this be refused, they go to the cady, who will do it readily, and this is practised by the Christians all over Turkey.

At baptism the child is plunged three times into the water, and then the priest dips the end of his finger into the consecrated wine, and puts it into the child's mouth; but if the child happens to be sick, instead of being immersed in water, it is laid on a cloth near the font, and the priest dipping his hands in the water, rubs it all over him; but if the infant be too ill to be brought to church, they then only anoint him, which they say is good baptism.

They administer the sacrament in both kinds on Sundays, Wednesdays, and Fridays, on all their numerous holidays, and every day in Lent; and when the priest, in reading the service, mentions Peter's cutting off the ear of the high priest's servant, the people cry out, Well done Peter. They abstain from swine's flesh, from blood, and things strangled; pray for the dead, and prostrate themselves before pictures; but have no images, except a crucifix. They administer extreme unction, and at the same time give absolution, anointing all the people present, that the evil spirit may not enter into them.

Though the religion of the Coptis in many respects resembles that of the Greeks, they bear an implacable hatred to them, and have generally as little regard for the Europeans, which proceeds in a great measure from the endeavours of those of the Romish church to make converts of them; for they seldom distinguish between those of different religions, but include all under the name of Franks.

The Jews are very numerous in Egypt, and, as in times of paganism, they were afraid of drinking wine offered to idols, they still have here all they drink made by their own people, sealed up and sent to them. This custom they observe throughout all the East. There is a particular sect among them who live by themselves, and have a separate synagogue: these are the antient Essenes, who are now called Charaims. They are distinguished by their regard to the five books of Moses, which they strictly observe according to the letter, without receiving any written traditions.

The Turks in Egypt are deeply tinged with the doctrine of predestination, which not only inspires them with courage, but makes them discover great magnanimity, when thrown from the height of power into a state of poverty and distress, saying, It is the will of God. They indeed behave better in adversity than in prosperity: for though persons in high rank assume a becoming gravity, and confer favours in a very graceful manner, they are greedy of money; for nothing is to be done with them without a bribe; and they are apt to fancy that the greatest villainies are expiated as soon as they have washed their hands and feet, which is their preparation for prayer. Religion is fashionable among them; they pray in the most public places, and when on a visit will call for water to wash, and then perform their devotions; and yet their words generally pass for nothing, either in their promises or professions of friendship. Opium is less used by them than formerly. The Arabs seldom drink wine or strong liquors, and the common people pound the leaves of green hemp, make them up into a pill and swallow it, in order to render them chearful. They have a high opinion of the magic art, and think there is great virtue in charms and talismans.

Though the poorest Mahometan thinks himself superior to the richest Christian, yet the Arabs and people of the country behave with great civility, and sitting about the stranger grow troublesome, by being too curious and inquisitive. The Turks likewise behave with great civility, either to obtain presents, or to discover your designs, in which they are very artful. They treat their superiors with the utmost decorum and the highest respect, and one of great dignity readily holds the stirrup to another who is still greater.

The way of saluting as they pass is by stretching out the right hand, bringing it to the breast, and a little inclining

inclining to the head. The extraordinary salute is kissing the hand, and putting it to the head. When they visit a superior they kiss his hand; but if he be greatly their superior, they kiss the hem of his garment. When they take any thing from a superior, or that is sent by a superior, they kiss it, and put it to their foreheads; and when they promise to serve or protect you, they put their hand to their turban.

The entertainments of the Turks and Arabs have been mentioned in treating of Turkey in Asia and of Arabia, and we shall only add here, that an Arab prince will frequently dine in the street before his door, and calling to all that pass, and even to the beggars, invite them to sit down by crying in their manner, "In the name of God." Upon this the poorest wretch sits down and dines with his prince; and when he has done retires without ceremony, saying, "God be praised."

The Mahometans have a most extraordinary veneration for idiots, whom they suppose to be actuated by a divine spirit, and consider as a kind of saints. Hence, they receive all possible marks of respect, and are received into every house and at every table. Though naked, they are every where caressed as saints of a superior order, the people flock about them with an air of reverence, and in the publick streets the women kneel before them, and, as among the Gentoos of India, kiss what other people conceal, as the most effectual means of being rendered fruitful. All these circumstances are mentioned by authors of the greatest reputation. They have a large mosque at Cairo, with buildings adjoining to it, and great revenues for their support. As these are recommended by their want of reason, so are the dervises by their want of money; for every Turk esteems poverty as a great degree of perfection in every one but himself.

Both the Turks and Egyptians are very frugal in their provisions, for the latter seldom eat meat, and the tables of the great are of little expence, considering the number of their attendants, in which they are very extravagant; for it is not uncommon for them to have fifty or sixty slaves, and many other servants and attendants. The cloathing of the slaves is, however, very expensive, as are also their horses, it being common for them to have from fifty to two hundred.

People of the middle rank usually rise at break of day, and go to the mosque, then to the coffee-house, and very late to their shops, which they shut up by four in the afternoon, and people of rank spend most part of the day in paying and receiving visits. On Sundays, Tuesdays, and Thursdays, they attend the basha's divan, or court, for these are the days of business; and on Fridays they generally go to the mosque. On other days they go to the meidans, or public places out of town, where they see their slaves ride, shoot, or throw the dart; and in the mean time regale themselves with coffee and a pipe. They are perpetually in company when they are not in the women's apartment, as they are from twelve at noon till four, and from supper-time till next morning, when no body is so rude as to disturb them.

They have public bagnios for men and women, and persons of distinction have them in their houses. None besides people of the middle rank resort to the coffee-houses. Some of them have music at certain hours of the day, and in others a man tells some history, or an Arabian tale, with a very good grace. Tradesmen often send to have their provisions brought hither, and those who have nothing to do spend whole days in these houses.

S E C T. IV.

Of the Revolutions in Egypt, and its present Government.

THE Egyptians, like the Chinese, and many other of the eastern nations, pretend that they had a race of kings, the first of whom reigned many thousand years before the flood. However, it is generally agreed, that the princes of the line of the Pharaohs sat on the throne, in an uninterrupted succession, till Cambyfes II. king of Persia, conquered Egypt five hundred and twenty-five years before the birth of Christ: and that in the reign of those princes those wonderful structures were

raised, which cannot now be viewed without astonishment. After the death of Cambyfes, Egypt continued under the Persian government. At length Alexander the Great having conquered the Persian dominions, it became subject to that prince, who soon after built the celebrated city of Alexandria.

He was succeeded by Ptolemy, the son of Lagus, three hundred and twenty-five years before the birth of Christ, who again rendered it an independent kingdom. Ptolemy Philadelphus, his son, collected the Alexandrian library, said to consist of seven hundred thousand volumes; and the same prince caused that translation of the Scriptures to be made, which is now distinguished by the name of the Septuagint. His successors ever after retained the name of Ptolemies, and in that line it continued between two and three hundred years, till Cleopatra, the wife and sister of Ptolemy Dionysius, the last king, ascended the throne, in whose reign Egypt became a Roman province, and thus remained till the reign of Omar, the second caliph of the successors of Mahomet, who expelled the Romans, after it had been in their hands seven hundred years.

The caliphs of Babylon were the sovereigns of Egypt, till about the year eight hundred and seventy, when the Egyptians set up a caliph of their own, called the caliph of Cairo, to whom the Saracens of Africa and Spain were subject; but the governors of the provinces, under the caliphs of Babylon and Cairo, soon wrested the civil power out of the hands of their caliphs, who had hitherto enjoyed an absolute power in affairs of religion and government, and left them only the shadow of sovereignty.

In short, about the year 1160 Assareddin, general of Norradin, the Saracen Sultan of Damascus, subdued the kingdom of Egypt, and was succeeded by his son the famous Saladin, who also reduced the kingdoms of Damascus, Mesopotamia, and Palestine under his dominion, and about the year 1190 took Jerusalem from the Christians. This prince established a body of troops in Egypt, which, like the present janizaries, was composed of the sons of Christians taken in war, or purchased of the Tartars, to whom he gave the name of Mamalukes. The posterity of Saladin sat on the throne till the year 1242, when the Mamalukes deposed Elmutan, and gave the crown to one of their own officers, named Turquemenius. This was the first king of the race of the Mamalukes, who engaged in continual wars with the Christians in Syria and Palestine, till sultan Araphus drove them entirely out of the Holy Land. At length Selim, a Turkish emperor, killed the sultan, and conquered Egypt in 1515; and the Turks have had the possession of it ever since.

With respect to the government of Egypt, ever since it has been subject to the Ottoman emperors, they have governed that kingdom by a viceroy, styled the basha of Grand Cairo; but as Egypt is subdivided into several inferior governments, these governors are neither sent from Constantinople, nor appointed by the viceroy; but are natives of Egypt, and appear to be vested with sovereign power in their several districts. They have the command of the militia of the several provinces, and many of them are of the race of the Mamalukes. The authority of the basha is very much limited by those beys, or governors, who are his grand council, and without whose concurrence he can transact nothing of consequence. Thus the Egyptians live under a kind of limited monarchy. All the lands in Egypt are indeed held of the Grand Seignior, and still pay him both an annual rent and a fine upon every descent; but they, however, descend from father to son. Hence the basha, in order to support his authority, finds himself under the necessity of courting some of the leading beys, and frequently foment divisions among them, lest they should unite to the prejudice of himself or the grand Seignior his master.

The basha has his guards, or bodies of spahis and janizaries, like the Grand Seignior at Constantinople; but as many of these have estates in the country, which is under the absolute power of the beys, the basha, if he happens to be at variance with those beys, cannot depend on their protection. Indeed the beys are said to be perpetually laying plots to destroy each other; and, upon these occasions, the basha does not fail to take that side

which is most likely to promote his own interest. Dr. Pococke observes, that neither the *bascha* nor any of the *beys* scruple taking off their enemies by poison or the dagger, of which he gives the following instance: A *bascha*, knowing that a *bey* whom he would willingly dispatch was jealous of his designs, ordered his servants when he came to visit him to pour his own coffee and that of the *bey's* out of the same pot. The *bey* seeing this, concluded that it could not be poisoned, and drank it off; but the slave, on his giving the coffee to the *bascha*, made a false step, as he was ordered, and spilt it on the floor; upon which the *bey* perceived too late the *bascha's* treachery.

The revenues which the Grand Signior receives from Egypt arise from the annual rents, customs, and a poll-tax on Christians and Jews. The rents of the villages are fixed, and this is the treasure which is annually sent to Constantinople, and amounts in the whole to six thousand purses, each purse being eighty pounds sterling. This is a very easy rent, and when the Nile does not rise sixteen cubits, even this is not paid.

S E C T. V.

A Description of the Cities of Alexandria and Rosetto.

IN describing the cities of Egypt, we shall begin with Alexandria, which was so called from Alexander the Great, who, after his return from consulting the oracle of Jupiter Ammon, built a city in the place where *Racotis* stood, three hundred years before the birth of Christ. This city is called by the Turks *Scanderia*, as among them Alexander is called *Scander*. It was once an opulent and elegant city, seated near the most westerly branch of the Nile, where the sea forms a spacious haven resembling a crescent, in thirty-three degrees eleven minutes north latitude, and in thirty degrees thirty-nine minutes east longitude from London.

The port of Alexandria was formed by the isle of *Pharos*, which extended across the mouth of the bay, and towards the west end was joined to the continent by a causeway and two bridges, ninety paces in length. On a rock encompassed by the sea at the east end of the island was the ancient *Pharos*, or light-house, so famous in antiquity, that it was esteemed one of the seven wonders of the world; and on the place where it stood is a castle called *Pharillon*. Nothing can be more beautiful, says the ingenious Mr. Norden, than to view from hence the mixture of antique and modern monuments in this city. On passing the smallest castle, called the Little *Pharillon*, you see a row of great towers joined together by the ruins of a thick wall. A single obelisk is of a sufficient height to make itself remarked where the wall has fallen down. On turning a little farther you perceive the towers appear again, but only in a distant view. New Alexandria afterwards makes a figure with its minarets, and at a distance rises Pompey's column, a most majestic monument; and the view is terminated by hills, towers, and a large square building that serves for a magazine of powder.

The outer walls round the old city are beautifully built of hewn-stone, strengthened by semi-circular towers twenty feet in diameter, and about a hundred and thirty feet distant from each other. At each of them are steps to ascend up to the battlements, there being on the top of the walls a walk built on arches. The inner walls of the old city, which appear to be built in the middle ages, are much stronger and higher than the others, and are defended by large high towers.

The palace, with the buildings belonging to it, took up a fourth part of the city, and within was the museum, or academy, and the burial-place of the kings, where the body of Alexander was deposited in a gold coffin; but that being taken away, it was put into one of glass, and was probably in that condition when Augustus, taking a view of the corps, scattered flowers over it, and adorned it with a golden crown.

The street, which extended the whole length of the city, is said to have been a hundred feet wide, and had undoubtedly many magnificent buildings, as appears from

the granite columns still remaining in several places: Among these was the *Gymnasium*, or public schools, to which were porticos that extended above half a quarter of a mile. These may have been where there are great ruins to the west of that street, and some large columns of red granite still standing. In this magnificent street was also probably the Forum, or court of justice, which was perhaps erected where some pillars remain nearer the sea.

The most extraordinary remains of the ancient city are the cisterns built under the houses for receiving the water of the Nile, as they do at present. The canal of *Canopus* comes to the walls near Pompey's pillar, and has a passage under them. But the water is not only conveyed to the cisterns from the canal on its entering the city, but from several distant parts of the canal, by passages under ground, to the higher parts of Alexandria.

The materials of the old city have been carried away to build the new, so that there are only a few houses, some mosques, and three convents within the old walls. Among these is a mosque, called The mosque of a thousand and one pillars. Dr. Pococke observed that it had four rows of pillars to the south and west, and one row on the other sides. This, it is said, was a church dedicated to St. Mark, at which the patriarch resided, it being near the gate without which the Evangelist is said to have suffered martyrdom. There is another great mosque, named St. Athanasius, which was also doubtless a Christian church. The Greeks, Latins, and Copts have each a monastery in the old city; but some poor Arabs being always encamped within the walls, it is dangerous being abroad after sun-set. All over the city are fragments of columns of beautiful marble, the remains of its ancient grandeur and magnificence. Among the rest an obelisk, formed of one single piece of granite, rises sixty-three feet high; but two of its four faces are so disfigured by time, that the hieroglyphics with which they were antiently covered can scarcely be seen. This is still called the obelisk of Cleopatra. Another lies near it broken.

About a quarter of a mile to the south of the walls stands Pompey's pillar on a small eminence. As this is not mentioned by Strabo, it was probably erected after his time, and perhaps in honour of Titus or Adrian. Near it are some fragments of granite columns four feet in diameter; and it appears that some magnificent building was erected there, and that this noble pillar was placed in the area before it. Indeed some Arabian historians say, that here was the palace of Julius Cæsar. This pillar is of granite, and, besides the foundation, consists of only three stones: the capital is supposed to be eight or nine feet deep, and is of the Corinthian order, the leaf appearing to be the plain laurel or bay-leaf, and a hole being on the top, it has been thought that a statue was erected upon it: the shaft, including the upper torus of the base, is of one piece of granite marble, eighty-eight feet nine inches high, and nine feet in diameter: the pedestal, with part of the base, which are of a greyish stone resembling flint, are twelve feet and a half high, and the foundation, which consists of two tier of stones, is four feet nine inches; so that the whole height amounts to a hundred and fourteen feet.

About three leagues from Alexandria are the ruins of an antient temple in the water, with broken statues of sphynxes, and pieces of columns of yellow marble; and near it are the remains of other buildings, part of which appear to have been a grand portico, from there being many pieces of columns of grey and red granite, and from the order in which they lie, they seem to have belonged to a round temple. Most of them are fluted, and three feet three inches in diameter.

These ruins are situated in a wide bay, in which is a little island joined to the continent by a chain of rocks; and on the shore of this bay are cavities in the rocks, used as agreeable retreats, where people may enjoy the cool air, and, without being seen, see every thing that passes in the port. The natural grottos in these rocks gave the antients the opportunity of forming them, by the assistance of the chisel, into places of pleasure. Entire apartments are thus formed, and benches are cut for seats, where you may be secured from the wet, or bathe in

in a part of the grottos, which are entered by the sea; and on the outside were formed little harbours, sheltered from all the winds. Opposite the point of the peninsula that forms the port is a cavern, generally termed a temple. The only entrance is a little opening through which you pass, lighted by flambeaus, and stooping for twenty paces, when you enter a pretty large square hall. The ceiling is smooth, but the bottom and sides are covered with sand, and with the excrements of the bats and other animals that harbour there. A passage leads from hence into a round cavern, the top of which is cut in the form of an arch. Here four gates are opposite to each other, each adorned with an architrave, a cornice, and a pediment, with a crescent on the top. One of these gates serves for an entrance; the others form each a niche, that only contains a kind of chest, saved out of the rock in hollowing it, and large enough to contain a dead body. Thus it appears, that what is in that country esteemed a temple, was probably the tomb of some great man, or perhaps of a sovereign prince. A gallery, which continues beyond this supposed temple, seems to shew, that farther on there are other structures of the same kind.

With respect to New Alexandria, Mr. Norden observes, that it may be justly said to be a poor orphan, who had no other inheritance but the venerable name of its father. The great extent of the ancient city is in the new contracted to a small neck of land, which divides the two ports. The most superb temples are converted into plain mosques; the most magnificent palaces into houses of bad structure; an opulent and numerous people have given way to a few foreign traders, and to a multitude of wretches, who are the slaves of those on whom they depend. This place, once celebrated for its commerce, is no longer any thing more than a place of embarking: it is not a phoenix that revives from its own ashes; but a reptile sprung from the dust and corruption with which the Koran hath infected the whole country: yet, notwithstanding the meanness of the buildings in general, in several houses built round courts on porticos, they have placed a great variety of columns, mostly of granite, with which the ancient city was adorned.

The great occasion of the decay of this city, was the discovery of the new way to the East Indies, by doubling the Cape of Good Hope; for till then it was one of the principal marts, to which the spices and valuable commodities of the East were brought, and from thence dispersed into all the countries of Europe.

The inhabitants consist of Jews, Turks, Coptics, Greeks, and Armenian Christians, and a few European merchants, the principal of which are the French and English; the former, 'tis said, flatter themselves with being treated with more respect, but the latter have, perhaps, a better trade. The French maintain a consul dependent on the consul of Grand Cairo, and enjoy considerable trade. The English have also a consul, and every year there arrives a good number of English vessels at Alexandria; but they are not always laden on the account of this nation. The Jews, and even the Turks, often freight them, and carry on a considerable trade on board these vessels.

Rosetta, called by the Egyptians Raschid, is situated twenty-five miles to the north-west of Alexandria in thirty-one degrees five minutes north latitude, and in thirty-one degrees ten minutes east longitude from London, and stands on the west side of the branch of the Nile, antiently called Bolbetinum, about four miles from its mouth. It is esteemed one of the pleasanter places in Egypt, and, being refreshed by the winds that blow from the sea, is extremely healthy. It is near two miles in length, but only consists of two or three long streets; however, the buildings are stately, and the houses commodious. It is defended by two castles, one upon each side of the branch of the Nile, by which merchandize is brought hither from Cairo. The fine country of Delta on the other side of the Nile, and two beautiful islands a little below the town, afford a delightful prospect; and to the north the country is agreeably improved by pleasant gardens of citrons, oranges, lemons, and almost all kinds of fruit, and is variegated by groves of palm-trees, small lakes, and fields of rice.

The inhabitants carry on a considerable manufacture of striped and coarse linen; but the principal business of the place is the carriage of goods between this town and Cairo; for all European merchandizes are brought from Alexandria hither by sea, and sent from thence in other boats to Cairo; and also those brought down the Nile from Cairo are here put into large boats to be sent to Alexandria. Hence the Europeans have their vice-consuls and factors in this place to transact their business, and letters are regularly brought from Alexandria to be sent by the boats from Cairo: however, those of great consequence that requires dispatch are sent across the desert, which lies betwixt Alexandria and Rosetta, by foot messengers.

S E C T. VI.

A Description of Grand Cairo. Of the Ceremonies observed at opening the Canal; the Egyptian Manner of hatching Chickens in Ovens; the Inhabitants and their Trade.

THE city of Grand Cairo is situated about a mile from the eastern bank of the river Nile, and extends eastward near two miles to the neighbouring mountain. It stands in Middle Egypt in thirty degrees fifteen minutes north latitude, and in thirty two degrees twelve minutes east longitude from London. It is about seven miles in compass, and was much larger before the discovery of the East Indies by the way of the cape of Good Hope, it being then the center of trade, all the spices of the east being brought to this city, and from thence sent to Europe. Grand Cairo at present consists of Old and New Cairo, which are a mile distant from each other.

Old Cairo is now reduced to a small compass, it not being more than two miles round; this is the port for the boats that come from Upper Egypt, and some of the beys and European merchants have houses there, to which they retire at the rising of the Nile. The Jews have a synagogue, said to have been built in its present form sixteen hundred years ago, and it nearly resembles our churches. They pretend that Jeremiah the prophet was on the very spot where they usually read the law, and that they have a manuscript of the Bible written by Ezra, which they esteem so sacred, that none are allowed to touch it, and it is kept in a niche in the wall about ten feet high, before which a curtain is drawn, and lamps kept continually burning.

The Coptics have twelve churches and a convent, and pretend that the holy family were in a cave in the church dedicated to St. Sergius. These churches are commonly adorned with columns in the front; they have two isles with galleries over them supported by pillars, and the part for the altar is separated by a partition, that in some of them is finely ornamented with carving and inlaid work of tortoise-shell and ivory. The Romans have an hospital belonging to the fathers of the Holy Land.

There are also here about half a dozen mosques, among which one named Amarah is said to have been a church, and is remarkable for having near four hundred columns, which, with their capitals, seem to have been collected from several ancient buildings.

In Old Cairo are what are usually called Joseph's granaries; these are square courts encompassed by walls about fifteen feet high, built chiefly with brick, and strengthened by semicircular buttresses. The houses are filled with corn, and room only left to enter at the door. The grain is covered with mats, and the door fastened only with wooden locks; but the inspectors of the granaries putting a handful of clay on the locks, fix their seal to it. Here is deposited the corn paid as a tax to the Grand Seigneur, which is brought from Upper Egypt, and distributed among the soldiers as a part of their pay. This granary, notwithstanding its name, is not very ancient, for it seems to have been built during the time of the Saracens. At the north end of the city is a plain building for raising the water of the Nile to an aqueduct. This structure is an hexagon, each side of which is between eighty and ninety feet in length, and about as many in height. The water flows into a reservoir below, and is drawn up by five oxen, which turn so many Per-

fan

sian wheels, that empty the water into the aqueduct. These wheels are turned at the top of the building, to which is an ascent on the outside for the oxen to go up. Both this edifice and the aqueduct are built with free-stone, in order to convey water to the castle. The aqueduct is supported by about two hundred and eighty-nine arches and piers of different dimensions, the former being only from ten to fifteen feet wide. These arches are low towards the castle-hill, where the water runs into a reservoir, whence it is raised up to the castle by several wheels one over another.

Opposite to Old Cairo is a pleasant island named Roida, situated in the midst of the Nile, and extending near a mile in length. Towards the north end is a village of the same name, and at the south end is the Mikias, or house in which is the famous pillar for measuring the rise of the Nile. This is fixed in a deep basin, the bottom of which is on a level with the bed of the river, and the water passes through it. The pillar, which is placed under a dome supported by Corinthian columns, is divided into measures for observing the rise of the waters, and is crowned with a Corinthian capital, and from the court that leads to the house, is a descent to the Nile by steps, on which the common people believe that Moses was found after his being exposed on the bank of the river.

A canal cut from the Nile runs through the city of New Cairo, but is only to be seen from the back of the houses built on its banks, and though several bridges are erected over it, yet houses being built on each side of them, the view of the water is intercepted; but when it is dry, it appears like a street, the common people passing along it. However, from the time when it begins to dry, the smell of the mud and stagnated water is very offensive.

If we form an idea of several squares or places about the city from a quarter to three quarters of a mile in compass, contrived so as to receive and retain the water of the Nile conveyed to them by the canal, as the river rises, we shall have a pretty just notion of the several lakes that are about the city during great part of the year, when nothing can be imagined more beautiful; for they are surrounded by the best houses in the city, and in the summer when the Nile is high, are covered with fine boats and barges belonging to persons of distinction, who spend the evenings with their ladies on the water, where concerts of music are never wanting, and sometimes fireworks are added. All the houses round are in a manner illuminated, and the windows filled with spectators. This pleasing scene is, however, entirely vanished when the waters are gone off, and nothing but mud appears. Yet this is soon succeeded by the agreeable view of green corn, and afterwards of harvest in the midst of a great city, and in the very places where the boats were sailing but a few months before.

Some of the most remarkable customs observed at Cairo are the ceremonies practised at opening the canal. When the Nile begins to rise, they cast up a bank of earth across the end of the canal near the river, and about the middle of August, when the water is risen to a proper height, it is broke down with great rejoicings. Mr. Thevenot, who gives the most particular account of these ceremonies, went to Boulac, the port of all the boats that come up the river, and which some reckon a part of Grand Cairo, to see the preparations, when he observed several gallies lying in the river, in the sterns of which were noble rooms, some of which were twelve or fourteen paces square, and surrounded with rails and ballusters gilt and painted, and the floors covered with rich carpets and cushions. About seven in the morning the basha arrived in great state; as he passed a sheep was killed in several places, and three or four more on the bank of the river. All the beys and great men of Cairo accompanied the basha in his galley, and having sailed as high as Old Cairo, he was saluted by the guns of the other vessels, which followed in order. The sails of the basha's galley were of several colours, and worked with large red roses, and the flags and streamers in this and the other gallies made a very pretty appearance on the water: the trumpets and other music played as they passed, while the guns fired, and the people shouted, to express the general joy. In this manner they moved gently along, till they came to the place where the bank was

to be opened to let the water into the canal. Here the mob were waiting in crowds, and there being two paddle-board towers filled with fireworks, these were let off as the basha passed; in the mean time the people broke down the bank to give the water a passage into the canal, and boat-loads of sweetmeats were thrown into the river, for which they jumped in and scrambled. The viceroy moved forward to his palace in the island of Roida, opposite to Cairo; and bonfires, illuminations, and fireworks were continued for three nights successively. There were particularly two vast machines representing a man and woman of gigantic stature placed on the river before the basha's palace, which took up no less than two thousand lamps to illuminate them; besides all the gallies, barges, and other vessels were hung full of lamps, and in them the music played, and fireworks, with great and small guns, were continually let off.

But the ceremonies are more usually performed by land, when the basha, attended by his guards, proceeds on horseback along the canal, and coming to the end of it, dismounts, strikes the bank, takes horse, and riding back, leaves several persons to break it down, while great crowds follow him, singing and striking each other with cudgels. The water at length flows in, accompanied by a number of men and boys swimming. Fireworks are played off, and all the while the canal is filling, it is covered with boats filled with young men, singing and playing on musical instruments, to express their joy for the fertility produced by this river.

The streets of New Cairo, as in all other Turkish cities, are very narrow, and the widest extends the whole length of the place; but in Europe it would only be considered as a lane, and the others are so narrow, that the people frequently spread a slight stuff across the houses, from one side to the other, to defend them from the sun. Most of the streets, or at least each end of every ward, is shut up as soon as it grows dark with gates, guarded by two or three janizaries, so that no idle people can lurk about them without being discovered. Several streets only consist of shops, without any houses; and are also locked up at night, when the tradesmen return home; and the shops of the same trade are generally together.

The houses, like those of Turkey, have very little beauty on the outside, being built below of stone, and above of a sort of cage-work, sometimes filled up with unburnt brick, and few or no windows on the outside. Within they, however, appear with sufficient magnificence. Dr. Pococke visited the house of the bey, where he entered a fine saloon, with a lobby before it. The grand room, he says, is an oblong square, with an octagon marble pillar in the middle, inlaid on two sides about eight feet high with pannels of grey marble, each bordered with Mosaic work. The sopha extends all round the room, and has rich velvet cushions, and the floor is covered with fine carpets.

Here is an antient palace built by the seventh king of Egypt of the race of the Mamalukes, who lived about the year 1279. The entrance to the grand apartment is by a fine door somewhat in the Gothic taste. In this room is a noble saloon in the form of a Greek cross, with a cupola in the middle, and it is wainscotted, or rather inlaid, ten feet high, in a very expensive manner. Round the top, about two feet deep, are Arabic inscriptions; then for two feet more it is covered with mother of pearl, and different kinds of fine marble, in the form of small arches. Below this the wall is covered with pannels, some of the most beautiful kinds of marble, and others of mother of pearl; while all the pannels are surrounded with a border of Mosaic work, in mother of pearl and azure.

This city contains several magnificent mosques, particularly one on the north-east of the town called Kubbel-Azab, which is about sixty feet square, and has a very beautiful dome raised on a base of sixteen sides, in each of which is a window. It is cased round with all the most beautiful kinds of marble, among which are several fine slabs of red and green porphyry. These are all placed in pannels finely carved and gilt, and above is a sort of frieze covered with sentences cut in large gilt characters, called the Couphe, in which they here antiently wrote the Arabic tongue. The walls above have Arabic inscriptions

J. H. de la.

Ceremony upon the overflowing of the Nile at Cairo

inscriptions in letters of gold, and the whole cupola is painted and gilt in the most splendid manner. All over the mosque are hung glass lamps and ostrich's eggs. Adjoining to this edifice are apartments built for the priests, and some very fine ones for the persons of rank who sometimes choose to reside here.

But a mosque at the foot of the castle-hill exceeds all the rest, both in the solidity of the building and in its grandeur and magnificence, which strike the beholder in a surprising manner. It is very lofty, and erected in the form of an oblong-square, crowned with a cornice all round that projects a great way, and is adorned, after the Turkish manner, with a kind of grotesque carving. The entrance is inlaid with several kinds of marble, carved at the top. The ascent to it was by several steps, but these have been broken down, and the door walled up, because the rebels have often taken shelter there when there have been public insurrections.

The castle of Cairo is said to have been built by Saladin. It is seated on a rocky hill, and is walled round; but, though it is of very difficult access, it is so commanded by a hill to the east, as to be of no strength since the invention of cannon. At the west end are the remains of very noble apartments, some of which are covered with domes, and adorned with pictures in Mosaic work; but these apartments are now only used for weaving, embroidery, and preparing the hangings and coverings annually sent to Mecca.

Above the castle is a higher ground, near a grand saloon called Joseph's-hall, from which is a fine prospect of the city, the pyramids, and all the neighbouring country. This was probably a terrace to the saloon, which is open on every side, except to the south, and is adorned with large and beautiful columns of red granite, some of which have capitals of the Corinthian order; some are only marked out in lines like leaves, and many are only plain stones that have but little resemblance of capitals.

In the west part of the castle is the jail, which the common people think to be the prison in which Joseph was confined.

About the middle of the castle is a large court, on the south side of which are the basha's apartments, and the great divan, where the beys assemble three times a week under the kaia, or prime minister of the basha; and the latter sometimes sits in a room behind, that has a communication by some lattice windows. A stranger may enter with the consul's interpreter, and being afterwards conducted to the basha's coffee-room, will be entertained by his servants with sweetmeats and coffee.

At a small distance stands the mint, where they coin their gold and small pieces of iron washed over with silver. These last are called medines, and are of the value of three farthings.

There is a well in the castle much admired on account of its great depth; it is cut through the rock, and the water brought up by several Persian wheels placed one over another, and turned by oxen. This is called Joseph's-well, not from the patriarch of that name, but from a grand vizier, who about seven hundred years ago had the care of the work under Sultan Mahomet. This castle is, in short, about a mile in circumference, and resembles a little town; but most part of it is now very ruinous.

In the rock upon which the castle is built are grottos all up the side, in many stories; but several of them are now inaccessible, while there is a way to others by a narrow terrace. These are generally lofty rooms, eight or ten feet square. On the top towards the brow of the hill are two rooms, with holes on the top to let in light, over which is a raised place to which the great often go to enjoy one of the finest prospects in Egypt, it commanding a view of Cairo and of all the country as far as the eye can reach. Over the south cliff is a mosque, in which was interred the Sheik Duise, whose name is given both to the hill and the mosque. The inside of this structure is painted all over with flowers on a red ground.

Among the curiosities at Cairo we ought not to omit that of their manner of hatching of chickens, by putting the eggs in ovens, which are heated with so temperate

a warmth, and so well imitates the natural heat of the hen, that they produce living chickens. These ovens are under ground, and the bottom covered with cotton, or flax, to lay the eggs upon. There are twelve of these ovens together, that is, six on a side, in two stories on each side the passage. They begin to heat them about the middle of February, with the hot ashes of the dung of camels or oxen, which affords a smothering heat without any visible fire. This they lay at the mouth and farther end of the oven, daily changing it and putting in fresh dung for ten days, and then lay in the eggs, which sometimes amount to eight thousand in an oven. After eight or ten days they pick out the good from the bad, which they discover by holding them to a lamp, and then putting out the fire, lay one-half of the eggs in the upper oven, and shutting them up close, let them lie about ten days longer; and then opening the ovens they find the chickens hatched. If it has happened to thunder, great numbers miscarry; and in common they often want a claw, a rump, or are some other way imperfect. It is said that the people of only one village are masters of the art, and that at the proper time of the year they spread themselves all over Egypt. Extraordinary as this method of hatching chickens may appear, it is practicable in other countries. The duke of Florence sent for some of the Copts employed in thus producing chickens, who hatched them in Italy in the same manner; and, since that time, the late learned and ingenious M. Reaumur, after many experiments, found it practicable in France, and has shewn the manner of doing it in a work on that subject, which has been translated into English.

Few arts in Egypt are carried to any perfection higher up the Nile; and this, with the convenience of water-carriage, renders Cairo a place of great trade, and brings a prodigious concourse of people to that city.

As to the inhabitants of Cairo, most of them seem descended from the Mamalukes; but there are also many Jews, some Greeks, and a few Armenians; but there are no other Europeans settled in the city but the English, French, and some Italians from Leghorn and Venice. And here it may be proper to observe, whenever any of the English die in any part of the Levant, where there is no English chaplain, they are interred with the Greeks, and according to the ceremonies of that church.

The European merchants, considering how much they are confined, live agreeably among themselves. They are sociable with those of their own nation: and, as the country is so plentiful, they possess whatever is capable of making life pass cheerfully. They spend the morning in business, and often pass the remainder of the day in the fields and gardens to the north of Cairo; and great part of their affairs being transacted by the Jews, they have a relaxation from business both on the Jewish and Christian sabbath. When the Nile has overflowed its banks, and they have little business to do, they retire to their houses at Old Cairo and Gize, which is situated on the opposite bank of the river, and there they pass their time as agreeably as the circumstances of the place will admit.

The trade of Cairo chiefly consists in the importation of broad-cloth, lead, and tin; and the exportation of flax, fena, coffee, and several drugs, chiefly brought from Persia. The natives likewise import raw-silk from Asia, which they manufacture into sattins and other silks, in imitation of those of India. Sugar of the growth of this country is also made here; but it is neither cheap nor fine: furniture for horses, and lattices for windows, of turned wood, brass, and iron, are made in great perfection; and they also export fine matting made of dried rushes, which are not only sent over the Turkish empire, but to most parts of Europe.

SECT. VII.

Of the Pyramids of Memphis and Saccotra.

THE most extraordinary monuments near Cairo are the pyramids, which were formerly ranked among the seven wonders of the world, and cannot now be viewed

viewed without admiration. These are situated upon the solid rock, at the foot of the high mountains that accompany the Nile in its course, and separate Egypt from Libya. Their architecture, both on the inside and without, is extremely different with respect to distribution, materials, and grandeur. Some of these are open, others are ruined, and most of them are closed; but all have been injured by time. The immense quantity of materials used in constructing them renders it impossible for them all to have been built at the same time, and those that were last erected greatly exceed the first in magnificence and grandeur. They are the works, says Mr. Norden, of the remotest antiquity, and even more early than the times of the most ancient historians whose writings have been transmitted to us, the very epocha of their beginning being lost at the time when the first Greek philosophers travelled into Egypt. It is not improbable, the above gentleman adds, that the invention of pyramids was owing to the ignorance of the people in having no other method of covering a great circumference, before the art of arching and employing columns to support a roof were invented. It is indeed a mortifying consideration, that the most durable works in architecture have been owing to ignorance. Thus the famous aqueducts of the antients, the remains of which are the wonder and admiration of the present times, were owing to their not knowing that water would rise up nearly to the same height as that from which it falls.

The common people are persuaded that the pyramids, the vast palaces and the temples, whose remains fill the spectators with amazement, were built by giants; and, indeed, it has been supposed, that men some thousand years ago were much larger than at present; but these opinions are fully confuted by the height of the entrances of the caves from whence they have taken stones for these purposes, by the narrowness of the passages of the pyramids, and by the height of the doors of the most ancient buildings.

The principal pyramids being situated three or four leagues to the west of Cairo, near the place where the city of Memphis is supposed to have stood, they are commonly called The pyramids of Memphis. They stand on a rocky plain, eighty feet perpendicular above the level of the ground overflowed by the Nile; and it appears that this rock, not being every-where level, has been smoothed by the chissel. It is remarkable that this rock is almost covered by the flying sand brought by the wind from the adjacent mountains; and that in this sand are a great number of shells, and those of oysters petrified, which is the more surprising, as this plain of solid rock is never overflowed by the Nile, which, besides, has no shell-fish throughout its whole course. Here are also found the beautiful flint-stones which, on account of the singularity of their colours, are thought much more valuable than agate, and of which the people of Cairo make snuff-boxes and handles for knives.

There are four of the pyramids that deserve the attention of the curious; besides these, there are seven or eight others, but these last are not to be compared with the former, especially as they are in a very ruinous condition. The four principal are nearly upon the same diagonal line, at about four hundred paces distant from each other; and their four faces exactly correspond to the four cardinal points. The two most northerly are the largest; and Mr. Graves, who measured the bottom of the first, found that it was exactly six hundred and ninety-three English feet square, and that its perpendicular height is five hundred feet; but if it be taken as the pyramid ascends inclining, then the height is equal to the breadth of the base. It cannot be improper here to observe, that the square of Lincoln's-inn-fields is said to have been formed by Inigo Jones of the size of this pyramid, which if placed in that square would on all sides reach to the houses.

This pyramid is ascended on the outside by steps, which run round the pyramid: the number of them has, however, been very differently related; but they are between two hundred and seven and two hundred and twelve in number, and from two feet and a half to four feet high, and are broad in proportion to their height.

The external part is chiefly built of great square stones cut from the rock which extends along the Nile, where to this day may be seen the caves from whence they were taken. The size of the stones is unequal; but they have all the figure of a prism, that they may lie perfectly close. The architect has only observed the pyramideal figure, without troubling himself about the regularity of the steps; and it appears that the inequality of the stones, which differ four, five, and even ten inches, is the reason why so many travellers, who have counted them, always differ with respect to number. These kinds of steps, says Mr. Norden, were not designed for ascending and descending, and therefore regularity was no farther sought than was necessary for the general shape of the pyramid and the facility of the work. It appears that the external lays are solely compacted by the weight of the stones, without mortar, lead, or cramps of any metal; but in the body of the pyramid they have used a mortar composed of lime, earth, and clay. At its four corners it is easily perceived that the lower stones are placed on the rock, without any other foundation; but beyond them, quite to the middle of each face, the wind has formed a slope of sand, which on the north side rises so high as to afford a commodious ascent to the entrance of the pyramid, which is about forty-eight feet high.

On ascending to the entrance, you discharge a pistol to frighten away the bats, and then two Arabs, whom you are obliged to have for your attendants, enter and remove the sand, which almost stops up the passage. You then strip yourself to your shirt, on account of the excessive heat constantly felt in the pyramid, and in this condition enter the passage, each of the company having a wax candle in his hand; for the torches are not lighted till you are in the chambers, for fear of causing too much smoke. This passage runs downward ninety-two feet and a half, and is very steep; but at the farther end of it is an opening so small, that it is barely a foot and a half high, and two feet in breadth; yet through this hole you are obliged to pass, but the traveller, instead of creeping, commonly lays himself down, and each of the two Arabs that went before take one of his legs, and thus drag him over the sand and dust.

On having passed this freight, which is luckily no more than two ells long, you enter a pretty large place, where travellers commonly take some refreshment to give them courage to proceed.

It ought not to be omitted that all these passages, except the fourth, are three feet and a half square, and lined on the four sides by great blocks of white marble, so polished, that this, with the acclivity of the way, would render them impassable, were it not for little holes cut for resting the feet in. It costs great trouble to advance forward, and if you make a false step, you will slide backwards to the place from whence you set out; but by observing these holes you proceed commodiously enough, though you must stoop till you come to the end of the second passage, which is a hundred and ten feet in length: you then come to a resting-place, on the right hand of which is an opening into a kind of well, in which nothing is to be found but bats of so prodigious a size, that they exceed a foot in length.

At this resting-place begins the third passage, which is a hundred and twenty-four feet in length, and runs horizontally in a straight line to the inferior chamber. The height of this gallery is twenty-six feet, and the breadth six, with benches on each side of polished stone. Before the chamber are some stones, with which the way is embarrassed; but having surmounted this difficulty, you enter a chamber which is also covered with stones. This chamber is lined with granite, finely polished: but at present extremely black with the smoke of the torches used in examining it.

Having visited the lower chamber, you return to the resting-place, and ascend upwards by fastening your feet as before, till coming to the end of the fourth gallery you meet with a little platform. You must then begin to climb again, but soon finding a new opening, where you may stand upright, you contemplate a little room, which is at first no more than a palm's breadth larger than the galleries, but afterwards enlarges itself on both sides;

and

and at length, stooping for the last time, you pass the remainder of the fifth gallery, that leads in a horizontal line to the upper chamber. This is a very noble room in the center of the pyramid, at an equal distance from all the sides, and almost in the midst between the basis and the top. The floor, sides, and roof, are all formed of vast blocks of granite marble. From the bottom to the top are but six ranges of stone, and those which cover it of a stupendous length, like so many huge beams lying flat and traversing the room, nine of them forming the ceiling. This hall is something more than thirty-four feet in length; it is seventeen feet broad, and the height is nineteen feet and a half. On the left side is what is generally supposed to be a coffin, formed of one entire piece of granite marble, and uncovered at the top; and on being struck with a key, sounds like a bell. This is said to be the tomb of Cheops, king of Egypt. Its form is like that of an altar, hollowed within, and the stone is smooth and plain without any relief. The exterior superficies contains seven feet three inches and a half in length, three feet three inches and three quarters in depth, and as much in breadth. The hollow part within is little more than six feet in length, and two feet in breadth. People in this room commonly discharge a pistol, which makes a noise resembling thunder. You then return in the same manner you came.

The traveller is no sooner out of the pyramid, than he dresses, wraps himself up warm, and drinks a glass of some spirituous liquor, to preserve himself from a pleurisy, occasioned by the sudden transition from an extremely hot to a temperate air. Having at length regained his natural heat he ascends the pyramid, in order to enjoy a delightful prospect of the surrounding country. The method of ascending it is by the north-east corner, and when the steps are high, or one broken, it is necessary to search for a convenient place where the steps are entire, or a high step is mouldered, so as to render the ascent more easy.

The top does not end in a point, but in a little flat or square, consisting of nine stones, besides two that are wanted at the angles. Both on the top, in the entrance, and in the chambers, are the names of abundance of people who at different times have visited this pyramid, and were willing to transmit the memory of their being there to posterity.

Many travellers have asserted, that a man standing on the top of this pyramid could not shoot an arrow beyond the bottom, but it must necessarily fall upon the steps; however, it is very certain that a good bow and a strong arm will send an arrow as far. There is as little justice in the remark, that these pyramids cast no shadows. Indeed in summer-time, and for near three quarters of the year, the pyramids cast no shadow at noon; but every morning and evening in the year, and at noon in winter, they certainly cast a shadow proportionable to their bulk; and according to Pliny and Laertius, Thales Milesius, about two thousand years ago, took the height of these pyramids by their shadows.

On approaching the second pyramid it appears even higher than the first, which is owing to its being placed in a more elevated situation; for, in other respects, they are both of the same size, only the second is so well closed, that there is not the least mark to show that it has been opened; and it is coated on the four sides with granite, so well joined and polished, that the boldest man would scarcely attempt to ascend it.

On the eastern side of this pyramid are the ruins of a temple, the stones of which are six feet broad, as many deep, and most of them sixteen or seventeen feet long, and some of them twenty-two feet in length. The whole building was a hundred and eighty feet in front, and a hundred and sixty in depth.

At some distance is a sphynx, whose enormous bulk attracts the admiration of every beholder. It is cut out of the solid rock; and Dr. Pococke observes, that what some have thought joinings of the stones are only veins in the rock. This extraordinary monument, which is said to have been the sepulchre of Amasis, is about twenty-seven feet high. The lower part of the neck, or beginning of the breast, is thirty-three feet wide, and it is about a hundred and thirteen feet from the fore-part of

the neck to the tail; but the sand is raised about it to such a height, that the top of the back can only be seen. This monument of antiquity is very much disfigured by the pains some people have taken to break off part of its nose.

The third pyramid is less than the two former by a hundred feet in height; but in other respects resembles them. It is closed like the second, and is without any coating. On the east-side of this pyramid was also a temple, which is more distinguishable in its ruins than the other, and was likewise composed of stones of a prodigious size.

The fourth pyramid, which is an hundred feet less than the third, is also without coating; it is closed, and resembles the others, but had no temple. However, it has one singularity, which is, its summit being terminated by a single stone that is very large, and seems to have served as a pedestal. It is situated a little more to the west, and out of the line of the others. These four great pyramids are surrounded by others that are smaller, and which have been for the most part opened, and are in a very ruinous condition.

At near ten miles distance from these pyramids are those of Socotra, so called from a mean village of that name. These pyramids extend from north to south, and are situated at the foot of the mountains in a plain that seems formed by nature for the use to which it is applied, it not being of great extent, but so high that it is never overflowed by the Nile; and there is reason to believe, that the celebrated city of Memphis extended almost thither.

One of the pyramids which rises above the rest is called the Great pyramid to the north. Mr. Norden measuring this structure found that the east side extended six hundred and ninety-feet, and the north-side seven hundred and ten. The perpendicular height is three hundred and forty-five feet. It has a hundred and fifty-six steps, from two to three feet in height, and is built of the same kind of free-stone as the others, but was cased with a fine hard stone, which is still remaining in several parts of the structure, though a great deal has fallen down. About one-third of the way up is an entrance three feet five inches wide, and four feet two inches deep. The stones within are of the height and breadth of the entrance, and about five feet in length. Our author and his companions entered this passage, which is steep, and has also holes cut as rests for the feet. Having passed through it they entered a room twenty-two feet and a half long, and eleven feet ten inches wide. At the height of ten feet six inches a range of stones projects five inches inwards on each side, and in the same manner twelve tiers project one farther than the other till they meet at the top. To the west of this room is another that resembles it: these rooms are formed of smooth white stones so large that there are only seven of them in length, and three or four in breadth.

At the distance of a mile to the south-east is another, called the Great pyramid to the south, which is about six hundred feet square at the bottom. It seems to have been cased all the way up, and is built within of good hewn stone.

On a lower ground, about two miles to the east of the last great pyramid, is one built of unburned brick, which seems to have been made of the mud of the Nile, it being a sandy black clay, with some pebbles and shells in it, and mixed up with chopped straw, in order to bind the clay together, as unburned bricks are at present usually made in Egypt and other parts of the East. Some of these bricks are thirteen inches and a half long, six inches and a half broad, and four inches thick; but others were sixteen inches long, seven broad, and four inches three quarters in thickness, but were not laid so as to bind each other. This pyramid is much crumbled, and very ruinous. It extends two hundred and ten feet on the west side, and is a hundred and fifty feet high; and at the top is forty-three feet by thirty-five. It seems to have been built with five degrees, each being ten feet broad and thirty deep, yet the ascent is easy on account of the bricks having crumbled away.

It seems not improbable that this pyramid was built by the Israelites, and that they also made the bricks of which

it is formed; for Josephus says, that when time had extinguished the memory of the benefits performed by Joseph, and the kingdom was transferred to another family, the Israelites were used with great rigour; they were ordered to cut canals for the Nile, to raise walls, and erect the pyramids.

It has been generally thought that the pyramids were erected as sepulchres for the kings of Egypt; but if this was the case, they would surely have provided a better entrance, and not made it necessary to drag the corpse through long, narrow, and intricate passages before it could be placed in its tomb: and it seems improbable that in the first pyramid eleven acres of ground should be covered with blocks of solid stone for so great a height, merely for the sake of a room or two of no extraordinary size, in which a coffin was to stand. Dr. Shaw is of the same opinion, and observes, that the great chest of granite marble found in the upper chamber of the pyramid, was probably intended for some religious use, it being of a different form from the stone-coffins found in Egypt, which are constantly adorned with sacred characters, and made with a kind of pedestal at the feet; for the mummies always stand upright, where time or accident have not disturbed them; but this chest lies flat upon the floor, and consequently wants that dignity of posture, which, says Dr. Shaw, we may suppose this wise nation knew to be peculiar, and therefore would be very scrupulous of denying, to the human body.

In so symbolical a religion as that of the ancient Egyptians, it is not improbable that the pyramidal form might convey some sacred meaning; and perhaps the pyramids themselves might be objects representing the Deity, and to which they offered their adorations; just as the Paphian Venus was, according to Tacitus, not of a human, but of a pyramidal form; as is also the black stone worshipped by the Gentoos of India, under the name of Jagernaut, of which we have given some account in treating of the religion of the Gentoos of Indostan.

SECT. VIII.

Of the Catacombs and Egyptian Mummies.

IN the same plain in which these last pyramids are placed are the catacombs, the entrance into which are by a kind of wells, about four feet square, and twenty feet deep, cut through a stony rock, covered with sand, which being moved by the wind, sometimes fills up these entrances. However, some of them are cased as far as the depth of the sand with large unburnt bricks. People are usually let down with ropes, when being got to the bottom, they find a passage five feet wide, and about fifty feet in length, filled up very high with sand, and having got to the end of it turn down another passage to the left hand about six feet high, on one side of which are little rooms, with benches about two feet above the floor, and on the other side are narrow cells just big enough to receive a large coffin. At the end of this alley is another, which is narrower, and on each side are niches that seem designed for coffins placed upright. This passage leads to rooms in the form of an oblong-square, filled with the remains of mummies. Our author observes, that here the inferior persons of a family were probably deposited, while the heads of the families were placed in the niches. Each family had originally, perhaps, its burial-place; and as the family increased they branched out these sepulchral grottos, that every descendant might have a separate place for his family.

In these catacombs are found the remains of embalmed bodies swathed scattered up and down, and sometimes, coffins standing upright and entire, made of sycamore or Pharaoh's fig-tree, that have continued in these subterraneous apartments above three thousand years, though the wood is to appearance spongy and porous. The upper part of the coffin is commonly shaped like a head, with a face painted upon it; the rest is a continued trunk, and the end for the feet is made broad and flat for it to stand upright in the repository. Other coffins are made

of stone, and they are generally adorned with carved work representing hieroglyphical figures.

Upon opening the coffins the bodies appear wrapped up in a linen shroud, upon which are fastened several linen scrolls painted with hieroglyphic characters. These scrolls commonly run down the belly and sides, or are fixed on the knees and legs. On a kind of linen headpiece which covers the face, the countenance of the person is represented in gold, or painted; but these paintings are very much decayed by time. The whole body is swathed by fillets or narrow bandages of linen wrapped round in so curious a manner, with so many windings and so often upon each other, that it is supposed a corpse has seldom less than a thousand ells of filletting. Those especially about the head and face are laid on with such surprising neatness, that some appearance of the shape of the eyes, nose, and mouth may be plainly perceived.

Dr. Pococke brought a mummy to England, which was in a coffin made of wood, the seams of which were filled up with linen and fine plaster. Four folds of cloth were over the head, and the upper one painted blue. Beneath these was a composition about half an inch thick of gum and cloth burnt by the heat of the things applied to it, and over the skin was a coat of gum, or bitumen, of the thickness of a wafer. The back part of the head was filled with bitumen, which had been poured in at the nose, and had penetrated even into the bone of the skull. The body was bound round with a bandage of linen tape about three quarters of an inch broad, under which were four folds of cloth, then a swathe two inches broad, and under that eight different bandages of the same breadth laid across from the shoulders to the hips on the other side: under this was a crust of linen about an inch thick, burnt almost to ashes, but sticking together by means of the gums with which it had been smeared. The arms were laid across the breast, the right hand over the left, and both lying towards the face. From the hips to the feet were eight bandages twelve inches broad, and under these were bandages an inch thick consumed by time and the heat of the drugs; but the outer bandages did not appear to have been smeared with gums. The coffin in which the body was put was formed of two pieces of wood hollowed so as to receive it, and being put together were fastened with broad pegs in the top fixed in holes in the lower part. This coffin was in the shape of an human body, as bound up after its being embalmed; and both the coffin and body wrapped up in linen, were covered with a thin plaster and painted.

Among the catacombs is one for the birds and other animals worshipped by the ancient Egyptians; for when they happened to find them dead they embalmed them, and wrapped them up with the same care as the human bodies. The catacomb is about thirty feet deep, and has the same kind of entrance, only the passage from it is about eight feet wide, and almost filled with sand. It is also much more magnificent than the others. The birds are deposited in earthen vases, covered over and stopped close with mortar. In one of the irregular apartments are large jars that might be for bigger animals. In short, the birds were embalmed by dipping them in gums and aromatic drugs, and bound up, like the human bodies, with many folds of linen.

SECT. IX.

Of the Ruins of Busiris, Heliopolis, the celebrated Labyrinth, Antinopolis, Hermopolis. Some remarkable Antiquities on the Side of a Mountain: Those at Gaua Kiebra; with a particular Account of the miraculous Serpent Heredy.

WE shall now describe the ruins still to be seen of several cities famous in antiquity. Some of the ruins of the cities and temples of Egypt, like those of Palmyra and Balbec, raise our ideas of their ancient magnificence and grandeur; while others only shew the places where the most splendid cities once stood; the vast length of time since they were built, having levelled them with the dust, and only left a few scattered monuments of the most superb structures,

structures, as testimonials of the truth of history, and as specimens of the architecture of the early ages, before it was improved and carried to perfection by the Greeks. Those of which we shall treat in this section are of the last kind, and the most imperfect.

A little to the northward of Cairo is the village of Baalbait, situated on one of those artificial eminences on which probably stood Busiris, a city celebrated for its temple dedicated to Isis; there being the remains of a temple, the most costly in its materials of any in Egypt. From these ruins the temple appears to have been about two hundred feet long and an hundred broad, and at about a hundred feet distance it is encompassed by a mound raised to keep out the Nile. The outside of this structure was of grey granite, and the inside and columns of red, the capitals being the head of Isis. There seems to have been four rows of twelve columns each in the temple; but what most commands the attention of the curious, is, the exquisite beauty of the sculpture; for though the figures are only about four feet high, there is something so fine and so divine in the mien of the deities and priests, that exceeds imagination. But the natives are constantly employed in destroying these fragments of antiquity, and frequently cut the columns in order to make them into mill-stones.

At a small distance near Cairo are the remains of the ancient city of Heliopolis, the Or of the Scriptures, a city of great antiquity, famous for the worship of the sun. A large mound encompasses the whole, and at the entrance on the west are the ruins of a sphynx of a bright shining yellow marble, and almost opposite to the gate is an obelisk sixty-seven feet and a half high. The priests of Heliopolis were the most famous of all Egypt for their skill in philosophy and astronomy, and were the first who computed time by years of three hundred and sixty-five days. Herodotus came to this city to be instructed in all the learning of the Egyptians; and when Strabo came here, he was shewn the apartments of Plato and Eudoxus.

At a small distance to the south of the above obelisk is the village of Matarea, where it is said the Holy Family lay for some time concealed when they came into Egypt; and they add, that being in danger from some bad people, a tree opened and became hollow to receive and shelter them. The Coptics even pretend to shew the very tree, which is hollow and of the sort called Pharaoh's fig, and take away pieces of it as sacred relics; but the Romans say, that the tree fell down, and was carried away by the monks of Jerusalem.

At a place called the town of Caroon, is the spot on which stood the famous labyrinth, which, according to Herodotus, was built by the twelve kings of Egypt, when the government was divided into twelve parts, as so many palaces for them to meet in, and transact the affairs of state and religion. This was so extraordinary a building, that Dædalus came to Egypt on purpose to see it, and formed the labyrinth in Crete for king Minos on the model of this.

"This labyrinth, says Herodotus, has twelve saloons
"or covered courts, with gates opposite to each other,
"six towards the south, and six towards the north in
"continued lines. They are surrounded by the same
"outward wall. The apartments are on two floors, the
"one under ground, and the other over them, and are three
"thousand in all, each floor consisting of fifteen hundred.
"Those above ground I myself have seen and gone
"through, so that I speak from my own knowledge;
"but those beneath being the sepulchres of the kings,
"and of the sacred crocodiles, the rulers of the Egyptians
"were by no means willing to shew them. The upper
"apartments are greater than any other human
"works: for the outlets at the top, and the various wind-
"ings through the saloons, gave me infinite surprize as
"I passed from a saloon into apartments, and from apart-
"ments into bed-chambers, and into other rooms out of
"the bed-chambers, and from apartments into saloons.
"The roof of the whole is stone as well as the walls.
"The latter are adorned with sculpture: each saloon
"has a peristyle of white stones admirably joined to-
"gether. Quite close to the line where the labyrinth
"terminates, is a pyramid of two hundred and forty feet,

"on which large animals are engraven; and the en-
"trance into it is under ground."

Little, however, is now to be seen of these boasted pieces of art, but heaps of ruins, broken columns, shattered walls and entablatures. Among the rest is the foundation of an oblong square building formed of a reddish stone or marble. Some semicircular pilasters are placed upon it, and the remains of the edifice above are of brick plastered over. Whatever this building was, it appears to have been repaired in this rough manner. More to the east are the remains of an oblong square edifice of white hewn stone plastered over, with a kind of base and plinth ranging round. Near it is a kind of rustic building that seems to have been a gate. At length appears some remains of the grand structure itself, which is now called the castle of Caroon. It had a portico of rustic work, which is now no where above six feet high, and the front is more ruinous than any other part. On the other sides are forty-four tiers of stone, each nine inches deep, and consequently it is there thirty-three feet high; it has signs of a cornice ranging round with ornaments of sculpture. There are four rooms in the length of this building with the doors crowned with double cornices, and over each a kind of false door ornamented in the same manner; on the sides of the walls are several niches, and many stones are scattered about the plain, some of which appear to have composed the shafts of columns.

A little farther to the south are the ruins of the city of Antinopolis, built by Hadrian in honour of Antinous his favourite, who was drowned there; but now named Enfeneh. Among these ruins are still standing a large pillar, with a Corinthian capital, on the top of which was a square stone, whereon a statue was probably placed. There is also a fine gate of the Corinthian order, and of excellent workmanship.

A little farther up the river is the village of Archomountain, which Dr. Pococke supposes to be situated on the ruins of the ancient city of Hermopolis. Little appears of the old city, but extensive heaps of rubbish, except a grand portico of an ancient temple, consisting of twelve pillars, six in a row. These pillars are six feet in diameter, and on every part both of them, and of the stones laid upon them, are hieroglyphics; on the pillars are also some remains of paint, and the ceiling is adorned with stars. Some pieces of columns of granite marble are also to be seen among the ruins.

Farther to the south is a mountain called Shebat el Kof-feri, on the side of which are some remarkable antiquities. After ascending the mountain for about two hours, you arrive at a gate which leads into a great saloon, supported by hexagonal pillars cut out of the solid rock. The walls are adorned with paintings, which are still plainly to be distinguished, and the gold that was employed glitters on all sides. There are openings leading to other apartments; but those are filled up with rubbish. There is another apartment above to which you may arrive, though with great difficulty, by climbing up on the outside. It is smaller than the first, and has no pillars, but is painted like the other. On each side of this second grotto is a tomb of the same stone with the mountain, with which they both form a continued body. One is open and the other is closed, but almost buried in the sand. This upper cavern had also a communication with other apartments; but these are also closed up.

A little farther to the south is Gana-Kiebra, where still remains a beautiful portico of a temple, containing eighteen pillars in three rows: these have a singular kind of capital, and their shafts are enriched with hieroglyphics, executed in a most masterly manner. This temple appears to have been extremely magnificent, not only from the grandeur of the portico, but from the vast stones which formed the walls, one of which Dr. Pococke found to be twenty-one feet long, eight broad, and four deep; and another thirty feet long, and five broad. At some distance behind the portico is a stone shaped like the top of an obelisk, which has on one side of it a niche as if for a statue, and is adorned with hieroglyphics.

At some distance to the south is the grotto of the famous serpent called Heredy, where is the tomb of a pretended Turkish saint, adorned with a cupola raised above the mountain.

mountain. The Arabs affirm, that this saint, who was named Heredy, dying in this place, was buried here; and that, by a particular favour of the Almighty, he was transformed into a serpent that never dies, but heals diseases, and bestows favours on all who implore his aid. Of this serpent both Dr. Pococke and Mr. Norden have given a very particular account, and perfectly agree in the particulars they relate of it; and therefore we shall give an account of it here, as this can hardly fail of being acceptable to the curious reader, who will doubtless be inclined to entertain a very mean opinion of the people who could be deceived by this pious fraud: but absurd as it is, it is not more so than the vulgar belief among the antient Romans, attested by very credible authors, of *Æsculapius* entering into a serpent, and under that form being brought to Rome and curing a pestilence.

This miraculous serpent it seems pays great respect to persons, and is more propitious to the great lords than to the poor: for if a governor be attacked with any disorder, the serpent has the complaisance to suffer himself to be carried to his house; but a person of the common rank must not only make a vow to recompense him for his trouble, but send a spotless virgin on the important embassy: for the fair alone can have any influence on him; and if her virtue should be the least sullied, he would be inexorable. On her entering into his presence, she makes him a compliment, and, with the most humble submission, intreats him to suffer himself to be carried to the person who wants his assistance. The serpent, who can refuse nothing to female virtue, begins at first with moving its tail: the virgin redoubles her intreaties, and at length the reptile springs up to her neck, places itself in her bosom, and there remains quiet, while it is carried in state, in the midst of loud acclamations; to the house of the person who dispatched the ambassadors. No sooner is it brought into the room, than the patient begins to find himself relieved. Yet this miraculous physician does not withdraw; for he is very willing to remain some hours with the patient, if during the whole time they take care to regale his priests, who never leave him. All this is performed to admiration, provided no Christian or other unbeliever comes in, whose presence, 'tis pretended, would disturb the feast; for this sagacious serpent, on perceiving him, would immediately disappear. The priests would search for him in vain, and it would be impossible to find him: for was he carried to the other side of the Nile, he would return invisibly to his dwelling in the tomb. The Arabs even boldly assert, that were he cut in pieces, the parts would instantly join again; and that being destined to be immortal, nothing can put a period to his life.

Even the Christians, who ought to claim a degree of wisdom superior to the Arabs, have the folly to believe that this pretended saint is the devil himself, whom God has permitted to mislead these blind and ignorant people; and in this belief they are confirmed by a tradition, that to this place the angel Raphael banished the devil *Asmodi*, whom, in *Tobit* viii. 3. he is said to send into Egypt.

"But I am persuaded, says Mr. Norden, that both the Arabs and these Christians offend against the rules of reason. Before we consider a thing as miraculous or superstitious, it is necessary to examine whether the fact itself be true; whether the circumstances are such as are pretended, and whether no fraud is used. I agree that the serpent is there, but it cannot be immortal; he undoubtedly dies like other serpents, and the priests who draw a profit from him substitute another of the same kind in his room. Were they indeed to cut the serpent in pieces, and were the parts seen to join again, it might be esteemed a proof of its immortality; but they can never be brought to this: and when the emir of Akmim ordered them to make this trial in his presence, the priests excused themselves from the experiment. Is there any thing easier than to make a tame serpent obey certain signs? The virginity of the ambassadors is secured by her being so young as to be free from suspicion; and serpents are known to be attracted by certain odours and herbs, with which the girl may be rubbed; at least she is adorned with chaplets and garlands of flowers, in which they take care not to forget such as are agreeable

to the serpent. In short, if it be asked how it is possible that it should disappear from the sight of so many people, I answer, that it is sufficient to conceive that these priests are excellent jugglers, and there will be no difficulty in imagining them capable of conveying away the serpent in the presence of a great number of spectators, without the most attentive and quick-sighted being able to perceive it: whoever has seen the tricks daily played by the mountebanks in the great square before the castle of Cairo, must have been struck with feats much more remarkable than this." If to all this he added the account given in this work of the dancing-serpents, and other particulars relating to those reptiles, in treating of *Indostan*, the fraud must appear extremely evident, and every thing mysterious in the affair will vanish.

SECT. X.

Of the Ruins of Tentyra and Thebes.

STILL farther up the Nile was situated the city of Tentyra, the inhabitants of which paid extraordinary adorations to Venus and Isis, to each of whom they built a temple. From the many heaps of ruins seen here, the city appears to have been of great extent, and to have been much frequented since it was in its antient splendor. People seem to have lived even in the temples, and several houses have been built of unburnt brick on the top of the great temple, which is two hundred feet long, and forty-five broad. The principal remains of the antient buildings are near each other; these are two gates and four temples. The grand temple already mentioned appears to be that of Isis, and seems entire, only the apartments which appear to have been built at the top are destroyed, and six or seven of the rooms which have been formed below are filled up.

There is an ascent to the top by ten flights of steps. The pillars are adorned with large capitals of the head of Isis, each capital having four faces, one on each side, and over them are compartments in basso relievo, finely executed, and in a noble taste. At the end of the grand room are four stories of hieroglyphics in seven compartments, each of which has two or three human figures, but some of them are defaced. There are likewise four stories of hieroglyphics on the outside, and it is not improbable that before the ground was raised there were five both within and without. On the outside of the south end are five colossal figures, and two more beautiful than the rest stand at each corner. Round the top of the edifice are several spouts, with an ornament over them representing the head and shoulders of the sphynx.

We shall now give a particular description of the ruins of the antient city of Thebes, which are the most considerable in Egypt, and are generally known by the name of The antiquities of Carnack and Luxerein, two villages situated among those ruins.

The great and celebrated city of Thebes was extended on both sides the river, and, according to some authors, was built by Osiris, and according to others by Busiris II. who appointed its circuit, adorned it with magnificent buildings, and rendered it the most opulent city upon earth. It was originally called Diospolis, or the city of Jupiter, and afterwards obtained the name of Thebes. *Diodorus Siculus* observes, "that not only this king, but many of his successors, improved the city with presents of gold and silver, with ivory, and a multitude of colossal statues; and that no city under the sun was so adorned with obelisks of one entire stone. There were four temples of amazing size and beauty. The most antient of these was thirteen stadia in circumference, its height forty-five cubits, and the thickness of its walls twenty-four feet. The buildings have remained to modern times; but the gold and silver, the ivory, and precious stones, were carried away by the Persians when Cambyfes set fire to the temples of Egypt. It is said that the Persians having transferred this opulence to Asia, and having carried artists with them from Egypt, built the magnificent palaces

"of

“ of Persepolis, Susa, and others in Media. It is added
 “ that the riches of Egypt were at that time so great,
 “ that from the ruins, after plundering and burning,
 “ were taken above three hundred talents of gold, and
 “ two thousand three hundred talents of silver.”

Of the four remarkable temples mentioned by Diodorus; Dr. Pococke, bishop of Ossory, imagines, that which he viewed was the same which that ancient historian mentions as of a most extraordinary size, since the ruins of this stupendous building extended near half a mile in length. The description Diodorus has given of the height and thickness of the walls has been thought extravagant, and beyond all the rules of probability; but, on examining the remains of this temple, it will appear that in both these respects they in some places exceed the account he has given of them.

This temple has eight grand entrances, to three of which were avenues of a great length between sphynxes, two of them having sixty of these statues on each side. Having passed between these at one of the entrances, you come to four grand gates at a considerable distance behind each other, in a direct line to the temple; they are about thirty-five feet deep, a hundred and fifty in length, and before the ground was raised, must have been from fifty to sixty feet high. These structures lessen every way like a pyramid, from the bottom to the top: the first is of red granite finely polished, and in a beautiful manner adorned on the outside with hieroglyphics, in four series from the top downwards, and three on the inside, in each of which are the figures of two men finely executed, and bigger than the life. Farther on each side are colossal figures, about fifteen feet high, with hieroglyphics under them; and in this last manner the other gates are adorned, but without the compartments. On each side of these gates there also seem to have been colossal statues.

On the outside of the first is on one side a statue of red granite, and on the other a statue of a kind of granite that seems composed of small pebbles. Our author measuring the head of one of them found it five feet six inches long. The next gate is much ruined, and has only two stories of colossal figures to the south, and one to the north. The third gate is covered all round with hieroglyphics and colossal figures of men, and here are the remains of a statue of white marble, the head of which has a serpent on its casque. This head is four feet and a half from the top to the lower part of the neck. The fourth gate is a heap of ruins, and before the main building is a large pond, that was probably a reservoir of the water of the Nile for the use of the temple. From these gates walls had been built, that not only extended to the other gates, to form the entire inclosure of the temple, but to inclose particular courts between the gates and that edifice.

About a hundred and fifty paces to the west is another superb entrance, with the same kind of avenue of sphynxes; and all the rest have the appearance of extraordinary magnificence.

The grand entrance to the west, which may be termed either a gate or a front to the great court before the temple, is extremely noble, and yet has the greatest plainness and simplicity, without any ornaments, and nearly resembles what among us is termed the rustic; it is forty feet broad, and the bottom is a solid wall of that thickness. In the front are two stories of small windows; but the upper story is in many parts so ruined, that at a distance it has the appearance of battlements.

On the inside of this gate is a large open court, which has a terrace eighty feet broad, and six feet above the ground, as it is now raised, to which there were probably steps to ascend from a colonade on each side of this anti-temple. The pillars of these colonades have square capitals, and on each side of the middle walk, to the inner part of the temple, was a very grand colonade of pillars above forty feet high, and eight feet in diameter, with large capitals like vases worked with figures in lines. At the farther end of this colonade are two colossal statues of red granite, much mutilated, and with the heads broken off.

Though the wall of the inner temple is greatly ruined, Dr. Pococke says it has more grandeur and magnificence

than is to be found in any other building he ever saw. The door is very high, and yet in a just proportion; and the walls on each side are beautifully adorned with hieroglyphics and the figures of men in six compartments, above nine feet high, and twelve wide, every compartment having the figures of three men.

On entering the inner temple there appears sixteen rows of pillars one way, and eighteen another: those in the two middle rows are eleven feet in diameter, and the others eight, with capitals of square stone. The temple was higher above the middle rows than in the other parts, and had a kind of windows over the space between every two pillars, with twelve lattices of stone in each. Every part of the temple, both within and without, is covered with hieroglyphics, and on the outside to the north are carved representations of battles, with horses and chariots, one of which is drawn by stags.

On each side of the entrance into the east end of the temple is an obelisk sixty-three feet four inches high, and six feet square. Farther to the east are two other obelisks seventy-three feet high, and seven feet six inches square; but one of them is fallen down. These obelisks are all of red granite, and covered with hieroglyphics. At a little distance from these obelisks are two walls, separated by an entrance in the middle, and on the west side of them are colossal busts. Continuing along the middle to the east you come to a small room of red granite, and all along are apartments that were perhaps appropriated to the use of the priests.

These ruins are scattered several miles round, and there are the remains of several other temples; and among the rest one which appeared to have been round, and a hundred and seventy-five feet in diameter.

That part of Thebes on the west side of the river is now called Gournou, from a village of that name situated near the ruins. There is in this place a very singular street, for the rocky ground rising on each side of it about ten feet high, has on each hand a row of rooms, some of which are supported by pillars; and as there is not here the least sign of raised buildings, Dr. Pococke remarks, that he could not help imagining that in the earliest times these caverns might serve as houses, and be the first invention after that of tents, when they might be contrived as a better shelter from the weather and the coldness of the nights: but it seems more natural to suppose, that the use of caverns preceded that of tents, and that the latter were chosen only by those who removed with their flocks from place to place for the sake of pasture.

Here the traveller passing through some other vallies, where the mountains rise to a great height, comes to a round opening like an amphitheatre, and ascending it by a narrow steep passage, arrives at the sepulchres of the kings of Thebes, which are formed in the rocks. The vale in which are these grottos, is covered with rough stones that have probably rolled from above. It is about a hundred feet wide, between high steep precipices, in which grottos are cut in a most beautiful manner. Long galleries, or passages, are formed under the mountains out of a close white free-stone that cuts like chalk, and is as smooth as the finest stucco-work. Generally there are four or five of these galleries, one within another, from thirty to fifty feet long, and from ten to fifteen feet high, leading to a spacious room, in which is the king's tomb, or coffin, with his figure cut in relief, or painted upon it, at full length. Both the ceiling and sides of the rooms are cut with hieroglyphics of birds and beasts; some of them painted, and almost as fresh as if they were but just finished, though they cannot be less than upwards of two thousand years old.

One of these sepulchres is most beautifully adorned with hieroglyphics cut in the stone and painted. The entrance, which has a descent, is cut through the rock, and for thirteen feet is open at the top; then for eight feet more the ceiling inclines, answering to the descent under it. The galleries have hieroglyphics carved on each side, first on a kind of compartments next to the ceiling, in the manner of a frieze. Below them are carved figures representing mummies, and under these are hieroglyphics all down the sides, divided by lines into different columns. In the middle of the ceiling are the

the figures of men, with stars on each side. The king's tomb is of one stone of red granite, seven feet nine inches high, eleven feet eight inches long, and above six feet broad, the cover being made to shut into it. The figure of the king is cut in mezzo-relievo, with an hieroglyphical inscription. The room is adorned with different columns of hieroglyphics.

In a large room belonging to another of the grottos is the statue of a man holding a sceptre in his hand, and on the ceiling is painted a large figure of a man holding a particular kind of sceptre, with wings hanging lower than his feet, and covering his whole body. On each side of the entrance are four men cut in the stone above the natural size, with the heads of hawks and other animals.

On the south side of these mountains are two very extensive apartments: to one of them is a descent of ten steps to a spacious area cut in the rock, which leads to a room supported by square pillars, also cut out of the solid rock; and beyond it is a long room supported by pillars on each side. All the apartments are adorned with hieroglyphics; but they are in some places black and scaled as if damaged by fire. Beyond these rooms are apartments, to which there is a descent of several steps to the right; and one part leads to a gallery cut round the rock, which has apartments on one side, and in them are holes cut perpendicularly down to other apartments below, where there are doors and openings, and probably as many rooms as above. One would imagine, says the right reverend Dr. Pococke, that these were the habitations of the living, and that they were cut under those of the kings of Thebes, if they were not themselves palaces, to which those princes retired to avoid the heat.

The other apartments are cut in a small hill near the appearance of a grand entrance under the mountains: the way to which is through a valley, that seems to have been divided by walls or mounds into four parts; one of them is dug much deeper than the rest, and was probably a reservoir of the water of the Nile, and the others extend towards some remains of old buildings. To the west is a room that has a well-turned arch, and appears to have been used as a Christian church; for the hieroglyphics, which are in small columns, and extremely well cut, have been covered with plaister, on which is painted Christ encompassed with a glory.

A little to the south-east are the ruins of a large temple, and at a distance from it the ruins of a pyramidal gate, and of a very large colossal statue, broke off about the middle of the trunk. It is twenty-one feet broad at the shoulders; the ear is three feet long, and from the top of the head to the bottom of the neck is eleven feet.

In the first court of the temple are two rows of square pillars, on each side of which is a statue, but their heads are broke off. Each of these statues has the lituus in one hand, and the flagellum or whip in the other, as is commonly seen in the statues of Osiris. In the second court are the remains of two colossal statues sitting; they are of black granite, and the head of one of them, which lies on the ground, is three feet five inches long.

A great number of pillars belonging to the temple are still standing, and many others are destroyed. Two sorts of pillars are observed in this edifice, one more beautiful than the other. Their thickness and solidity give them at a distance a noble appearance, and on approaching them the eye is entertained with the hieroglyphics; and when you are near them their colours have a fine effect. This sort of painting has neither shade nor degradation. The figures are encrested with it like painting in enamel; and Mr. Norden observes, that it surpasses in strength every thing he had seen of the kind, it being superior in beauty to the al-fresco and Mosaic work, with the advantage of being more durable. It is surprising to see, says he, how the gold, ultra-marine, and other colours have preserved their lustre to the present age.

At a considerable distance from the temple are what is called the colossal statues of Memnon, which front the Nile. The first appears to represent a man sitting, and the other a woman in the same posture; and they are both

fifty feet high from the bases of the pedestals to the top of their heads. They are seated upon stones fifteen feet in height, and as many in breadth; but the back part of each stone is higher than the fore part by a foot and a half, and they are placed on plain pedestals five feet high. The statue to the north has been broken off at the middle, and has been built up with five tiers of stones; but the other is of one single stone: the feet have the toes broken off, and the features are moulded away by time. The sides of their seats are covered with hieroglyphics; on the pedestal of the statue, which has been broken, is a Greek epigram; and on their insides and legs are several Greek and Latin inscriptions, some of them epigrams in honour of Memnon; but most of them are the testimonies of those who have heard his sound; for one of them has been thought the famous statue of Memnon, which at the first and second hour, it is pretended, uttered a sound occasioned by the rays of the sun striking upon it.

At a little distance from these statues are the ruins of several others, particularly one of yellow granite almost entire, and twelve feet long from the top of the head to the thigh.

At Luxerein are the remains of a large and magnificent temple, which was also a part of the ancient Thebes, and is called by Diodorus the sepulchre of Osymandus: it is situated on the east side of the river, to the south of the antiquities just described. On approaching it you come to two obelisks, which are probably the finest in the world; they are at present sixty feet high, and might be seventy or eighty, according as the ground has risen, which is certainly a great deal: they are seven feet and a half square, and at bottom might be eight feet. The hieroglyphics extend in three columns down each side, and are cut with a flat bottom an inch and a half deep, and the granite has perfectly retained its polish, which is as fine as can be imagined. On the top of each side a person sits on a throne, and another offers him something on his knees. These figures are likewise below. Lower down are three hawks, then three bulls, and at the distance of about every foot is an owl. There are also monkeys, heads of camels, hares, dogs, serpents, birds, and insects.

At a small distance is a pyramidal gate, two hundred feet long, and at present fifty-four above the ground. On each side of the entrance is a colossal statue, which rises thirteen feet and a half above the surface of the earth, though the shoulders are only three feet and a half above the ground. In the front of the pyramidal gate are windows and sculpture, particularly a person seated on a throne, holding out one hand, in which he has a sceptre or a staff, and is surrounded by others in postures of adoration. On the other side a man is represented in a car, galloping and shooting with a bow, and followed by many chariots. This may have a relation to the wars of this king against the Bactrians. Within this gate is a court almost filled with cottages, with some pillars that once formed part of a colonnade, beyond which was another gate now in ruins, and beyond that another court, which had a large and beautiful altar in the middle, and the history of the king was cut all round on the walls. The pillars in this court are forty feet high; but the work in the capitals instead of being in relief, is only cut out in lines. The walls of the rooms are adorned with sculpture, among which a Deity is represented carried by eighteen men in a kind of boat, preceded and followed by a person holding a particular ensign. Here are also a person sitting, and another kneeling to him, with instruments of music, and men kneeling who have the heads of hawks; and also a man leading four bulls with a string.

S E C T. XI.

Of the Ruins of Esne, or Essnay; of the Temple of Pallas, at Latopolis; of one at the ancient City of Appollinopolis; with the Ruins of Comambo, Elephantine, and Philæ.

AT Esne, a considerable town farther up the river, are the remains of a magnificent temple, that is cloated on three sides, and has in the front twenty-four pillars

pillars that seem well preserved. A channelled border runs all round the top of the edifice, and in the middle of the front is a cartouch, or ornament like those seen on all the principal gates of Egypt. A semi-corona borders the whole edifice, the sides of which are filled with hieroglyphical figures that appear of the most ancient kind, and seem to have been executed in haste. The pillars support stones placed cross-ways, on which rest great tables that form a roof, that is also adorned with hieroglyphics. The figures of the inside are easily perceived to be done by another hand, and executed with more care than those without; but none of the hieroglyphics are incrustated with colours. The pillars are likewise covered with hieroglyphics, which in some places are small and much crowded. It is remarkable, that among all the pillars of this temple there is not one capital that resembles another; for though the proportions are the same, the ornaments are different. The inside of the edifice is blackened by the smoke of the fires formerly made there: however, every part of it is well preserved, except the gate, and the intermediate spaces between the front columns, which the Arabs have filled up, in order to shut up their cattle in the temple, which is at present applied to no other use.

At about three miles from this temple is another, which Dr. Pococke supposes to be the Temple of Pallas at Lato-pylis, where both that goddess and the fifth Latus were worshipped. There are here also several different kinds of capitals, some of which resemble the Corinthian, but have a very flat relief. The inside has three stories of hieroglyphics of men about three feet high, and at one end the lowest figures are as large as the life: one of them has the head of the Ibis, and the figure of a woman sitting appears in several parts of the wall. The ceiling is adorned with a variety of animals, which are painted in very beautiful colours; and among them is a man sitting in a kind of boat, with a circle round him. This temple seems to have been used as a church, there being some Coptic inscriptions on the walls.

At Etsou, where was once situated the city of Apollinopolis, is a noble temple and a grand pyramidal gate, which the Turks have converted into a citadel. There runs all round it a semi-circular corona, but no cornice is to be seen: upon its faces are three rows of hieroglyphical figures, which appear designed to represent infants, though their stature exceeds that of men. The temple, which was dedicated to Apollo, is in a manner buried under ground; and the Arabs have made no scruple of employing what they have been able to take away in erecting some pigeon-houses.

Still farther to the south is the village of Comombo, where are some beautiful ruins, which it is impossible for a curious traveller to view without great satisfaction. A noble building rests upon twenty-three well wrought pillars adorned with hieroglyphics: the stones that cover the top are of a prodigious size, and the architrave, which is at present split, was anciently a single stone. The pillars are above twenty-four feet in circumference: part of the building is covered with earth, and three quarters of the pillars are under ground.

At about fifty paces distance on the declivity of a mountain is another antique monument, about eighteen feet in height. The sides are thick set with hieroglyphics, which are much decayed towards the ground, and the back part is almost buried under the sand. This edifice is entirely built of large square blocks of a whitish stone that nearly resembles marble.

Farther up the Nile is the island Elephantine, in which was a city of the same name, though it is only about a mile in length, and at the south end about a quarter of a mile in breadth. In this island was a temple to Cnuphis, and a nilometer to measure the rise of the Nile. In the midst of the island are the remains of one side of a magnificent gate of red granite, finely adorned with hieroglyphics. Its southern part is mountainous and covered with ruins, most of which are buried under the earth. Among others is an ancient edifice still standing, though covered with earth at the top, as well as on the sides, and this is still called the temple of the serpent Cnuphis. It is inclosed by a kind of cloister supported by columns. At the four corners and in its breadth it has walls, but

only a single column is to be seen in the middle. This inclosure contains a grand apartment that has two large gates, one to the north, and the other to the south; but the inside is almost entirely filled with stones and earth. The walls are covered with hieroglyphics, but are bedaubed with dirt, and blackened by the smoke of the fires made there by the shepherds.

Farther to the south is the island of Philæ, which is high and very small, it not exceeding a quarter of a mile in length, and half a quarter in breadth; and it appears that there were no other buildings in the island, but what had a relation to the temples; for Diodorus seems to insinuate, that none but the priests were permitted to land, on account of the sacredness of the place; accordingly the whole island seems to have been walled round, somewhat in the manner of a modern fortification, and a great part of that wall still remains. The particular kind of Ethiopian hawk worshipped here is cut among the hieroglyphics in several parts, and represented with a long neck, extended wings, and a serpent coming out of it.

The temple of the hawk is built with free-stone on the west side of the island. In the court of the temple, which is of great length, is a row of pillars on each side, adorned with a variety of capitals. Beyond this is an inner court, in which are very beautiful pillars with capitals wrought in basso relievo, in something like leaves and branches, above which is the head of Isis on each of the four sides. On the outside of this inner court are large colossal figures, cut on the south side of a great pyramidal gate. At the entrance to the east is an obelisk of red granite on each side, and near each of them a lion. Between the west side of the grand area and the water is only a narrow terrace, with doors to it from the portico; and the whole ends at the water to the south with a parapet wall, at which are two obelisks about two feet and a half square raised on their pedestals. Here the island rises twenty or thirty feet above the water, affording a prospect above a mile south to the rocks of granite, where the Nile turning, the view is terminated by those rocks in a most agreeable and romantic manner, all together having a noble and beautiful appearance.

To the east of this structure is, according to Mr. Norden, the temple of Isis, which is an oblong-square building, open on all sides. The capitals of the pillars which have some resemblance to those of the Corinthian order, may be reckoned among the most beautiful in Egypt, and were probably of the last invention.

S E C T. XII.

Of the Manufactures, Arts, and Commerce of Egypt.

THE manufactures of Egypt consist of woollen, linen, and silk. Their flax, of which great quantities grow in the Delta, or that part of Egypt which is enclosed between the two branches of the Nile, is spun with a spindle, and the thread drawn out from the distaff without the use of a wheel. They are not now, as formerly, remarkable for their fine linen, for the people of rank commonly wear muslins: however, the Egyptian linen is exceeding white and cheap; it is chiefly manufactured at Rosetta, where they also make striped linens for curtains to defend themselves against the gnats, which are very troublesome in Lower Egypt. In other parts, they make a strong coarse linen for sheets, and great quantities of sack-cloth.

The woollen of this country chiefly consists of unnapped carpets used in their sophas.

Their raw-silk is brought from Syria, and manufactured by them into large handkerchiefs for women's veils: they also make very rich handkerchiefs worked with gold and flowers of various colours, and sometimes make coverings of this sort for their sophas; they likewise manufacture a great variety of taffetas and sattinets.

The Christians are the persons chiefly employed in their manufactures and mechanic arts: they are in particular the jewellers and silver-smiths of Egypt. There is a very great demand for these sort of goods; for tho' the people are prohibited the use of plate in their houses,

or the wearing of gold rings, a great deal of jewellers-work is used as ornaments in the dresses of their women, and plate in the furniture of their houses.

The Egyptian pebbles are wrought and polished in great perfection, for the making snuff-boxes and the handles of knives, which is done with a wheel as they cut and polish precious stones. They also make red leather; but it is not equal to that of Morocco or Constantinople.

As Lower Egypt furnishes the rest of the country with rice, so Upper Egypt supplies the Lower with wheat and other grain. Since the Europeans found way to the Indies by encompassing the coast of Africa, the foreign trade of Egypt has so declined, that Indian calicoes, muslins, and China-ware, are at present dearer in that country than they are in England.

The exportation of rice and coffee from Egypt to any place out of the dominions of the Turks is prohibited; but several drugs are sent from thence to Europe, as coloquintida, fenna, and the red dye called saffranon. Flax is also exported to other parts of Turkey, and likewise to Leghorn, and cottons to Marseilles.

Their importations are silk from Venice and Leghorn; English, French, and Venetian cloth, drugs, dyes, and English tin, lead, and marble blocks from Leghorn; furs, copper-vessels and plates from Constantinople; small-wares from France, Venice, and also Constantinople. They likewise bring iron from Salonichi, carpets from Asia Minor, silks from Syria, woollen manufactures from Barbary; coral and amber they also import in order to send it to Mecca.

CHAP. II.

OF NUBIA and ABYSSINIA, or UPPER ETHIOPIA.

SECT. I.

Of NUBIA.

Its Situation, Extent, Climate, Vegetables, and Animals. The Persons, Dresses, Customs, and Manners of the Inhabitants. With a concise Account of the Cities of Dangala and Sennar, and the Articles of their Commerce.

WE shall now proceed up the Nile to Nubia, which is also called Sennar, and is bounded on the north by Egypt; on the east by the red sea; on the south by Abyssinia; and on the west by the kingdoms of Tagua, Caoga, and the desert of Gorham. It is situated between the thirteenth and twenty-fourth degrees of north latitude, and between the twenty-fifth and thirty-eighth degrees of east longitude, extending in an irregular oblong-square. Its principal rivers are the Nile, the Nubia, and the Sira.

Though this country is entirely under the torrid zone, it is in many places very fruitful, especially on the banks of the Nile, where the inhabitants, as in Upper Egypt, raise the water up to the high banks by art and labour. Hence it produces some very fine fruits, with plenty of sugar-canes; but the natives are unacquainted with the method of making good sugar. They have also a great variety of medicinal plants, roots, and drugs; with others that are extremely obnoxious, particularly a most dreadful poison, so quick and fatal in its operations, that, it is said, a single seed taken inwardly gives almost instant death. These seeds grow on the top of a plant that resembles our nettles, and it is said that considerable quantities of it are exported to the neighbouring countries. Nubia also affords gold, ivory, sanders, and other medicinal woods.

In Nubia are likewise great numbers of dromedaries, camels, horses, and various kinds of wild beasts, as lions, tygers, leopards, crocodiles, vipers, and several kinds of serpents, particularly one of a colour which so nearly resembles that of the dust, or sand, in which it lurks, that it is not easily avoided, and its bite is commonly attended with almost immediate death, and that of the most painful and dreadful kind.

The generality of the inhabitants are Mahometans; they are much given to cheating; are a stupid debauched people, and are said to have neither modesty, civility, nor religion. Those that live in villages chiefly apply themselves to agriculture, except those who inhabit the more desert parts, who live upon plunder. Mr. Norden, who proceeded up the Nile, a considerable way into Nubia, found them base, treacherous, mean, and avaricious; especially some of the great, who scruple neither threats nor entreaties to obtain the treasures of those whom they dare not to plunder by open violence.

They are swarthy, and small of stature. Those of superior rank in the heart of the country wear a vest without sleeves; but the common people only wrap a piece of linen cloth about them, and the children go quite naked. However, persons of quality wear fine loose long robes of silk or cotton, and those of the women reach to the ground; these last also adorn their hair with rings and other trinkets of gold, silver, and brass; yet have nothing on their legs or feet but a kind of sandal, or leather sole. As for the women of lower rank, they only wear a short kind of petticoat.

In war they fight to greater advantage on horseback than on foot, for they are very expert horsemen; but, as they poison their weapons, the Turks seldom care to attack them; they are, however, almost perpetually at war either with the inhabitants of Gorham, the desert tracts on the south-west, or making excursions into the eastern parts as far as the Red Sea.

Poncet, a French physician, who passed through this country in his way to Ethiopia, says, they are subject to a prince, who wears a long robe, embroidered with gold and silver, fastened with a girdle of the finest cotton. On his head he has a turban of the same, and never appears in public without having his face veiled with a silk-gauze of various colours. Strangers who are permitted to pay their homage to him, are obliged to pull off their shoes, and kneeling to kiss the ground two or three times; nor do his subjects ever appear before him without being bare-footed.

The royal palace is a large confused pile of buildings, without any regularity, and surrounded with a high brick wall; it is, however, furnished with every thing esteemed curious, rich, and costly; and the floors after the manner of the Eastern nations, are covered with the finest silk carpets. The same author observes, that this prince applies himself five days in the week to affairs of state, and the administration of justice, at which times he sits at the head of his council, and decides causes with the utmost expedition. When sentence of death is passed on the criminal, it is immediately executed by laying him flat on his back, and beating him on the breast with a stick till he expires. It is also said, that on the death of the king the grand council assemble, and have the inhumanity to cause all the brothers of their new sovereign to be put to death. However, the accounts we have both of this country and Abyssinia are not entirely to be depended upon; though the author last mentioned seems to have as much veracity as those writers among the Jesuits, who have described the country of Abyssinia, and have endeavoured, with the utmost malignity, to destroy his character.

The principal cities of Nubia are Dangala or Dongola, and Sennar.

Dangala,

Dangala, the present metropolis of Nubia, is situated on the eastern bank of the Nile, on the declivity of a dry sandy hill, in fifteen degrees fifteen minutes north latitude. It is said to be very populous, and to contain near ten thousand houses, though most of them are mean, and built only of wood daubed over with mud; but the streets are filled with heaps of sand brought down by the waters from the mountains. The cattle, which is in the center of the town, is large and spacious, but not very strong.

Sennar, which is another of the capital cities, stands on the western bank of the Nile, near the frontiers of Abyssinia, which lies to the south, and of Gaoga which lies to the west, and is about two hundred and fifty miles to the south of Dangala. It is situated on a fine eminence, from which is a delightful prospect of a fertile plain covered with variety of fruit-trees. It is five miles in circumference, and is very populous, it containing near one hundred thousand inhabitants; but the houses, which are flat roofed, are only one story high, and very ill built: those in the suburbs are much worse, they consisting only of poor small cottages formed of wood and mud, and covered with reeds. Every thing here is in the greatest plenty, so that a camel may be bought for the value of eight or ten shillings; an ox for three or four, a sheep for about one, and a fowl for a penny. But in this city the heats are so insupportable, that in the day-time, from January till the end of April, a man can hardly breathe; but then the rainy season begins, and continues three months, at which time the air is extremely unhealthy, and often produces a great mortality among both the men and cattle.

Their commodities are elephants teeth, gold dust, tamarins, civet, and tobacco. There is in this city a market every day in the middle of the town, where all sorts of provisions and goods are sold. It is said, that the females sit on one side, and the males on another, and that the Egyptian merchants buy great quantities of the above goods every year. The merchandizes required at Sennar, are spices, paper, hard-ware, brass, glass beads, and a black drug with which they colour their eye-lids and eyebrows. There are here a few merchants, who travel to Suaquen on the Red Sea, from whence they go with their commodities into Arabia Felix, and there exchange them for those of the East Indies, which they bring back.

SECT. II.

Of ABYSSINIA, or UPPER ÆTHIOPIA.

Its Name, Situation, and Extent, Face of the Country, Climate, Mountains, Salt-pits, Rivers, and Lakes.

THE empire of Abyssinia is indifferently called Abyssinia, Abissinia, Abassia, or Habessinia, from the Arabic Herbest, which signifies a mixture, the country being peopled by various nations; but the inhabitants themselves call it Itjopia or Ethiopia. It has also been known, though absurdly, by the name of Prester John's country. It extends from twenty-six to forty-five degrees of east longitude, and from six degrees thirty minutes, to almost twenty degrees north latitude. It is bounded on the north by the kingdom of Nubia: on the east it had formerly the coast of Abex on the Red Sea; but this is dismembered from it, and makes a separate province under the dominion of the Turks; and partly by the kingdom of Dancala: on the south it is bounded by Alaba, and Ommo Zaidi, and on the west by Gorham and Gingiro.

As Abyssinia is situated between the tropic and equator, it may reasonably be supposed to be in a very hot climate, but the extreme heat is only felt in the campaign country, the villages, and low-lands; for the tops of the mountains, most of which are of a great height, enjoy a delightful coolness. Hence this country is very healthy, but is subject to terrible thunder and lightning.

Most of the mountains are said to exceed Olympus, in height; yet their steep, and to appearance inaccessible

rocks, are inhabited. They are surrounded with deep and extensive valleys, which, with the flat lands, are dry in winter, and commonly overflowed in summer by the rains, which instead of falling by drops, pour with such vehemence, that the torrents from the mountains sweep away trees, houses, and sometimes rocks, while all the rivers, overflowing their banks, lay the country under water; which, on its retiring, leaves the land covered with a thick slime or mud. This overflowing of the rivers of Abyssinia is an advantage not confined to that empire, but spreads its happy influences over all Egypt, and extends the blessing of plenty from Abyssinia to the Mediterranean,

Some of their winds appear no less dreadful than their thunder and lightning, particularly one called in their language sengo or the serpent, which sometimes blows down the houses, trees, and rocks, and even snaps the masts of ships in the harbours. But these periodical rains and these storms are not peculiar to Abyssinia; in almost all countries within the tropics, the former pour in torrents, overflow the land, and the rivers swelling above their banks, fertilize the land. The reader has seen too that these storms are also periodical; but in China and the East Indies they are called by our mariners typhoons or typhons.

Some of the mountains have large plains on their tops, covered with trees and other verdure, and afford excellent springs. Some are well cultivated, though the access to them is extremely difficult and dangerous; sometimes through a craggy way incumbered with huge stones, which must be climbed up with ladders, and the cattle drawn up with ropes. Many of the mountains abound in gold, as plainly appears from the dust found upon them, or washed down by the torrents, some pieces of that metal being of the size of a pea. But no mines of silver have yet been discovered.

However, the salt-pits of Abyssinia are as valuable as mines of gold and silver, since these not only supply the inhabitants of that extensive country with this necessary commodity, but salt there answers all the purposes of money, and they exchange it with other nations for whatever commodities they desire to purchase. The principal place where salt is procured is on the confines of Dancala and Tigra, where there is a large plain, four days journey in extent; one side of which is incrustrated all over with a pure white salt, in such quantities, that some hundred of camels, mules, and asses, are constantly employed in fetching it from thence.

There are several considerable rivers, the most famous of which is, 1. The Nile. 2. The Niger, which Mr. Ludolph assure us is no more than the left channel of the Nile. 3. Tacazee rises in the kingdom of Angola, and after considerable windings falls into the Nile. 4. The Maleg, which, after a long course, falls into the White River. 5. The Howash, which after running through several kingdoms, loses itself in the sandy desert in the kingdom of Adel. 6. The Zebee, which rises in the kingdom of Nerea, and, after a long course, flows into the Indian ocean. 7. The White River, which receives several smaller streams, and after surrounding the kingdom of Changaia, which lies to the west, falls into the Nile, sixty leagues below Sennar in Nubia.

Here are few considerable lakes, except that of Dambea, called by the natives the sea of Tzana, from the chief island in it. This lake is situated in thirteen degrees north latitude, and may properly be considered as the source of the Nile, which flows out of it. It is computed to be about ninety miles long, and thirty-six broad; its water is clear, sweet, and wholesome; it abounds in fish, and the natives sail upon it in flat-bottomed boats, made of the bamboos which grow along the banks. It contains about twenty-one islands, some of which are very fertile, and are covered with groves of orange and citron trees, and in seven or eight of them are old monasteries, which appear to have been elegant structures.

S E C T. III.

Of the Fertility of the Soil of Abyssinia. The Corn produced in the Country; with the Trees, Plants, Beasts, Birds, Reptiles, amphibious Animals, and Fishes, among which is a particular Account of the Camelopardus, Hippopotamus, and other extraordinary Animals.

SOME of the lands in Abyssinia are so fertile as to yield two or three harvests of very good millet, barley, and wheat. They have no rye, instead of which they make use of a small grain called teff, which is of much the same taste and flavour, and yields very good nourishment. It is smaller than our poppy-feed, and a little oblong; but at the same time the people in general live very poorly, and even nastily, and their cattle seem to fare much better than they do themselves. As they have no oats, they feed their horses, camels, dromedaries, and other large beasts with barley; for though their low lands produce plenty of grass sufficient to feed a prodigious number of cattle, yet they never make any hay, which is here the more necessary, as it must be frequently scorched up by the heat of the sun, and even when it is most plentiful, it is liable to be destroyed by the vast flights of locusts, with which they are sometimes infested, which cover the surface of the earth, and soon devour every blade of grass.

The trees of this country are said to be crowned with a constant verdure, and if the inhabitants have a scarcity of fruit, it is rather owing to their negligence than to any fault of the soil, which is capable of producing as great a plenty and variety of them as any country in Africa. They cultivate the black grape, peach, sour pomegranate, sugar-canes, and some citrons and oranges: they have also several kinds of figs, and among others one called ensette, which grows to a prodigious size, and which Ludolph has endeavoured to prove to be the dudaim of Moses, which ours and other versions rendered mandrakes.

There are here not only the same variety of medicinal and odoriferous plants, herbs, and roots that are to be met with in Europe, and which here grow without cultivation, but many more unknown to us. The country produces great quantities of senna, and there are plains covered with cardamoms, and a kind of ginger that has a most agreeable scent, and is four times as large as that of India.

We ought not to omit the assazo, which has such an effect, that it stupifies the serpents and venomous reptiles that approach it, and its root is a certain cure for those who are bitten by them.

The cotton shrub is extremely plentiful, and produces a great quantity of cotton.

The banks of the rivers are, during the greatest part of the year, adorned with jessamines, roses, lilies, jonquils, and a prodigious number of flowers unknown in Europe.

Scarce any country produces a greater variety of both domestic and wild animals: among the former are camels, dromedaries, horses, asses, mules, cows, sheep with great tails, and goats, which are bred in vast numbers, they being the principal wealth of the inhabitants. Their fat oxen are said to be of so monstrous a size, that at a distance they have been mistaken for elephants; whence it has been said, that horned elephants were common in Abyssinia, and these horns travellers have represented as being so large, that one of them will contain above ten quarts of liquor, and say they are used by the people instead of pitchers and other vessels to carry water, wine, milk, or other liquids. But besides these large oxen, which are fatted for slaughter, they have an ordinary sort designed for labour and carriage, whose horns are said to be so soft and flexible, that they hang down like a dead weight.

They have here a very fine breed of horses, which, like those of Europe, are of various colours, but the black are the most numerous and in the greatest esteem. These are only used for war and for travelling. In long journeys they make use of mules, which are commonly very gentle, sure-footed, and fit for the craggy mountains; they have a quick easy pace, and are com-

monly preferred by the Abyssinians to their best horses in travelling.

Among the animal of the camel kind is the camelopardus, which is said to be much taller than an elephant, but as slenderly made as that is clumsy and unwieldy; its fore legs are represented as of an amazing length, and tho' the hinder are somewhat shorter, its belly is so far from the ground, that a tall man may easily pass under it without stooping. The neck is of a proportionable length, to enable it to reach the ground, and feed upon the grass, which is its proper food.

The elephant ought here to be placed among the wild beasts, as they are extremely numerous, and none were ever known to be brought up tame in this empire. They make dreadful havoc among the corn and other grain, destroying much more by trampling it down than by feeding upon it.

One of the most beautiful animals in this country is the zebra, which is of the shape and size of a mule, but more sleek and slender; it is here curiously marked with white, black, grey, and yellow streaks across the back from the neck to the tail. This animal is not, however, very common, since it is so much admired as to be thought a present of sufficient value to be offered to the monarch.

This country abounds with lions, tygers, panthers, leopards, wolves, monkeys, foxes, wild cats, civet cats, hares, rabbits, squirrels, and a variety of other animals.

Those who have visited Abyssinia mention a very extraordinary animal, which is probably one of the many species of monkeys. They represent it as no bigger than a cat; but as having the face of a man, with a mournful voice. It lives upon the trees, where they say it is brought forth and dies: but it is so very wild, that there is no possibility of taming it; for when any of them have been caught in order to bring them up, all the care that can be taken of them will not prevent their pining away till they die.

There are a great variety of the feathered kind, both wild and tame, many of which are found in Europe; but those here excel several of ours in beauty and size, particularly their partridges, which are said to be as large as our capons; they have several kinds of them, and also of pigeons and turtle-doves. Among the birds which seem in a manner peculiar to the country is the maroc, or honey-bird, so called from its particular instinct in discovering the hidden treasures of the industrious bees.

The ostrich, the largest and most unwieldy of all the feathered race, is common, not only here, but in the greatest part of Africa. The ibis, a bird which destroys innumerable serpents, is also known in Nubia and Upper Egypt. In this country are also the pipi, so named from its constantly uttering those two syllables, and is said to direct hunters to their game, when it feeds on the blood of the beast killed by its direction. The cardinal is so called by the Portuguese from the beautiful redness of his feathers, except those on its breast, which resemble the finest black velvet; and the white nightingale, is a beautiful bird that has a tail two spans long.

There are also a multitude of obnoxious animals, particularly serpents and insects; many of the former are extremely venomous, and their bite attended with almost instant death, if the above remedy be not immediately taken. But none of these are capable of doing an hundredth part of the mischief produced by the locusts, which sometimes appear in such thick clouds as to eclipse the light of the sun, and to lay whole provinces desolate.

Among the amphibious animals the crocodile and hippopotamus, or river-horse, are the largest and most destructive. The former we have already described in treating of Egypt, and as the latter is seldom seen in that country, and only inhabits the upper part of the Nile, a description of it can no where be more properly placed than here. It is not easy to conceive how this animal came to be called a horse, to which it has scarce any resemblance; its body is like that of an ox, but is twice as big as that of a bull; its legs are short, and resemble those of a bear, it having large round feet, with four claws

claws in each; the tail is like that of an elephant, and it has no more hair on its body than there is upon that animal. In the lower jaw it has four large teeth, two of them crooked like the two tusks of a wild boar, and the other straight, but standing forwards, and all of them as thick as the horns of an ox. Its eyes and ears are small, considering its bulk; but it has a wide mouth, great open nostrils, and an upper lip like a lion's, on which grows a bristly beard. He spends the day commonly in the water, and the night on land, when he feeds on the grass, which is his principal food: his teeth are esteemed more valuable than ivory, on account of their not being subject to turn yellow.

There is great plenty and variety of fish in the lakes and rivers, among which is the torpedo, which upon being touched by the finger, while alive, conveys a surprising numbness to the whole arm.

S E C T. IV.

Of the Persons, Dress, Manners, and Customs of the Abyssinians; their Buildings, Furniture, Hospitality to Strangers, and Ignorance in Arts and Manufactures.

THE Abyssinians are generally tall and well shaped; their complexion may be called black, but some of them are inclined to the tawny, and to a reddish brown. Among them the olive is reckoned the finest complexion, and next to that the jet black; but the reddish, and particularly the yellowish brown, is esteemed the most disagreeable. Their noses are not flat, nor their lips protuberant, as among the natives of Guinea; but they have regular and agreeable features, and their eyes are black, brisk, and lively.

They are stout and strong, brisk and healthy; and their labour, together with the temperance they use in eating, prolongs their lives to a good old age. Most of them are so nimble and active as to climb up the tallest tree, or steepest rocks, with surprising ease and agility. The women greatly exceed those of Europe and Asia in strength and sprightliness; they breed easily, are delivered without help, and can take care both of the child and themselves, without the assistance of a nurse. But this singular quality is common to all the women in these hot climates, except where they are weakened by a sedentary life.

The habit of the men of quality is a long fine vest, either of silk or cotton, tied about the middle with a rich scarf; that of the citizens is much the same, but of cotton only, they not being allowed to wear silk, neither is their cotton of the same fineness. The common people have only a pair of cotton drawers, and a kind of scarf, with which they loosely cover the rest of their bodies; and, till about a century ago, this was the common dress of all the people, none but the emperor, the royal family, and some distinguished favourites, being allowed to wear any other; and this scarf, or a piece of cloth, serves them at night to wrap themselves in.

As to the women, they are allowed to appear as fine and genteel as their circumstances will admit; for they are far from being kept in so reclusive a manner as those among the more Eastern nations. Those of high rank usually dress in the richest silks and brocades, their upper garments are wide and full, not unlike surplices: they adorn their heads and hair an hundred different ways, and take care to have the richest pendants in their ears; besides, they spare no expence in adorning their necks with the most costly ornaments of chains, jewels, and other embellishments.

Both the men and the women are extremely curious about the management of their hair, on which they lavish a great deal of butter, to render it smooth and shining. This vanity is perhaps the more excusable, as none but the emperor is allowed to wear either a cap or any other covering for their head, which, as they have a great deal of idle time upon their hands, is an inducement to them to bestow some part of it in this amusement. Indeed, their hair not being apt to grow thick and long, but mostly thin and frizly, some additional art seems

necessary to keep it in tolerable order, so as to distinguish each sex; and therefore while the men take much pains in braiding it up in various forms, the women strive to have it hang loose in a variety of curls and ringlets, except the fore-top, which they take still greater pains to adorn with jewels or trinkets according to their rank.

Upon the whole, their dress is chiefly accommodated to the climate. The excessive heat, which will hardly suffer them to allow any cloaths to touch their flesh, makes them contrive to have them as light, and to hang as loose as possible during the heat of summer.

Hence the cloth that covers their bodies, their breeches, and the womens drawers, are made wide and long to let in as much air as possible; but in the cooler seasons, they bring them much closer to their bodies, and the rich then appear in handsome vests, open only to the waist, and closed with small buttons: these have small collars, and very long and straight sleeves gathered in at the wrist. Some authors have mistaken them for flirts, though they have another light garment under them next to the skin made of thin taffety, sattin, or damask, according as the season and their circumstances will permit.

They are not so temperate in their drinking as in their food, especially at their feasts, where, after a full meal, they usually drink to excess; according to a proverb of theirs, Plant first and then water. Their liquors are indeed more tempting than their meat. As they have plenty of honey, they have excellent mead; they have likewise some other liquors made of various fruits, and a third sort made of barley without hops. These excesses are attended with no ill consequences; for they live peaceably and seldom quarrel among themselves; or if they do, their contests seldom go farther than exchanging a few blows; and in matters of consequence, they generally decide the controversy by umpires chosen among themselves, or lay the affair before the ruler of the place. Here they are allowed to plead their own cause without the help of a lawyer; and when judgment is given, whether by the judge or the arbitrator, they faithfully stand to it, without grudge, murmuring, or appeal.

Both the men and women are said to be witty and ingenious; but those of the kingdom of Nerea are said to exceed the rest in sense, bravery, generosity, affability, and other social virtues. They are extremely inquisitive and fond of learning: yet the people of Tigra and the neighbouring kingdoms are represented as being for the most part haughty, inconstant, revengeful, cruel, and perfidious.

The Abyssinians are naturally docile, and fond of knowledge, which is alledged to have been one of the principal motives that induced them to give the Jesuit missionaries so kind a reception at their first coming; and, though there is but little learning found amongst them, it is rather for want of proper means than of capacity of attaining it.

They are entirely negligent with regard to the symmetry and architecture of their buildings, which is owing to their living in tents or camps, after the manner of their monarchs; so that, except a few old royal palaces, here are neither public structures nor private buildings worthy of notice to be seen throughout the whole empire; for those they stile houses would hardly deserve the name of huts among us, they being built of clay and laths put together in the meanest and most slovenly manner, so as to be easily reared, and as readily abandoned, when they think proper to remove their quarters. These buildings belong to the inferior sort, who follow the royal camp, and being unable to purchase tents erect these huts with almost as little trouble as is commonly taken in rearing a large tent.

The very emperors themselves had neither castles nor palaces, till the Portuguese missionaries came among them, but lived in their stately pavilions, where they were attended by all their nobles, guards, and other retinue.

Such strangers were they not only to all kinds of stately edifices, but even to common regular buildings, that when father Pays undertook to build a magnificent edifice for Sultan Segued, none of that prince's subjects knew so much as how to dig the stones out of the quarries,

quarries, much less how to square or work them fit for use. He was therefore obliged to teach them both that, and how to make the proper tools for the masons, carpenters, joiners, and in short for every part of the work; and also how to join the stones, which was performed with a red clay of so glutinous a nature, that it makes a good strong cement, without the help of quick-lime. The people were filled with amazement at beholding not only a large stupendous structure, erected with much strength and regularity, but even high and stately stories raised one upon another, for which they had not even a proper word, but stiled them *babeth-laibeth*, or house upon house.

Their tables are generally round, and among the rich are large enough for twelve or fourteen persons to sit about them; but they are very low, as the people, like the inhabitants of most of the countries in the East, sit upon carpets, and the meaner sort upon mats, or on the ground.

Their furniture, even among those of high rank, is mean: they have no fine paintings, tapestry, or other ornaments; and indeed their way of living is in some measure incompatible with any such finery. Even their best beds are no better than couches, on which they lie upon hides or soft furs wrapped in their upper garments. Indeed, some of their princes and persons of wealth purchase Indian quilts, with silk borders, which now come to them from the ports on the Red Sea; and these they spread upon their couches, chiefly in their outward apartments, that they may be seen by those who come to visit them. But the poor mostly lie on mats, or a hide or two spread on the ground.

They have neither inns, taverns, nor caravanseras for the entertainment of strangers. These are rendered unnecessary by that spirit of hospitality which prevails amongst them. If a traveller stays longer in a village or camp than three hours, the whole community are ready to lodge and furnish him with proper necessaries for himself, his servants, and cattle, at the public expence. He need only enter the first hut or tent he likes, and reveal his wants to the master of it, who immediately goes and informs the chief person of the place, upon which an ox is ordered to be killed, and so much of it is sent to him as will be sufficient for him and his company; together with a proper quantity of bread, liquor, and conveniences for lodging. All these they are the more careful to supply him with, as they are liable to be punished for their neglect with a fine of double the value of what they were bound to furnish him with, should he prefer a complaint of their neglect to a proper magistrate. However, this laudable custom is attended with great inconveniences, as it gives encouragement to a number of idle vagabonds to abuse it.

They have but few manufacturers among them, and though they are chiefly dressed in linen and cotton, and their country is as proper for producing them as any in Africa, they are so indolent, that they raise no more than will just serve their present wants, and the less of either serves them, as they make no use of any either at their tables or for their beds, and a small quantity is sufficient to serve the common people as a covering for their bodies. The Jews are said to be their only weavers, as they are in most parts of the empire their only smiths, and work in all kinds of metal. What joiners, carpenters, and masons are produced in this country may be easily guessed from the meanness of their buildings and furniture; and the same may be said of other trades, as tailors, shoemakers, &c. from the plainness of their dress. Indeed the potters, and makers of horn-trumpets and drinking-cups, are in the highest request. These and other inferior artists are incorporated into tribes or companies, and have their several quarters, neither intermingling nor intermarrying with the rest, the children commonly following the business of their parents.

Jewellers, gold and silver-smiths, and other curious artificers of the like kind, are altogether unknown to them, unless by some of their works being brought by way of traffic or exchange, and these are only to be found among the great and opulent. The same may be said of their carpets, tapestry, silk, brocades, velvets, and other

costly stuffs, which are all brought hither by the Turks, by the way of the Red Sea, and exchanged for gold-dust, emeralds, and fine horses. The Jews, Armenians, and Arabians, are the common brokers between them and the Abyssinians, who seldom or never travel out of their own country, or indeed are suffered to do so by the Turks, who, being possessed of all the sea-ports on the Red Sea, enrich themselves by this monopoly, and are extremely careful to prevent any trade from being opened into the country by any other nation, or of its being carried on by any other hands but their own.

Besides the above articles of commerce, the Turks bring them several kinds of spices, in very small quantities, which they keep up at so high a price that none but the richest of the Abyssinians can purchase them. In return for these the Abyssinians bring them ivory, honey, wax, skins, furs, and leather in great quantities, for which they are obliged to take what the brokers please to give them.

It ought not to be omitted, that in Abyssinia the people have no idea of money; but in purchasing what they want, exchange one commodity for another. The most common article of trade exchanged by them is salt, by which they rate the value of every thing else; and which in general answers the purposes of money, by being exchanged for all the necessaries and conveniences of life.

SECT. V.

Of their Marriages, their Treatment of their Wives, Divorces, and Funeral Rites.

MARRIAGE among the Abyssinians is little more than a firm bargain, or contract, by which both parties engage to cohabit and join their stock, as long as they like each other; after which they are at liberty to part. The custom of meeting and blessing the married couple at the church-door is doubtless derived from the Jews; and it is said that none but priests and deacons are married within the body of the church. In this part of the matrimonial service several ceremonies are performed. Alvarez, who was present when the abuna, or patriarch, officiated at one of them, says, that the bridegroom and bride were waiting at the church-door, where a kind of bed or couch had been prepared for them, and on which the patriarch ordered them to sit; he then, with his cross in one hand, and a censer in the other, made a kind of procession round them; and then laying his hands on their heads, told them, that as they were become one flesh, for they ought to have but one heart and one will. This was followed by a short exhortation suitable to the occasion; after which he went into the church, and celebrated divine service, at which they both assisted; and that being ended he gave them his blessing, which renders the marriage valid, and then dismissed them. The more religious sort not only attend divine service, but receive the holy communion, either just before or after their being joined. What festivities and rejoicings attend their nuptials we are not told. The husband and wife, after consummation, keep separate tables; or if they agree to eat together, each brings their own provisions ready dressed, or sends them in before by their servants or slaves.

The married women are permitted to appear abroad, and to visit their friends and relations: and the princesses of the royal blood have still greater privileges, and are said to think no gallantries, however injurious to their honour, ought to be denied them by their husbands; in which liberties they are so far upheld by their own relations, that all complaints against them will not only be in vain, but taken very ill.

But this is far from being the case of those of inferior rank, who are generally obedient and faithful to their husbands. These are commonly obliged, especially among the meaner sort, to perform some of the most laborious offices of the family, and particularly to grind all the corn used in it, which the very slaves of the other sex will refuse to do: for as they have only hand-mills, they are forced to grind corn either for bread or drink every day.

They

They forbid marriage between persons in the second, third, and even fourth degree of consanguinity, and therefore esteem it unlawful to have more than one wife at a time; yet many amongst them are said to have a plurality of wives: these are indeed deprived by the church of the benefit of the holy communion; but as polygamy is not deemed by the state detrimental to society, they are suffered to live with them without molestation.

They admit, as hath been already intimated, of divorces, not only on a breach of conjugal fidelity, but for want of children, disagreement, bodily infirmities, and the like; in all which cases the women have the same privilege of abrogating the marriage-contract as the man. In such cases the dissatisfied party applies to the bishop, and having obtained the desired divorce, which is seldom denied, if the party cannot be prevailed on to withdraw the suit, they next petition for a licence to contract a fresh marriage, and obtain it with the same ease.

Hence these divorces are very frequent, especially among those of high rank. But, with respect to the grand motive, the breach of fidelity on either side, they frequently compromise the affair; for as both the husband and wife have their separate lands, goods, and chattels, they can make what is esteemed a suitable compensation for the transgression. But where such a compensation cannot be agreed on between the injurer and the injured, the women are usually the most severely punished: she is condemned to lose all her goods, and to leave her husband's house in a mean ragged dress, and never to enter it more; carrying with her a sewing-needle, by which she may earn her livelihood; and sometimes she is sentenced to lose her head of hair, which is her chief ornament, and to be close shaved, except a single lock on her fore-top. But the husband, if he pleases, may take her again; or if he does not, they may both marry. If the husband be the offender, he is also liable to be punished, as well as the partner in his guilt; but a fine is generally laid upon them both, and appropriated to the use of the wife. Thus likewise the man who has debauched the wife, if convicted, is sentenced to pay a fine of forty cows, horses, suits of cloaths, &c. and if unable, he becomes the prisoner of the husband, till the debt be paid. If the injured husband suffers him to go, he obliges him to swear, that it is to fetch what will satisfy him; upon which the guilty person sends him a piece of beef and some liquor, after which they sometimes eat and drink together; and then, upon his asking pardon, the husband first remits one part of the fine, and then another, till at last he forgives him the whole.

With respect to their funerals, after washing the body, they perfume it with incense, sprinkle it with holy water, and wrapping it in a sheet, place it on a bier. The bearers then take it, and hurry it away with such swiftness, that those who attend can hardly keep pace with them. When they come to the church, or the church-yard, for they bury in either, they again incense it, and throw plenty of holy water upon it. After the priest has read the fourteen first verses of the Gospel of St. John, they shoot the corpse into the ground, instead of letting it down gently; the priest repeating some psalms, till the body is covered with earth.

They bewail their dead many days; their lamentations begin early in the morning, and continue till the evening; the parents, relations, and friends meet at the grave, together with women-mourners hired to accompany the solemnity with their out-cries, all clapping their hands, smiting their breasts, and uttering, in a doleful tone, the most affecting expressions.

If the deceased be a person of distinction, his horse, shield, lance, and other accoutrements are also brought to the place, offerings are made to the church and the clergy, and provisions given liberally to the poor. This ceremony continues, according to the quality of the person, from three to forty days, and is repeated afresh on the anniversary; and, during the mournful solemnity, they all pray to God to be merciful to the soul of the deceased.

S E C T. VI.

Of the Power, Authority, Descent, and Titles of the Emperor. Of his Camp, and its Removal. The Manner in which the Princes were formerly confined, and raised to the Throne. The Marriage of the Emperor; and the Revenues of the Empire.

THE Abyssinian empire appears to have been from its first foundation entirely despotic, and, according to their annals, there never was a period of time since its first origin, when the princes of this country did not claim an absolute right over the lives, liberty, and fortunes of their subjects, as well as an uncontrollable authority in all ecclesiastical affairs; and it is not known that there ever were any written laws to restrain this exorbitant power, or secure the liberties of the subject.

These princes boast their being descended from Mentiehech, the son of Solomon, king of Israel, by the queen of Sheba. According to them, this prince reigned twenty-five years after her return from Judea, and was succeeded by this son, from whom descended a series of princes in a direct line down to the year nine hundred and sixty, when the crown passed into another family, but was afterwards restored to it again. Hence the emperor still retains the pompous titles of the Beloved of God, Son of the Pillar of Zion, Kinsman to the race of Judah, Son of David and Solomon, and Emperor of the Great and High Ethiopia, its kingdoms and provinces, &c. They also bear in their arms a lion holding a cross, with this inscription in the Ethiopic tongue, "The lion of the tribe of Judah is victorious."

The respect paid to this prince amounts almost to adoration; those who are admitted to his presence fall prostrate before him, and kiss the earth as they approach his person; and it is said that even in his absence they never hear his name mentioned without bowing very low, and touching the ground with their hand. The other marks of grandeur chiefly consist in the retinue with which he is attended; for he is not only accompanied by his own household and guards, which are very numerous, but by all the grandees and officers of the empire, who strive to outvie each other in the greatness and splendor of their retinue, in the richness of their dress, and the magnificence of their pavilions. We have already observed, that they chiefly live in tents; the emperor's camp always takes up a large space of ground, and makes a very splendid appearance, to which the regular disposition of the streets, and great variety of tents, streamers, and other ornaments, and especially the many lights and fires at night do not a little contribute; so that the whole appears like a vast open and regular city, in whose center, or on some eminent part of it, stands the imperial pavilion, which outvies all the rest in height, bulk, and grandeur. Next to it are those of the empresses and royal family, and then those of the officers of the court, all appearing with a proportionable though inferior lustre: to these may be added those large and stately pavilions which serve as churches, upon which they bestow no small expence, in adorning them both within and without. In short, the imperial camp is of vast extent; and yet good order is commonly observed in it. It has markets, courts of justice, and places where young persons of rank perform a variety of exercises on horseback. But all the rest only resembles a great number of long extensive lanes, of mean ordinary taste, or low miserable huts of lath and clay covered with straw, which serve the emperor's guards, soldiers, and a prodigious multitude of fustlers and other attendants.

When the emperor removes his camp, or, as it may be properly styled, his metropolis, which is chiefly occasioned either through the want of wood, provisions, or the different wars in which he is engaged, the chief care is to choose a convenient and spacious spot well furnished with water, and especially with wood, of which they make such havock, that vast forests are frequently laid bare in a short time; and they are amazed, and think it incredible, that such great cities as are in other parts

of the world should be able to subsist so long a time in one place without being in extreme want of wood.

The emperor in his march, whether in time of peace or war, is always attended by his chief ministers; he appears with a crown on his head made of pure gold, with silver lilies, intermixed with pearls, and fixed on a cap of blue velvet, on the top of which is a gold cross.

Some time before the emperor begins his march, officers are sent before to the governors of every province and place through which he is to pass, with orders to clear and repair the roads, and to open the woods thro' which his way lies, by cutting down branches of trees, the briars, and every thing else that may retard the march; and to provide necessaries both for him and the whole army, which travels but slowly, and by short journies, on account of the multitude of women, children, and cattle, which follow the camp. At the time appointed all the governors punctually come in with their quotas of corn, cattle, beer, and other liquors; all which are distributed, with the utmost exactness, among the several ranks and orders of the army. In these marches the *titicrari*, an officer who commands the van-guard, fixes his pike on the spot he chooses for the imperial pavilion; after which every one of the rest knowing his own rank, and the ground he is to take up, easily guesses by his eye where the tents are to be pitched; so that the whole encampment is soon completed with surprising readiness, and in so exact and regular a manner, that, notwithstanding their being so frequently removed, every one knows the ways and paths so well, that he can go to the tent of any one with the same facility as he can to his own, or as we can find a street, lane, or house in any of our cities.

The camp is always divided into seven parishes, each of which has its minister, deacons, and inferior officers, who assist in the instruction of youth, in performing divine service, and the other functions of the minister's office. Whenever an enemy is near, the army is ordered to march close and in the best order; the van-guard and rear drawing up close to the main body; the wings spread themselves out, and the emperor keeps in the center with his guards, great officers, and ladies, a sufficient interval being left for inclosing the baggage. At other times little order is observed in their marches, only there is always a number of warlike instruments sounding before, and a particular guard marching round the emperor. He generally mounts and lights in his tent; but if he has occasion to dismount by the way, the guards immediately make a ring about his person, spreading their cloaths to keep him unseen; and if he dismounts in order to take rest, a couch, which is commonly carried for that purpose, is brought him, on which he lies on cushions covered with carpets of the finest silk.

It has been already hinted, that the crown of Abyssinia is hereditary, and must be preserved in the same family; but the emperor, if he pleases, may choose any one of his children whom he thinks most worthy to succeed him. This probably gave birth to the severe custom, formerly observed in this empire, of confining all the princes of the blood to the fortress, or rock, called *Ambaguexen*, which some have described as a severe and disagreeable place of confinement, on the summit of a lofty mountain; while others represent it as an earthly paradise, in which these princes enjoyed every blessing except liberty, and were educated in a manner suitable to their birth.

The manner in which any of these young princes were brought out of this abode to ascend the throne, was as follows: After due consultation, and a strict enquiry into the character of the prince, or after the emperor's having declared him his successor, which precluded all such consultations, the viceroy of Tigrā went at the head of some forces, and encamped at the foot of the mountain, whence, with a proper retinue of grandees and officers, he ascended it, and entering the cell of the prince elect with great formality, fixed the imperial ear-ring to his ear, as a token of his election; and instantly the other young princes were sent for to pay him homage, and congratulate him on his accession to the throne. The new emperor was no sooner come down from the mountain, than the go-

vernors and other officers met him at the head of the army, and all alighting together saluted him. After which, upon his giving them the signal, they mounted again, and taking him into their center conducted him to the debana, or imperial pavilion, with the sound of trumpets, kettle-drums, and other musical instruments, intermixed with loud acclamations of joy. Here he alone alighted within, while all the rest did the same without the pavilion. He was soon after solemnly anointed by a prelate, and the rest of the clergy accompanied the ceremony with psalms and hymns suitable to the occasion. Soon after he was invested with the imperial robes, and the crown set upon his head. The sword of state was then drawn and put into his hand, and he being seated on the throne an herald proclaimed him emperor, and was suddenly answered by the loud acclamations of the whole assembly and army, who came to pay him their homage. Upon these occasions a kind of ritual, which perhaps contained the duty of a good sovereign, was read and explained before him, either by the metropolitan, by whom he was anointed, or by some of his substitutes. From thence the new sovereign went and assisted at divine service, and received the holy communion; after which he returned, accompanied by his court and army, to the royal tent, through the joyful acclamations of the people, with the sound of musical instruments; and the solemnity was closed with feasting and other tokens of joys.

The Abyssinian monarchs, like their antient progenitor Solomon, king of the Jews, allow themselves a plurality of wives; and not only imitate him in that, but in taking those of different religions, even Mahometans and Gentiles; and some have carried this so far, as to allow their heathen wives to have their own temples and idols; so that on one side might be seen the church of God, and on the other a pagan temple. Others, however, have had so much regard to their religion, as to cause those Pagan or Mahometan ladies to be instructed and baptised before they married them. The generality of these princes, however, choose to marry the daughters of noble families among their subjects; while others pay a greater regard to the natural endowments of the mind, or the beauty of the person, than to their noble extraction.

The monarch has no sooner pitched upon a young lady for his wife, than she is taken from her parents, and lodged with some of his relations, in order to obtain a better knowledge of her good qualities. If he is satisfied with her, he takes her with him to church, and having both received the holy communion, they are conducted to the imperial pavilion, attended by the whole court in their richest attire, and there the abuna, or chief prelate, commonly performs the matrimonial ceremony; which being ended, the emperor, as at other times, dines by himself in his own apartment, and she in hers, in company with a number of other ladies. The nobles and clergymen are treated at other tables in separate tents with variety of meats and liquors; and the feast generally continues among the male guests till all the liquor is drank, after which every one lays himself down and sleeps till morning.

It was formerly the custom for the emperors never to appear in public, and they were seldom known to trouble themselves with the affairs of government, the care of which was committed to two ministers, called *babluded*, or favourites: but this custom has been long abolished, and they shew themselves to their subjects at least three or four times a year, though none is allowed to see them eat, except the pages who feed them; (for both they and all the great have their meat cut into bits, and conveyed to their mouths by young pages): and when they give audience to foreign ambassadors, they always sit out of sight behind a curtain.

The revenues of the empire seem to be very considerable, and chiefly arise from the four following branches: the first is the tribute paid by the governors of such provinces and kingdoms as abound with gold, which amounts to no more than about five or six thousand ounces per annum, one year with another. The next branch arises from the sale of all the great offices of the empire, and the yearly tribute they pay him. The third branch

branch consists of a tenth of all the cattle of the empire levied every third year, and the fourth of a piece of cotton cloth paid for every cotton loom:

S E C T. VII.

Of the great Officers, and the Forces of the Empire; the Manner of trying Causes; and the Punishments inflicted on Criminals.

THE emperor has a chief officer, who is called Rash, or principal, and is generalissimo of all the forces; he has under him two great officers, one of whom is a kind of high-steward, and is called lord of the servants, whose power extends not only over the civil judges of the empire, but over all the viceroys, governors of provinces, and the generals of the army. The other, who is only a kind of under steward to the king's household, is styled lord of the lesser servants.

These have in a good measure the management of the empire and the regulation of the army, which is indeed far from being answerable to the extent of the country, as they seldom exceed forty thousand men, of whom between four and five thousand are horse, and the rest foot. About fifteen hundred of the former are well fixed and properly mounted; but the rest are indifferently armed and accoutred, having no other arms but spears and a buckler. The spears are of two sorts, the one like our half pikes, and the other resembles a halbert or partisan. The staves of the former are slender, and the iron narrow like our pike, but the iron of the other is broad and thin; the first is to be darted at the enemy, and the last to be used in close fight with one hand, while the other holds the buckler, which is usually very thick and strong, and made of a buffalo's hide.

Each common soldier carries two spears, and those of a higher rank have likewise swords, which they seldom use in battle, but rather wear them as a mark of distinction, and chiefly in time of peace, commonly holding them in their hands when in conversation; but if they walk, their servants carry them under the arm. As these are chiefly worn by way of ornament, they have the hilt of gold, or silver gilt, and the scabbard of velvet or rich damask, which is commonly red.

They likewise wear a kind of dagger under their girdle, and some also carry a club of some hard heavy wood, with a dagger in it. This weapon they commonly use when they come to a close engagement with the enemy, and sometimes dart it at them.

The horse are armed much like the foot, and are all said to be very good horsemen; they mount and sit their horses extremely well; but in other respects both they and the foot are very ill disciplined.

The Abyssinian soldiers are but little acquainted with fire-arms, and as poorly furnished with powder and ball. The Abyssinians have not above fifteen hundred muskets, and there are not more than three or four hundred musqueteers in any action, who are generally so ill trained to the use of arms, that they never fire above once for want of powder and ball. These they seldom have at their exercises, except a few of the higher rank, who use a rest with their muskets.

Their army is generally drawn up with little regularity, so that the first shock frequently begins and ends the battle, one side turning their back, and the other pursuing; for it is so common to run from the enemy, that it is not considered as any disgrace, and they never endeavour to rally their troops, or indeed know how to go about it. This behaviour is entirely owing to their want of discipline, for they are commonly hardy and inured to hunger, thirst, and fatigue, to which they are trained up from their youth; and as they continue in the field the greatest part of the year, they are equally capable of bearing the most excessive heat, the sharpest cold, and the most violent rains, with very little for their sustenance; and even this they procure by their labour from the lands the emperor allows to those in his service. Another disadvantage is, their taking their wives and children with them; and these are generally so numerous, that a camp

of thirty thousand men always consists of above a hundred thousand persons, all of whom are obliged to live on the produce of the lands assigned for their maintenance.

The army is attended by drums, and kettle-drums, larger and louder than ours, besides trumpets, hautboys, flutes, and other instruments; and also by a vast number of priests, who not only perform the divine service in pavilions, but escort and attend the sacred utensils with great pomp and ceremony, and with vocal and instrumental music.

With respect to the civil government, the viceroys and governors of provinces, as well as the military commanders and civil magistrates, hold their several courts of judicature, in which all causes, whether civil or criminal, are decided; only those of the martial kind have martial officers, who preside in them, and the others are tried by the civil judges, who alone are allowed to sit, while the plaintiff, defendant, and the rest of the company stand. These, upon proper occasions; will even sit upon the ground in the highway or open field, and try a cause brought before them, when every one who pleases may be present. They make use of no writing, nor keep any records, nor do they allow of attorneys and counsel to plead on the merits of the cause; but both the plaintiff and defendant plead their own cause, the former speaking first, and the latter after him: each may answer and reply three or four times by turns, after which the judge commanding silence, asks the opinion of the bystanders, and then pronounces sentence upon the spot. In criminal cases, if the accuser be cast, he is either kept prisoner by the judge till he has made satisfaction to the accuser, or if the crime be capital, as in the case of murder, he is delivered up to the plaintiff to be punished with death at his discretion, and that of the relations of the deceased, who either sell the murderer, or put him to death in what manner they please. But when a murder cannot be sufficiently proved against any man, all the inhabitants of the place where it was committed are severely fined, or suffer some bodily punishment.

The Abyssinians have three kinds of capital punishments; the first burying the criminal quite up to his mouth, then covering his head with thorns and briars, they lay a heavy stone upon them. The second is beating them to death with thick clubs about two feet long; but the most usual method is running them through with their lances, in which case the nearest relation of the deceased makes the first thrust, and the rest follow in due order; even those who come after the criminal has expired, generally dip their weapons in his blood, to shew that they are also concerned to revenge the murder of a relation. But what is still more barbarous, is the feasting and loud rejoicing made by those relations from the time the criminal is delivered into their hands till his execution, and more particularly on the night preceding it, to all which the prisoner himself is a witness. This frequently exasperates his friends so far, that it commonly ends in the death of some of his most zealous prosecutors.

S E C T. VIII.

Of the Religion of the Abyssinians, both before and since their Conversion to Christianity.

IT has already been intimated, that the Abyssinians boast their having received both their kings and the Jewish religion from Solomon. Of this they have an ancient record, which gives the following account of this singular event: "That a great and potent queen, named Azeb, or Maqueda, reigning in Ethiopia, being informed by a merchant, named Tamerin, of the great power and wisdom of Solomon, travelled to Jerusalem, attended by a retinue of the greatest princes and nobles of Ethiopia, and with immense treasure. There Solomon instructed her in the knowledge of the true God; and upon her return home, at the end of nine months, she was delivered of a son, who was called Menilech, and also David. This son afterwards going to Jerusalem to see his father Solomon, was magnificently entertained by him, and anointed

“ king of Ethiopia by Zadoc and Joash, the high-priest; “ and when he was thoroughly instructed in the law of “ God, which he was to cause to be observed in his dominions, Solomon assigned several of the first-born “ of Israel to attend and serve him in Ethiopia, and furnished him with officers and servants belonging to the “ house of Judah, with a high-priest, levites, and doctors in the law of Moses.”

There is nothing in this account very improbable; but the same record adds many circumstances that are evidently false; as, that the first-born of Israel, at the instigation of Azariah, the son of Zadoc, went to Jerusalem and fetched the ark out of the temple; and, being assisted by a train of miracles, escaped the pursuit of Solomon, and arrived with it in Ethiopia. However, it is not improbable that the prince of Abyssinia might cause another ark to be made like that formed by Moses, and that this story might be afterwards invented, in order to procure it a more general veneration.

This ark is said to be still kept, and so closely concealed, that even their monarchs are not admitted to the sight of it. Since the Abyssinian emperors have assumed the custom of living in tents, this precious relic is no longer confined to a temple, but always accompanies the royal camp, and is carried about with the greatest form and ceremony, attended by four prelates in their pontifical habits, and about forty or fifty other priests, who chant before and after it, while one marching backwards before with a censer in his hands, incenses it all the way, till it be deposited in the grand pavilion, which is the church of the imperial court.

The Abyssinians maintain, that they were converted to Christianity by the eunuch or prime minister of their queen Candace, or, as they call her, Hindake, who, after his conversion by Philip, they say returned into Ethiopia, and gave his queen a full account of all that had passed; upon which that princess also believed in the Gospel.

However, in the year 335, Athanasius, patriarch of Alexandria, ordained Frumentius bishop of Axuma, and sent him to preach the Gospel in Ethiopia. This he performed with great success; the discipline of the church was then settled conformably to that of Alexandria; priests and deacons were every where ordained; liturgies, articles, and canons were settled and confirmed; and the Abyssinian church was brought to acknowledge herself wholly subject to and dependant upon that of Alexandria.

The Abyssinians, however, retain many of the Jewish ceremonies besides that of attending the ark. They circumcise not only the male but the female infants, which last is done by cutting off a small piece of skin from the clitoris. They abstain from blood, things strangled, the flesh of swine, and the other animals prohibited by the Mosaic law. They use purifications and washings after certain defilements. They oblige a man, if his brother die without male issue, to marry his widow and raise up seed to his name; and they keep the seventh day sabbath.

On the other hand, they believe the doctrine of the Trinity, and that Christ shall come again in glory to judge the quick and the dead, when the just shall inherit the kingdom of heaven, and unrepenting sinners be sent into hell.

The Abyssinian clergy are allowed to marry. The people never enter their churches without pulling off their shoes or sandals. The divine service consists of a set of prayers, psalms, and hymns suitable to the seasons, and for the most part performed with great decency and devotion, without any of that pomp and ceremony used in the church of Rome. They have no bells, but call the people to church by the sound of wooden hammers, which they strike upon a hollow board; at the hearing of which both the clergy and laity repair thither with a decent gravity, saying some prayers all the way they go; and when there, neither stare about, whisper, cough, or spit. The priests and laity are separated from each other; the former are in a kind of choir, with a curtain drawn before them, which hinders the people, who are in the body of the church, from seeing, though not from hearing the divine service. They have neither pews, benches, nor hassocks, but continue standing all the time. In none of these edifices, whether sumptuous or mean, are

any statues or carved images of any kind, except pictures: they will not suffer any crucifixes, whether carved or cast in metal, to be seen in them, or to be worn about their necks.

They baptize by a three-fold immersion, if the infant be capable of bearing it, without danger of its life; if not, the three-fold aspersion of water is deemed sufficient. The first immersion is only of one-third of the body, in the name of the Father; the second of two-thirds, or up to the breast, in the name of the Son; and the last of the whole body, by plunging in the head, in the name of the Holy Ghost. They then anoint the whole body, especially the joints, with the holy chrysm, and afterwards administer the holy communion to the child in both kinds, by dipping a bit of the consecrated bread into what they call the wine, and applying it to the child's lips.

Every church has a small room behind the east end, in which are the materials for making the communion-bread, which is a leavened cake, that they consecrate every time they administer the Lord's supper, dividing the whole among the communicants, and having it fresh made every time. Instead of wine, from which they wholly abstain, they keep in this little room a small quantity of dried raisins, which they squeeze and macerate in a greater or less quantity of water, according to the number of the communicants, for they administer the cup also to the laity, and receive both the elements as symbols and channels conveying to them the benefits of Christ's death. They do not admit laymen and women to come up to the altar to receive, but administer it to them at the door of the choir; nor do they oblige them to receive it kneeling, but standing.

Their clergy are little versed in the sacred writings, having neither expositors, commentators, concordances, nor any of those helps which are in use amongst us, except a few homilies upon some select parts of the Gospel, or upon a few theological points; but as they never preach or expound them to the laity, it is not surprising that they are extremely ignorant, and in many particulars grossly superstitious. Like the Romans, they offer up their devotions and prayers to the saints, and have proper offices, fasts, and festivals to their honour. Though they do not believe a purgatory in the same sense as the Greek and Roman churches, nor have any particular office for the dead, yet they make mention of them in their common service, and pray to God to absolve them from their sins, and to make them fit for the joys of heaven. They likewise keep a kind of anniversary of their departure, on which they give alms, according to their ability, to the priests, monks, and poor, to pray for their souls.

They receive the same canonical books, both of the Old and New Testament, that we do; the former are translated into Ethiopic from the Greek version, called the Septuagint; and the latter also from the Greek text: they have likewise the Apostolical Constitutions, which, in many respects, differs from the work we have under that name. This they believe to be of divine authority, and to have been written by St. Clement, whose name it bears. They have also the Nicene creed, but not that called the Apostles.

In short, like the oriental churches, they observe four Lents, viz. the Great Lent, which lasts fifty days; that of St. Peter and St. Paul, which lasts forty days, more or less, according to the nearness of their Easter; that of the Assumption of our Lady, which continues fifteen days; and that of Advent, which lasts three weeks. In all these Lents they abstain from eggs, butter, cheese, and neither eat or drink till after sun-set, which is never later than between six and seven in the evening; and after that time they may eat and drink till midnight. Instead of butter they use oil, which they extract from a small grain, and is far from having an unpleasant taste.

They fast with the same strictness on all the Wednesdays and Fridays throughout the year, and on those days always go to prayers before they begin their meals. The very peasants leave their work to have time to perform that duty, before they break their fast.

Neither the old nor young, nor even the sick, are excused from fasting, though in some cases they make some abatement

abatement in the rigour of it. The monks are more strict than the rest, for some of them eat but once in two days of their meagre fare, and others, authors say, pass the Holy Week in devotion, without either eating or drinking till the sabbath; and perform many other acts of mortification equally incredible.

SECT. IX.

Of the antient Churches of Abyssinia; their Monasteries, the different Orders of Monks, and their Manner of Life.

AS the Abyssinians did not always live in tents, and still spend some part of the year, which is doubtless the rainy season, in houses, they have several towns which are in a ruinous situation, and several antient churches still standing: some of these, particularly those belonging to their most celebrated monasteries, appear to have been formerly large and sumptuous structures, mostly built after the model of the temple of Jerusalem; but some of them are round, and have a square chapel in the centre built of stone, with four gates facing the four cardinal points. The portals and windows are generally of cedar, and the roof rises in the form of a cupola; but within appears dark and gloomy, on account of the dome having no opening to admit the light. The body of the church, between this square structure and the round walls, were wainscotted with cedar, and the roof supported with cedar pillars. Most of them are, however, gone to decay, and of some of them little more is left than the ruins. From these structures it is probable, that the arts once flourished in Abyssinia.

But those churches that are most worthy the attention of the curious reader, are nine of them cut out of the solid rock, all begun and completed by the command of Lalibela, one of their monarchs. Their names are St. Saviour, St. Mary, the Holy Cross, Golgotha, Bethlehem, St. George, the Martyrs, Marcoreos, and Lalibela, which was thus named from its founder, and is by far the noblest structure of them all. This prince, being sensible of the scarcity of architects and workmen in his own empire for carrying on such vast designs, sent for a number of them out of Egypt, and these, by his munificence, we are told, completed all these churches in the space of twenty-four years, which is the less incredible, as it is said, the rock out of which they were so curiously cut, was of so soft a nature as to be easily wrought by the tools of the workmen; though they afterwards hardened and acquired great solidity by being exposed to the sun and weather.

The monasteries of Abyssinia have not the least resemblance to those of the Roman, Greek, Armenian, and other Christian churches, either with regard to their structure, form, church-service, government, discipline, and way of life. Instead of being inclosed with strong high walls, they only resemble so many large villages in which each monk has a hut at a distance from the rest, and all of them scattered round the church. Instead of being confined within the walls, and not being allowed to stir out without leave from their superior, these, except at the times of devotion, may range where they please. Instead of leading an idle life, and living upon the charity of the laity, these spend most of their leisure in cultivating the spot of land assigned to each individual. Instead of eating in common, and having their tables served with variety of flesh, fowls, fish, and other dainties, with plenty of wine to help their digestion; these eat within their homely cells their small pittance, which is commonly the produce of their own grounds, and of their own cultivation; a few herbs, pulse or roots, with only a little salt; and on holidays a little butter, and nothing to dilute their frugal meals, but plain water. Instead of excluding women from their communities, some orders among them marry, and bring up their families in the same way of life; but they do not admit their wives and daughters into their churches, but have particular chapels for their use, to which they repair at all the canonical times of the day and night, with the same exactness as the men, and use much the same divine service, except the addi-

tional music of drums and tabors, which are peculiar to the latter.

There are however other orders of them, who abstain from all commerce with the other sex, and never admit them to live within the limits of their monasteries.

There are likewise a third sort, who prefer the eremitical life as most adapted to contemplation, and choose to abide in caves, or on the top of high rocks and other lonesome and unfrequented retreats; and these are generally more highly revered than the rest.

In the huts of all these monasteries nothing is to be seen but meanness; their very churches and chapels are most of them thatched and void of all ornaments, except a few ordinary paintings; yet on the inside they are well lined with timber, and have some accommodations for the old and weak to lean their elbows upon, because they chant all their service standing. They have neither refectories nor halls, and their huts or cells are of clay, small, low, and thatched, and so meanly furnished, that every thing within is answerable to their mortified life; thus their only bed is a poor mat spread on the floor.

Two different orders of them are distinguished by the name of their founders, or rather reformers: these are those of Tekla Haymanout, a native of Ethiopia, and of Abba Eustatius, an Egyptian. Those of the former order have a kind of general amongst them, chosen by the heads of the monastery; and the other has a superior styled Abba, or Father, over each monastery, elected by the majority of votes of the monks belonging to it. The habit of both is nearly the same, or, to speak more properly, differ in each particular; for, except their *ashæma*, which is only worn by the Abbots or Priors, and is no more than a braid of three thongs of red leather which they put about their necks, and fasten with an iron or copper hook, every one cloaths himself as he thinks fit; but all are meanly dressed, and the cloth or skin which covers their body is girt about them with a leather strap. Some go bare-headed like the laity; others wear a kind of hat, others some sort of cap, and some cover their heads with a piece of cloth. Those who affect a more ascetic life sometimes retire into the deserts, and afterwards return again and distinguish themselves as they please, some by having a yellowish skin about their neck, others by a piece of cloth of the same shape and colour, and a third sort by a kind of black mantle. Those of the monks who observe celibacy are generally more esteemed than those who marry, and are often, especially their abbots, employed by the emperors in public affairs, negotiations, &c.

SECT. X.

Of the several Kingdoms or Provinces of Abyssinia, with a particular Account of the Gallas, a barbarous Nation who have conquered the greatest Part of that Empire.

HAVING given an account of Abyssinia in general, and of every thing worthy of notice, in relation to the manners, customs, and religion of its Christian inhabitants, we shall just take notice of the kingdoms of which it is composed, and of the neighbouring states, and shall begin with Tigra, as being the most easterly, the nearest to the Turkish dominions and conquests, and of the largest extent.

Tigra or Tigre is bounded by Nubia on the north; by the Red-Sea on the east; by the kingdoms of Angot and Danicali on the south; and by the kingdoms or provinces of Dambea and Bagamender on the west. Its length from north to south is computed to be about three hundred miles, and its breadth about a hundred and sixty. It is under the government of a viceroy, and is divided into thirty-four districts.

The principal place of this kingdom or province was the city of Axuma, formerly its capital, and that of the whole empire; it was situated in fourteen degrees, forty-five minutes north latitude, and in thirty-five degrees forty-five minutes east longitude, on a spacious and delightful plain, watered by several rivulets, and was once adorned with stately palaces, churches, obelisks,

obelisks, and arches. There are particularly the remains of a large and magnificent structure, some of the stones of which are of a prodigious length and thickness; but it has now scarcely two hundred houses left, and those very mean. There are but few other towns either in this province, or the whole empire.

Contiguous to Tigra is the kingdom of Angot, which was formerly rich and fertile; but is now almost ruined by the Gallas, who have subdued the greatest part of it, and the small remains they have left are scarce worthy of notice.

The kingdom or province of Bagemedor, or Bagamedri, lies west of Tigra, and extends from it to the Nile. It is about a hundred and eighty miles in length, and sixty in breadth; but a great part of it is mountainous, rocky, and inhabited by wild nations. It has some towns, particularly one of its own name, which is the metropolis, but is an inconsiderable place, and the others are still more unworthy of notice. This province is however divided into thirteen governments, most of which are fertile, and well watered by small rivers.

The province of Amara or Amhara lies to the south of the last mentioned province, and on the west is divided by the Nile, which separates it from the province of Gojam. It is computed to extend about forty leagues from east to west, and has thirty-six districts. This is considered as the most noble province in the empire, from its being the usual residence of the Abyssinian monarchs, and consequently of the chief nobility. It has a peculiar dialect different from all the rest, which is become that of the court, and of the polite throughout the empire. Here stand the rocks of Ambaguexen, where the princes of the blood were formerly confined and educated; and this province is considered as the centre of the empire.

Farther to the west, and on the other side of the Nile, is the province of Gojam, which is almost encompassed on every side by that river, except to the north-east, where it is bounded by the Dambean lake. Its length from the north-west to the south-east is somewhat above a hundred and fifty miles, and its breadth from east to west, where it is broadest, is about ninety. This country is fertile, but in the middle is high and mountainous, and these eminences are partly inhabited by a people said to be descended from Hagar, Abraham's Egyptian bondmaid. The northern parts are altogether mountainous and rocky, and said to be inhabited by Jews; but it is more probable that they are some of the ancient Abyssinians, who have never yet embraced the Christian religion; for though there are great numbers of Jews dispersed through the whole empire, yet that people are never known to prefer desert habitations before the inhabited plains and places of commerce: nor is it probable, that they would reside among the inhospitable rocks, unless we suppose some rich mines lie hid amongst them, which keep them more profitably employed. This country contains twenty districts or governments.

To the north of Gojam lies Dambea, which is separated from it by the lake of its own name and the Nile. This is one of the flattest countries in all Abyssinia, and is therefore frequently overflowed. It is about ninety miles in length from east to west, and about thirty in breadth from north to south. Notwithstanding its being esteemed a level country, it has some mountains of an extraordinary height. Geographers mention several considerable towns; but it does not appear that there are any, except Gubea, which is the residence of the queen, as well as that of the emperor whenever he leaves his camp. This province is divided into fourteen districts.

The last kingdom or province worth notice is that of Narea, or Enarea, which extends south as far as the sixth degree of latitude, and consequently to the extremity of the empire. It was formerly governed by its own monarchs, who, as well as their subjects, were pagans; but being conquered about a century ago, they embraced Christianity. However, a considerable part of the country is still unsubdued, and perhaps unconverted. The whole kingdom is esteemed rich and fertile, and produces a great number of cattle. The inhabitants carry

on a considerable trade with the Caffres, who bring them abundance of gold, which they exchange for cloth, salt, and other commodities.

The Abyssinians themselves allow the Nareans to be the best and handsomest people in all Ethiopia. They are tall, strong, and well shaped; and in their dealings honest, wise, faithful, and undisguised. They are also brave and warlike, and have always defended their country with great gallantry against the incursions of the wild and barbarous Gallas, who have subdued even half of the Abyssinian empire. The tribute they pay to the emperor of Abyssinia appears rather to proceed from their loyalty than any force; for they receive no assistance from him against those common invaders, nor does he maintain any standing forces, garrisons, or fortresses there to keep them in awe. This kingdom is said by some authors to abound in gold; but that is probably owing to the great quantity of that metal brought into it by the neighbouring Caffres, unless it be supposed that they designedly conceal and forbear seeking for it, lest the fame of their wealth should induce the Turks, or the plundering Gallas, to invade them.

As the Gallas have obtained so considerable a part of the empire, it is proper to give some account of them. These people, who are also called Galli and Balli, are commonly distinguished according to their situation, with respect to Abyssinia, into eastern, western, and southern. They are a bold warlike people, who live by the sword, and consider that as giving the best title to every thing, and as being the surest means of preserving what they have acquired. They are brought up to arms from their infancy, and are early taught to love glory and conquest, and to despise slavery and death. Their youth are not allowed the privilege of cutting their hair, which they esteem the badge of manhood, till they have killed an enemy or some savage beast. The greater number of brave actions a man has performed, the more he is respected, and this gives them the precedence at councils and at festivals, on which account they save the heads of those enemies that fall by their hand as the most valuable trophies. After an engagement they lay them before the proper officers on the field of battle, where they are registered in favour of the persons by whom they are brought; after which the owner may carry them to his own tent, together with his share of the plunder, which is adjudged to him according to the share he had in the victory.

Their weapons are the bow, the arrow, and the dart, when they fight at a distance. Those of high rank close in upon the enemy with their swords, and the rest have a club, with one end hardened in the fire. Their shields are chiefly made of the hide of a bull or buffalo. They had formerly no cavalry, but have since learned to fight on horseback; and though their horses are but indifferent, yet they fight so close, and in such good order, that the Abyssinians, though much better mounted, cannot bear the shock. It is even a capital crime among them to give way after the onset is begun; hence they all fight to conquer or die, neither giving or asking quarter; rushing with such fury on the foe, that it is very difficult to make head against them; whence they have gained many signal victories over Abyssinian armies that have been much more numerous, and provided with better horses and arms. Whenever therefore the Gallas make excursions into the territory of an enemy, instead of trussing to numbers, they commonly choose a select body of determined youths, not exceeding eight or ten thousand at the most, who being all sworn to stand by each other to the last, fight with such intrepidity as seldom fails of putting an enemy of twice or three times their number into disorder.

They despise agriculture as a slavish employment; and though they admire the bread they take from the Abyssinians and other neighbours, are generally above sowing corn; and if they do, leave that work to their slaves and women, while they follow what they esteem the more manly exercises of war and hunting. They, however, feed numerous herds of cattle, and live chiefly upon their milk, and such productions of the earth as the country affords, shifting from place to place for the sake of pasture,

pasture, and carrying their wives and children with them wherever they go.

They are said to be divided into above sixty tribes, each of which has a particular head or prince; and these choose from among themselves a luva, or luba, who presides over all the rest, but whose authority extends only to military affairs, and is confined to eight years. He convenes the grand council, in which the affairs of peace and war are determined; and if they agree upon the latter, he heads the army as commander in chief, distributing to each of the heads of the tribes his proper province and

duty; and after the war or expedition is over, assigns to each his proper honours, rewards, and share of the plunder; but if any dispute arises, it is commonly decided by the general council.

With regard to religion, the Gallas acknowledge a Supreme Governor of all sublunary things, and yet they are said to pay no outward worship, and to be extremely ignorant of every thing relating to religion; but their very enemies allow that they are extremely honest and true to their promises, and are never known to violate an oath.

CHAPTER III.

OF ABEX and ANIAN.

SECT. I.

Of ABEX.

Its Situation, Extent, Climate, Face of the Country, Inhabitants, and principal Towns; with a concise Description of the little Kingdom of Dancali.

ABEX, or Habasha, is only a narrow slip of land which extends along the western or African shore of the Red Sea, and was formerly a part of Upper Ethiopia, though it is at present subject to the Turks, who seized on all its bays and ports from Egypt to the Straights of Babelmandel, by which means the natives of Abyssinia were excluded from all intercourse with the Red Sea.

This territory is hot and sandy, and the air not only sultry, but foggy and unwholesome, especially after sunset; and the country is so parched by the sun, that it is almost barren, and produces few of the necessaries of life. It has however some deer, and also sheep of a prodigious size, with large tails like those we have described in treating of Syria: it is also said to abound with a great number of lions, tigers, and other wild beasts.

The western part of this tract of land is secured by a long chain of inaccessible mountains, which prevent the passage of an army from Abyssinia into their country, there being only two narrow passes, that of Suakin and that of Arkico; and even in these passes the road is so rugged and difficult, that there is no travelling above five or six miles a day, and consequently they may be easily defended by a handful of troops against a numerous army.

The inhabitants consist of a mixture of Turks, Egyptians; Ethiopians, Arabs, and Caffres.

The principal towns are Suaquam and Arkico, or Ercoco, and a number of villages of fishermen. Suaquam is built on a small island of its own name, situated in nineteen degrees forty-five minutes north latitude, and in thirty-seven degrees thirty minutes east longitude, and is one of the best sea-ports in the Red Sea; the entrance into the harbour is by a narrow strait that reaches into a lake, in the midst of which is the island on which the town is built. All the houses are of stone and mortar, and here resides a Turkish governor under the basha of Cairo. This city is chiefly inhabited by Turks and Arabs.

Arkico, or Ercoco, is situated in sixteen degrees five minutes north latitude, on the coast of the Red Sea, and is defended by a castle; but is small, and neither rich nor populous.

To the south of Abex are several petty kingdoms scarce worthy of notice: one of the principal of these is Dancali, or Dancaly, which extends beyond the Straights of Babelmandel. The soil is for the most part dry, sandy, and barren; for the whole country labours under a great scarcity of water, and that which they have is very brackish. The land produces little besides some hardy vegetables which serve to feed the goats, which are in

a manner the only quadrupeds in the country. It has, however, some good ports on the Red Sea, the principal of which is Baliur; and having some salt-mines, the produce of them is sent into other countries; and in return they receive the necessaries of life. Its king, tho' a Mahometan, is said to be tributary to the emperor of Abyssinia.

SECT. II.

Of ANIAN, or AJAN.

Its Situation, Extent, Climate, Soil, and Inhabitants in general. Of the Kingdom of Adel; its Country, Cities, Produce, Commerce, and Inhabitants.

THE country of Anian extends along the southern coast of the gulph of Babelmandel to Cape Guardafuy, and from the twelfth degree of north latitude to the equator; it being bounded on the north by the gulph of Babelmandel, on the east by the Indian ocean, on the south by Zanguebar, and on the west by Abyssinia and the unknown parts of Africa.

As the climate is exceeding hot, all the eastern coast is a mere sandy barren tract, producing neither corn, fruit, nor any animals but of the wild kind, on which account it is generally called the Desert Coast; but the northern coast, which is washed by the gulph, is a fertile country that produces plenty of provisions, in which the natives carry on a considerable commerce. They have also an excellent breed of horses, which foreign merchants purchase in great numbers, in exchange for silks, cottons, and other stuffs.

The inhabitants along the north coast are for the most part white, with long black hair, and grow more tawny, or even quite black, on proceeding towards the south. Here are likewise many negroes, who live and intermarry with the Arabs settled in the country, and carry on a great commerce with them in slaves, horses, gold, and ivory, which they commonly bring from Abyssinia, with which they are almost constantly at war; and, by their frequent inroads into that kingdom, have rendered themselves a warlike people.

In this tract is included several kingdoms, the most considerable of which is that of Adel, so called from its metropolis, which authors have not described; it is also named Zeila, from another sea-port situated on the southern coast of the Red Sea.

This kingdom has the Straights of Babelmandel on the north, part of the eastern ocean on the east, and the Gallas with the kingdoms of Dancali and unknown countries on the west.

The city of Zeila is seated on a spacious bay, to the south-east of the mouth of the straits of Babelmandel, in eleven degrees ten minutes north latitude, and forty-four degrees thirty-five minutes east longitude from London. It is extremely populous, the streets

are regularly laid out, and the houses built of free-stone. Its haven is very commodious, and it carries on a considerable commerce, it being the place through which the greatest part of the merchandize carried into the Abyssinian empire commonly pass, as well as those that are consumed in the kingdom of Adel. The soil about Zeila is only a dry barren sand, and the inhabitants are obliged to fetch fresh water at the distance of two days journey from the city, where the country abounds with corn and fruit to such a degree, that the inhabitants cannot consume it all, on which account the people of the neighbouring places come thither to purchase provisions.

The next city is Barбора, situated at the bottom of a bay, on an island of its own name. It has been all along a kind of rival in commerce with Zeila, and is no less resorted to by foreign merchants. The island, which is almost contiguous to the continent, is very fertile, and produces plenty of corn, fruit, and cattle, great part of which is exported into other countries. The other parts of the kingdom of Adel being generally flat, and with very few hills, they have seldom any rains; but that defect is abundantly supplied by the many rivers that run through it.

One of these rivers named the Hawash, flows down from the Abyssinian mountains, and receiving some other rivers, takes a circuit before it enters the kingdom of Adel. This river is very broad and deep, but it has scarce run six miles through the country of Adel, before the inhabitants divide it into such a multitude of canals, that it is in some measure exhausted before it reaches the sea. This renders the country so rich in grain, fruit, and other provisions, that part of it is conveyed into the neighbouring kingdoms. In particular, they have plenty of wheat, barley, and millet, and a variety of cows, sheep, and other beasts; but their principal traffic consists in gold-dust, elephants teeth, frankincense and negro slaves, which the inhabitants of Adel carry to the port of Zeila, where they never fail of meeting with merchants from Arabia, Guzarat, and other parts, who give in exchange for them cloaths of cotton, silk, and linen of various sorts, collars, bracelets, and other ornaments of amber and crystal; with dates, raisins, fire-arms, and other commodities.

The Adelites are brave and warlike, and fight with surprising intrepidity against the Abyssinians, who are far from being equal to them in valour, discipline, and offensive weapons, the Adelites being furnished by the Turks and Arabs with variety of fire-arms. Their dress chiefly consists of a piece of cotton cloth, which covers them only from the girdle to a little below the knee, all the rest of their body being naked; but the king and nobles of both sexes wear a kind of loose garment which covers their whole body, and a cap on their heads; all the women, however, are very fond of adorning their necks, arms, wrists, and ankles with bracelets of glass, amber, and other trinkets.

SECTION III.

Of the Kingdom of Magadexa, and the Republic of Brava.

THE next considerable kingdom on the coast of Anian is that of Magadexa, which is situated to the south of Adel, and extends from five degrees forty minutes north latitude to the equator, where the river or gulph of Jubo divides the coast of Anian from that of Zanguebar; but how far it extends towards the west is uncertain. It has its name from its capital, which is situated on a large bay, formed by the mouth of the river of the same name, that annually overflows like the Nile. Some authors have pretended to fix the spring-head of this river, but chuse different mountains. Indeed, we are so little acquainted with these inland countries, that the source of this and other rivers is as much unknown, as that of the Nile was formerly. However, its course is probably a very long one, as it has a considerable channel; and this farther appears from its regular and extensive inundations; the whole country being rendered so fertile by the numberless canals cut from

it, that it produces a great quantity of wheat and barley, variety of fruit, and a multitude of horses, oxen, sheep, and other animals, wild and tame.

The city of Magadexa is a place of great trade, and of vast resort from the countries of Arabia, India, and other parts; whence their merchants bring cotton, silk, and other stuffs, spices, and a variety of drugs, which they exchange with the inhabitants for gold, ivory, wax, and other commodities.

Some of the people are white, others tawny, and others quite black; but all speak the Arabic tongue. The king and his court are Mahometans, and most of the inhabitants are of the same religion; they are bold and warlike, and, among other weapons, use poisoned arrows and lances.

Within the kingdom of Magadexa, and on its southern extremity is the republic of Brava, which is perhaps the only government of that kind in all Africa; it was founded by seven Arabians, who were all brethren, and fled thither from the tyranny of Lacah, one of the petty monarchs of Arabia Felix. Here they found a most convenient and delightful situation, in a small country bounded on each side by a river, or, as others suppose, by two branches of the same river.

This republic is said not to extend much farther than the coast; its chief dependence being on the great commerce of its capital of the same name, which is conveniently situated on a bay formed by the mouth of the northern branch of the river, about the distance of one degree from the equator.

This city, which seems to be the only one that belongs to this republic, is large and well peopled, chiefly by rich merchants, the descendants of the seven Arabs just mentioned, whose chief trade consists in gold, silver, silk, cotton, and other stuffs, elephants teeth, gums, and other drugs, particularly ambergris, with which this coast abounds.

The houses are large and well built, and the town is strong, well fortified, and esteemed one of the most celebrated and greatest marts on the whole coast. Both the city and the republic are governed by twelve magistrates, chosen out of the principal families of the seven founders above-mentioned, and to them the administration of justice, and the management of all public affairs are committed. The people are chiefly Mahometans, and yet are under the protection of the king of Portugal, to whom they annually pay a small tribute of five hundred mitigates, amounting to about four hundred French livres.

SECTION IV.

Of the Islands of Babelmandel and Zocotra, Socotra, or Socotora, situated on the North Coast of Anian.

THE island of Babelmandel gives name to the straits at the entrance into the Red Sea, and is situated in thirteen degrees north latitude, and in forty-three degrees thirty-three minutes east longitude from London. The Abyssinians and Arabians formerly contended with great fury for the possession of this island, on account of its great importance, from its commanding the entrance into the South Sea, and preserving a communication with the ocean; but the Turks having obtained the possession of both shores, the island is now in a manner deserted.

Babelmandel is about four or five miles in compass, rocky, barren, and exposed to all the winds: it has a barren soil, scorched by the heat of the sun, and affords scarce any sustenance for man or beast.

The island of Zocotra, or Socotra, is situated in the Eastern Ocean, thirty leagues to the eastward of Cape Guardafuy, and extends from the twelfth degree to the twelfth degree twenty-five minutes north latitude. It is fifty miles in length and thirty-two in breadth, and is particularly famed for the aloes brought from thence, which, from the name of the island, are called Socotrine aloes. This island also produces great quantities of frankincense, dates, and rice, which are exported from thence to Goa and other parts of the East Indies; from whence they bring other merchandizes. They likewise trade

trade all along the coast of Arabia. The island also abounds in cattle and fruit.

The climate is extremely hot, and it is said that the rainy season does not last above a fortnight or three weeks: however, here are some rivers which are never dry, and on the coast are wells dug by the Arabs. There are two pretty good harbours, where the European ships used formerly to put in, when they were disappointed of their passage to India by the monsoons: but now this seldom happens, as our mariners are well acquainted with the winds and seasons in this part of the world.

The inhabitants consist of negroes of a large stature, with disagreeable features, and frizzled hair: but those who live in the middle of the island, and are probably the original inhabitants, are much fairer, and have features that nearly resemble those of the Europeans. These are solely employed in fishing, and attending their flocks. On the coast are a considerable number of Arabs, who are masters of the country, and people of a mixed breed, produced from the Arabs and negro women.

The people are clothed with a stuff made of goats-hair, of which they make long gowns, which are fastened round the waist with a sash. They have also a kind of cloak, which they throw about their shoulders, and wrap the whole body in it. The people in the heart of the island have no other cloaths but a piece of cloth or the skin of a beast fastened round the waist. The men wear caps like those of the Abyssinians, and the women go bareheaded.

Their food consists of the milk and flesh of their cattle, with dates, rice, and herbs.

As to the religion of the people, the greatest part of them are Pagans; but the Arabs, who are the trading part of the island, are Mahometans.

In the island is but one city, which is also called Socotora, and this is the residence of the king; some say there are likewise considerable villages inhabited by the Arabs. The original natives live in cottages dispersed over the country.

C H A P. IV.

Of ZANGUEBAR, and SOFALA.

S E C T. I.

Of the Country of Zanguebar and Sofala in general. Its Situation, Extent, Climate, and Division. A Description of the Kingdom and City of Melinda. The Persons, Dress, and Manners of the People; the State of the King, and the Manner in which Justice is administered. With a particular Account of the Reception of the Portuguese on their first Arrival at Melinda.

ZANGUEBAR and Sofala include a large part of the eastern coast of Africa, extending from the equator to twenty-three degrees south latitude, and from thirty-four to forty degrees east longitude, from London. It is therefore about fourteen hundred miles in length, and three hundred and fifty in breadth. It is bounded on the north by Anian, on the east by the Indian ocean, on the south by Caffraria, and on the west by Monomugi and the unknown parts of Africa.

The air of this country would be intolerably hot, was it not cooled by the annual rains which overflow the country, and by refreshing breezes from the sea. It is also well watered by rivers, which renders the soil exceeding fruitful. Zanguebar is divided into several kingdoms, which, beginning at the north, are Melinda, Mombaze, or Mombaza, Quiloa, Mofambique, or Mofambico, and Sofala. The Portuguese are indeed sovereigns of all the coast, and have many black princes subject to them.

The kingdom of Melinda begins, according to most geographers, under the equinoctial, and extends to the river Quilmanci, between the third and fourth degree of south latitude. The coast of Melinda, especially near the capital, is extremely dangerous and difficult of access, it being full of rocks and shelves, and at certain seasons the sea is frequently tempestuous.

This kingdom is however for the most part rich and fertile, producing almost all the necessaries of life, except wheat and rice, both of which are brought thither from Camboya and other parts; and those who cannot purchase them make use of potatoes in their stead: these are very plentiful, and are fine and large. The country also abounds with great variety of fruit-trees, roots, plants, and other esculents, with melons of exquisite taste. It is also covered with citron-trees, with whose odoriferous smell the air is generally perfumed almost all the year. There is great plenty of oxen, sheep, venison, and other game; with geese, and several kinds of poultry.

The city of Melinda is agreeably situated on a beautiful plain, and surrounded with many fine gardens and orchards, which abound with all sorts of fruit-trees, particularly oranges and citrons. The houses are built of square stone; these are for the most part handsome structures, with flat roofs; some of them are even magnificent, and all of them are richly furnished, they being chiefly inhabited by rich merchants. Melinda is much resorted to by foreigners, who carry on a great trade with the city in gold, copper, quicksilver, ivory, wax, drugs, &c. which are here exchanged for corn, silks, cotton, and other stuffs; besides various other commodities. The only inconvenience attending this city is, that ships are obliged to anchor at some distance from it, on account of the rocks and shelves which render the access to it difficult and dangerous.

The inhabitants are a mixture of blacks, and of persons of a swarthy, tawny, and whitish complexion. The last are chiefly the women, who are mostly either inclining to the white, or an olive colour. Their dress is very agreeable, for they never stir out but in fine silks girt about them with a rich gold or silver girdle. They wear a collar and bracelet of the same metals, and their heads are covered with a veil.

The men do not here go bare-headed, as in most other parts of Africa, but wear a kind of turban wrought with silk and gold; but some are only clothed from the waist downward with silk and cotton stuffs; others wear a short cloak of calico, and a sword and dagger handsomely ornamented; while their legs and feet are bare. The meaner sort, and those who live farther from the coast, wear little more than a piece of cloth about their middle. These carry a shield, bow and arrows, the scymetar and the javelin; in using which they are extremely expert, they being esteemed the bravest soldiers on all that coast; for they go to war with undaunted spirit, and maintain their ground with greater intrepidity than any of their neighbours. They are also said to be very courteous and obliging; they are free from flattery and fraud, and live in a very friendly manner with the Portuguese, who are commonly buried amongst them, without any other mark of distinction than a cross over their tombs.

As to their religion, they are a mixture of Mahometans and idolators; but the Roman Catholics are so numerous in the city, that they have built no less than seventeen churches and chapels in it, before one of which they have erected a cross of gilt marble.

The government is monarchical, and the king seldom stirs out of his palace, without being carried in a pompous sedan on the shoulders of four or more of the greatest nobles of his kingdom. Whenever he passes through the streets of the city, incense and other perfumes are burnt before him, by a multitude of ladies who come to welcome him with songs in his praise, playing on several kinds of musical instruments, which, though not extremely harmonious, they touch with great art and dexterity. If he goes upon any expedition, whether civil or military, he is then mounted on a stately horse richly caparisoned, and attended by a numerous retinue, with great crowds of his subjects, who fill the air with loyal acclamations. At his setting out he is met by his priests, or soothsayers, who bring a deer just sacrificed, with its blood still reeking, over which he leaps his horse three times; which is no sooner done, than these soothsayers examine the entrails, and from thence pretend to foretell the success of his expedition.

The same superstitious ceremonies are also observed when any prince, or an ambassador from a prince, comes to his court, in order to learn whether the visit or negotiation will be attended with good or bad success. Upon this occasion the prince, or ambassador, is accompanied by a great number of women through the streets, some burning perfumes before him, others singing or playing on instruments.

The kings of Melinda are in a manner obliged to submit to the ceremonies performed by the soothsayers, and to regulate their resolutions by them, whether it be for peace or war, or on any other exigence, even whether they give any credit to them or not; for on this in a great measure depends the honour, affection, and veneration they receive from the people, which would quickly degenerate into hatred and contempt, if not into open rebellion, should they fail to shew an implicit obedience to the determinations of the soothsayers, who have an entire influence over all the people. It is, however, not improbable, that these pretended predictions, calculated to amuse the multitude, are privately directed by the prince, in order to make the people enter with confidence, and a firm assurance of success, into all their measures.

However, the kings of Melinda are said to take a more rational method of securing the loyalty and affection of their subjects, by their constant application to public affairs; by their vigilance in watching the conduct of their ministers, governors, and other magistrates; by their assiduity and attention in listening to the complaints of their subjects; and by the strict and severe administration of justice on all delinquents, of what rank or degree soever; but more particularly on those who attempt to impose upon, or mislead them, by fraud or artifice.

When any complaint or appeal is presented to the king, he causes the plaintiff to be detained till the defendant, who is instantly summoned to appear before him and his council, has heard his accusation, and made his defence. If an inferior complains against a governor, a minister of state, or any other grandee, he is no less obliged to appear than the meanest subject; with this difference, that on his approach to the court he causes the horn or trumpet to be blown, to give notice of his coming: upon which some of the king's officers go and receive him into their custody, and, having dismissed his retinue, conduct him to the hall of justice. In such cases the accuser must be provided with sufficient evidence; for if that be wanting, he is immediately condemned to die, and is instantly executed; but if the accusation be fully proved, the defendant is sentenced to make restitution suitable to the wrong he has done, and is also fined and obliged to suffer corporal punishment; which, if the offender be a person of rank, is commonly being bastinadoed with greater or less severity, according to the nature of the offence, and the dignity of the offender, in which case the bastinado is inflicted by the king himself.

No sooner is the sentence pronounced, than the offender is conducted out of the hall into another chamber, where he must acknowledge his fault, and the justice as well as lenity of his punishment, in the humblest terms and posture. He is then stripped, and laid with his face

on the ground; when the king taking his staff of justice in his hand, gives him as many strokes as he thinks proper; and having at length received the offender's thanks for this kind correction, he bids him rise, and put on his cloaths; which having done, he kisses his majesty's feet, and accompanies him with the rest of the attendants into the hall, with a serene countenance that betrays not the least grief or discontent. The king there graciously dismisses him before the whole court, charging him to be careful to administer justice to his subjects, and then causes him to be accompanied with the usual honours and perfumes to the gates of the city, and the affair is hushed up as if nothing had happened, the people without being entirely ignorant of what has been transacting within. The fine and expences of the suit are levied out of the offender's estate, or, if a favourite, out of the king's coffers.

The Portuguese boast of the good understanding that has always subsisted between them and the kings of Melinda ever since their being admitted into their dominions, and more particularly of the extraordinary respect which that prince pays to the subjects of Portugal. Indeed, on their first entering that kingdom, they were treated in a very friendly manner; and as these Portuguese were the first Europeans who had ever appeared before that city, a particular account of their reception will not, we imagine, be disagreeable to our readers, especially as it will also serve to give some idea of the manners of the people.

Vasco De Gama, who commanded a Portuguese fleet sent to discover the East Indies, appearing before Melinda, in the year 1498, was overjoyed at seeing a city like those of Portugal, and anchored within a league of it; but nobody coming on board, for fear of being made prisoners, he caused an old Moor to be set on a shelf of the rocks over-against the city, from whence a boat came immediately to fetch him. Being carried before the king he informed him, that the general, for so the admirals were then called, was desirous of entering into a league with him. The king returned a favourable answer, with a present of sheep, fruit, and other refreshments; in return for which De Gama sent a net, two branches of coral, three brass basons, some little bells, and two scarfs. The next day the Portuguese anchored nearer the city, when the king sent to let him know, that he himself would visit him the next day, and that the meeting should be upon the water. Accordingly the next day, in the afternoon, the young king, to whom his aged father had devolved his authority, came in a large boat, dressed in a gown of crimson damask lined with green sattin, with a rich scarf rolled round his head. He sat in a beautiful chair, neatly inlaid with wire, on a silk cushion, with another by him, on which lay a hat of crimson sattin. Near him stood an old man, who carried a very rich sword, with a silver scabbard. He was attended by about twenty of the nobles of his court richly dressed, and a kind of music. De Gama went to meet him in his long-boat, which was adorned with flags, carrying with him twelve of the chief men belonging to the ships; and after many salutations, went, at the king's desire, into his boat, where he was honoured as a prince. The king's behaviour was polite, and his converse full of good sense; he viewed his new guest and his men with great attention, enquiring after the country he came from, the name of his king, and for what purpose he entered those seas. The general having answered these questions, the king, at his desire, promised him a pilot for Calicut, and invited him to take the pleasures of his palace. But De Gama excused himself, promising to call there at his return; and at the same time made the king a present of thirteen Moors he had a little before taken prisoners; which the king said, he received with greater pleasure than if he had given him such another city as that of Melinda.

The king then rowed among the ships, which he beheld with surprize, and was greatly delighted at the firing of the ordnance, telling the general, that he never saw any men that pleased him so well as the Portuguese, and wished he had some of them to assist him in his wars. De Gama, at parting, let two men, at the king's request, accompany him; and had, as hostages for their safety, his son

son and a priest. The next day De Gama and one of his principal officers went with armed boats along the shore to see the king's horsemen run and skirmish. In a little time there came some footmen from the king's palace, which was in sight, and bringing his majesty in a chair carried him into the general's boat, where he very courteously treated him to land and go to the city, because his father, who was lame, was desirous of seeing him, offering to stay with his children on board the ship till his return; but De Gama, fearing to trust himself, pretended that he durst not, on account of his having no licence from his sovereign; and at length, having obtained a very expert pilot, he took his leave.

De Gama, at his return, took with him an ambassador from the king of Melinda, whom he brought to Portugal; and every thing being settled to the satisfaction of both monarchies, the Portuguese assisted the king of Melinda against his enemies, and that prince gave them free leave to settle and build a fort in his capital.

S E C T. II.

Of the principal of those small Islands and Kingdoms which lie along the Coast of Melinda, particularly Pate, Lamo, Pemba, and Zanzibar, or Zanguebar.

NEAR the coast of Melinda are several islands and petty kingdoms, the most considerable of which we shall here describe, beginning with the kingdom of Pate, which takes its name from its capital, situated on a small island, at the mouth of a commodious bay, named by the Portuguese Baye Formosa, in about the first degree of south latitude. This city is large, well built, and populous. It has a good and convenient port, and carries on a considerable commerce with the neighbouring kingdoms and islands, particularly those of Lamo, Ampasa, Sian, and Chelichia, which surround it at a small distance, and have also their names from their respective capitals; but all of them are too insignificant to require a farther description.

The king of Pate is a Mahometan, as are also most of his subjects, and is tributary to the Portuguese, who have a fort in the city, under the command of the governor of these coasts, who is little better than a tyrant over them. Pate had another town and port, named Mondra, but it was taken and razed by a Portuguese admiral, named Thomas de Soufa, for refusing, or perhaps only neglecting, to pay the usual tribute.

The isle and kingdom of Lamo has also its capital of the same name, which has a good port, and is well walled and fortified. The island is situated at a small distance from the mouth of the river Quilmanci. The king and government, being Mahometans, are frequently at war with the rest of the inhabitants, who are idolaters. It is remarkable, that in the year 1589, the king of this island was beheaded by the Portuguese. He was named Panebaxita, and his crime, whether real or pretended, was his having basely betrayed Rock Britto, governor of the coast, for which he was seized, with four of his Mahometan subjects, in his own capital, by the admiral Soufa Contingo, and carried to Pate, where they were publicly executed in the presence of that and some other petty kings of the neighbouring islands; from which time Lamo has continued tributary to Portugal.

The isle and kingdom of Pemba is situated opposite to the bay of St. Raphael, in the kingdom of Melinda, and De Lisle places it in four degrees fifty minutes south latitude. It is small and inconsiderable, though its princes assume the title of kings.

The isle and kingdom of Zanguebar, or Zanzibar, is also situated opposite the bay of St. Raphael, between the islands of Pemba and Momfia, at the distance of about eight or nine leagues from the land, and has been tributary to Portugal ever since their fleet appeared on this coast, when the king submitted to pay annually a certain weight of gold and thirty sheep.

This island abounds with rivers of excellent water, and produces plenty of rice, millet, and sugar-canes: it has also forests of citron-trees of an extraordinary size and odoriferous smell, intermixed with a multitude of

orange trees; and the natives carry on a very considerable trade with the adjacent kingdoms.

The islands of Quirimba, Anifa, Amfia, &c. have little worthy of notice, except their breeding great numbers of large and small cattle, and abounding with corn and fruit; all which, except what is consumed among them, is carried to the continent of Africa, and great advantage is made of this commerce. The island of Quirimba also abounds with a coarse kind of manna, of a greyish red; it is difficult to dissolve, but is as purgative as the best.

The inhabitants are slender, meagre, and weakly, notwithstanding their being great feeders. Their dress resembles that of the inhabitants of Melinda, and the women are equally fond of adorning themselves with chains and bracelets of gold and silver. The men in general apply themselves to agriculture and commerce; for which they are better formed than for war. Their trading vessels are slightly made, the timber being fastened together by ropes made of flags instead of nails, and their sails are formed of mats. Those of Zanguebar are not only stronger and better built, but carry some great guns on account of their being commonly laden with the richest merchandize of that coast, while the greatest part of the others carry only cattle, rice, and fruit.

S E C T. III.

Of the island of MOMBASA, or MOMBASA.

Its Situation, Extent, Climate, and Produce; with a Description of the city of Mombaza, and a concise Account of its Inhabitants.

THE island of Mombaza, or Mombaso, is contiguous to that of Melinda, and is situated in four degrees five minutes south latitude, in a convenient bay formed by the river Quilmanci already mentioned, and is said to be about twelve miles in circumference.

The climate is pretty temperate, considering its situation, and the air healthy. The island abounds with excellent springs of fresh-water, and the soil, which is exceeding fruitful, produces rice, millet, and other grain; with variety of fruit-trees, and other vegetables and esculents. Here also are bred great numbers of cattle, and various kinds of poultry. Their cattle are well fed, and agreeably tasted: they have great plenty of pasture, and some of their sheep have those large and fat tails which we have frequently mentioned as weighing between twenty and thirty pounds.

The inhabitants live long and happily, especially in the capital, where they enjoy great plenty, with ease and elegance. Their bread, which is made either of rice or millet, is in flat cakes, and mixed with sugar, herbs, and other ingredients, to give it a more agreeable taste. They have drink made of rice, and other liquors made of honey, or of particular sorts of fruit, which are here excellent, especially their oranges, some of which are very large, and of exquisite taste and flavour. These liquors are usually kept in vessels of different sorts and sizes, neatly made of bullocks horns, and of the same materials are their drinking-cups, and other household utensils; they having plenty of horns, and their artists work them with great skill and neatness.

The city was originally built on a peninsula; but the spot on which it stands has been since turned into an island, by cutting a canal through the isthmus in such a manner, that one corner of it covers the city, so that it cannot be seen till a person enters the port. The houses are built of stone, cemented with mortar; the streets are straight, though narrow; and the houses being contiguous, and terraced on the tops, one may walk upon them from one end of the street to the other, without interruption. The city is defended by a strong citadel, and before the town is a most commodious bay, in which the trading vessels have all the depth and room to sail and tack about that can be wished, the channel being wide enough for the largest of them to enter with all their sails displayed. Within this inclosure is a dyke, or causeway, on the farther side, built of stone, and running across the channel, so that at low water one may pass from one

side to the other. Besides the channel which surrounds the town, there are several other navigable ones that run into the land.

Here is a great variety of inhabitants, some black, some swarthy, others olive, and others white; but they generally dress after the Arabian manner, and the richer sort very magnificently, chiefly of the richest silks and stuffs; and the women wear gold and silver tissue. The furniture of their houses is no less elegant, it consisting in rich carpets, paintings, hangings, and a variety of utensils and ornaments imported from Persia, Cambaia, and other countries. The people are represented as being the most affable and civil to strangers of any upon this coast, though they consist of many nations, complexions, and religions. They were once all Pagans, but the Portuguese, upon their settling in this kingdom, made a small number of converts; but afterwards the far greater part of them either returned to their ancient paganism, or turned Mahometans, after the example of one of their monarchs who had been brought up in the Christian religion, and in the year 1631 married a Christian; but falling out with the Portuguese governor, on account of his being guilty of some acts of injustice or oppression, he drove him out of the citadel, massacred all the Portuguese that fell into his hands; and, in order to obtain the protection of the Turks, turned Mahometan.

SECT. IV.

Of the Island of QUILOA.

Its Situation; the Extent and Fertility of the Territory belonging to it; a Description of the City of Quiloa, and of the Manners of the Inhabitants; with a concise Account of the small Kingdoms of Mongalo and Angos.

THE island of Quiloa is situated in eight degrees twenty minutes south latitude, and was first discovered by the Portuguese in the year 1498. It has its name from its capital, which is a large and opulent city, and the kingdom, which also bears the same name, lies opposite to it on the continent, and extends about two hundred miles from north to south along the coast, but how far to the south is unknown. It is separated from the island by a narrow channel, and the soil of both is so nearly of the same goodness and fertility, that they are thought to have been formerly contiguous. The country, though low, is very pleasant and fertile in rice and millet, fruit, and good pasture; the inhabitants breed abundance of cattle and fowl of all sorts, both wild and tame; they have likewise great plenty of very good fish, and, according to most travellers, the climate is healthy and pretty temperate.

The city of Quiloa is large, rich, and well built: the houses are handsome, and built of stone and mortar: they are several stories high, and have behind each a pleasant garden, well watered and cultivated, here being plenty of springs of fresh-water. The houses are terraced at the top with a hard kind of clay, and the streets, as in most places under the tropics, are narrow. On one side of the town is the citadel, which is the residence of the Mahometan prince; it is adorned with stately towers, and surrounded with a ditch and other fortifications: it has two gates, one towards the port, where is a view of the ships sailing in and out, and the other towards the sea.

The king and his subjects are Mahometans; part of the latter are black, and part tawney: they all speak Arabic, and several other languages, which they learn from the nations with which they trade. Their dress resembles that of the Arabians, and is not very different from that of the inhabitants of Mombaza, nor do they come behind them either in the finery and richness of their cloaths, the elegance of their furniture, or in their manner of living; for they here enjoy the same plenty. The women in particular are fond of making a gay appearance, and of having a variety of ornaments about their necks, arms, wrists, and ankles; in particular they have bracelets of ivory curiously wrought, which upon the death of a parent, a husband, or other near relation, they break in pieces, as a token of their sorrow; while

the men express their grief by abstinence from food, and shaving off their hair.

There are two small kingdoms or states between Quiloa and Mosambique: the former is called Mongalo; but though very small, it is well peopled, mostly with Arabs, and the inhabitants carry on a considerable trade in gold, elephants teeth, gums, &c.

The other is named Angos from its capital, and by the French and Italians is called Angoche and Angochia. This kingdom is much smaller than that of Mongalo, which is said to extend far westward into the continent. Both of them are fertile, produce a great deal of rice and millet, and breed abundance of cattle. The inhabitants of both are chiefly Mahometans, but intermixed with negroes, who are idolaters, and are remarkable for the smallness of their stature. They go naked from the middle upwards, and wear round the waist a piece of silk and callico; some wear a turban, and others go bareheaded, according to their circumstances: they are all fond of trade, which they carry on chiefly with the kingdoms of Quiloa, Melinda, Mombaza, and Monomotapa.

SECT. V.

Of the Kingdom of MOSAMBICO, or MOSAMBIQUE.

Its Situation, Vegetables, Animals, and Minerals; with a Description of the City of the same Name, and of its Importance to the Portuguese.

THE next kingdom of any note still farther to the south is that of Mosambique, or Mosambique, thus named from its capital, which is situated on an island in the sixteenth degree of south latitude, and is the chief of the three islands of which this kingdom is composed; the others are called by the Portuguese St. George and St. James, and all three lie at the mouth of the river Magincata, or Megincata, between the kingdom of Quiloa, and that of Sofala.

Though the island of Mosambique is the largest of the three, it is nevertheless very small, not being above two bow-shots in breadth, and about six in length. It is situated about two miles from the continent. The bay is about three miles in circuit, the points of land on each side advancing into the sea; and the two islands of St. George and St. James lie on each side of it, facing the continent. The bay, which serves for a haven both for the islands and continent, is convenient and safe, it having seldom less than eight or ten fathoms water, which is so clear, that one may see every bank, rock, and shallow, and may sail into it without a pilot.

The soil of this island is only a white barren sand, yet the wealthy part of the inhabitants have in many parts of it found means to procure an artificial soil, on which grow very fine ananas, citrons, oranges, figs, and other fruit, notwithstanding there being great scarcity of water; but the far greatest part of their other fruits, pulse, and roots, are brought thither from the continent, where the ground is fat, and produces plenty of rice and millet, with a variety of fruits, pulse, and roots.

Among the plants they have one called by the Portuguese pao d' antac, or antac wood, which spreads itself along the ground, and bears a fruit like our pears, but somewhat long, soft, and green: its chief virtue lies in the root, which, they say, is a sovereign remedy against a distemper to which they give the name of antac, and is occasioned by the too great familiarity of the Europeans with the negro women of that country; this being the only remedy they know against it.

The inhabitants make several pleasant liquors from their fruits; but their most common drink is made of millet, and called pumbo.

They also breed many cattle, great and small, particularly the sheep with large tails. There are likewise great numbers of wild beasts, as wild boars, stags, and elephants so mischievous that the inhabitants are obliged to kindle large fires round their corn-fields, to prevent their destroying the fruit of their labours.

The woods are filled with wild-fowl of all sorts, particularly with a kind of wild poultry, not unlike those common

common among us, except their being as large as turkeys, spotted with white and grey; but their heads are smaller in proportion, and their combs are shorter, thicker, and of a more vivid red than those of our fowls. Their flesh is black, but more delicious than that of any other fowl, as the flesh of their hogs, which are here in great abundance, is finer eating than that of any other beast. The fowl above-mentioned are extremely wholesome, and some of the people eat them quite raw, without feeling any inconvenience from it. The only defect is the blackness of the flesh, which when boiled turns the broth of the same disgusting hue, and makes it resemble ink; but those who feed upon it receive ample amends from its exquisite taste and flavour, as well as from the wholesome nourishment it yields.

The country abounds in gold, which is washed down by the rivers in great quantities, and forms a chief part of the commerce of the country. Ivory, ebony, slaves, and cattle, are likewise exchanged for European goods, such as little bells, knives, scissars, and razors. These last were so valued among them, that when the Portuguese first came there, they would give fifteen cows for one of them. They have likewise some silver and other metals, but the inhabitants do not trade with it; and indeed are so mistrustful of strangers, that they do not like to have any dealings with them, but wholly confine their trade to the coasters, to whom they convey their merchandize in small boats made of a single piece of timber; but if the nature or quantity of the cargo require a more capacious vessel, they make them of planks joined together with ropes, made of the bark of the palm-tree, without the assistance of either pegs or nails.

The city of Mosambico is very handsome, and the houses well built, especially the churches and convents. The fort is also one of the strongest and best contrived the Portuguese have on this coast; it is of a square form, with each corner flanked by a bulwark, and defended by some pieces of artillery. It is also surrounded by a three-fold rampart and large ditch, and is so strong as to be proof against all the attempts made by the Dutch against it. Upon the whole, the port of Mosambico is in a manner the key of the East Indies to the Portuguese, which if once lost, or wrested from them by an European trading nation, they would find it difficult to carry on their commerce into the East Indies; it being almost impossible to continue their voyage thither without such a place of refreshment, where they can take in fresh water, provisions, and other necessaries. We need not therefore wonder at the Dutch having made many strenuous, though hitherto fruitless, attempts to wrest it out of their hands, particularly in the year 1606, when admiral Paul Van Caerden laid siege to it with forty stout ships; but after lying before it thirty-two days, finding all his efforts frustrated, he was glad to raise the siege, and continue his voyage to the Indies.

SECT. VI.

Of the Kingdom of SOFALA.

Its Situation, Climate, Soil, Produce, and Face of the Country. The Persons, Dress, Food, Employments, and Religion of the Natives: with the Manner in which the Portuguese subdued the Country.

TO the southward of Zanguebar lies Sofala, or Cefala, a kingdom which, from its abounding in gold, many of the learned have supposed to be the Ophir, whence king Solomon annually drew such prodigious quantities of that valuable metal.

This kingdom extends along the coast from the river Cuama on the north, to that of Magnico, since called Riode Spirito Sancto, on the south; that is, from the seventeenth to the twenty-fifth degree of south latitude, having, according to the latest observations, Cape Coriantes about two degrees from the last mentioned river, and not in the middle between them, as some geographers have placed it. It is bounded on the east by the Indian sea, and on the west by the empire of Monomotapa, and

according to Marmol, is seven hundred and fifty leagues in compass.

The temperature, soil, and produce of the country are much the same with those of Zanguebar; only, as it is farther from the Line, the heat is more moderate, and the land more fertile in rice, millet, and pasturage. The best part of the country lies between Cape Coriantes and the river de Sancto Spirito, where are the most numerous herds of cattle, especially of the larger kind, which are the more necessary as the inhabitants have scarcely any other fuel but cows dung; and the country is much exposed to the southerly winds, which are as piercing on that side of the Line, as our northern winds are on this. Here also the elephants herd in large droves, and being the chief food of the common people, such numbers of them are killed for the sake of their flesh, that, according to the report of the natives, they seldom kill fewer than between four and five thousand of the year with another, which is in a great measure confirmed by the vast quantity of ivory exported from thence by the Europeans.

On the contrary, that part of the country which extends from Cape Coriantes to the river Cuama abounds with mountains covered with large woods; and the valleys, being watered with a variety of springs and rivulets, are extremely fertile and agreeable; and here the king and his court spend the greatest part of the year. Among other advantages, we are told that this division of the country enjoys such an odoriferous verdure, that, the coast being low on that side, the fragrance which exhales from it is frequently perceived by mariners at a great distance before even the land itself appears: but from the above cape to the river of Sancto Spirito the country is rough, barren, and less inhabited, except by elephants, lions, and other wild beasts.

Most of the natives of Sofala are black, with short curled hair, there being but few of a tawney or swarthy complexion. They are taller, and have a genteeler shape than the negroes of Mosambique and Quiloa; and those who live near Cape Coriantes are esteemed extremely courteous.

Their common dress is the same with that of the inhabitants of Mosambique, that is, a piece of silk cotton wrapped round their waist, and hanging down to the knees, the rest of the body being naked, only those in more affluent circumstances wear a turban on their heads, and all of them adorn their neck, arms, wrists, and ankles with rings of gold, silver, amber, or coloured beads, according to their rank. These stuffs and ornaments are chiefly brought to them by the Portuguese; and the persons of distinction wear swords.

They cultivate plenty of rice and millet, which serves them for bread, and eat both the flesh of elephants, that of their large and small cattle, and also fish, of which both the sea and rivers yield great plenty and variety.

They have likewise a kind of beer made of rice and millet, and some other liquors made of honey, palm, and other fruits. The honey is here in such plenty, that great part of it lies neglected, no more of it being gathered by the people than they themselves use, or than is sufficient for extracting so much wax out of it as will procure them silks and painted cottons in exchange. For though they make great quantities of white cloth, they have not yet learned the art of dyeing it; they are therefore obliged to send it, or at least their thread, to be dyed at Guzurat, or other places, of such colours as are most in vogue among them. Their chief commerce is with the inhabitants of Melinda, Mombaso, Quiloa, and Mosambique, who come hither in their small barges, which are laden with a variety of the above-mentioned stuffs of all colours, which they exchange for gold, ivory, wax, and ambergris; and the Sofalans usually go and exchange their silks and coloured cloths with the inhabitants of Monomotapa for gold, not by weight but in such quantities as will satisfy the seller, so that the profit of the exchange commonly amounts to ninety or ninety-five per cent.

Besides the gold they obtain from Monomotapa, the kingdom of Sofala has considerable quantities of that valuable metal, which, according to the Portuguese inhabitants,

bitants, yield the value of two millions of metigals annually, each metigal being valued at about fourteen French livres; and it is said that the merchants from Mecca and other parts export, in time of peace, about the same quantity. The soldiers are paid in gold dust, just as it is gathered, which is of so pure and of so fine a yellow, that it greatly exceeds ours, no other gold being superior to it but that of Japan.

As to the metropolis, it stands in a low and unhealthy situation, and was at the first arrival of the Portuguese but an inconsiderable town, neither large nor walled, it having no other fence than a hedge of thorns; but it has been since fortified, and in every respect greatly improved by those Europeans, who called it Cuama, as well as the fort which they built for its defence; the city being conveniently situated on a small island at the mouth of the river Cuama: but it has since resumed its ancient name, and both pilots and geographers now call it Sofala. There are two other towns on the coast, one called Haulema, and the other Dardema; besides the villages of Gaita, Bocha, Savona, and some others.

At the first arrival of the Portuguese the people used no other weapons than the javelin, the scymetar, the bow and arrow, the dagger, and the hatchet; but they have been since taught the use of firearms, both small and great. The king keeps a great number of forces in pay, but the Portuguese are become so powerful as to keep the whole kingdom in awe, and their governor keeps vessels of observation to prevent what they call an illicit trade, particularly the exportation of gold, without his special licence.

As the Arabs have been for some centuries settled on the coast, they, as in many places in the East Indies, have obtained the dominion, and both the king and his court, with a great part of the people, are descended from them; they speak the Arabic tongue, and are still of the Mahometan religion. But the original natives retain their ancient customs, both of a civil and religious nature: they are said to acknowledge one Supreme Being, whom they call Mozimo, or Gunguimo, and have neither idols, altars, nor sacrifices; but abhor the idolatrous rites of the rest of the African negroes and their priests, and punish them with the utmost severity, not from a spirit of persecution, but from their thinking them destructive to society. They also punish theft and adultery with great rigour, and, with respect to the last, make it death for any man to be found sitting upon a sofa, or mat, with a married woman: yet they allow of polygamy as much as the Mahometans. They never marry any woman till she has had her monthly courses, as being held incapable of having children till then; and this no sooner happens, than the family make rejoicings and a festival on the occasion. They do not seem to have any religious ceremonies, except in observing some particular days of the moon, as the first, sixth, seventh, eleventh, sixteenth, &c. on which they pay a kind of offering to their deceased friends, particularly to their parents, whose bones, after the flesh is consumed, they preserve in a place appropriated to that use; and, in remembrance of their owing their being to them, set plenty of provisions before them, and offer up their petitions to them as if they were still alive, not forgetting to pray for the preservation and prosperity of the king. Having ended their petitions, they sit down in their white garments, which is the proper colour on these occasions, and eat what had been served up to the dead, which concludes the ceremony. This custom is also practised by the Chinese and many other pagan nations.

We shall conclude this article with an account of the manner in which the Portuguese obtained the power and authority they exercise throughout the kingdom of Sofala.

Francesco Gnaja, by others called Anaga, was the first Portuguese admiral who came to anchor before the city of Sofala. He had with him only four of his smallest vessels, for two of his fleet were so large that they could not enter the port. Having engaged in his interest Zacote, one of the court, he sent him to the king, whose name was Jusuf, and was then blind with age, to obtain leave to build a fortress near the city, which he pretended would be of great service to the king, as well as to

the Portuguese. By the good offices of his friend Zacote he met with a kind reception from the old Mahometan monarch, whom he afterwards visited, notwithstanding the strenuous opposition of the Arabs against his landing, the dangers they told him he must run before he could reach the royal palace, and the difficulty he would find in getting access to the king; he even met with all the success he could wish for, the old monarch not only granting him free leave to build the fortress, but, as a farther mark of his regard, delivered up to him about twenty of his countrymen who had been lately shipwrecked on that coast, and who had been treated with the utmost hospitality.

The old monarch had, however, a son-in-law, named Mengo Musf, a brave and warlike prince, who boldly laid before him his apprehensions of the danger that would attend his receiving those strangers into his dominions; and much more at his permitting them to fortify themselves there at the imminent hazard of his own safety and that of his subjects. Whatever were the king's views, he endeavoured to dissipate Musf's fears, by telling him, that time, which brings every thing to light, would soon discover his motives for thus encouraging these dreaded strangers. "Thou wilt soon, said he, perceive them dwindle into nothing, through the heat and inclemency of a climate to which they are unaccustomed, and then it will be time enough to drive them out of their fort, if they do not abandon it of their own accord." The prince acquiesced in his reasons, and the fortress was carried on with double vigour, the king having ordered his subjects to lend the Portuguese all possible assistance.

His majesty was, however, soon alarmed by the pathetic remonstrances of the Mahometan merchants, who endeavoured to awaken him to a sense of his danger, from the well known perfidy of the Portuguese; and addressing themselves to him in a body, reminded him of the repeated warnings they had given him, and then added: "To what end do these strangers build a fort in your dominions, but to increase their own power, in order to strip you of yours and of your kingdom? Have they not by the like artifices expelled the king of Quiloa, and robbed many other princes in Africa and India of their dominions? Where, in short, have they ever got a footing without leaving numberless traces of their villainy and cruelty? If therefore you have any regard for your safety and welfare, destroy them before they are become too powerful, lest hereafter you be unable to avert the ruin and destruction which they will bring upon yourself and kingdom."

This speech had the desired effect, and the alarmed monarch began to see his folly and danger. He assembled a number of troops, and appointed a day when they were to fall upon the Portuguese, while they were employed in building the fort. Unhappily for him, he had a traitor who watched all his motions; this was Zacote, who was originally of Abyssinian extraction, but having been taken prisoner when young by the Mahometans of Sofala, had embraced their religion, and by his address, had raised himself to the highest degree of credit with the old king; but being now corrupted by the Portuguese, he betrayed all his master's secrets, and failed not, on this occasion, to send them timely notice of the design formed against them; on which Gnaja prepared to give them a warm reception.

Accordingly on the day appointed the Sofalans furiously attacked the fort by throwing lighted brands into it, while others assailed the walls with their warlike engines. The besieged, with Gnaja at their head, made a very brave defence; but being reduced to thirty-five men, the rest being either sick or invalids, they would have stood a poor chance against six thousand men, had not Zacote found means to enter the fort at the head of a hundred men, who immediately attacked the besiegers with such bravery that a desperate conflict ensued, in which the Portuguese, now inspired with fresh courage, discharged their artillery and darts with such vigour, that the besiegers soon fled with the utmost precipitation and terror, leaving them the quiet possession of their fortress; but the Portuguese boldly rushing out pursued them with the utmost fury, not only into the city, but forced

forced their way into the royal palace. They even crowded into the very apartment into which the old king had retired, and found him lying on his couch; but their insolence soon roused his courage, so that blind and old as he was, he hastily arose, and darted several javelins at them, which, as they crowded thick upon him, did some execution, several of them being wounded; and among the rest Gnaja received a wound in his neck: when on a sudden the Portuguese agent advanced with his drawn scymetar towards the king, and at one blow struck off his head, which filled his attendants with dread and horror.

Gnaja, fully satisfied with seeing the good old king lying in his blood, and headless at his feet, immediately forbade his men to offer any farther violence towards a people whom he pretended he wanted to gain by acts of friendship, rather than to terrify with farther proofs of the Portuguese bravery and martial prowess; adding, that as they had by this time sufficiently experienced the one,

he was now ready and willing to give them the most convincing proofs of the other, by acts of humanity and compassion to their present distress. This plausible speech had the desired effect; and the Sofalans, finding they had to do with a nation that was too strong and artful for them to contend with, forbore all farther hostilities.

Ossorio observes, that Gnaja, having succeeded so far, thought it now time to settle this newly subdued state, and, as a mark of the Portuguese generosity and gratitude, to reward the perfidious Zacota for his friendship and fidelity to them in the amplest manner. He accordingly caused him to be sent for in great pomp, and then proclaimed him king of Sofala, enjoining the people to obey him as their sovereign. He next obliged him to take the oath of fidelity and allegiance to the king of Portugal, and to promise to behave on all occasions as his most faithful tributary.

CH A P. V.

Of the COMORA ISLANDS.

S E C T. I.

Of their Situation; with a concise Account of Comora the principal of them, and of Mayotta, Mohilla, and Angazeja. Of the delightful Island of Johanna: a View of it from the Road; and the speedy Cure of the Sick who are set on shore. The Face of the Country, as it appeared in a Walk taken by two English Gentlemen: with an Account of the Fruits, Beasts, Birds, and Fishes.

THE Comora islands take their name from Comora, the largest of them; they are five in number, and the other four are distinguished by the names of Mayotta, Mohilla, Angazeja, and Johanna. The last is situated in twelve degrees fifteen minutes south latitude, and all of them lie opposite the shore of Zanguebar, and north of the great island of Madagascar.

Comora, the largest and most northerly of these islands, is not frequented by any Europeans, it having no safe harbour, and the natives being untractable and averse to any commerce with strangers. For this perhaps they have sufficient reason, as it was too common for the Portuguese, especially at their first entering those seas, to take advantage of the simplicity of the inhabitants, unacquainted with arms and incapable of defence, and to land parties in order to rob and commit all possible outrages on the natives, whom they frequently carried away slaves. This may have given them a traditional aversion to all strangers; and it is not improbable, that the revenge they might take on the next who visited them, without distinguishing the innocent from the guilty, may have gained them the inhospitable character which they still retain.

Angazeja, Mayotta, and Mohilla, are but little resorted to, on account of the superior advantages of Johanna, in the safety of its road, and the civilized disposition of the inhabitants, which, together with the fineness of the country, have induced the Europeans to touch there for refreshments.

The ships on their arrival anchor in the road on the west side of the island, where the high hills, covered with evergreens, ending in a delightful valley, form the most pleasing landscapes that can be imagined. The sailors usually pitch a tent on shore for the reception of the sick, when, such is the excellence of the climate, that those ever so much disabled with that dreadful disease the scurvy, generally recover their health with surprising speed, which is probably as much owing to the reviving influence of the earth, as to the variety of excellent refreshments with which the country abounds. The common sailors

who arrive in health, are however in danger, by their intemperance in eating the delicious fruits the island affords, of laying the foundation for distempers to break out when they go again to sea. It has also been said, that lying ashore is prejudicial to them, on account of the moist vapours diffused from the neighbouring hills; but all the danger here is probably occasioned by a tent being not sufficient to preserve them from the keenness of the night-air, and from the damps which rise from the earth.

We cannot give a better or more perfect idea of this beautiful island, which is no more than about ninety miles round, than by giving a description of a walk taken by the ingenious Mr. Grose and another English gentleman the second day after their arrival, which we shall do in his own words.

“As we set out pretty early in the morning, we made a shift to penetrate about five miles into the country before the sun began to be any-ways troublesome; and this was no small stretch, considering the mountainous way we had to go. We had fowling-pieces with us, and the view of excellent sport in shooting, could we have reached the places where we might perceive the game lay: but we could not conquer the ascent of the hills, though we endeavoured to scramble up them on our hands and knees. We were obliged therefore to rest satisfied with what small birds presented themselves in the vallies and hills that were passable. We made our breakfast on pine-apples, and the milk of cocoanuts, which served to quench our thirst. About noon, coming to a beautiful piece of water, we seated ourselves in the shade by the banks of it, to make a second meal, as well as to enjoy the tinkling of several little springs and natural cascades that fell from the rocks, and, according to their distance, seemed to found a gradation of notes, so as to form a kind of agreeable soothing water-music.

“The orange and lime-trees, which stood in great numbers about that spot of ground, bending under the weight of their fruit, diffused a most fragrant odour. There were also pine-apples which grew wild of eleven and thirteen inches in circumference, of a much richer flavour than those I afterwards met with in India. Our guides too made us distinguish a number of goyava, and especially plumb-trees, the size of whose fruit is about that of a damascene, and leaves a pleasing relish on the palate for some minutes after it is eaten. All these growing promiscuously, and without the least arrangement or order, combined with the falls of water and the stupendous height of the surrounding hills, covered with trees and verdure, and

“ in their various breaks and projections exhibiting the
 “ boldest strokes of nature, altogether composed what
 “ might, without exaggeration, be called a terrestrial
 “ paradise, compared to which the finest gardens in Eu-
 “ rope, with their statues, artificial cascades, compart-
 “ ments, and all the refinements of human invention,
 “ would appear poor indeed ! Here it was impossible for
 “ art to add any thing, but what would rather spoil than
 “ adorn the scenery.

“ It was not then without regret that we quitted so
 “ charming a spot, after having feasted our eyes with
 “ the beauties of it ; to which it may be mentioned, as
 “ no inconsiderable addition, that there was no fear of
 “ wild beasts or of venomous creatures mixed with our
 “ pleasure, the island being so happy as to produce none.
 “ We returned then to our tent, well paid for the slight
 “ fatigue we had undergone in this little excursion.”

Besides the fruit already mentioned, and many others common in the Indies, there is a remarkable sort of sweet oranges of a small size, not exceeding that of a common apricot, but filled with a juice that has a much more delicious flavour than the larger sort generally imported here from Portugal, under the name of China-oranges; and their being gathered ripe and fresh from the tree is doubtless an advantage to their taste.

In the woods are a great number of monkeys of different kinds and sizes, and a beast of about the bigness of a common monkey, with a head nearly resembling that of a fox; it has a lively piercing eye, its coat is woolly, and generally of a mouse colour; and its tail, which is about three feet long, is variegated with circles of black, within an inch of each other, quite to the end; the natives call it a mocawk, and when taken young it soon grows exceeding tame: the country also abounds with squirrels, which are generally large and shy; but neither well shaped, nor of an agreeable colour.

Their oxen, which are very numerous, are of a middling size, and, like those in the East Indies, are remarkable for their differing from ours in having a large fleshy excrescence between their neck and back, which when kept in pickle for some time, is generally preferred either to tongue or udder, it tasting like firm marrow, and nothing can be imagined sweeter than their flesh.

Their fowls are also extremely good and fat; but our author observes, that he had no opportunity of tasting their game, of which they are said to have great variety; but the natives are very indifferent sportsmen, either with a net or gun.

The sea also furnishes them with fish of different sorts, and in great abundance, which they are very expert at catching. Among the rest they have a particular species called the parrot-fish, which is beautified with the liveliest colours that can be imagined; it is about three feet and a half in length, thick in proportion, and is esteemed delicious eating. They have likewise some flat fish that nearly resembles the turbot, and also thornbacks, mullets, and several other sorts.

S E C T. II.

Of the Persons, Dress, Food, Language, and Manners, of the Natives; with a Description of their Huts, and of the Town of Johanna.

MOST of the inhabitants are tall of stature, strong, and well proportioned; they have piercing eyes, long black hair, lips somewhat thick, and their complexions in general are of a colour between olive and black; but their women are rather more clumsily made than the men.

The common people only wear a skull-cap of any sort of stuff, and a coarse wrapper round their loins; but those of a superior rank have a kind of wide sleeved shirt hanging over a pair of long drawers, and a waistcoat, which is either thick or thin according to the season; few wear turbans, except those of high rank: these are also usually distinguished by the nails of their fingers and toes, which they suffer to grow to an immoderate length, and tinge them with alhenna, a yellowish red, furnished by a shrub that grows in the marshy places of the island.

They usually carry large knives, or poniards, which are stuck in a sash they wear round their waists; some of them have silver or agate handles, but they have commonly wooden ones carved.

The women take more pains in their dress, and wear a short jacket and petticoat, with a sort of loose gown, and a veil to cover their faces. They usually adorn their arms and wrists with a number of bracelets made of silver, pewter, copper, iron, and glass, according to their rank and circumstances. Their fingers and toes, and the small of their legs, are likewise decked with chains and rings. Their ears are stuck so full of mock-jewels and ornaments of metal, that the lobes are in particular greatly dilated and weighed down, which they are taught from their infancy to consider as a singular beauty.

The children of both sexes are suffered to go stark naked from the time of their birth till they are seven or eight years old; which proceeds less from any consideration of the heat of the climate, than from physical reasons; for they imagine, that infants are more apt to be hurt by heat than by cold, and that the free access of the air to every part of the body is nutritious and more favourable to their growth, than their being heated by swathing and cloaths, which deprive them of a hardiness conducive to health; and in case of any disposition to deformity obstruct the free course of nature, which strives to free itself from any imperfections. By this means they are also preserved from the galling and chafing of cloaths, which frequently occasion such cryings and strappings, as if not carefully attended to terminate in ruptures.

As the soil is of itself so naturally fertile as to produce every thing they covet for food, so their constitutional indolence keeps them satisfied, without any attempts to improve it by tillage or cultivation. They chiefly subsist on milk and vegetables, both which they possess in great plenty and perfection. Instead of oil and vinegar to their salads, which are of the lettuce kind, they use a liquid which has some resemblance to our treacle, and is a preparation of the juice yielded on incision from the cocoa-nut tree.

Their language is a corrupt Arabic, mixed with the Zanguebar tongue of the opposite part of the continent, from whence the Comora islands were probably first peopled: but those of the fairest complexion, who are generally of the best rank, or at least the most esteemed amongst them, derive their colour partly from the Arab mixture, and partly from their communication with Europeans, which was formerly much more common than at present.

Their manners still retain much of the simplicity of uncultivated nature. The mildness of the climate renders them indolent and prone to idleness. They frequently make use of the liberty granted them by their religion, which is that of Mahometanism, of divorcing their wives upon slight pretences, for the sake of novelty; they have usually two or three of them, and may have as many concubines as they can maintain.

Though they are forward to beg whatever they like, they are from being thievish. They treat the English in a very friendly manner, not merely from a principle of interest and convenience, though this has doubtless some influence, but also from a sense of gratitude for the effectual assistance they formerly received from them in their wars with the Mohilians, and from their being assured, by frequent intercourse with them, that they have no intention to invade their country or liberty, of which they retain a strong jealousy against the Portuguese and other European nations; but chiefly place their safety on the inaccessibility of their mountains, which nature has formed as an impenetrable barrier and defence of the inland country.

The huts of the lower sort of people have some resemblance to our barns, the sides being formed of reeds tied together, and plastered over with a mixture of clay and cow-dung; and the roofs are thatched with cocoa-leaves. That man is thought very great who has a house erected with stone and mud.

The town, or more properly village, of Johanna is composed of about two hundred houses and huts together. Those houses, which are of stone, belong to the chief, who is honoured with the title of king of Johanna, and

and to the principal men of the country. Their best buildings are very low, and only of one story high. They permit strangers to come familiarly into their first apartment, all the others being reserved for their families. The house in which the king resides is built, like the rest, of stone and mud, and does not make a better figure than a common English alms-house; it being wretchedly furnished, and awkwardly hung with pieces of coarse chintz, with here and there a small looking-glass. Yet with all this inferiority in point of state and grandeur, in comparison with what is seen in more extensive and civilized kingdoms, his title of king cannot be improper, he having all the essentials of royalty, and an unlimited power over his subjects both in temporals and spirituals; with the government of seventy-three villages, and near thirty thousand inhabitants.

S E C T. III.

Of the Manner in which Johanna became subject to the present Race of Kings. The Presents necessary to be made him. The Manner in which Trade is carried on in Canoes. The Canoes and Panguays described.

THE grand-father of the present king, says our author, was an Arab, or Moorish trader to Mofambique, where on a quarrel with a Portuguese, with whom he was dealing for slaves, he killed him; and being obliged instantly to fly, put to sea in the first boat he could seize on the shore, when the first land he made was Johanna; where meeting with an hospitable reception, he remained some years in obscurity, till an Arabian vessel being driven in there by stress of weather, he made himself known to his countrymen, and procured them all the relief the place afforded. In the mean while he had perfectly learned the language, was become acquainted with the manners of the inhabitants, and was so pleased with the fertility and pleasantness of the country, that he not only laid aside all thoughts of leaving it; but formed a scheme to raise himself to the sovereignty of it; and the Arabs his countrymen readily entered into his views, from the advantages they hoped to derive from his success.

Instead of proceeding on a plan of violence, he made himself necessary to the natives by instructing them in the use of arms, before unknown to them, particularly the lance, which those of any rank amongst them now handle with great dexterity. This, with his teaching them other methods of war, entirely new to those simple savages, proving of singular advantage to them, by enabling them to repulse the inhabitants of the neighbouring islands, especially of Mohila, with whom they were constantly at variance, sometimes invading and at others invaded by them, acquired him such respect and authority, that soon availing himself of it, he caused himself to be elected their chief, or king, and to be invested with despotic power. In obtaining this point he proceeded by degrees, and made use of all his art; but he had no sooner gained the summit of his ambition, than he made them repent of their confidence and credulity; for he not only strengthened himself by inviting some of his countrymen to settle in the island with their families; but chose for his guards the most bold and resolute of the natives, by which means he was soon able to establish an arbitrary government. Those who endeavoured to oppose his pretensions and innovations he forced from their families, and sold for slaves to the Arabs, who, upon this change, resorted more than ever to the island for the sake of trade; and this they still continue. In short, he overcame all opposition, and before his death bequeathed the sovereignty of the island to his son, who was about forty-three years of age when his father died, and obtaining the peaceable possession of the kingdom enjoyed it during his life; and dying a few years ago left two sons, the eldest of whom succeeded him, and was on the throne in 1750.

The king for the most part resides about nine miles up in the country, seldom coming to what they call the

lower town by the sea-side, except when the European ships lie there, and he is then accompanied by a numerous retinue.

On his coming on board our vessels, which he seldom misses, he expresses a great desire of knowing the name of every thing that is new to him; and as he has obtained a tolerable smattering of the English tongue, he is very inquisitive in relation to our wars in Europe, and is particularly pleased with the civility of the English captains, who regale him with European fare, and generally salute him with five guns, both on his coming on board and at his departure. This is a ceremony he would not willingly dispense with, as it is a mark of respect that gives him an air of importance, and tends to increase, or at least preserve the esteem of his subjects. His attendants, however, are far from standing so much upon ceremony as their sovereign, and have a forward way of begging any thing they fancy, and even put on an air of dissatisfaction if they are refused.

When any ship arrives, it is necessary to obtain the licence of this prince for dealing with the natives, especially for the more considerable articles of refreshment, such as oxen and goats, and also for wooding, watering, and landing the men. His permission, however, is purchased at a reasonable expence, consisting of a few presents, as a little gun-powder, a few musquets, some yards of scarlet cloth, or other European commodities.

Indeed a ship has no sooner cast anchor than it is surrounded by a number of canoes, the people hurrying aboard with refreshments of the produce of the islands; and it is diverting enough to observe the confusion and strife among the rowers, all of whom exert their utmost endeavours to get first to their market the ship. When the sea runs high, they are sometimes over-set; but this is attended with no danger, on account of their being excellent swimmers, and therefore they only lose their little cargoes of greens and fruit. Most of these canoes are balanced on each side with out-leaguers, formed of two poles each, with one across to prevent their over-setting, which has some resemblance to the flying-proas we have described in treating of the island of Timan and others in the East Indies. They use paddles instead of oars, and both ends of these vessels are formed for cutting the water, without any distinction of head and stern, and consequently they can sail backwards and forwards without tacking about. Their larger boats, called panguays, are raised some feet above the sides with reeds and branches of trees, well bound together with small cord, and afterwards made water-proof with a kind of bitumen or resinous substance. The mast (for few of them have more than one) carries a sail or two made either of the leaves of a cocoa-tree, or of sheer-grass matted together; and in these boats they will venture out to sea for trips of three or four weeks, and sometimes longer.

Not long ago it was common for the natives, when they came off to the ships with cocoa-nuts, plantanes, fowls, &c. to deal entirely by way of barter for handkerchiefs, rags, glass bottles, bits of iron, and in short almost any thing, without regard to money; but they now begin to know its value, and will part with only the most inconsiderable articles in this manner. However, they sell every thing as cheap as can well be desired.

If the English want to purchase cattle, fowls, or cowries, they desire to be paid in specie, fire-arms, or gun-powder. They likewise solicit all who come there, particularly the passengers, to contribute a dollar or two towards improving the navigation they carry on with the continent of Africa, and, to influence them by the force of example, produce several lists of persons who have subscribed; so that they sometimes collect thirty or forty dollars from a ship that touches there: and when the captains leave the place, they generally make it a point for them to sign, and also to leave with them a certificate of the good usage they have received.

C H A P. VI.

OF MADAGASCAR, and the Isles of MAURITIUS and BOURBON.

S E C T. I.

Its Name, Situation, and Extent. The Face of the Country : its principal Rivers, Minerals, Trees, Plants, Beasts, Birds, Reptiles, and Fishes.

MADAGASCAR, the largest of the African islands, and one of the biggest in the known world, is called by the natives Madagasc : but the Portuguese, who first discovered it, gave it the name of St. Laurence ; the French call it l'Isle Dauphin, or the Dauphin's island ; and the Nubian geographers, Persians, and Arabs, call it Serandib. It is situated between the twelfth and twenty-sixth degrees of south latitude, and between the forty-fourth and fifty-first degrees of east longitude from London, about forty leagues to the east of the continent of Africa, it being about a thousand miles in length from north to south, and generally between two and three hundred miles broad. Its southernmost end, which leans towards the Cape of Good Hope, is the broadest ; for towards the north it grows much narrower, and terminates in a point. At a distance from the sea are many high and steep mountains, yet it abounds in spacious plains that have excellent pasture, and has several large forests always green, in which lemons, pomegranates, and a variety of other fruits grow wild. It has also several considerable rivers and lakes.

The island is divided into several countries and provinces, inhabited by different nations, who speak the same language, but differ in their complexions. These several nations are perpetually at war with each other, not from the desire of subduing each other's territories, but in order to plunder each other of their goods and cattle.

The principal rivers of this island are those of St. Augustine, called by the natives Onghelaha, Ampatres, Caremboulle, Mangharac, Munherei, Vohitfinenes, Manumpani, Maranzari, and Franshere.

In this country are found gold, silver, copper, tin, and iron, of which the natives make razors, lances, hatchets, and other instruments. Here are also several sorts of precious stones, as topazes, amethysts, agates, and several sorts of jaspers : frankincense and benzoin are found in abundance ; and ambergrise is gathered on the sea-coast.

Among the fruit, besides the lemon and pomegranate trees already mentioned, they have palmettos, plantanes, bananas, tamarinds, a currant which grows on a tree, and not on a bush as in Europe, and is very pleasant.

They have a large tree that bears a kind of a plumb, which when ripe is black, and of the size of a cherry, and on the inside are little stones like those of grapes ; this tree has thorns two inches long.

They have a very tall tree, the leaf of which resembles that of the pear-tree ; it has a fruit speckled like a sparrow's egg, and of the same size ; it is full of seeds, and of a sweet juice esteemed a certain cure for fluxes.

They have a kind of nut which smells of all sorts of spices ; it is as large as a nutmeg, but browner, and more round.

They have pepper, which grows in small quantities, no care being taken to cultivate it ; this pepper grows in clusters upon shrubs that trail upon the ground.

Here is a tree whose leaves and tender sprigs sting like nettles, but the root is of great use where there is a scarcity of water, which is the case of many parts of the country ; for it retains a great deal of juice, which is extracted by beating the root in a wooden mortar, and pressing out the liquor ; and of the bark of this tree they

make ropes. Here is likewise wood proper for building, as also cedar and ebony ; but none fit for masts. They have also sugar-canes, oats, barley, and rice.

The plains are covered with several sorts of grafs of different colours, which grow to a much greater height than any in England : the natives never cut any for hay ; for before the old is withered, new grafs springs up under it ; but they commonly set the old grafs on fire.

There is also tobacco, which is smoked in reeds or shells. The natives are also fond of smoking a plant, to which they give the name of jermangler ; this plant grows about five feet high, bearing a long and slender leaf, and a pod which contains about a dozen seeds like hemp-seed. The natives mix the leaves and seeds together, and lay them three or four days in the sun, till they are very dry and fit to be smoked ; but it strongly intoxicates the people : their eyes, after smoking it, look red and fiery, their aspect fierce and wild ; and they are even more active, bold, and vigorous while the effect continues ; but those who use it much are weak and dispirited whenever they are not intoxicated by smoking it.

In short, the soil is so fertile that it produces two crops in a year of every thing, except sugar-canes, which must be left two years standing, that they may grow to a proper size.

The country abounds with oxen which are prodigiously large, and yet so nimble and unruly, that they will leap very high fences : they are beautifully coloured, some of them being streaked like a tyger, others are black with white spots, and some are white with black spots. They have a protuberance between their shoulders, which has some resemblance to that of a camel, and consists of fat and flesh ; some of these humps are said to weigh between three and fourscore pounds. The cows do not give so much milk as ours in England, nor will they ever suffer themselves to be milked till the calf has first suckled ; so that they keep a calf for every cow till she is again with calf, for they seldom miss a season. Here are some sheep with great heavy tails, and also goats ; but they keep no tame hogs, these being sufficiently numerous in the country, and so very mischievous to the plantations of potatoes, and other roots, that they are forced to set traps in order to catch them. They have also wild dogs, and foxes, which are very fierce, and will sometimes attack a man ; but they have no lions, tigers, or any other savage beasts.

They have excellent fowls, with plenty of turtle-doves, partridges, pigeons, ducks, teal and other wild fowl.

The bees of Madagascar are very numerous, and great quantities of honey are found in the woods. The natives also keep bee-hives ; for they not only eat the honey, but make a palatable liquor of it, called toack, which has a considerable spirit, and of which they frequently drink till they are intoxicated ; this is the common liquor drank at their entertainments.

There are two or three kinds of silk, found in plenty in almost every part of the island, some of a brownish colour, and one sort white, the outside of which is full of small pointed prickles. The cone is about three inches long, shaped like a ninepin, and at the top is found a small hole, out of which a blackish worm is sometimes seen to creep ; but we have no account of its changing its form in the manner of the common silkworms, though it probably becomes a flying insect. There are, however, no mulberry trees in the island, and these worms and silk are found on three or four different sorts of trees, adhering to the thick branches or trunk. The people pull out the cone on their knees, teasing it to pieces with their hands, and then spin it with

with a spindle made of a bone, and a rock-staff, after which they weave it, and it makes pretty fine lambers to wear round their waist.

In some parts of the country is a tree called roscer, which is of great use to the lower or middling sort of people, from its furnishing materials for a cloth to wear round their waist. The leaf resembles that of the cocoa-tree, but is longer by two feet, and bears a plum almost like a damascene. The outer bark they take away, and the inner, which is white, they peel off entire, and beat with a stick till it is soft and pliable. It then resembles a long, white, thin shaving. After this they soak it in water, then split it into threads, which they tie together, and weave into cloth. They frequently dye a part of it, and make their lambers striped.

They have large snakes, but they are not poisonous; they seldom bite any one, and when they do, it is attended with no worse consequence than the bite of any other animal.

Here are great numbers of lobsters and craw-fish, excellent turtle, eels, the sword-fish, the sea hedge-hog, and many kinds of fish common to other countries in the same climate. In the rivers are many alligators.

SECTION II.

Of the Persons, Dress, Manners, Customs, and Food of the People.

AS to the persons of the natives, they are commonly tall, well made, of an olive complexion, and some of them pretty black. Their hair is not woolly, like that of the negroes of Guinea; but it is always black, and for the most part curls naturally; their noses are not flat, though they are small, nor have they thick lips.

The men wear only a piece of cotton cloth or silk round their waist, called a lamber; some of these they make themselves, but those who are rich buy the silks and calicoes at sea-port towns, giving a great price for them, as a cow and a calf for no more than will make one lamber. The men and women of distinction also adorn themselves with rings on their wrists; some are of gold, some of silver, but most of them of copper. They curl their hair, and make it lie close and smooth, and those of superior rank adorn their hair with rings, and other ornaments.

The women wear a lamber which reaches to their feet, and above it a garment like a straight shift, which covers all the body, and has short sleeves. This is commonly made of cotton, and dyed of a dark colour. The women of superior rank adorn it with beads, especially in the back, where they are ranged in rows, and cross each other; these being of different colours, form a large double cross so like the Union flag, that one would imagine they copied it.

The women are remarkable for their obedience to their husbands, their good temper, and agreeable conversation. Indeed, the people in general are of a humane and friendly disposition; they share with their neighbours what they take in hunting, and the great even take a pride in relieving the distressed, though they were before at enmity. In short, they have many virtues; but, as in other countries, there are considerable numbers who violate the laws of justice and humanity, in order to gratify their passions; but these perhaps are not more numerous than in civilized countries.

They are not deficient in point of understanding, but are capable of reasoning upon any subject where they have not been blinded by superstition; and many of them are endued with admirable good sense.

The most respectful salutation is licking the feet of a superior. This kind of abject submission is practised by all inferior persons when they address their prince, and by the women when they come to welcome their husbands on their returning from the wars: the slaves also pay the same preposterous mark of respect to their masters; but those of superior rank lick only the knees of their sovereigns.

The riches of the inhabitants consist in cattle, and in fields of rice and roots, which are under the management of their slaves. Gold and silver here serve only for ornaments; for whatever they purchase, it is by way of exchange, the use of money not being known amongst them.

The common food of the inhabitants is cow's milk, rice, and roots, and they sometimes roast large pieces of beef with the hide on; they frequently broil meat on the coals, and sometimes bake it, by making a hole in the earth, on the bottom of which they lay stones, then making a great fire in it, let it burn till the stones are red-hot: then placing sticks over the embers, they put in their meat, and covering up the hole, let it continue there till it is baked. They also sometimes boil their meat and fowls, but have no bread, instead of which they make use of various roots.

SECTION III.

Of the Dress and Power of the Sovereigns. Their Cities described; and their Manner of making War.

MR. Drury mentions a king to whom he was presented, whose hair was twisted in knots, beginning at the crown of his head, where they formed a small circle; below them was another ring of knots, and thus they were continued in several circles, each larger than that above it. On some of these knots hung fine beads; he had also a forehead-piece of beads that hung so low as to reach his nose. About his neck he had a fine necklace, formed of two strings of beads, several of which were of gold; this necklace hung down before in the manner of an alderman's chain, and on each wrist he had five or six silver bracelets, and four rings of gold upon his fingers. On each ankle were near twenty strings of beads strung very close, and exactly fitted to his legs. He had a silk mantle over his shoulders, and another piece of silk, as usual, about his waist. But these sovereigns are as different in the disposition of their ornaments, as in their passions. They usually give audience to their subjects sitting cross-legged on a mat.

Though they have an absolute power over the lives of their subjects, and sometimes kill those who exasperate them with their own hand; they will talk familiarly with every body, and yet preserve a decent state.

They have cities, towns, and villages, noblemen and slaves. Many of the cities contain upwards of a thousand huts, which are built with branches of trees, and covered on the top with leaves, in such a manner as to keep out the rain. But these buildings are extremely low, and cannot be entered without stooping. The house of the prince is built up with boards, formed by the hatchet out of the trunks of trees; for they have not the use of saws. These buildings, though handsomer than the others, are not raised much above six or seven feet from the ground.

Their cities are surrounded with ditches near six feet deep, and as many in breadth, with palisades on the bank of the ditch next the houses; and sometimes, when they apprehend the approach of an enemy, they defend themselves by trees cut down, forming a kind of wall; and if it be in a stony place, this defence is made with a stone wall without mortar.

Yet the princes have no regular bodies of troops trained to war, but make use of their vassals, who endeavour to imitate their bravery, but generally fly when they set them the example, or when they are killed. Their arms are lances and hatchets made in the country, and guns purchased of the Europeans who frequent their ports.

When they make war, it is very common for parties to go out and surprize their enemies by night when least expected. On these expeditions every man generally carries a piece of meat in his hand, and entering the town in the dead of night, throws the meat to the dogs to prevent their barking. When they are all entered one fires a musket, at the noise of which the inhabitants suddenly

rising, hastily endeavour to get out of the doors of their low huts in a stooping posture, but are stabbed with lances. The children and women they take captive, and driving away all the cattle they can find, they burn the town, and then return home with the plunder and the cattle by private ways.

Indeed it is customary with them in time of war to hide their wives, children, and cattle in remote and secret places in the woods, that the enemy may not find them when they plunder the country; but the women and children are never with the cattle, lest their bellowing should make a discovery. In this case the women, to prevent their being traced by the track they leave, draw boughs after them when they retire to their solitary retreat.

Though they have no knowledge of letters, they have a concise system of laws, which are handed down by memory from father to son; and these, for the most part, seem founded on good sense.

If one man assaults another maliciously, and breaks a leg or an arm, the offender is fined fifteen head of cattle, which he must pay to the sufferer.

If a person breaks another's head, and the wounded has not returned the blow, he has three cows or oxen for the damage.

If two men quarrel, and one curses the other's father and mother, whether they be dead or alive, and his antagonist retorts not the curse against his father and mother, he recovers two oxen for the damage.

If a man is caught robbing his neighbour of an ox or a cow, he must restore ten for it; and this is rigorously executed, though it is frequently violated by the great men, who, as in other countries, are seldom held by the ordinary laws of their country.

If a person is taken stealing Guinea corn, caravances, potatoes, &c. out of a plantation, he forfeits a cow and calf to the owner, or more in proportion to the offence. If one man's cattle breaks into another's plantation, for every beast found there the owner must give an iron shovel.

If a man borrows a cow of his neighbour, in a year's time six calves are supposed to be the proper value which he ought to return; and if he then neglects paying, those calves are supposed to be three steers and three heifers, and the increase computed to arise by their growth and production is due to the man of whom the cow was borrowed.

If any man be caught stealing another's hive of honey, the fine is three iron shovels; for it must be observed, that shovels and hoes, in the course of exchange, serve the purpose of small money.

If a man lies with the wife of his superior, he forfeits thirty head of cattle, besides a great number of beads and shovels; but if the man is of an equal rank, he is fined twenty cattle: but to lie with one of the wives of the king is death. Notwithstanding this, if a man has two wives, and his brother or an intimate friend comes to visit him, he makes no scruple of letting him lie with one of them.

S E C T. IV.

Of their religious and superstitious Rites; their Manner of administering an Oath; the Form of Circumcision; their Funeral Ceremonies; and of the Umosses, or pretended Magicians.

THEY acknowledge and adore the one Supreme God, whom they call Deaan Unghorray, which signifies the Lord above; but they say, there are four other lords, each of whom has his respective quarter of the world, as the northern, the eastern, the southern, and the western lords. The eastern lord they say is the dispenser of plagues and miseries to mankind, by the permission or command of the Supreme God; and though the others also fulfil his commands, they are chiefly the dispensers of benefits. These lords they consider as mediators between men and the great God, on which account they have an high veneration for them, and recommend themselves to them in their prayers and sacrifices.

They have in their houses a small portable image, or idol, consecrated to religious uses: this they call the Owley. It is made up of a peculiar wood in bits neatly joined, almost in the form of an half moon, with the horns downwards, between which are placed two alligators teeth; it is adorned with several sorts of beads, and behind it is fastened a sash, which the master of the house is to tie round his waist when he goes to war. This is supposed to be a kind of talisman, or vehicle, to which their spirit, or guardian genius, is attached, and by which, as a proper medium, he will be invoked. Almost every person is supposed to have a distinct and separate spirit who presides over his actions, and presents his prayers to the great God; and the people expect, that after a sacrifice these spirits will tell them in dreams what they are to do, and warn them of the dangers that await them. This naturally renders them superstitious with respect to dreams, and the common affairs of life.

When they offer their adorations they take two pieces of wood forked at one end, and fixing them in the ground, lay a slender piece of wood about six feet long over the forked ends of the two poles, and on this they hang the Owley: behind it is a long pole, to which they tie a bullock. They then place a pan with live coals under the Owley, and strewing sweet-scented gums into it, take some of the hairs of the tail, the chin, and the eye-brows of the bullock, and put them on the Owley; after which they address a prayer to the Supreme God, the four lords of the earth, the guardian spirits, and particularly that who is attached to the Owley, and to the spirits of their ancestors, begging for what blessings they want, and returning thanks for those they have received.

This being done they throw the ox on the ground, with his legs tied, and the chief person present cuts his throat; for they having no priest, the chief man, whether of the country, town, or family, performs all the sacred offices himself, and the people join with him in their devotions.

Their oath or manner of swearing is performed in a very singular manner, which will appear from the following instance: The master of a French ship putting in at Port Dauphine, where the French, by their behaviour, had made the natives their mortal enemies, pretended to be an ambassador from the French king; and going ashore in great state, entered into an alliance with the queen of that part of the country, on which she caused her Owley to be elevated in the above manner; and a bullock being killed they took some of the tail, and some of the hair of the nose and eye-brows, and put on the live coals that were smoking under the Owley, which they also sprinkled with the blood of the victim. The liver was then roasted, one piece of which was placed on the vehicle of the guardian spirit, and two pieces stuck on two lances, which were fixed in the ground between the queen and the ambassador; and then the queen took the oath in the following terms:

"I swear by the great God above, by the four Gods of the four quarters of the world, by the spirits of my forefathers, and before this holy Owley, that neither myself, nor any of my offspring or people, who assist at this solemn oath for themselves and their offspring, will willingly kill any Frenchmen, unless they first kill some of us; and if we, or any of us, mean any other by this, but the plain and honest truth, may this liver which I now eat be turned to poison in my belly, and instantly kill me." When she had said this, she took the piece of liver off the lance and ate it; after which the ambassador did the same.

These people perform the rite of circumcision, but with very different ceremonies from those practised by the Jews and Mahometans. It is commonly performed when the child is about a year old, but they have no certain time of doing it. Great preparations are made by preparing toack, a liquor made of honey and the honey-combs together; and the people, before the ceremony begins, give themselves up to mirth and rejoicing, many drinking to excess. A bull is tied and laid on the ground, and the relations and friends bring presents of cows, calves, beads, hatchets, &c. till at length the principal relation

relation runs with the child in his arms to the bull, and putting the child's right hand on the bull's right horn, says, "Let the great God above, the lords of the four quarters of the world, and the guardian spirits prosper this child, and make him a great man; let him be strong, like this bull, and overcome his enemies."

If the bull roars while the boy's hand is on his horn, they consider it as an unfortunate omen of his being sickly or unhappy. Any experienced man in the neighbourhood performs the office, by cutting off the fore-skin as close as he can, while two men hold the child's legs and arms. When the fore-skin is cut off, it is put upon a stick like a gun-rammer, the biggest end of which is cut pointed, and a man goes with it to the wood and throws it eastward. The ceremony being finished, the boy is delivered to his mother, who is seated on a mat surrounded by women, and the bull being killed, perhaps with several oxen, if that be not sufficient, to feast the whole company, the meat is boiled, some parts broiled, and others roasted; and the weapons of the men being secured to prevent mischief, they are plentifully supplied with toack, and the revel continues with singing, drumming, hollowing and blowing of shells as long as they are able; and the feasting-sometimes lasts all night.

The veneration they have for their forefathers, and the assurance of their spirits always existing, appear in almost every circumstance of the few religious offices they perform. The burial of the dead is very singular and solemn. As they treat each other in all calamities and misfortunes with great humanity, so they frequently visit the sick, and contribute all in their power to assist the afflicted family, and to restore those to health who are ill. When a person dies, all the relations and neighbours come to the house, the women lament, and the men assist in preparing for the funeral. The first thing to be done is to pitch upon a tree for the coffin; then a cow or an ox is killed, and some of the blood sprinkled on it, while they offer up their prayers to their forefathers, their guardian spirits, and demi-gods, to assist them, taking care that the tree be not split in falling, nor that any man be hurt in felling or cutting it. After the tree is down they cut the trunk about a foot longer than the corpse, and then split it in the middle, for they always choose a tree which they know will split. They then dig both parts hollow, in the manner of two troughs, and it is then fit to be carried to the house. In the mean time the corpse is washed and sewed up in a lambe, or perhaps in two. Frankincense, or a gum very like it, is all the while kept burning in the house. The corpse is seldom kept above a day, especially in hot weather; but being put into the troughs they are neatly closed together, and carried on six men's shoulders.

Every family has a peculiar burying-place, which none dare to break into. It is enclosed with a kind of palisades, and when they come near the place, the corpse is set down on the outside, and four fires are made, one at each corner without the burying-place. On those fires they burn an ox or cow, which was before killed on purpose, and divided into quarters, consuming the whole. They then sprinkle frankincense on the coals, and spread them about: which being done, the chief, or eldest of the family, goes to the gates of the burying-place, and hollows aloud several times; after which he calls upon all the dead there deposited, beginning at the earliest and proceeding to the last, mentioning every one distinctly by name; and concludes with telling them, that a grandchild, or relation, is come to lie amongst them, and hopes they will receive him as a friend. He then opens the gate, and two or three persons are sent in to dig the grave, which is commonly seven or eight feet deep; and the body being placed in it, is covered with earth, without any farther ceremony.

Nobody is permitted to enter the burying-ground but some of the nearest relations and the bearers; and they have no sooner left it than the door is closed up. There are generally a great number of people without, who are busily employed in cutting up and dividing among themselves the cattle which the rich cause to be brought for that purpose; but those who are poor cannot gratify their

friends so bountifully. They commonly go once a year to this burying-place to clear it of weeds, but never enter it till they have burnt a bullock or a cow before it.

It ought not to be omitted, that their manner of mourning does not consist in the colour or form of the garment, but in shaving their heads; and every man under the jurisdiction of a king, or lord, who does not do this at the death of his prince, is esteemed disaffected.

The superstition of these people appears in nothing more evident, than in their implicit obedience to all the directions of their umossees, or magicians, who pretend to know the secret powers of nature, and how to engage the assistance of the guardian spirits on all occasions. They pretend by their charms and incantations to search into futurity, and by mixing certain ingredients to be carried before an army, to insure their success, while, by throwing it towards their enemies, they can defeat all their designs. By sprinkling the bee-hives they are supposed to make the honey poisonous to those who steal it, while those to whom it belongs may eat it in safety; and such faith have the people in these impostures, that those whom no laws could bind are deterred by the dread of death from touching what the umossee has rendered an object of terror. Nothing of importance can be undertaken without consulting them, and it appears that some of the lords, who are men of sense, keep one of these conjurers out of policy, only to amuse their people, who, they think, ought to be humoured in their bigotry, and captivated by the artifices of these impostors, in order to render them more tractable and obedient. Indeed the success promised by their incantations does not always happen; but when it fails, they are never at a loss for a reason: and as they frequently guess right, and what they promised comes to pass, their wisdom and skill are admired, and they meet with esteem, reputation, and rewards.

These umossees, however, never interfere in the acts of religion, except in fixing the proper minute of performing them: nor, in religious matters, is any one offended because his neighbour has some ceremonies of his own, and deviates from the general forms.

S E C T. V.

The Manners, Customs, and Religion of a different People from the common Inhabitants of Madagascar.

TO the south-west of Madagascar, are a people who seem almost of a different species from the other inhabitants of the island. These are called Virzimbers. Their heads are of a very singular shape, the hinder part being as flat as a trencher, and the forehead nearly so, which, our author observes, was probably occasioned by their pressing the child's head from its birth. Their hair is not long, like that of the other natives, nor is it quite so woolly as the hair of the inhabitants of Guinea. They have also a language peculiar to themselves, though they speak that of the island.

The religion of these people is likewise different from that of the other natives, they having no Owleys in their houses; but pay an extraordinary attention to the new moon, and to several animals, as a cock, a lizard, and some others. When they sit down to their meals, they take a bit of meat, and throwing it over their heads say, "There is a bit for the spirit." Then cutting four more little bits, they throw them to the lords of the four quarters of the earth. This is the general practice of those who have a regard for religion, though there are many who neglect it, just as in Europe, many neglect saying grace at their meals. But these people, like the others, have neither priests nor temples: nor is difference of religion considered as a crime.

The Virzimbers also dress their food in a better and more orderly manner than the other inhabitants, boiling plantanes or potatoes with their meat, and making a kind of soup.

These people make very good earthen ware, as pots, dishes, and jugs, glazing them both within and without, and are very ingenious artificers in many other things.

S E C T. VI.

Of the Places where the Europeans have attempted to make Settlements.

THE places remarkable on the coast from the Europeans having traded thither, are the Bay of Antongil, the island of St. Mary, Fort Dauphin, and the Bay of St. Augustin.

The Bay of Antongil is situated on the eastern coast, in the 16th degree of south latitude; it extends about 14 leagues due north, and is 9 leagues broad at its entrance. In the bottom of the bay is a small island, which affords plenty of provisions, good water, and a safe harbour for shipping.

This bay was once frequented by the Dutch, who had a kind of factory there, consisting of fourteen men, for buying of slaves and rice; but some of them died with sickness, and others were murdered by the inhabitants, whom they treated with insolence.

The island of St. Mary, also called Nassi Ibrahim, or the Isle of Abraham, is situated to the southward of the bay of Antongil, in the 17th degree of south latitude, and is 54 miles long from north to south, but its greatest breadth from east to west does not exceed nine miles. The nearest part of this island is about two leagues distant from the coast. The island is entirely surrounded with rocks, over which canoes may pass at high water; but at ebb there is not above half a foot depth, and on these rocks may be seen the finest white coral in the world. Ambergise is often found on the eastern coast of the island, and the island itself affords many sorts of gums. Since the settlement of the French upon it, it is become much more populous than formerly, and the prince of Antongil, who used to make war on the inhabitants, does not dare to attack them since the French took them under their protection.

Fort Dauphin, which was erected by the French, is situated near the south-east point of Madagascar, in twenty-four degrees twenty-five minutes south latitude, near the mouth of the river Fransiere; but the French finding that the trade there did not answer the expence of keeping the colony, have left it.

St. Augustine's bay is on the western coast of Madagascar, in twenty-three degrees thirty minutes south latitude, that is, just under the tropic of Capricorn. It is formed by the mouth of the river Yong Lahe. The English formerly traded for slaves at this bay, and at other places on the western side of the island.

Indeed the Europeans who frequented the island of Madagascar, purchased scarce any thing there but slaves and cattle, which the natives exchanged for guns, gunpowder, beads, cloathing, and hard-ware; and here the ships bound to and from India sometimes stop, in order to furnish themselves with water, fresh provisions, and fruits, for which they give pieces of silk, calicoe, and some of the above articles.

It was once expected that the pirates would have made a settlement in this island, and usurped the dominion of, at least, great part of it, they having six or seven ships of force, with which they used to infest the Indian seas, returning with their prizes to a place of security on the north-east coast, where they took possession of a harbour or difficult access, and defended from storms by St. Mary's island; but they are now dispersed.

S E C T. VII.

Of the Islands of Mauritius and Bourbon.

THE only remaining islands worthy of notice, to the south-east of the Cape of Good Hope, are those of Mauritius, which belongs to the Dutch, and Bourbon, which is claimed by the French.

Mauritius was so called by the Dutch, in honour of prince Maurice their Stadtholder, under whose administration they made themselves masters of it. It is situated in twenty degrees south latitude, an hundred leagues to the east of Madagascar. It is of an oval form, and about fifty leagues in circumference, abounding with high mountains, from whence the rivers fall in torrents; and it has great quantities of wood of various kinds, particularly of ebony. The Dutch found it uninhabited, and without any other cattle but deer and goats; and took possession of it, as a proper place of refreshment between Europe and India, they having no other place to touch at in that long voyage before they made themselves masters of the Cape of Good Hope.

The Dutch have a fort and garrison of fifty men in the island; besides which there are about eighty families that keep abundance of negro slaves, who are employed in husbandry and other laborious works. They have now introduced almost all the excellent plants of Europe and Asia, and well stocked the island with cattle and poultry; rice, sugar-canes, and tobacco, are also raised here, but in no great quantities. The Dutch still touch here in their passage from the Cape to Batavia, in order to take in refreshments.

The island of Bourbon or Mascarin is situated in twenty-one degrees south latitude, about forty leagues to the south-west of Mauritius. This island is also of an oval figure, and about ninety miles in circumference: it has plenty of wood and water, and is finely diversified with mountains and plains, forests and fields of pasture, watered by springs and rivulets. The air is excessive hot; but it is much refreshed, and rendered healthy by almost incessant breezes. The island produces tobacco, aloes, oranges, lemon and other fruit-trees, ebony, trees that produce odoriferous gums, as benzoin, &c. and many proper for timber. It abounds with black cattle, hogs, goats, parrots, turtle-doves, pigeons, and other fowl; the rivulets have plenty of fish, and on the shores are great numbers of turtle, where are also found considerable quantities of ambergise, coral, and fine shells. It was discovered by the Portuguese in the year 1545, who stocked it with hogs and goats; but afterwards deserted it. Captain Castleton, an English commander, landed in this island in the year 1613, and was so delighted with the beauty of the place, that he gave it the name of the English Forest; but though our East India company did not think it worth their while to fix a colony here, the French took possession of it in the year 1654, and gave it the name of Bourbon, leaving a few people and slaves there, who afterwards came away in an English ship. They however formed a regular settlement there in 1671, when they quitted Madagascar; and have now three pretty considerable towns on the island; St. Paul, St. Denis, where the governor resides, and St. Sufanna; and here their East India ships cast anchor to take in refreshments; there being about the island several good roads for shipping, but no safe ports to secure ships from the violent storms that frequently rage in these parts.

C H A P. VII.

Of CAFFRARIA, or the Country of the HOTTENTOTS.

S E C T. I.

Its Situation, Form, and Extent; the Mountains visible on approaching the Coast; the Face of the Country, and a general Account of the Situation of the sixteen Hottentot Nations.

WE now come to Caffraria, the most southern part of Africa, which lies in the form of a crescent about the inland country of Monomopata, and is bounded by the ocean on the east, south, and west; extending from the tropic of Capricorn on the east, to the most southerly part of Africa, called Cape D'Aguilas, which is situated in the thirty-fifth degree of south latitude; and from thence it runs up on the western side of Africa as high as the same tropic.

This country is divided into two parts, Caffraria Proper, which lies to the north, and the country of the Hottentots, situated to the south between the twenty-eighth and thirty-fifth degrees of south latitude, and between the eastern and western ocean; extending about three hundred miles from east to west, and about four hundred from north to south; the Dutch town at the Cape of Good Hope lying in latitude thirty-four degrees fifteen minutes, and in sixteen degrees twenty minutes east longitude from London.

On approaching the Cape of Good Hope, three remarkable mountains are visible at a considerable distance; these are the Table Hill, the Lion's Hill, and the Devil's Hill, which may be seen at sea at the distance of forty or fifty miles.

The Table Hill is the most lofty, and was thus named by the Portuguese, from its resembling at a distance a square table: the perpendicular height is upwards of eighteen hundred and fifty feet, and yet on the top of it are several fine springs of clear and well-tasted water. In the summer season, which begins in September, and continues till March, a cap of clouds constantly encompasses the summit of this hill before a storm, and thus gives the sailors notice to prepare for it.

The Lion's Hill lies contiguous to the sea, to the east-ward of the Table Mountain, from which it is separated by a narrow valley. According to some it obtained its name from its resembling a lion couchant, with his head erect; and, according to others, from its being infested with lions, when the Dutch first settled in this country. On this hill is a flag guarded by soldiers, who give notice of the approach of ships, and shew their number, and from what quarter they come, by hoisting and lowering the flag.

The Devil's Hill, supposed to be thus named from the furious storms that issue from it, when the top is covered with a white cloud, is not so high as either of the former: it extends along the shore, and is only separated from the Lion's Hill by a cleft, or small valley. These three hills lie in the form of a crescent about the Table valley.

The greatest part of the country about the Cape is indeed full of rocks and mountains, which long after the discovery of this country, being only viewed at a distance, were thought to be barren; but their spacious tops are covered with rich pasture, every where enamelled with a variety of flowers of uncommon beauty and fragrance, and abound with delicious springs flowing in many streams into the vallies. The skirts of the mountains are interspersed with groves that afford excellent wood for the joiners and turners. The plains and vallies all consist of delightful meadow lands, where nature appears with such a profusion of beauties as to charm the eye of the beholders, and are adorned with the finest trees, plants, and flowers, that fill the air with the sweetest odours.

The soil is so amazingly rich as to be capable of every kind of culture; it bears almost all sorts of grain, and every kind of fruit-trees.

The country also abounds with salt and with hot baths of mineral-waters, that have been found salutary in many diseases.

But the region about the Cape is subject to boisterous winds, which generally blow from the south-east or north-west, and have certain seasons for reigning in each of those quarters. While the sun is in the southern signs, they hold in the south; while in the northern signs, in the north-west. In the south-east they are troublesome, and dangerous to the ships coming in; in the north-west to the ships at anchor; and frequently blowing in a hurricane, they not only endanger the shipping, but do incredible damage to the corn on the ground and the fruit on the trees: yet these boisterous winds are of excellent use; for, by purifying the air, and keeping it as they do almost continually in a very brisk agitation, they generally contribute to the health of the inhabitants, who, when these winds lie still for a week, or ten days together, complain of the head-ach and other distempers, which vanish when they blow again.

The Hottentot nations who inhabit the country are sixteen in number: these are the Gunjemans, the Cochaquas, the Sussaquas, the Odiquas, Chirigriquas, the Greater and Lesser Namaquas, the Attaquas, the Koopmans, the Hessaquas, the Sonquas, the Dunquas, the Damaquas, the Gauroes, the Houteniquas, the Chamtours, and the Heykoins.

The Gunjeman nation lie nearest the Cape, and sold their territories to the Dutch, with whom they still dwell promiscuously, but hold only a small part of their antient possessions.

Bordering on them to the northward are the Cochaquas, in whose territories are spacious meadows, in the possession of such Europeans as are particularly employed in supplying the company's ships with provisions; and here the Dutch have several fine salt-pits. The Cochaquas still possess most of the land, and, like the other Hottentot nations, remove with their cottages and cattle from one part of their territories to another for the convenience of pasturage. When the grass is too old and rank they set it on fire, and leaving the place, return when it grows up again, which is very speedily; for the ashes of the grass enrich the soil, which is usually in no want of refreshing rains. Thus as the grass grows thick and high, the country is sometimes seen in a blaze for several miles round. In this particular the Europeans at the Cape imitate the Hottentots, but use the precaution of making ditches round the land where they would burn the grass, in order to put a stop to the progress of the flames; but the Hottentots are not willing to give themselves so much trouble.

To the northward of the Cochaquas are the Sussaquas, who were a numerous people, and had great herds of cattle, till they were plundered and dispersed by the Dutch freebooters, who in the infancy of the settlement, ravaged several Hottentot nations. As this territory is but thinly peopled, it has few villages, and indeed there is but little spring-water in the country; but though it is mountainous, it affords plenty of grass, not only in the vallies, but on the tops of the highest hills; both which are adorned with the gayest flowers, and the most odoriferous herbs.

The territory of the Adiquas lying contiguous to that of the Sussaquas, these two nations formerly entered into a confederacy against their neighbours the Chirigriquas, with whom they had many long and bloody wars; but, by the mediation of the Dutch, they have been reconciled.

The Chirigriquas extend along the shore by the bay of St. Helen's, and are a numerous people remarkable for their strength and dexterity in throwing the hassagaye or lance. The soil of their country is much superior to that possessed by the two last nations. This territory is mountainous, but, as in the other Hottentot countries, the highest hills have their tops covered with rich pasture, as are also the vallies, which are adorned with flowers, but abound with snakes. Through the middle of the country runs the Elephant river, which is very large, and is thus named from the elephants resorting to it in great numbers. Here are also woods of thick and tall trees, different from those of Europe, and inhabited by lions, tygers, leopards, and other ravenous beasts. Through these woods are formed roads, over which the branches of the trees meeting at the top, render them gloomy in the brightest day, and in some places so dark, that it seems as if the traveller was proceeding through a cavern. These roads, however agreeable from the advantages of shade and verdure, are rendered dangerous by the wild beasts.

We now come to the two nations called the Greater and Lesser Namaquas. The Greater is the next nation eastward, and the Lesser is situated on the coast. Tho' these nations have the same name, they differ in their form of government and manner of life; yet both are much respected by the other Hottentot nations, on account of their strength, bravery, and discretion; and they are so populous, that upon occasion they are able to take the field with twenty thousand fighting men. They are superior to the other Hottentot nations in sense; they speak little; their answers are short, and they never return them without taking time to deliberate.

Both these territories are full of mountains bare of grass, the soil being stony and sandy; besides, there is little wood, and only one spring in all the country; but the Elephant river running through it, supplies the inhabitants with water. Here are numbers of wild beasts, and also deer spotted with white and yellow; these are smaller than those of Europe, but exceeding swift: they always keep together by hundreds, and sometimes there are thousands in a company. The venison is generally very fat and delicate.

North of Namaqua is Attaqua, which has a very indifferent soil, and is but ill supplied with water: on which account the inhabitants live in small companies on the most fertile spots, and have generally no more cattle than, with the game they catch, is necessary for their support: yet they are brave, and as lively and contented as if they enjoyed the most flourishing country. They live in tranquility, and are seldom at war with their neighbours. When they are in danger of an invasion, they hasten, like the Swis, to the tops of their highest mountains, where they light fires that cast a great smoke by day, and a clear flame by night. Upon this signal all who are able hasten with their best arms to one constant place of rendezvous, and a numerous army is speedily assembled.

We shall now return to the Cape, and trace the several nations that lie to the eastward.

Next to the Gunjemans are the Koopmans, so called from Koopman, a captain of that nation, whose territory extends far to the eastward. Many Europeans have settled here, and enjoy large and rich tracts of land, this being a fruitful country, well watered, and abounding in woods.

To the north-east of the Koopmans are the Hessaquas, who are perhaps the richest of any of the Hottentot nations. Their pastures are covered with herds of horned cattle and flocks of sheep. Their oxen for carriage exceed all others in strength and beauty. They traffic with the Europeans for brandy, tobacco, and beads, more perhaps than any of their neighbours, and are consequently more luxurious and effeminate. Their villages are larger, more numerous, and better peopled than those of any other Hottentot nation. The country abounds with game, and furnishes more of the accommodations and luxuries of life than any other of these territories.

Bordering on the Koopmans to the eastward are the Sonquas, a lively daring people, very dexterous in the

management of their arms. This proficiency and martial genius they owe to their living in a mountainous rocky country, that affords but little subsistence for man or beast, and therefore obliges them mostly to become a kind of mercenaries to the other Hottentot nations in their wars, serving barely for food from day to day. The barrenness of their land likewise renders them dexterous at the chase: they pursue all the game they discover, and it rarely escapes them. Hence they are far from being numerous, for they have only a few small villages, and cattle great and small are so scarce, and esteemed so valuable, that they kill none, when any other food is to be had, except on certain solemn occasions. But plants, herbs, and roots fit for food, are here and there found in plenty; with woods that serve for firing to keep off the wild beasts from their villages. These people are very dexterous in robbing the bees of the honey they lay up in hollow trees, though they are not fond of it themselves; but they exchange it with the Dutch for brandy, tobacco and pipes, knives, and other implements of iron and brass. They put it into leathern sacks, and exchange a sackful for a very trifle.

Next to the Sonquas are a people called the Dunquas, who possess a fine and fertile country, well watered by several rivulets. Both the hills and plains are covered with plenty of grass, herbs, and flowers; and in all the parts of this territory cattle and game abound.

Bordering on them are the Damaquas, who inhabit a tract of land as fine and fertile as the former, and much more level. It abounds with cattle and game, and produces water-melons and wild hemp; but has such scarcity of wood, that the inhabitants are hard put to it for fuel to dress their provisions. There are likewise several salt-pits; but these being at a considerable distance from any European settlement, no use is made of them, as the Hottentots eat no salt. The Palmet river runs through the country with many turnings and windings, and the inhabitants pass it in canoes, and on floats of timber. The Damaquas being great lovers of the flesh of such wild beasts as are fit for food, they are often engaged in the chase, and are plentifully provided with furs for their apparel.

Bordering on this nation are the Gauroes, a numerous people, who inhabit a small country; in which the soil is every where so rich and fertile, that they all live in ease and plenty. The pastures are covered with cattle, and the territory swarms with wild beasts of every kind, more than any other about the Cape, in which the inhabitants glory, as it calls for the frequent exercise of their courage and dexterity, which they are fond of shewing, most of them wearing the skins of lions, tygers, wild cats, and other animals, as trophies of their bravery.

To the north-east of these people, on the coast, dwell the Houteniquas, in whose territory are several woods of stately trees, and between them fine meadows adorned with wholesome herbs, and a variety of the most beautiful and odoriferous flowers.

Next to these are the Chamtours, who possess a fine flat country, in which are many little woods that consist of the tallest trees in all the country of the Hottentots. Here is great plenty of game, with all sorts of wild and ravenous beasts. The land is divided by several large streams, that contain different kinds of wholesome and very delicate river fish, and sometimes fish from the sea; the sea-cow in particular often appears in their channel. It is said that neither elephants nor buffaloes are to be found in the woods, though those in all the other Hottentot countries abound with them: but the Chamtours perhaps kill or chase them out of the country, whenever they are found.

To the north-east of the Chamtours is situated the nation of the Heykoms, who possess a mountainous country, unprovided with fresh water, and only fertile in the vallies: yet it is pretty well stocked with cattle of every sort, which thrive upon the brackish water of the rivers, and the reeds on their banks. The country likewise abounds with game and wild beasts of all the kinds seen about the Cape, but the people are under great difficulties in procuring fresh water.

S E C T. II.

Of the most remarkable Trees, Plants, and Fruits; with a concise Account of the Kitchen Gardens at the Cape.

THE vegetables of the Cape countries are extremely numerous, but we shall only mention a few. Among those which are natural to the soil is the aloe, of which there are many sorts, and not a few of them are planted in the Company's gardens. On the mountains and in the clefts of the rocks they are seen in great numbers, and one sort or other is in blossom throughout the year. Their flowers, which are of different colours, some white, some red, and others variously spotted, appear very beautiful.

The amaquas-tree, called by the Cape Europeans keurboom, grows so quick that in two years time it rises from a small plant to a tree of eight or nine feet in height, and of a considerable thickness. The leaves resemble those of the bird-pear-tree, but the blossoms are of a whitish red, like those of the apple-tree, and of a fragrant smell. From these rise pods, which contain from five to seven seeds of the bigness of a pea, but brown and of an oval form. The seeds are bitter and astringent, but are applied to no manner of use at the Cape. The root spreads very much, and is so attractive of nourishment, that it starves most of the trees that are near it; on which account the Cape Europeans do not care to have it near their vineyards, orchards, or gardens.

Another tree at the Cape is called by the Cape Europeans cripple-wood. These are dwarf trees, which have very crooked knotty branches: the leaves are broad, thick, rough, and shaped like those of the apple-tree. The fruit resembles the pine-apple, the bark is thick and wrinkled, and is used by the Cape tanners; the physicians pulverize it, and administer it with success in dysenteries.

The stink-wood-tree grows to the size of an oak, and the leaves are three fingers broad. It is called stink-wood from its filthy scent; for while it is under the tool, it sends forth so nauseous a stench, that the workmen can scarcely endure it; but, after some time, the stench goes quite off. The wood is beautifully clouded, and the Cape Europeans have tables, presses, and several other useful and ornamental pieces of furniture made of it.

In the Company's fine garden are figs of various kinds, all of them admirably sweet and good. The choicest and largest are those called pifang-figs, which grow upon a plant that has no sooner brought them to maturity, than it withers away; and the next year a new plant springs up from the same root, yielding the same tribute. This plant has no stock; but its leaves, which are from six to seven ells long, and from two to three ells broad, embrace each other from the ground upwards, forming a kind of barrel, in the place of a stock. Its blossom consists of four leaves, which form themselves into a kind of bell, at the mouth of which, in the proper season, hang fifty or more of the most delicious purple figs.

In this garden is also a tree of Indian extraction, called the quajavos. Its fruit is shaped like an apple, and, when ripe, is yellow and green, with the inside extremely yellow. It contains a number of oval white seeds, and is a wholesome fruit, of an exquisite flavour.

The ananas, or pine apple-trees, at the Cape are of the American race, and there are three sorts of them in the Cape colonies, one called jujama, the apple of which is the largest and best tasted. It is from six to eight inches long, and pretty thick. The colour on the outside is red and dark yellow, but within it is almost of a perfect yellow.

The other sorts are the bonjama and the jajagna: the apple of these last species is white on the inside, and the taste of the jajagna resembles that of rhenish wine. The pine-apples at the Cape have a certain acrimony, which the Cape Europeans take off by cutting them in slices, and laying them in spring water; and if after this they are laid in rhenish wine, with sugar scattered upon them, they eat deliciously, having much the taste of strawberries. The Cape Europeans preserve pine-apples

in sugar. On the top of the fruit is a part that has some resemblance to a crown, which being cut off and planted, yields fruit the next year.

There are here four sorts of camphire-trees, one transplanted thither from the island of Borneo, which is much the best: the other three sorts were brought from Japan, China, Sumatra, and Sunda; they all grow very quick, and to the size of a walnut-tree. The outside of the leaves is grass-green, and the other ash-coloured. The leaves, on being rubbed between the fingers, send forth a strong odour like that of camphire. These trees are so soft and tender, that they are frequently stripped by the wind of many of their branches, and sometimes nothing is left standing but the trunk.

The Indian gold-tree at the Cape grows about six feet high, and has small leaves of a yellow colour speckled with red. These leaves, which are nearly of the colour of gold, are very beautiful, and strike the eye where these trees are ranged in gardens among other trees. The blossoms are very small, and of a greenish colour, but they have no manner of scent.

Quince-trees are seen in great numbers in the Cape colonies, and the fruit is said to be larger and better than the quinces produced in any other part of the world. Of this fruit the Cape Europeans make great advantage; for they have several ways of preparing and preserving quinces, which they sell to the ships that touch at the Cape; they also make and sell a great deal of marmalade.

There are here two sorts of Indian orange-trees, which are larger than any other trees of the same sort, and the fruit much bigger, and spotted like the skin of a tyger: the blossoms are white, like those of the apple-tree.

There are here likewise several sorts of sweet and sour lemon-trees, and in the gardens are walks of them of a great length.

In the Cape colonies are also many citron-trees, which yield fruit all the year round.

The Cape pomegranate-trees are much larger than those of any other part of the known world. The fruit is likewise so large, and in such plenty, that it is frequently necessary to prop up the branches, to prevent their being broke down by their weight. There are two sorts of these trees, one of which yields yellow kernels, and the other kernels of a crimson colour: the first sort are chiefly planted near ponds. The kernels of both contain a very pleasant cooling juice, which is very refreshing in hot weather.

There are two sorts of the netted melons, or pompions, which grow very plentifully in the Cape colonies, and are of the Indian kind. In shape and size they come pretty near our melons. The colour on the outside of both is a dark green, and within the fruit of one sort is of a whitish colour with white seed, and in the other of a carnation with black seed. These fruits are extremely comfortable and refreshing in fevers, speedily and very deliciously quenching the thirst, without any ill consequence. Both sorts are very juicy, and as sweet as sugar; but that with the black seed is esteemed the best.

Peaches grow so plentifully at the Cape, that in some seasons the Europeans there have more than they can well consume, and therefore throw many of them to the hogs; however, some people preserve them for winter.

Vines were transplanted to the Cape from the Rhine, from Persia, and many other countries; and are so vastly increased, and yield so plentifully, that the Cape Europeans have much more wine than they can drink, and sell a great deal to the ships that touch there.

In short, "there is no other soil in the world, says Mr. Kolben, that has for all sorts of vegetables so cherishing a bosom; nor any other clime so benign to them. All the splendors of the vegetable world shine out at the Cape. The hills and dales are covered with its most radiant beauties, and the air is enriched with its noblest odours."

We shall now take a short view of the kitchen gardens at the Cape, which in many respects resemble those of Europe; and there is not a house or cottage in all the colonies without one. They are supplied with seeds from Europe; but though they produce most of our herbs and

roots in perfection, it is remarkable that the seeds of the third product of the European herbs degenerate in the Cape kitchen gardens, so as to be not worth sowing; the colonies therefore still continue to be supplied with seeds from Europe.

In these gardens the seeds are sown in May and June, and appearing in August are transplanted into other grounds, which are by that time well moistened by the rains; they then grow apace, and become larger and much sweeter than the same herbs produced in Europe. In the dry season they are watered from the next rivulet; but they have neither hot-beds or winter-houses for the forcing or preservation of any thing.

The head of the white or blue Cape-cabbage weighs at its full growth from thirty to forty pounds; as does also the head of the Cape cauliflower, the seed of which is brought from Cyprus and Savoy, and all are as sweet and serviceable as in their native soil.

Potatoes are brought to the Cape from the Indies, and are there of two sorts, white and red. They are in general shaped like turnips; but are much larger, a Cape potatoe weighing from six to ten pounds; four of them will afford a meal for above twenty persons, and they are extremely well tasted, very wholesome, and nourishing. From these potatoes there run strings or branches three or four ells in length; these are cut off close, and in August or September are planted half a foot deep, being wound up in the form of a ring.

The Asian and European trees also need less culture at the Cape than in their native soil. The fruit or seeds put into the ground soon take root; so that if an almond in its hard shell be set in the Cape soil, in six weeks time it sends forth a fine infant tree; and if it be transplanted a year or two after, it quickly arrives at perfection: so if a young branch of almost any tree be set pretty deep in the earth, it speedily takes root.

SECT. III.

Of the tame Cattle and the Husbandry of the Cape Colonies.

THE colonies at the Cape abound with great and small cattle, as do all the Hottentot countries. The Cape cows, like the cows of Europe, bear every year a calf; but they will seldom suffer themselves to be milked till their calves have sucked a while, after which they yield milk to the hand very liberally. If their calves die, the only method of obtaining milk in the colonies is wrapping the skin of the dead calf about a living one, and applying this counterfeit to the teats: this cheat is generally very successful; for the cows taking the counterfeits for their own calves, yield their milk very plentifully. But many of the cows in the colonies, especially the young ones, are so wild and mischievous, that it is dangerous to approach them till they are tied short by the horns, and their legs are also tied together. The Cape oxen generally weigh from five hundred to six hundred pounds weight, and some a great deal more.

The Cape mutton is extremely good and well tasted, and the sheep have the great tails so often mentioned, which furnishes the Europeans at the Cape with a joke which they are fond of passing upon strangers at their tables: "You have no appetite, say they, you are not able to manage a sheep's tail."

They have also two sorts of tame hogs, one brought from Europe, and the other from the Isle of Java, which have short legs, large hanging bellies, and are without bristles.

They have likewise a great number of horses, which were originally brought from Persia, and have multiplied exceedingly: they are in no want of asses and mules.

The pasture-grounds about the Cape are covered with an astonishing number of great and small cattle, and they are no where in the world either so numerous or so cheap. The Hottentots sell many of them annually to the Europeans for brandy, tobacco, or some inconsiderable trinkets; and, when Mr. Kolben was there, a pound of tobacco would purchase a fine fat ox, and half a pound a fat sheep.

Among the cattle of the colonies, as among those of the Hottentots, great depredations are sometimes made by the lions, tygers, and wild dogs, &c. When the tygers get into a herd or flock, they kill great numbers merely for the sake of their blood, which they suck. The wild dogs are infinitely worse; for when they attack an herd, or flock, they are not guided in their slaughter by their appetites, but worry all before them: the lion, contented with a single carcase, makes off with it, and never looks for fresh prey till he has eaten that. The cattle run as fast as they can, whenever they discover any wild dogs. They do the same on the approach of a lion, tyger, or leopard, which they smell at a considerable distance; but the great cattle running swifter than the small, the latter always suffer most by the enemy.

We shall now give a concise account of the art of husbandry, as practised at the Cape colonies.

When a piece of uncultivated land is laid out for a corn-field, vineyard, or garden, it is first plowed up and cleared of all the weeds, and every thing which it is imagined will prove detrimental to the intended seeds or plants.

The ploughs used by the Europeans at the Cape are furnished with two wheels of unequal diameter; that towards the furrow being considerably larger than that on the side towards the ridge. The plough-share is divided in two, one side bending considerably outward, the other pointing straight forward, and the coulter is straight.

They plow only with oxen, and though they are prodigiously large, often put five pair to one plough, and sometimes more; because the soil, being generally fat and heavy, the plough does not easily pass through it. Indeed in the dry season the ground frequently becomes so hard, that twelve oxen are not sufficient to pass a plough through it; and in the rainy season it becomes in many places so light and soft, that an ox sinks up to the belly. This business is therefore principally performed in the months of June and July, which are their winter months.

Corn is not sown so thick at the Cape as in Europe; for if it was, the grain would be choaked up, the ears would be small, and the crop be neither so plentiful nor so valuable as it proves upon being sowed more thinly.

But, notwithstanding all that has been said of the fertility of the soil, oats and lentils cannot be brought to perfection; great pains have been taken to raise the former, but it has always happened, that when the crop was almost come to maturity, the south-east winds have blown almost every grain out of the ears, and scattered them over the neighbouring fields, where they have taken root, and produced wild oats. The other grain, however, produce very plentiful crops; for one bushel of wheat sown at the Cape yields from thirty to forty bushels; one of barley from fifty to sixty, and sometimes seventy; one of pease and beans from twenty to twenty-five; but the pease and beans suffer so much from the caterpillars and locusts, that sometimes what is reaped is hardly sufficient for the next year's seed.

The Europeans at the Cape, instead of threshing out their corn, have it trodden out by oxen or horses in the open air. In performing this they choose a level piece of ground, and taking cow-dung and chopped straw, mix and work it into a loam with water, then spread it pretty thick on the earth in a circle of about ten yards diameter; and leaving it to dry by the heat of the sun, in a few days it becomes as hard as stone: then on this floor they lay two circles of sheaves ear to ear, and drive over them a team of eight horses or oxen, round and round, now and then turning the sheaves, till they judge all the corn is trodden out. This is a much more expeditious method of getting the corn out of the ear than threshing it; for a team of eight horses or oxen will tread out more corn in a few hours, than a dozen men can thresh out in a whole day. Indeed, the crops of corn are in general so large, that it would probably cost the farmers the whole winter to thresh it out; whereas, by treading, the whole business is performed in less than a month.

When the corn is trodden out they winnow it, and pass it through a machine that performs the business of a sieve,

sieve, and clears the corn of all sand, and other dirt, too heavy to be carried off by the wind.

The Company have a tenth of the crops of all the corn raised at the Cape, which is all they get by the grant of lands for tillage; and whatever is not used in the families of the farmers is sold to the Company for ready money, and deposited in their magazines.

There is hardly a cottage in all the colonies without a vineyard, and there are but few settlers who do not produce from their own vineyards a plentiful provision of wine for themselves and families; and many, when their own cellars are supplied, have large quantities for sale.

In August, when the spring commences, the Cape vines are pruned, and in September the leaves appear. The grapes ripen from the beginning of December to the end of February, which is the heat of summer; and the vintage continues from the end of February till the end of March.

The Cape wines are extremely rich, and, by being kept about two years, allume the taste of sack; and Cape wine that has been kept till six years old sparkles like old hock, and is as racy as the finest Canary.

S E C T. IV.

Of the wild Beasts in the Country of the Hottentots; containing a Description of the Elephant, the Rhinoceros, the Buffalo, the Elk, the Lion, the Leopard, Tyger, Tyger-Wolf, Wild Dog, Porcupine, Baboon, several Species of wild Goats, the Earth-hog, Rattle Mouse, and Stinkingsen.

IN treating of the wild beasts we shall begin with the elephant, the largest of them all: those of the Cape are of a prodigious size, and of proportionable strength. Their skins are without hair, and have a multitude of scars and scratches, which they receive in making their way through the thorns and bushes. The tail ends in a large tuft of hair, each hair being about a foot and a half long, and as thick and as strong as a hog's bristle. The teeth are exceeding large, each weighing from sixty to a hundred and twenty pounds weight.

The female elephant is much less than the male: her dugs fall from her breast between her fore legs. The male and female retire for the consummation of their love to some unfrequented part, and there remain till conception, when they return to their ordinary haunts; and the female never admits of fresh embraces till a considerable time after she has brought forth her young, which she carries two years. Some authors have pretended, that elephants sleep standing; but this is a mistake, for they lie down like other beasts. Their ordinary food is grass, heath, roots, and the tender branches of shrubs. Sometimes they enter the corn-fields, and do a great deal of damage, not only from their eating the grain, but the immense quantity they spoil by trampling it under their feet. These incursions are generally made in the months of August and September, when the fields are strictly watched, and fires are kindled about them in the night to frighten them away. However, the elephants will sometimes venture in, and are shot for their pains. One would imagine, from the size and clumsiness of the Cape elephant, that he must travel very slowly; but this is far from being the case, for they walk so fast, that it would be no easy task for a man well mounted to keep up with them.

The Caperhinoceros is of a dark ash colour, approaching to a black: his skin, like that of the Cape elephant, is without hair, and is full of scars and scratches; yet is so hard that it is difficult to pierce it with a sharp knife. Indeed the painters represent him as armed all over with a kind of scales; however, he has none upon his body, but the numberless scars and scratches which intersect each other make him look at a distance as if fenced with scales. His mouth resembles that of a hog, but is somewhat more pointed. Upon his snout grows a dark grey horn, a little bent, and larger or smaller according to his age; but it never exceeds two feet in length. When he is angry he tears up the earth with his horn, and throws it furiously over his head: he will also throw stones with it to a vast distance behind him. With this he will like-

wife tear up the roots of trees, and almost every thing he can fix it in. This horn is very solid, and the end of a lighter colour than the rest. On his forehead is another horn, which upon a young rhinoceros is about a hand high, and upon an old one not above six inches. It is in the form of a bowl inverted, and is hollow. His ears are small, and his legs shorter than those of the elephant.

His sense of smelling is very surprising, for he catches the scent of any creature that is at a considerable distance to the windward of him; and if it be his prey, he immediately marches towards it in a right line, furiously tearing his way through all opposition of trees and bushes, grunting like a hog; when his breaking the trees, and throwing the stones, if he meets with any in his way, give warning of his approach.

He never attacks a man unprovoked, unless he is dressed in a red coat, and then he is all in a flame for his destruction, rending and destroying every thing that opposes the gratification of his rage. If he seizes him, he throws him over his head with such force, that he is killed by the fall; and he then feeds upon him, by licking, with his rough and prickly tongue, the flesh from the bones.

It is remarkable, that the eyes of the rhinoceros are extremely small in proportion to his body, and that he sees only in a right line; and therefore if the passenger slips but a few paces aside when he is near, it costs him a great deal of awkward trouble to get him again in his eye, by which means he has a fair opportunity of escaping. This I myself, says Mr. Kolben, have experienced, for he has more than once made towards me with the utmost fury.

He is not fond of feeding upon grass, but rather chooses shrubs, broom, and thistles, and is fond of a shrub that resembles the juniper, which the Cape Europeans call the rhinoceros-bush. This animal is in perpetual enmity with the elephant, and whenever he discovers him makes at him with the utmost rage. The elephant knows him to be his mortal enemy, and therefore when he sees him, gets out of the way as fast as possible. If the rhinoceros surprizes the elephant, he rips up his belly with the horn on his snout, by which means the elephant's entrails fall out, and he soon expires.

The flesh of the rhinoceros, which Mr. Kolben says he has often eaten with great satisfaction, is not so finewy as some authors have represented. The same gentleman mentions, that the horn of the rhinoceros will not endure the touch of poison, of which he says he has often been a witness. Many people of fashion at the Cape have cups turned out of the horn, some set in gold, and others in silver. If wine be poured into one of these cups it immediately bubbles up, as if it were boiling; and if there be poison in it, the cup immediately splits. This, says our author, is known to thousands of persons at the Cape. The chips made in turning one of these cups are carefully saved, they being esteemed of great service in convulsions, faintings, and other disorders; and the blood of the rhinoceros is said to have great virtue in the healing of inward sores.

Buffaloes are numerous in the Cape countries, and are larger than those of Europe; they are of a brown red, but the European buffaloes are black. Those of the Cape are well proportioned, and hold their heads aloft. On their foreheads grow hard frizzled hair. They have short horns, which incline towards the neck, and bend inwards, so that their points almost meet. Their skin is hard and tough, and it is difficult to kill them without very good fire-arms; but their flesh is neither so fat nor so tender as that of a common ox. A Cape buffaloe is, like the rhinoceros, enraged at the sight of red cloth, and at the discharge of a gun near him. On these occasions he roars, stamps, tears up the ground, and runs with such fury at the offending party, as to beat down all opposition, passing through fire and water to come at him.

A large body of Europeans at the Cape once chased a buffaloe, and having driven him to the Water-place, as it is called, near the Cape harbour, the beast turned and ran with all his fury at one of his pursuers, who was in a red waistcoat. The fellow nimbly skipped aside, and

ran towards the water, whither the buffalo pursuing him, obliged him to plunge in, in order to save his life. He swam well and as quick as possible; but the buffalo leaping in after him, pursued him so closely, that he could only save himself by diving. The buffalo thus losing sight of him, swam towards the opposite shore, which was at three miles distance; and our author observes, that he would undoubtedly have reached it, had he not been shot by the way from one of the ships in the harbour.

The African elk is much larger than either the European or the Asian, it being generally five feet high. The head resembles that of the hart; but is small in proportion to the body. The horns are about a foot long, and run up twisting; but the ends are straight, smooth, and pointed: the neck is slender and beautiful, and the upper jaw somewhat larger than the other: the legs are long and slender; the hair of the body smooth, soft, and of an ash colour; and the tail about a foot in length. The taste of the flesh resembles that of good beef, and is agreeable either boiled or roasted.

These elks are generally found on high mountains, where there are good pasture-grounds, and near some spring. They climb the highest and roughest rocks, and pass the most difficult ways with surprising dispatch and security. They sometimes visit the vallies, and frequently attempt to enter the gardens of the colonies. The inhabitants therefore place traps before those gardens, which are most exposed to their inroads, in the following manner: The Cape gardens being usually encompassed with a ditch, over which is a bridge at the entrance, they fix in the ground at one corner of this bridge a strong, pliant, taper pole by the broad end: to the small end of the pole is fixed a long rope, by which that end of the pole is pulled down to the other corner of the bridge, where it is fastened so slightly, that by a small touch it is freed, and flies up with a strong elasticity. When the small end of the pole is properly fixed, the remainder of the rope is formed into several coils and nooses, and laid under the arch of the pole. An elk coming to one of these gardens, and finding no communication but by the bridge before the door, he steps upon it through the arch, and hampering his legs in the coils of the rope, shakes the pole, on which the small end flying up and fastening him in one of the nooses, he is drawn up and unable to escape. If by struggling he breaks the pole, it is a hundred to one but he falls into the ditch; and, if he escapes that, he drags a piece of the pole after him, which so embarrasses him in his march, that he is easily taken.

The hart of the Hottentot countries differs only from the European in the horns. These have no branches, are about a foot long, and run up twisting in the manner of a screw to about half the length; then running aside a little outward, they are straight and smooth quite up to the point: they are about three times as far asunder at the point as they are at the head.

The lion is usually called the king of the beasts, but it is such a king as lives upon the blood of his subjects; and whatever compliments are paid to his majestic air, he can only be compared to the most savage tyrants. These animals are common at the Cape, where they are very large; every limb is expressive of the greatest strength: his sparkling eyes, his dreadful paws, and the firmness of his tread, command the attention, and shew his superior strength to that of other animals. Some modern writers have affirmed, that the bones of the lion are not so hard as they have been represented by the ancients; but they are mistaken. The hollow which runs through the shin-bone of a lion, Mr. Kolben observes, is as small as that which runs through a tobacco-pipe; and when the bone is broken to pieces, and the greatness is exhausted by the heat of the sun, these pieces appear as hard, as smooth, and solid as flints, and serve altogether as well to strike fire with. Indeed a considerable part of his strength lies in the hardness of his bones; for when he comes upon his prey he knocks it down dead, and never bites till he has given the mortal blow, which he generally accompanies with a terrible roar.

When the lion is enraged, or pinched with hunger, he erects and shakes his mane, lashing his back and sides with his tail. When he is thus employed, it is certain

death to come in his way; and as he generally lurks for his prey behind bushes, travellers are sometimes devoured by him: but if the lion neither shakes his mane, nor makes any great motion with his tail, a traveller may be fully assured that he shall pass by him in safety. A horse no sooner discovers a lion than he runs at his full speed; and if he has a rider throws him, if possible, that he may run the faster. When a traveller on horseback discovers a lion, the best method of preservation is for him immediately to dismount and abandon his horse, for the lion will pursue the horse only without taking notice of him. The flesh of the lion eats something like venison, and has no ill taste. Our author says, that he has eaten of it several times when killed with shot, but could never be prevailed on to eat any of the flesh when the lion had been killed with the poisoned arrows of the Hottentots.

The leopard and the tyger are beasts of the like nature, and in point of fierceness next to the lion. The only difference between them is in their size, and the figure of their spots. The tyger is much larger than the leopard, and is distinguished by rings of black hair inclosing spots of yellow; while the black streaks on the leopard are not round, but formed with an opening in the manner of a horse-shoe.

In the year 1708 two leopards, a male and a female, with three young ones at their heels, entered a sheep-fold at the Cape; and having killed near an hundred sheep, feasted on the blood of the slain. When they had sucked their fill, they tore a carcase in three pieces, and carried one of them to each of the young ones they had left at the door of the fold. Each then took a whole carcase, and the troop thus laden with their booty began to move off; but having been perceived at their first entering the fold, they were way-laid on their return, and the female, with the three young ones, were killed; but the male made his escape.

We shall add another instance of the ravenous nature of the tyger. Mr. Bowman, a burgher at the Cape, walking by himself in the fields was surprized by a tyger, who leaped at his throat, and endeavoured to fix his teeth in it in order to suck his blood; but, though terribly frightened, he had the courage to contend for his life; and seizing the tyger by his head, struggled with him, and threw him on the ground, falling upon him. Having got him down, he held him with one hand and the weight of his body, till with the other he drew a knife out of his pocket and cut the tyger's throat, on which he immediately expired; but Mr. Bowman received so many wounds, and lost so much blood in this brave conflict, that it was long before he recovered.

The flesh of a tyger or leopard is white, tender, and well tasted; and, in our author's opinion, is much finer eating than the best veal. It has every good quality that can be wished for in meat; and the flesh of the young ones is as tender as that of a chicken.

There are two sorts of wolves in this country, one which agrees in every particular with the wolves in Europe, and the other called tyger-wolves. The latter are of the size of an ordinary sheep-dog, or somewhat larger; the head is broad like that of an English bull-dog. The jaws of this animal are large, as are his nose and eyes. His hair is frizzled, and spotted like that of a tyger. His feet are large, and armed with strong talons, which he draws in as a cat does her claws; and, like a cat, he is not heard in his tread. His tail is short. He keeps all day in holes in the ground, or in the clefts of the rocks, seeking his prey only in the night, which he might generally do in safety, were it not for his dismal howling while he is out upon the prowl, which rouses the dogs who keep the flocks; these join together against him and drive him away: but if he gets safe into a fold, he generally kills two or three sheep; and having fed heartily upon the spot, carries a carcase away to his den. He also frequently scratches open the graves of the Hottentots, and devours the bodies he finds in them. The lion, tyger, and leopard are bitter enemies to the tyger-wolf, and following him by his howl come softly near him; and then suddenly leaping upon him, tear him to pieces.

There are wild dogs which range the Hottentot countries in troops, and sometimes make great havoc among the cattle. They seem a species of hounds, and packs of thirty,

thirty, and sometimes forty of them encounter lions, tygers, and other animals, which by their numbers they conquer. They spend the greatest part of the day in the chase, and drag what they kill to a place of rendezvous, where they share it amongst them. It is usual both for the Europeans and Hottentots, when they discover these dogs on the chase, to follow them to the place of rendezvous, and to take what they think proper of what the dogs have killed; which they permit them to do very quietly, without any manner of grumbling. The Hottentots eat what they take from the dogs, and what the Europeans take they sell for their slaves. These dogs sometimes destroy seventy or eighty sheep in one flock.

The porcupine, which is pretty common in the Cape countries, is about two feet high, and three long. His head and feet are like those of a hare, and his ears resemble the human. His whole body is armed with a sort of quills, partly black and partly white, very sharp at the outward points, and not much unlike goose-quills stripped of the feathers. He has some quills on the top of his head, but they are very short. The quills on his back are about six inches long, those on his sides are something shorter, but the longest are on his hind parts, and those he darts at his pursuer, whether man or beast; but he never darts one of them till his pursuer is pretty near him, and sometimes he does it so effectually that it sticks in the flesh, and causes great pain and inflammation. If he is not angered, his quills lie close upon his body; but on his being enraged, he spreads them out.

As this animal is very fond of the produce of the gardens, he frequently enters those of the colonies, and does much damage. When the breach is discovered by which he enters, the people plant a musquet there, charged and cocked, and tie a string to the trigger, from which it runs close along by the barrel to the muzzle of the piece, where a turnip or carrot is tied to it. As the porcupine always enters the garden by the same way as long as it is open, and instantly begins to devour the turnip or carrot, he by that means pulls the trigger and is shot. His carcase, gutted and stripped of the quills, weighs about twenty pounds. His flesh is well tasted and wholesome.

Baboons are pretty numerous in the Cape countries. They are a large kind of monkeys, but the head has some resemblance to that of a dog, and the features are very ugly. The fore part of his body nearly resembles that of a man, and the teats of the female hang from her breast. The teeth of the baboon are very large and sharp: his fore paws resemble human hands, and his hind paws human feet; but they are all armed with very strong and sharp talons. His whole body is hairy, except his posteriors, which are bare, and marked with streaks and spots of a blood colour. When the baboons are beset with dogs, or cudgelled by men, they sigh, groan, and give a cry, as men and women in extreme fright or pain. As they are very fond of grapes, apples, and garden-fruits, they sometimes enter the vineyards, orchards, and gardens. It is also said they have a method of catching fish, and will attack and kill deer and other animals; but whatever truth there is in this, it is very certain that they will eat neither flesh nor fish that has not been roasted, broiled, or some other way fitted to the palates of men. If they discover any traveller resting in the fields, and regaling himself, if he does not look sharp about him, they will steal part of his provisions; and having run to some distance, they turn about, and resting on their posteriors, hold what they have taken in their paws stretched out towards him, as if they would say, Here, will you have it again? at the same time falling into such ridiculous gestures and grimaces, that if a man was robbed of all the victuals he had, he would find it difficult to forbear laughing.

They go about every thing with surprising cunning, as is particularly seen in their robbing of an orchard, which they generally do in a troop. When a company of them have entered an orchard, or garden, a party is set to watch upon the fences, and give notice of the approach of danger. Some of them then begin the pillage, while the rest extend themselves at proper distance from one another, from the orchard, or garden, to the place of rendezvous on the mountains. The melons, pumpkins, and other fruit they gather in the gardens, and the apples

and pears they gather in the orchards, they toss to the baboon at the head of the line; he tosses them to the next, and thus the fruit passes swiftly up the hills; these creatures being so very nimble and quick-sighted, as hardly ever to fail catching in their paws the fruit that is thrown to them. But if the baboons upon the watch discover any person approaching, they give a loud cry, and all scour away up to the mountains, the young ones jumping upon the backs of the old ones, and posting away in a very diverting manner.

It is even supposed that they punish their sentinels for neglect of duty with death; for when any of the troop are shot or taken before the cry is given, a loud quarrelling noise is heard among them after they have got back to the hills, and some of them have been found torn to pieces in the way; and these are judged to have had the watch.

There are here several species of goats, the most remarkable of which we shall now describe.

They have blue goats, shaped like those of Europe, but as large as an European hart. Their hair is very short, and of a fine blue, but the colour fades when they are killed to a blueish grey. Their beards are pretty long, but their horns are short and very neat, running curiously up in rings till within a little of the point, which is straight and smooth. These are only to be met with far up in the country.

Spotted goats are seen in great numbers, there being sometimes above a thousand of them together. They are covered with red, white, and brown spots, and are rather larger than the blue goats. Their horns, which are about a foot long, incline backwards, and run up twisting to the middle, from whence to the end they are very straight and smooth. Their beards are of a brown red, and very long. Their legs are well proportioned to their bodies, and their joints about their fetlocks are of a dark brown. The young ones are easily taken, and made so tame as to run with flocks of sheep. Their flesh is very agreeable food.

There is another sort of goat, which is said to be not yet distinguished by any particular name. His head is very beautiful, and adorned with two smooth, bending, pointed horns three feet long, and the points two feet distant from each other. A white streak runs from the forehead along the ridge of his back to his tail, and is crossed by three streaks, one over his shoulders, another on the middle of the back running down on both sides to his belly; the third crosses it above his buttocks, and runs down them. The hair on all the other parts of his body is greyish, with little touches of red, only the belly approaches to white. His beard is grey, and pretty long, as are also his legs. The flesh of these goats is very agreeable food. The female is less than the male, and without horns.

The diving-goat at the Cape is almost as large as an ordinary tame one, and is of much the same colour. As soon as he sees any person or thing from which he apprehends danger, he squats down close in the grass; and seeing nothing but grass about him, perhaps imagines himself unseen; for thus he lies, giving now and then a peep out, and pulling his head suddenly down again, till either the danger is past, or he is seized, shot, or knocked on the head.

The Cape rock-goat is seldom larger than an European kid of a quarter old, and his horns are about half a foot long. He frequently enters the vineyards and gardens, where he does great mischief, and is therefore narrowly watched and often taken. His flesh is esteemed a great dainty.

The earth-hogs in the Hottentot countries have some resemblance to the European swine, only their colour approaches to a red; their heads are longer, their snouts more pointed, and they are quite toothless. The tongue of the earth-hog is long and pointed; and when he is hungry he searches for an ant-hill, and lying down with his head pretty near it, stretches out his long tongue, and the ants soon mount in great numbers upon it; and the upper part being very clammy, they are held fast by the legs, so that they cannot return. When he has thus hampered a considerable number of those insects, he draws in his tongue and swallows them, and then stretches

stretches it out for more. This is his method of feeding. His legs are long and strong, and he has also a long tail. He scratches holes in the ground, in which he burrows, and is very quick at his work; if he gets but his head and fore legs into one of these holes, he keeps such fast hold, that the strongest man cannot pull him out. Both the Europeans and Hottentots go frequently in search of him, and knock him down; for a blow on the head with but a small cudgel will kill him. His flesh is well tasted and wholesome, and resembles that of the wild hog.

In the Cape Colonies is also a creature called a rattle-mouse, though it is larger than an European squirrel, and has a head shaped like that of a bear. The hair on the back is of a liver colour; but that on the sides is almost black. With its tail, which is neither very long nor very hairy, it makes, from time to time, a rattling noise, and thence obtained its name. It purs like a cat, feeds on acorns, nuts, and the like; and lives mostly on trees, leaping from one tree to another after the manner of the squirrel. It is so nimble and bites so close, that it is seldom taken alive.

One of the most extraordinary animals at the Cape is called by the Dutch stinkbingssem, or stinkbox; stinking being the grand defence nature has given this creature against all its enemies, and is a more effectual defence than horns are to the bull, or sharp teeth and talons are to the lion and the tyger. It is shaped like a ferret, and is of the size of a middling dog. When its pursuer, whether man or beast, is come pretty near, it pours from its tail so horrid a stench, that it is impossible to endure it. A man is almost knocked down by it, before he can get away; and a dog, or other animal, is so strangely confounded by it, that he is obliged every minute to stop, to rub his nose in the grass, or against a tree. The stinkbingssem having thus stopped his pursuer, gets a great way a-head of him before the chace can be renewed; and if he comes up with him a second time, he gives him another dose, and by that means escapes again. Thus he proceeds till his pursuer is stunk out of the field. This animal is sometimes shot by the Europeans, but they are obliged to suffer it to lie till it rots; for it is no sooner dead, than its body contracts all over so nauseous a smell, that if you do but touch it with your fingers, they retain a stench that you can neither endure, nor easily get off by any kind of washing.

Besides these there are at the Cape a considerable number of other quadrupeds; among which are wild hories. Here is also that beautiful creature called the zebra, which we have already described in treating of Abyssinia; and one of which is now in the possession of the queen. Here are likewise several species of wild cats, which are larger than the tame; some of these are all over blue, and retain that colour after the skins are dressed: others have a streak of bright red running along the ridge of the back from the neck to the tail, losing itself in grey and white on the sides. Another called the bush-cat, from its keeping in hedges and bushes, is very large, and spotted like a tyger. They have also the musk-cat, the skin of which has a very strong scent. Besides these there are many of the quadrupeds common in Europe.

SECT. V.

Of the feathered Race, particularly the Ostrich, the Flamingo, the Crane, the Spoonbill, the Knor-Cock and Hen, Eagles of several Kinds, the Blue-Bird, the Long-Tongue, the Gnat-Snapper, the Wood pecker, and the Edolio.

WE shall begin our description of the birds of the Hottentot countries with the ostrich, the largest of them all; and these are so numerous, that a man can hardly walk a quarter of an hour in the Cape countries without seeing one or more of them. The feathers of some of the Cape ostriches are black, and some of them white. The head is very small in proportion to the large size of the body, and the bill is short and pointed: the neck is long like that of a swan: the legs are thick and strong, and the feet are cloyen, resembling those of a goat. These birds are easily tamed; and many tame ones are

kept in the Cape fortrefs. Their eggs are so large, that the shell of one of them will contain the yolks of thirty hens eggs: they are pretty good eating, and one of them will serve three or four persons.

The ostriches at the Cape do not suffer their eggs to be hatched merely by the heat of the sun; for they sit upon them like other birds, and the male and female perform that office by turns. I have a hundred times (says Mr. Kolben) found both the male and female ostrich hatching of eggs, and have as often driven them from their nests and carried their eggs off, with which I feasted both myself and friends, but sometimes found them almost hatched. Nor do the ostriches at the Cape forsake their young as soon as they are out of the shell; for being then unable to walk, they are attended and fed by the old ones with grass; and when they can walk, they accompany the old ones till they are strong enough to take care of themselves. The old ones are then watchful to keep them out of danger, and are so enraged if they happen to lose one, that it is dangerous to go near them.

Yet if any body does but touch the eggs in the nest of an ostrich, without doing them the least harm, the ostrich will forsake them.

This bird has so large and heavy a body, that she cannot fly, and on seeing herself in danger runs away, assisting her flight by fluttering her wings, by which means she runs so fast, that a man must be well mounted to overtake her. But if she finds she cannot escape her pursuer, she hides her head where she can, and stands stock-still till she is shot or seized.

These birds will swallow pebbles, pieces of iron, and the like; but they do not digest them, for they come from them in much the same condition in which they were swallowed.

The flamingo, called by Mr. Ray the phœnicopterus, is a very fine and beautiful bird, larger than a swan; the bill is very broad, and the upper mandible, which is longer than the other, is very crooked, and bends considerably over it. The hollow of the lower mandible is filled with the tongue, which is large and flat; the bill is black at the point, but every where else of a dark blue, and is furnished with sharp teeth. The neck is much longer than that of a swan, and both the neck and head are as white as snow; the upper part of the wing feathers are of a high flame colour, and the lower part of them black. The legs, which are of an orange colour, are half as long again as those of the stork, and the feet like those of the goose. These birds, which are very numerous in the Cape countries, keep in the day-time on the lakes and rivers, and at night retire to the hills, where they lodge among the long grass; their flesh is wholesome and well tasted, and their tongue eats like marrow.

Cranes are more numerous at the Cape than perhaps in any other part of the world. They resemble in shape, colour, and size, those of Europe, feed upon grass, herbs, worms, frogs, and serpents. I never saw a flock of them, says our author, but some of them were planted on the skirts of it, as centinels to give notice of the approach of danger. These stand upon one leg, and every minute stretch out their necks, this way and that, to see if any enemy approaches; and as soon as they discover him, they give notice to the rest, and instantly the whole flock is on the wing. During the night, some of them are planted on the skirts of the flock to watch while the rest sleep, and standing upon their left legs each holds in his right foot a stone, that if he should be overcome by sleep, its falling may awake him. The flesh is unfit to eat.

The spoon-bill, called by the Europeans the serpent-eater, is something larger than a full-grown goose, which it resembles in its neck; the eyes are grey; the bill broad, long, and straight, ending in somewhat like a spoon, and the feathers of the tail are about six inches in length. These birds feed upon serpents, toads, or frogs, &c. and are so destructive to the former, that the people seldom shoot at them.

Among the wild fowl at the Cape is a sort of birds, the male of which is called by the Europeans there, the knor-cock, and the female the knor-hen. These birds are a kind of centinels, and give warning to all other birds

birds of the approach of danger ; for they no sooner discover a man, than they make a loud noise, crying crack, crack, which they repeat very clamorously, and thus frequently disappoint the sportman ; for the other birds no sooner hear the noise, than they fly away quite out of sight. This bird is of the size of a common hen, the bill is short and black, and the feathers on the crown of the head also black, the rest are a motley of red, white, and ash colour ; the wings are small, considering its size, which prevent its flying far at once, and the legs are yellow. These birds generally keep in heaths, and in places remote from the habitations of men, where they build their nests in bushes ; but never lay above two eggs in a season. The flesh is of an agreeable taste.

There are at the Cape a kind of eagles which will feed upon fish, asses, and most other creatures which they find dead ; they also kill many animals for food, devouring cows, oxen, and other tame beasts, and leaving nothing but the skin and bones ; the flesh is, as it were, scooped out, and the wound by which the eagles enter the body being in the belly, the beast seems to lie dead, and no body would imagine that his bones were picked. The Dutch at the Cape call these kind of eagles dung-birds, from their tearing out the entrails of beasts. The size of this eagle or dung-bird is larger than that of a wild goose ; the feathers are partly black, and partly a light grey, but mostly black. The bill is large and crooked, with a very sharp point, and the talons are also very large and sharp. It frequently happens, that an ox freed from the plough in order to return home, lies down to rest himself by the way, and if he does, he is in great danger of being devoured by these eagles. They attack an ox or cow in a body consisting of a hundred and upwards ; they watch for their prey so high in the air as to be out of human sight ; but their own sight is so extremely piercing, that they see every thing beneath them, and when they discover their prey, fall down right upon it.

There is another kind of eagle, distinguished by the name of the duck-eagle, from their being fond of ducks. These frequently carry off young ducks in their talons, and tear and devour them in the air.

A third kind of eagle in the Cape countries is called the ossifrage, or the bone-breaker ; these feed upon land tortoises, which they carry to a great height in the air, and then let them fall upon some rock, in order to break the shell.

The Cape blue bird is of the size of a starling, the feathers of the neck and thighs are of a sky blue, and the back and wing feathers of a dark blue, approaching to a black. The bill is between three and four inches long, and pointed, and the under mandible is of a dark red. This bird is sometimes seen in gardens, but it keeps for the most part upon high hills. The flesh is delicate food.

There is a little bird which the Cape Europeans call the long-tongue : it is something larger than the goldfinch ; the feathers on the belly are yellow, and the rest speckled : the tongue, which is long and pointed, is as hard as iron, and as sharp as the point of a needle. When any person endeavours to seize this bird, it pricks and wounds him with his tongue, which is its defensive weapon against its enemies : its feet are like those of the nightingale, and its claws are pretty long. Its flesh is wholesome and well tasted.

The gnat-snappers, or honey-eaters, live entirely on gnats, flies, bees, and honey : their bill is long, straight, very strong and red : the feathers on the upper part of the breast are of a deep azure, and those on the lower part of a pale blue ; their wings and tail feathers are black, as are also the legs, which are very long. These birds are a sort of guides to the Hottentots in the search of honey, which the bees lay up in the clefts of rocks.

Among the several kinds of wood-peckers in the Cape countries, is one called the green peak, which is a beautiful bird, it being all over green, except a red spot on its head, and another on its breast. It sometimes builds its nest on high and steep rocks, but generally in bushes in the vallies. It feeds on a small insect, which it picks from the bark of trees.

The edolio perfectly resembles the European cuckoo, and is mostly seen in high trees and thickets. In fine

weather it distinctly repeats in a low melancholy tone, Edolio, Edolio ; and this is all its song.

In short, the Cape abounds with a prodigious variety of fowls, among which are, wild geese of several sorts, water hens, wild peacocks, snipes, ravens of different colours, pheasants, ducks, yellow hammers, larks, green-finches, black-birds, finches, wagtails, tit-mouses of several sorts, bats, canary birds, starlings, pigeons, swallows, thrushes, quails, daws ; and in short, the turkeys and poultry are so numerous in the Cape countries, that they are cheaper than butcher's meat. These last exactly resemble the cocks and hens in Europe.

SECT. VI.

Of the Serpents, Scorpions and Insects at the Cape of Good Hope.

THERE are many kinds of serpents or snakes at the Cape of Good Hope, some of which are very dangerous, while others are entirely free from poison.

The asp is of an ash colour speckled with red and yellow. The head and neck are very broad, the eyes flat and sunk in the head, and near each grows a fleshy protuberance about the size of an hazle nut. These serpents are of various lengths, some even several yards long.

The tree-serpent is thus named from her being seen mostly in trees. This reptile, which is about two yards long, and three quarters of an inch thick, winds herself about the branches of trees, and thus remains for a long time without motion, when she is so like the branch she covers, that a man who has not a very good eye, or some knowledge of her ways, would be mistaken : all the difference in point of colour is her being a little speckled ; and hence persons have sometimes been surprised by her. If any one stands near the side on which she is lodged, she darts her head at their faces, and sometimes wounds them. She has no sooner done this, than drawing in her head, she turns about in order to descend from the tree, by winding herself from one part to another, but is so slow in doing it, that it is easy to knock her on the head before she gets to the ground.

The dipsas, or thirst serpent, is thus named from its bite causing a burning thirst. This reptile, which is frequently met with in the Cape countries, is about three quarters of a yard in length, has a broad neck, and a blackish back. It is very nimble in its assault, and its bite soon inflames the blood, and causes a most dreadful thirst. Our author says, he knew a man at the Cape, who on being bitten by the dipsas in the calf of the leg, immediately tied his garter very tight above the knee, and above the garter tied some other thing he had at hand, to stop the course of the poison upwards, and then made all possible haste to the nearest house, which happened to belong to a smith, with whom he was acquainted. Before he got thither his leg was much swelled, and he was seized with a burning thirst ; he impatiently asked the smith for water to drink, and at the same time let him know his misfortune. The smith being acquainted with the nature of the poison, and having an antidote against it, would not suffer him to drink any thing ; but told him he must immediately consent to have his swelled leg laid open, and trust to him for a cure. He submitted, and on opening the leg, there issued out a great deal of a watery yellow humour. The smith then prepared a pretty large plaister, and tied it over the incision, advising his patient to refrain from drink for a quarter of an hour. He did so, and in that time his thirst was considerably abated, and the plaister had drawn a great deal more of the yellow humour, and being cleaned was put on again. The swelling was by this time considerably abated ; the patient grew easy, and was soon perfectly cured.

The Cape hair-serpent is about a yard long, and three quarters of an inch thick ; its poison is reckoned more malignant than that of other serpents, its bite causing immediate death, unless an antidote be instantly applied.

Some assert, that there is a stone in the head of the hair-serpent, which is a never failing antidote both against the poison of this, and of every other serpent. But our author, after killing many hair-serpents at the Cape, and searching the heads of all of them very narrowly, in order to find this stone, could never discover any such thing. The serpent stones in the possession of the Cape Europeans, are all artificial ones brought from the East-Indies, where they are prepared by the Bramins, who are alone possessed of the secret of their composition. Our author says, he saw one of them tried upon a child at the Cape, who had received a poisonous bite in one of the arms, but it could not be discovered from what creature. When the stone was brought, the arm was prodigiously swelled and inflamed; the stone on its being applied to the wound stuck to it very closely, without any bandage or support, drinking in the poison, till it could receive no more, when dropping off, it was laid in milk, that it might purge itself of the poison, and it did so, the poison turning the milk yellow. The stone was then applied again to the wound, and when it had drank in its dose, was again laid in milk, and this was repeated till the stone had exhausted all the poison; after which the arm was soon healed. The artificial serpent stone is shaped like a bean, the matter in the middle is whitish, and the rest of a sky blue.

There is a sort of snakes at the Cape called house serpents, from their loving to be in the houses. These are from an inch and a quarter, to an inch and a half thick, and about an ell long. They are very fond of getting into people's beds, and lying with them all night. They will slip through the hands like eels, and when you drive them out of bed, if you use them in what manner you will, so that you don't disable them, they will return, and get into bed again if they can. If they are offended, they bite; but their bite is not poisonous, nor attended with any ill consequence.

In short, there are many other kinds of serpents in the Cape countries; one sort is mostly seen upon rocks, and another on flat sandy ground. There is a sort usually seen about the roads, and a small snake of a black colour that loves to harbour in straw and reeds. Numbers of these last are in the thatch upon the houses in the colonies, where they lay their eggs, and breed their young; a full grown snake of this last sort is no longer than a man's middle finger, nor thicker than a goose quill.

Scorpions are so numerous at the Cape, where they generally harbour among stones, that the Cape Europeans are very cautious of putting their hands among them, for fear of being stung by those creatures. The Cape scorpions are from two and a half to three inches long, and of a dark green speckled with black. They resemble the craw-fish in every part but the tail, which is longer and narrower. Their sting causes intolerable pain, and frequently endangers life.

Among the spiders at the Cape, of which there are many sorts, there is one no bigger than a white pea; but of which the Cape Europeans are very cautious. It is of a black colour, and very active. In houses it fastens on the walls, or ceiling, and in the fields fixes its web in the grass; and its bite is so poisonous, that it causes death, unless an antidote be used in time. Our author mentions a negroe who died of it, and an European boy who suffered the most tormenting pain from the bite of this insect; but his life was saved by applying the serpent stone. This insect frequently does damage to both the great and small cattle.

There are here also a few of the centipedes, which are red and white, and about a finger long, but scarce half so thick: they are downy like Cape caterpillars, and provided with two horns; the bite of this insect is as dangerous as that of a scorpion, but the serpent stone is an effectual remedy, as is also the application of roasted onions applied to the wound.

There are various kinds of caterpillars at the Cape, different from those in Europe: these quickly arrive at maturity, soon after which they fix themselves to a plant, tree, or flower, and sometimes to a wall, where they change their form in the manner of the silk-worm which we described in treating of China, and are covered

with a crusty matter or shell fourteen or fifteen days, when the shell opening, there issues from it a most beautiful butterfly, the wings of which are enamelled with gold and various other lively colours. There are indeed as many sorts of butterflies as there are of caterpillars; and every butterfly at the Cape retains much of the colour of the caterpillar from which it was changed.

The sea-flea is thus named from its leaping after the manner of a flea; it is nearly of the shape of a shrimp, and sometimes continues under water. As it is provided with a sting, it is a great plague to fish; for when it lights on them, it stings them so grievously, that they fling themselves in a fury up and down, and then swim as quick as they can to a sea-rock, or stony-shore, in order to rid themselves of this enemy by rubbing themselves against it.

The sea-louse resembles a horse-fly, but is broader, and covered with a hard shell. It has many legs, each of which ends in a hook. This insect keeps generally under water, and when it gets upon fish clings fast to it by its claws, and gives it great torture by sucking it; and it is said, that if the fish finds not some means to rub it off, this insect will suck it to death.

SECT. VII.

Of the Sea and River Fish at the Cape of Good Hope.

AMONG the fishes at the Cape are the lesser whale, called the grampus, which is frequently seen there; but we shall find another opportunity of describing the whale when we come to those countries on the coasts of which these enormous fish are caught.

The blower, so called from a faculty it has of blowing itself up into a globular form, is frequently seen about the Cape. This fish is without scales, and very smooth; the mouth is small, but furnished with four broad teeth; and it has a white belly. This fish is not food for man, it being very unwholesome.

The torpedo-cramp-fish is frequently taken at the Cape. It is of the cartilaginous kind, and roundish, being blown up as it were into that form. The head does not project from the body; but the mouth and eyes are fixed in it much in the same manner as you might carve them on a bowl. The eyes are very small; and the insides have a mixture of black and white. The mouth, which is shaped like a half-moon, is also small; but furnished with teeth. Above the mouth are two little holes, which are perhaps its nostrils. The back is orange-coloured, the belly white, the tail thin, and fleshy like that of a turbot. The skin upon every part is very smooth, and entirely without scales. When the fish is opened the brain is plainly seen. The gall is large, the liver white, and very tender. But after all, this extraordinary fish does not weigh above a quarter of a pound.

It is a certain truth, that whoever touches this fish, whether with his hand or foot, or even with a stick, will immediately feel his limbs cramped and benumbed to such a degree that he cannot move them, particularly the limb with which he touched the fish, or with which he extended the stick that touched it, which will appear totally and strongly convulsed. But this general convulsion seldom lasts above half an hour: for it lasts a minute or two at the height; it then gradually abates, and in half an hour is quite gone. The Cape fishermen are extremely afraid of touching the torpedo; and whenever, on their dragging out a net, they perceive this fish, they turn the net aside, and are content to lose half their fish, nay their whole draught, rather than drag the torpedo ashore, and by that means expose any one to the hazard of touching it.

The gold-fish, which is very different from that of China, is thus called from a circle of a gold colour about each eye, and a streak of gold from the head along the ridge of the back to the tail. The Cape gold-fish is about a foot and a half long, and is of about a pound weight. The teeth are small, but very sharp, and do good execution upon muscles and other fish that are its prey. Gold-fish are never seen near the Cape, but in the months of May, June, July, and August, when they appear

appear in shoals, and great numbers of them are taken by the Cape Europeans. The colour of the meat is a mixture of white and red; it is of a delicate taste, and is not only esteemed very wholesome, but a great cleanser of the blood.

The Cape silver-fish resembles a carp in its shape and taste, and weighs about a pound. It is a very white fish, adorned with several streaks of a bright silver colour, falling from the ridge of the back down both sides, and the tail seems covered with silver. The jaws are furnished with small sharp teeth. These silver-fish keep generally in the sea, but at certain times come in shoals into the rivers, where they are caught in great numbers.

The bennet is a fish of which there is great plenty at the Cape, but how it came by that name is unknown. It is about the length and thickness of a man's arm, and weighs from six to eight pounds. It is a beautiful fish covered with large scales of a bright purple, intermixed with streaks of gold. The eyes are red, the mouth small and without teeth, and near the gills are two fins of a gold colour; but the other fins are of a light yellow. The tail is reddish, and has much the form of a pair of open scissors. The scales appear transparent, as does likewise the skin; but, when the scales are off, the skin appears of a bright purple. The meat is of a crimson colour, and is divided into several parts by a sort of membranous substance interwoven with it. It loses nothing in point of colour by boiling, but a little of its lustre. It is a dry food, but agreeable to the palate, and easy of digestion.

In the Cape sea are two kinds of brassens, one somewhat rounder, broader, and shorter than the other. This is of a blackish colour on the back and sides, with the head of a dark purple. The other is of a dark blue, and seems speckled. A brassen of this last sort is about seven or eight inches long, and weighs about a pound. Both sorts feed upon sea-grass, and upon dung and offals when they meet with them. They are seldom taken in the net, except in very stormy weather, when they come in shoals to the shore. Both the European fishermen and the Hottentots usually take them with the line; and, when they are at this sport, either whistle or make a hideous bawling noise, in both which the brassens delight; and are thus allured in shoals about the baits. They are very wholesome and well tasted, and three or four of them are bought at the Cape for about two-pence.

The sea near the Cape also abounds with a fish called by the Cape Europeans the stone-brassén. These come in shoals with the tide into the rivers, where they are fond of feeding on the grass which hangs in the stream, and go out again with the tide. This fish is shaped like a carp, but is a much finer fish, and not near so boney. On being boiled or fried, it splits into many flakes like the cod. These fish are from a foot and a half to three feet long, and weigh from two to eight pounds. They are of different colours, but the backs of all of them are brown; some have several brown streaks falling on both sides from the back to the belly. These add not a little beauty to the scales, which are large and white; and some have the belly of an ash colour.

The red stone-brassens at the Cape have the name of Jacob Everffions; the skin and scales are red, speckled with blue, and in the middle of the fish with gold colour. The belly is of a pale green; the eyes are large and red, with a silver circle about each. The mouth is small, and as it were under the gullet, and is furnished with little sharp teeth. This fish is of a delicate taste, and is very wholesome nourishing food. There is another sort of red stone-brassens, or Jacob Everffions, which differs from the above in their being larger, in their having shorter mouths, and in having the out-parts of the gullet of a deep red. Both sorts keep entirely in the sea, and are seldom found in great depths of water.

Francisci has given the reason of these fish being called at the Cape by the name of Jacob Everffion; and as his account appears at the same time diverting, and is acknowledged to be strictly agreeable to truth, we shall transcribe it. "There was many years ago, says he, a master of a ship at the Cape, whose name was Jacob Everffion; he had a very red face, and was so deep pitted with the small-pox, that his beard, which was

black, could never be shaved so close, but that several hairs would remain in the poek-frets: so that his face, when it was shaved, had the colour, and seemed to have the specks of the red stone-brassén. This Jacob being once a-fishing with his crew for red stone-brassens, at Maurice island beyond the Cape, and the crew dining that day very jovially upon this sort of fish, one of them took it in his head, in a fit of mirth, to call it the Jacob Everffion. The crew were struck with the brightness of the allusion, and received it with the highest agitations of mirth, and with thunders of applause: and when they got back to the Cape, they immediately published this new name for the red stone-brassén. The settlers (among whom Jacob was very well known) were as much struck as the crew with the justness of the name, and very merrily agreed to call a red stone-brassén a Jacob Everffion ever after. Every one that knew Jacob, being ravished with the mirth in the allusion, this new name for the red stone-brassén, together with the reason of its assignment, soon after reached several settlements in the Indies; and was so well received there, that red stone-brassens (of which the Indian seas furnish plenty) have gone there by the name of Jacob Everffions ever since."

There are also in the Cape sea porpoises, sharks, pilot-fish, dolphins, and flying-fish, which we have already described in treating of the fish on the coast of Indostan. There are likewise sea-lions and turtle, of which we shall defer the description till we come to the coast of America. Besides these there are many of the fish common in Europe, as pike, which are here only found in salt-water, and are of a dark yellow, but in every other respect resemble those of Europe; herrings, thornbacks, soles, barbel, carp, eels, and gudgeons.

Among the shell-fish at the Cape are lobsters, crawfish, crabs, oysters, muscles, and periwinkles, which differ but little from those of Europe; but there are others unknown amongst us.

At the Cape are two sorts of water-snails, called by the Europeans there the porcupine-snail and the sea porcupine-snail. The shell of the former is twisted like that of a garden-snail, but more variously and beautifully coloured. The shell of the sea porcupine-snail has also many beautiful colours, and is armed on almost every part with long prickles, which stand out much after the same manner as the raised quills of the porcupine. The shells of both sorts retain their colours as long as the fish within them live; but when it dies, the colours on the shell fade away.

At the Cape are shell-fish called by the Europeans there sea-funs and sea-stars: both sorts breed in the sea, and are driven ashore by the tide. The shells of both are multangular, and approach to a globular figure; but the sea-fun is smaller than the sea-star, and the shell more nearly resembles a globe. The shells of both are also covered with a thick scaly skin, something like that of a serpent, and have small prickles upon them shooting out every way, like beams of light, whence they receive their names; but the prickles on the sea-funs are longer than those on the sea-stars. In hot weather the fish in these shells are dried up on their remaining a few days out of the water, and the shells are left so bare, that there is no mark of their having been inhabited by any creature.

At the Cape is a shell-fish which the Cape Europeans call pagger, and is covered with dark brown scales, beautifully spotted with red and black; but on the back of it, near the head, is a sort of horn, or prickle of a poisonous nature, which is apt to wound the hand that touches it; in which case it causes a dreadful pain and inflammation, and if speedy care be not taken the hand perishes.

The shell-fish, called at the Cape the mussel-crab, resembles the lobster, but is much smaller. These, besides the coat shell, have another, which serves them as an habitation, and they go in and out with great ease, though they never go so far out as to separate themselves quite from the shell.

There are several other shell-fish distinguished by the beauty of their shells; but we shall only take notice of the nautilus, called at the Cape the pearl-snail. It is

no small pleasure to observe these fish in calm weather on the surface of the water, when their shells serve them as boats. They erect their heads considerably above these natural vessels, and, spreading out a kind of sail with which nature has furnished them, move along in a manner very diverting to the spectators. If when they sail they find they are in danger, they draw themselves close into their shells, and sink out of sight. Many of these shells will hold near a quart, and are used at the Cape as drinking-cups. The Cape Europeans put to them a foot of silver, ivory, or wood; and some are very curiously embellished with ornaments engraved on the outside.

SECT. VIII.

Of the Persons, Dress, and Character of the Hottentots; particularly exhibited in the Life of an Hottentot, who had been employed by the Europeans.

THE Hottentots are neither so small of stature, nor so deformed and wrinkled, as some authors have represented them; for most of the men are from five to six feet high; but the women are a great deal less. Both sexes are very erect and well made, and are in the medium between fat and lean. There is not a crooked limb or any other deformity to be seen among them, which is the more remarkable, as they take much less care of their children than the European women. As their heads are generally large, their eyes are so in proportion; and their aspect is so far from being wild and terrible, as some have represented it, that it is sweet and composed, and even expressing the utmost benevolence and good-nature. The worst features they have is their large flat noses, and their thick lips, especially the uppermost; but the flatness of the nose is not natural, but caused by art. Their teeth are as white as ivory, and their cheeks have something of the cherry; but, from their continual daubings, it is not easily discerned. The men have large broad feet, but those of the women are small; and neither sex cut the nails either of their fingers or toes. But what is very extraordinary, and must appear incredible to those who have not given attention to the variations observable in the human species, is, that all the Hottentot women are distinguished by having a broad callous kind of flap growing to their bellies, which seems intended by nature to hide what civilized nations are taught most carefully to conceal; and some of them have it so large, that it can hardly be covered with the sheep-skin they wear before them, it being often seen below it. This no Hottentot considers as a deformity, and for a little tobacco they will suffer any one to handle and examine it. Indeed Thevenot, in his Travels, says, the negro, Egyptian, and the women of some other nations, are subject to the like excrescence, but stop the growth of it very early by searing: this may probably be done from their considering it as a deformity.

What chiefly renders the Hottentots a very nasty people, is a custom observed by them from their infancy of, smearing their bodies and apparel with mutton fat, marrow, or butter, mixed with the foot that gathers round their boiling-pots, in order to make them look black, they being naturally of a nut or olive colour. This custom is repeated as often as the grease is dried up by the sun or dust; if they are able to procure butter or fat. The indigent part of the people are usually obliged to make use of that which is rank; but the more wealthy always besmear themselves with the freshest and choicest that can be had. Every part of the body, from the crown of the head to the sole of the foot, is covered with this filthy paint, and their skins are thoroughly daubed with it. The richer they are, the more fat and butter they use; for this is the grand mark of distinction between the rich and poor; but they have the extremest aversion to the fat of fish.

It is, however, worthy of observation, that this rubbing and greasing has a natural tendency to promote the suppleness and activity of the body; and thence the Hottentots, though a lazy race, are, perhaps, the swiftest of foot of any people upon earth; for they not only dart away from

the swiftest European, but some of them will out-run the fleetest horse. Besides, by their living almost naked where the sun's heat is very great, and by their thus closing their pores with grease, they prevent that excessive perspiration which would otherwise exhaust their spirits and enervate their bodies. Indeed the same custom is practised in a less degree by most savage nations.

What renders them still more disagreeable, is their suffering their woolly hair to be matted together with fat and dirt; their offensive smell arising from these uncleanly customs and their abominable leanness.

With respect to their dress, the men, during the hot season, have no other covering for their heads than this composition of fat, foot, and dirt; for they say the fat keeps their heads cool under the most raging sun: but in the cold season, and in wet weather, they wear caps made of cat or lamb-skins tied on with two strings; however, the face and fore part of the neck are always uncovered. About the Hottentot's neck hangs a little greasy bag, in which he carries his pipe and tobacco, with a little piece of wood of a finger's length, burnt at both ends, as an amulet against witchcraft.

The mantles they hang over their shoulders, which they call crossas, are worn open or close according to the season. Those of the most wealthy are of the skins of tygers or wild cats, and those of the common people of sheep-skins. These they wear all the year round; in winter turning the hairy side inward, and in summer turning it outward. They lie upon them in the night, and when they die are tied up in them when put into their graves. As they generally wear these crossas or mantles open, you see all the fore-part of their bodies naked to the bottom of the belly, where they are covered with a square piece of the skin of a wild beast, generally of a wild cat, tied round the waist, with the hairy side outward. When they drive their herds to pasture, they put on a kind of leather stockings, to secure their legs from being scratched by the thorns and briars; and when they are to pass over rocks and sands, they wear a kind of sandals, cut out of the raw hide of an elephant, or an ox, each consisting of one piece fitted to the sole of the foot, and turning up about half an inch quite round it, the hairy side outward, and fastened on with strings passing through holes made in the turnings up of the toes and the heels.

Besides these more essential parts of their dress, the men generally wear three rings of ivory upon the left arm. These they form from the elephant's teeth they find in the woods, which they cut into rings, and finish with such art and exactness, as would surprize the ablest turner in Europe. These rings, or bracelets, serve as guards when they fight an enemy; but when they travel they fasten to these rings a bag, in which they carry their provisions, which they fix so cleverly that it is hardly any incumbrance.

The women in general wear caps all the year round, night and day, made of the skins of wild beasts, pointing up spirally from the crown of the head. They generally wear two crossas round their shoulders, which, like those of the men, cover their backs, and sometimes reach down to their hams. Between these crossas they fasten a sucking child, if they have one, with the head just peeping over their shoulders. The under crossa serves to prevent their bodies being hurt by the children at their backs. They cover their posteriors with another crossa, which generally reaches to the calf of the leg; and have another before, which is always of sheep-skin stripped of the wool or hair.

About their neck is tied a string, to which is fastened a leather bag, which they constantly wear from morning till night, both at home and abroad; it contains some kind of food, a pipe, tobacco, &c. The girls, from their infancy to twelve years of age, wear bulrushes tied in rings round their legs from their knees down to their ancles. These bulrush rings are then laid aside, and their place is supplied with rings of the thickness of a little finger made of slips of sheep or calf-skins, from which the hair is singed; for the Hottentot sheep have nothing like wool. Some of the women have above an hundred of these rings upon each leg, so curiously joined, and so

nicely

*Claus the Hottentot, surrenders himself Prisoner to
the Dutch Ensign.*

nicely fitted to the leg, and to each other, that they seem like curious pieces of turnery. They are smooth and as hard as wood, and when they dance make a clattering noise. These rings are kept from slipping over their heels by wrappers of leather or rushes about their ancles; and as the women are obliged every day to walk thro' bushes and brambles to gather roots and other things for food, they preserve their legs from being torn by the thorns and briars. These rings are one great distinction of their sex, and are considered as very ornamental; for the more rings they wear, the finer they are reckoned: but this is not all, they are provisions against an hour of hunger and great scarcity; for when that arrives they pull them off, bruise them between two stones, and then eat them.

But the principal part of the finery of both sexes consists in the brass buttons, and plates of the same metal, which they buy of the Dutch, and then polish to an amazing lustre; these dangle in the men's hair. They are also extremely fond of fixing in their hair bits of looking-glasses, which they also consider as very splendid ornaments; nor are diamonds more admired by the Europeans than these trinkets by the Hottentots. They likewise wear small ear-rings of brass wire, which they always polish very neatly; and those of the highest rank, or the greatest wealth, hang in these ear-rings bits of mother of pearl, to which they have the art of giving a curious shape and polish. Of these ornaments they are extremely proud, as they imagine they procure them the admiration of every beholder.

To their commerce with the Dutch they likewise owe several other ornaments, as brass and glass beads, of which they are extravagantly fond. There is hardly a Hottentot of either sex who is not adorned with some of them: but the preference is universally given to brass beads, on account of their not being so easily broken as those of glass. They wear them in bracelets, necklaces, and girdles; of which every one has more or less according to his or her ability. For the neck and arms they choose the smallest beads they can meet with: the large ones they wear about their waist. Some wear half a dozen necklaces together, and others more, so large that they fall very gracefully to their navels. They also cover their arms with bracelets from their elbows to the wrists, and wear half a dozen or more strings of large beads of various colours about their waists. For these ornaments they freely exchange their cattle; and if they serve the Europeans, they always stipulate for some ear-rings, if they are not already provided; and whenever one of them works for an European, though it be but for a week, or even a day, he seldom fails in the agreement to article for beads.

It is also an invariable custom among the men, who have distinguished themselves by their bravery, to wear the bladders of the wild beasts they have slain, blown up and fastened to their hair, where they hang as honourable trophies of their valour.

But with this finery the men do not think themselves completely dressed, unless their hair be lavishly powdered with a pulverized herb called buchu; and this being done, they are beaus and grandes, and appear in their utmost magnificence. As the hair of the women is constantly hid under their caps, they lay this powder as thick as they can upon their foreheads, where being rubbed into the grease, it sticks very firmly. The women also paint their faces with a red earth, with which they make a spot over each eye, one upon the nose, one upon each cheek, and one upon the chin. These red spots they consider as striking beauties, and therefore this is their constant practice, when they are called to a mirthful assembly, or intend to make a conquest: but whatever attractions the men among the Hottentots may perceive in a woman thus painted, to an European they appear perfectly frightful.

The men have usually in their hand, especially when they go abroad, a small stick about a foot long, at one end of which is fastened the tail of a wild-cat, fox, or other wild beast that has a bushy tail; and this they use as an handkerchief to rub the sweat off their faces, to wipe their noses, and clear away the dust and dirt that gather about their eyes. When this tail is covered with sweat and filth, they plunge and toss it about in water till all is washed off.

The Hottentots have been represented by some authors as being scarce above the level of the brutes, and as having neither understanding, nor any sense of order or decency, and as scarce possessing the least glimpse of reason and humanity: but this is far from being true. "I have known many of them," says the learned and judicious Mr. Kolben, who understood Dutch, French, and Portuguese to a degree of perfection; and one I knew who learnt English and Portuguese in a very short time, and having conquered the habits of pronunciation contracted from his native language, was said, by good judges, to understand and speak them with surprising readiness and propriety."

They are esteemed at the Cape the most faithful servants in the world, and the Europeans there are so pleased with them in that capacity, that they are loth to part with them. Though they are extremely fond of cutlery ware, wine, brandy, and tobacco, and will at any time part with the most valuable things they have to purchase them; yet they will neither diminish them themselves, nor suffer any one else to diminish the least drop or part of those commodities, when they are committed to their trust; and the care and fidelity with which they acquit themselves on these occasions is really surprising. They are even employed by the Dutch in affairs that require judgment and capacity.

Nothing can give us a juster idea of a people, than seeing how they act on particular occasions; since this more perfectly shews their capacities, tempers, and dispositions, than the most elaborate disquisitions and explanations; with this view we give the reader the following little history.

An Hottentot named Claas was a man of such integrity and discernment, that he was often, says Mr. Kolben, entrusted by Mr. Vander Stel, the late governor of the Cape, with large quantities of wine, brandy, rice, and other commodities, and directed to exchange them for cattle among the Hottentot nations at a great distance from the Cape, attended by a guard of two armed men belonging to the governor. These commissions he executed with address and reputation, and generally returned the governor more and finer cattle than the commodities he carried out could be judged to be worth. To these qualities he joined the greatest humanity and good nature; and, notwithstanding the ignorance in which he was bred, and in which, with respect to religion, he always lived, was a man of excellent morals, and had, perhaps, as much charity and benevolence as the best of us all. Many an European in distress has been relieved by this generous good-natured creature, who, by means of a handsome stock of cattle, in which the wealth of the Hottentots consists, was well able to supply their wants.

This Claas was descended of a family rich in cattle, and the herd he had received from his father was, by his care and prudent management, considerably increased. He usually resided at a distance from the Cape, where he lived very happily with his wife, whom the Hottentots esteemed a great beauty. She loved him tenderly; but her love awakened the envy of the king or captain of his nation, who resolving to possess her, and being unable to shake her constancy, took her away by force. Claas being unable to obtain any relief against so powerful a ravisher, (the Dutch never intermeddling in the private quarrels of the natives) bore his misfortunes like a wise man, suppressed his grief, and troubled none with his complaints: but his wife gave full scope to her resentment, and equally regardless of threats and flatteries, deafened the tyrant with her continual reproaches. He shut her up, and, after trying every art to quench her affection for her husband, resolved on his destruction.

Claas had cherished the Dutch, and in a very extraordinary manner contributed to their establishment at the Cape: but his zeal for their service, which had even reached the city of Amsterdam, had procured him many enemies among his countrymen: but he had enemies still more dangerous; these were the governor's people, who had before been entrusted to traffic with the Hottentot nations, and had embezzled the goods delivered them to trade with. None of them returning with cattle that bore any proportion in number or value to his, the

governor had set them aside, and committed the whole business to Claas, who had now managed it for a considerable time with the highest reputation. These hating the man whose integrity was a bar to their fortunes, had conspired his destruction; and knowing how eagerly it was sought by the Hottentot chief, who had already injured him in a tender part, they made him of the conspiracy. It was resolved, that the ravisher should give information that Claas was endeavouring to raise an insurrection against the Dutch, in order to drive them out of the country; and as his father, who was lately dead, had left him such a number of cattle, that he was esteemed one of the richest Hottentots in the country, it was farther resolved, that the ravisher should accuse Claas to the governor of embezzling his excellency's commodities, and defrauding him of a great number of cattle, by which means he had acquired such wealth.

Information was accordingly given, and the governor, who had a thousand times declared his satisfaction at this worthy man's fidelity and affection for him and the settlement, either not suspecting the trick, or longing for the great herds of cattle that would fall to him on his conviction, ordered the ensign of the garrison, who was the arch-conspirator, to march with a party of soldiers, in order to seize and bring Claas before him. The honest creature was then at the village where he usually resided, and the ensign and his party arriving there early in the morning, before any of the inhabitants were stirring, caused a volley of shot to be fired into the cottages. Claas fellied out upon the alarm, and knowing the assailants, addressed himself in Dutch to the ensign, demanding the reason of such an insult on the village.

The ensign replied, they were come to seize and carry him before the governor, to answer to a charge of conspiracy against the Dutch; and calling upon him to surrender, Claas returned, "I, Sir, conspire against the Dutch! I, who have given so many proofs of my zeal and affection for them! I, who have served them so long and so faithfully!" The ensign replied, it was not his business to expostulate with him; and, if he did not instantly surrender, he would fire upon him. "Is it true then, returned Claas, that there is such a charge against me?—But what then have these done? Sir?" (pointing to the men, women, and children of the village, who were now assembled in a great fright) "what have these done, that their innocent lives should be exposed to your fire? Are they too charged with a conspiracy against the Dutch? If I am only concerned, Sir, it was surely great rashness to attack them. Besides, was I upon my defence? Or, am I in a post of defence? Did you, before your fire, send me notice of your arrival? Did you summon me to surrender; and did I refuse? There is hardly a man that I would have sooner chosen than yourself for a judge of my fidelity to the Dutch, and of the warmth of my heart for their service. I have given so many proofs of both, and so many of these have passed through your own hands, that I can neither see how you, nor any one else, can entertain a doubt about them."

The ensign commanding him silence, summoned him again to surrender, upon pain of immediate death. Claas then came forward, adding, that as he was innocent he feared no trial, and they might carry him where they pleased: upon which they bound him with ropes, the greatest ignominy next to a shameful death, that can befall a Hottentot, and then led him away.

This worthy injured man being brought before the governor, denied every thing laid to his charge with serenity of temper; he refuted the allegations of the pretended witnesses with the utmost strength of reason, and rehearsed many recent instances of his fidelity and affection to the governor and the settlement; while his accusers could only produce the suggestions of malice, without the least air of proof. The people soon saw that all was a base conspiracy to ruin him; but observing by the governor's behaviour that he would not see it, they did not think it safe to attempt publicly to detect the conspirators. In short, Claas was, upon the bare suggestions of his enemies, convicted before the governor of every charge brought against him: he was instantly banished for life to Robben Island; his effects were confiscated;

and this unjust sentence was immediately put in execution.

The infamous ensign was now appointed to succeed Claas in trading for the company with the Hottentot nations for cattle: but, by his perfidious management, the abilities and integrity of Claas daily became more illustrious. Being soon suspected of breach of trust, he was put under such restrictions as took away all the honour of his employment; and at length, by his folly, arrogance, and knavery, the Hottentots raised their markets, and the price of cattle was so enhanced to the company, that the directors put a stop to all commerce with the Hottentots, and ordered that all supplies of provisions for the use of the company should be purchased of their own burghers at the Cape.

We have already mentioned the humanity of Claas: among others who had tasted of his hospitality, and felt and blessed his bountiful hand in the time of their misfortunes, was captain Theunis Gerbrantz Vander Schelling, who having lost his ship in the bay of Algoa, on the eastern coast, was forced to go by land to the Cape, through several Hottentot nations, and to subsist on the charity of the people. In this distress he was met by Claas, who entertained and relieved him in so bountiful a manner, that, to the honour of the captain for his gratitude, as well as of the Hottentot for his hospitality, he delighted to tell the story; and upon the repair of his broken fortune, which was not effected till after the death of Claas, would be ever expressing his sorrow, that the generous creature was dead to whom he owed a thousand returns of kindness. This gentleman was indeed at the Cape in the time of Claas's troubles; but was then unable to assist him. However, he saw how matters were carried against him, and upon his arrival in Holland made such representations to the directors in his favour, that by the first opportunity they dispatched orders to the Cape for the recalling of Claas, and restoring all his effects. He was accordingly recalled; but as for his cattle, the wolves by whom they had been seized, could be brought to restore only a very small part. He, however, repaired very contentedly with the trifles that were allowed him to his old seat; but was soon murdered by the Hottentot chief, who found the possession of his wife extremely precarious while her husband was living; and the Dutch never intermeddling between the Hottentots in affairs wherein they themselves are not concerned, the ruffian was never called to an account.

To return to the character of the Hottentots in general: Notwithstanding what has been said of them, they seem to place all human happiness in sloth and indolence. They can think to purpose if they please; but they hate the trouble of thought, and look upon every degree of reasoning as a disagreeable agitation of mind: they therefore never exert their mental powers but in cases of necessity; that is, when it is necessary to remove some pressing want of their own or their friends. If the Hottentot be not roused by any present appetite or necessity, he is as deaf to thought and action as a log; but when thus urged, he is all activity. Yet when these are gratified, and his obligation to serve is at an end, he retires to enjoy again his beloved idleness.

S E C T. IX.

Of their Food, their Manner of dressing it, and their Regulations in Relation to Things forbidden. Their fondness for Tobacco, Ducha, the Kanna Root, Wine, Brandy, and Arrac.

SOME authors pretend, that all the Hottentots devour the entrails of beasts, uncleansed of their filth and excrements, half broiled; and that whether sound or rotten, they consider them as the greatest delicacies in the world: but this is not true. When they have entrails to eat, they turn and strip them of their filth, and wash them in clean water. They then boil them in the blood of the beast, if they have any; if not, they broil them on the coals. This, however, is done in so nasty a manner as to make an European loath their victuals. They have, indeed, been represented as the most filthy people with-
respect

respect to their food in the world ; but this is not true, they being exceeded in nastiness by the Kamptschadales, and even the inhabitants of St. Kilda, who are fond of putrid fish and rotten eggs. However, uncleanly as their manner of dressing their provisions is, those who keep to the diet of their country have few diseases, are seldom sick, and live to an extreme old age. But those who drink wine, brandy, or other strong liquors, suffer diseases before unknown to them, and shorten their days : even the meat dressed and seasoned after the European manner is very pernicious, with respect to them.

The provisions of the Hottentots consist not only of the flesh and entrails of cattle, and of certain wild beasts, but of fruit and roots. Except upon solemn occasions, they seldom kill any cattle for their own eating ; but readily feed upon those that die naturally. The women furnish them with fruit, roots, and milk ; and when they are not contented with these, the men go a hunting, or, if they live near the sea, a fishing. They boil the flesh of their cattle in the same manner as the Europeans ; but their roasting is very different, and is performed in the following manner : a large flat stone being fixed on the ground in the manner of a hearth, a brisk fire is made upon it, which burns till the stone is thoroughly heated : the fire is then removed, the stone cleaned from the ashes, and the meat placed upon it. It is then covered with a flat stone, as large as that upon which the meat lies. They then make a fire both round the meat and upon the stone which covers it, and thus it remains till it is roasted, or rather baked.

They love to eat their meat very raw, and do it in such a hurry, tearing it in pieces with their fingers, in a manner that makes them look extremely wild and ravenous. They use the lappets of their crossas as plates, and their spoons are mother of pearl and other sea-shells, but they put no handles to them.

They eat many sorts of roots and fruit, in the choice of which they follow the hedge-hog and the bavian, a kind of ape, and will taste of no sort which those creatures do not feed upon ; for in the country are many fruits that appear very agreeable to the eye, and many roots which promise well for food, that are of a poisonous nature.

They never pass their milk through any kind of strainer, but drink it settled or unsettled from the vessel in which it was received from the cow. In this they boil the roots they eat, making of the whole a kind of pap.

Their manner of making butter is extremely filthy ; instead of a churn they use the skin of a wild beast, made up into a sort of sack, with the hairy side inwards. Into this sack they pour as much milk as will about half fill it, then tying up the sack, two persons of either sex take hold, one at each end, and toss the milk briskly to and fro, till it becomes butter. They then put it in pots, either for anointing their bodies, or for sale to the Europeans ; for none of the Hottentots, except those in the service of the Europeans, ever eat any butter. This butter is extremely foul with the hair and other filth that sticks to it, as well as with the grease and dirt that continually sticks to the hands of the Hottentots ; but though the sight of it is enough to make any one sick, yet there are Europeans at the Cape who buy it in large quantities ; and having the art of purging it of its filth, make it look like the butter of Europe. The greatest part of what they have so cleansed they sell to great advantage to masters of ships and others, as butter of their own making, and the rest they eat themselves. These Europeans, exceeding even the Hottentots in nastiness, give the dregs and refuse of this filthy butter to their servants and slaves to eat : though the Dutch governor at the Cape publishes, from time to time, an express order to the contrary, for fear the health of the people should be injured by mingling such foul unwholesome butter in the ordinary diet of the servants. The butter-milk, foul and hairy as it comes from the sack, the Hottentots give to their calves and lambs ; and, though they never strain it, they sometimes drink it themselves.

The Hottentots have no set times for their meals, but eat as humour or appetite invites, without any regard to the hour of the day or night. In fair and calm wea-

ther they eat in the open air, but when it is windy or rainy they eat within doors.

It is remarkable, that they have traditionary laws forbidding the eating of certain meats, which they accordingly abstain from with great care. Swine's flesh, and fish that have no scales, are forbidden to both sexes. The eating of hares and rabbits is forbidden to the men, but not to the women. The blood of beasts, and the flesh of the mole, are forbidden to the women, but not to the men. But, notwithstanding these distinctions, both the men and the women are so very filthy as to eat lice ; and if they are asked how they can eat such detestable vermin, they cry they do it in revenge : " They suck our blood, say they, " and do not spare us ; why should not we be even with " them ? why should we not make reprisals ? "

It has been already intimated, that when pinched with hunger, they will devour the rings of leather which the women wear upon their legs. They will also, upon the same occasion, eat the old cast-off pieces of the hide of an ox or stag that have been worn for shoes, which they only dress by singeing off the hair ; then having soaked them a little in water, they broil them upon the fire till they begin to wrinkle and curl up, and then they devour them.

The Hottentots, when among themselves, never eat salt, nor season their provisions with any kind of spice : yet they are not a little delighted with the high seasoned food of the Europeans ; but such provisions are very pernicious to them, they being often sick at the stomach, and attacked by fevers, after such a meal ; and those who eat for any length of time with Europeans, become subject to many diseases. They were in no danger of experiencing while they lived in their own manner, and never attain the great age to which the Hottentots usually live.

It has been always customary with them, for the men to avoid joining with the women, not only at their meals, but in any entertainment whatever ; and there is no exception to this rule, but the indulgence that is granted to a man on his wedding-day ; for they apprehend, that some of the women may be in a state of defilement, when it is criminal for them even to come near them.

The wealthy Hottentots, when they travel, generally carry with them some flesh-meat, and being usually provided with a flint and steel, and fuel being every where to be had, they can easily make a fire in order to dress it. Those who are not provided with a flint and steel, light a fire by rubbing a dry twig upon a piece of iron-wood they carry with them. This twig they rub so quick and hard that it presently smokes, and soon after flames ; and then they light a fire by adding other fuel. If they are obliged to lie all night in the fields, they make a large fire in order to preserve themselves from the cold, and to frighten away the wild beasts. Their tinder is a dry reed, which catches fire as quick as the tinder made of the finest rags.

Both the men and women are extravagantly fond of smoking tobacco. Their passion for this plant has no bounds, for when they are without it, they will part with any thing they have to procure more. They say that nothing they eat or drink is so exquisite a regale, and that it comforts and refreshes them beyond expression. A Hottentot, who has no other means of procuring it, will perform a hard day's work for half an ounce ; and when he gets it, will hug it in a transport of joy. The Europeans at the Cape think them much better judges of tobacco than themselves ; and, indeed, by smoking a pipe out of a parcel of tobacco they will discover its good or bad qualities to a wonderful nicety, and give a particular detail of them. For this talent they are in no little esteem among the Europeans at the Cape, who seldom purchase a stock of tobacco till a Hottentot has smoked a pipe of it, and passed his judgment ; and indeed they are very proud of this office.

A Hottentot will never enter into the service of an European, except tobacco be made a part of his wages ; and he must have a certain allowance of it every day, or it is in vain to treat with him : and if the quantity agreed upon be with-held but one day, he instantly becomes untractable ; upon the like usage the day after, he demands his other wages, and can hardly be persuaded to strike another stroke for such a master.

The

The Hottentots are also extremely fond of dacha, which they say banishes care and anxiety like wine or brandy, and inspires them with a thousand delightful fancies, and with this they are often intoxicated to a degree of madness: they frequently smoke dacha mixed with tobacco.

There is likewise a root gathered in the Hottentot countries called kanna, which is so highly esteemed for its great virtues, that they almost adore it; and what greatly enhances its value is its scarcity, for it is very seldom found. They consider it as the greatest cheerer of the spirits, and the noblest restorative in the world. They will any of them run twenty miles upon an errand for a very small bit of it; and if you give them the least chip, they will run and serve you like a slave for so charming an obligation. Mr. Kolben says, he distributed a bit of this root not bigger than his finger, in small chips, to several Hottentot families, near which he resided, and so gained their hearts by these little presents, that from that time till the time he left them, they sought all opportunities to oblige him.

Several authors have supposed this to be the ginseng of the Chinese, and indeed it has surprising effects in raising their spirits, for they scarcely begin to chew it before their eyes brighten, their faces assume an air of gaiety, and their imaginations are greatly enlivened: but it is not certain that it has the medicinal virtues ascribed to ginseng.

The Hottentots are great lovers of wine, brandy, and arrac. For wine they never trouble themselves about its qualities, if it has but the taste of the grape. They are immoderately fond of brandy, because it soon makes them merry; but apprehend that malt-spirits are not so wholesome, and therefore they drink little of them: but as arrac is cheaper at the Cape than brandy, they frequently drink it to excess, and even boast of it the next day as an extraordinary honour.

However, the ordinary drink of the Hottentots is milk and water, for they have nothing better of their own, and cannot afford to make a large purchase of wine or brandy. When they are plentifully provided with milk, they often drink it without water; and when they have no milk, they are contented with water alone.

SECT. X.

Of their Huts and Furniture, with the Form of their Villages, and the Manner in which they are guarded by Dogs and fighting Oxen. Of their Management with respect to their Cattle, and their Dexterity at several Arts.

WE shall now describe the manner of building their huts, and disposing of their villages. The huts are all oval, about fourteen feet the longest way, and the shortest about ten; formed of sticks, one end of which is fixed in the ground, and the other bent over the top, so as to form an arch, but they are seldom so high as to allow a man to stand upright within them. The arches being fixed and made steady by crossing them with bent sticks, tied with a kind of rope made of rushes, the whole is covered with mats made so fast to each other, and to the sticks, as not to be removed by the wind and rain. Those of the wealthy Hottentots have also a covering of skins. These huts have no other opening but at the entrance, which is also arched, and no more than about three feet high. On the top of this entrance is fixed a skin, which may be let down in order to keep out the wind, or taken up to admit the light; and this is also the only passage for their smoke.

Their furniture consists of earthen pots for dressing their victuals, and several other vessels for holding water, milk, and butter. Their bed is a skin spread in a hole sunk a little below the surface of the ground, and their fire-place a hole made in the middle of the hut. The huts of the wealthy are frequently hung with beautiful skins, and a variety of trinkets. A village consists of twenty or more of these huts placed near each other in a circle, leaving an area in the middle, each village containing from one to three or four hundred persons. Though all the Hottentot huts are narrow, dark, and filthy, har-

mony, that heavenly charm, so seldom found in the palaces of Europe, continually reigns in almost all of them. When a difference arises between a man and his wife, it is soon accommodated; all their neighbours instantly interpose, and the quarrel is speedily made up. The Hottentots run to the suppression of strife when it has seized a family, as we do to put out a fire that has seized a house, and allow themselves no rest till every matter of dispute is adjusted, and peace and tranquility restored.

There is hardly a hut that has not a dog or two belonging to it, and these are extremely cherished by their masters for their fidelity and good services. These dogs they allow to sit about the fire with them, but turn them out every night to guard their cattle, who encompass the village on every side; and this office the dogs discharge with great watchfulness and courage.

A dog is the only domestic animal the Hottentots have, and he is so necessary, that they can by no means do without him; but though the dogs of the Hottentots have a thousand good qualities, there is nothing in their appearance that indicates anyone of them; for their mouths are pointed, their ears erect, and their tail, which is long and slender, they drag on the ground; their hair, which is thin, but long, points every way, and falls no where sleek upon their bodies.

The Hottentots have also what they call backeyleys, or fighting oxen, which they use in their wars, as some other nations do elephants; and these, as well as their dogs, are of great use in the government of their herds at pasture, for upon a signal given they will fetch in stragglers. Every village has at least half a dozen of these oxen; and when one of them dies, or grows so old as to be unfit for service, the most stately young ox is chosen out of the herd, and taught to succeed him. The backeyleys know every inhabitant of the village; but if a stranger, and particularly an European, approaches the herd without having with him an Hottentot of the village to which they belong, they make at him full gallop, and if he is not within hearing of any of the Hottentots who keep the herds; if there is not a tree which he can immediately climb; or if he has not a light pair of heels, or a piece of fire-arms, he is certainly slain: but they no sooner hear the whistling of the keepers thro' their fingers, or the report of a pistol, than they return to the herds.

The Hottentots have likewise great numbers of oxen for carriage, which they break with such art, that they render them as obedient to their drivers, as a taught dog in Europe is to the commands of his master. When the Hottentots remove their villages, they convey the materials of their huts, with their furniture, on the backs of these oxen.

It is necessary to observe, that all the cattle of a village run together, and the meanest inhabitant who has but a single sheep has the privilege of turning it into the flock, where as much care is taken of it as of the sheep of the richest and most powerful of the village. They have no particular herdsmen or shepherds for driving their cattle to the pasture, and guarding them from wild beasts. This is an office which they all take upon them by turns, three or four of them together, while the women milk the cows morning and evening. In the area of the village they lodge the calves and all the small cattle, and on the outside range their great cattle, tying two and two together by the feet. These are in the night guarded by the dogs.

The Hottentots are extremely expert at several arts: they with surprising dexterity cut out the hide of a beast in an even strap many yards in length: they make mats of great strength of flags and bulrushes, and form handsome earthen pots of the mould of ant-hills, in which the bruised eggs form a surprising cement. They make this earthen-ware on a smooth flat stone by hand, as our pastry-cooks do a pye, in the form of a Roman urn: they let it dry in the sun, and then burn it in a hole made in the earth by making a quick fire over it. These pots are as black as jet, and of a surprising firmness.

The Hottentot ropes are made of flags, reeds, and bulrushes dried in the sun; and are as strong, neat, and durable as the best European ropes made of hemp. The flags, &c. are twisted separately into small strings, and tied afterwards at the length of four yards: these lengths are

are afterwards twisted one round another to the thickness of an inch and a quarter. Though they make them only with their hands, frequent experiments have been made of the strength of these ropes, which no pair of oxen could ever break.

The instruments they use for sewing their skins are, the bone of a bird, for an awl; split sinews, or the veins of the back-bones of cattle dried in the sun, for thread; and a knife for scraping the cross-grain.

They dress their sheep-skins, or those of their wild beasts, while warm, by repeatedly rubbing them only with fat, when they are to be sold to an European; and with cow-dung and fat alternately, when they do it for themselves. Their hides are tanned by rubbing wood-ashes into the hair, which they afterwards sprinkle with water, and lay them rolled up in the sun. In two days time he opens the hide, and if he finds the hair loosened, plucks it off: if it sticks fast, he rubs it again with ashes, and having sprinkled it with water, rolls it up again, and lays it up for two days more in the sun. A second time never fails to loosen the hair, and that being taken off, he rubs as much fat as he can into the hide, labouring and currying it with all his might, till it has received a full dressing.

The ivory workers make ornamental rings for the arms: a knife is the only tool; and yet the rings, when finished, are as round, smooth, and bright, as the most expert European can produce.

They point their weapons with iron, which they even draw from the ore; for this purpose they dig a hole in a raised piece of ground, and at about a foot and a half on the descent from it make another of less extent, to receive the melted iron, which is to run into it by a channel made from the bottom of the upper hole. In the first hole they kindle a fire, and when the earth about it is sufficiently heated, put in the iron-stone, and make a large fire over it, which they supply with fuel till the iron runs into the receiver. When the iron is cold they take it out, heat it in other fires, and laying it upon one stone beat it with another, and thus form their weapons; after which they grind and polish them upon a flat stone so neatly, as to render it valuable both for its use and beauty. This ingenuity, which perhaps could not be equalled by an European smith with the same tools, is not wholly inconsistent with their habitual indolence; for a poor Hottentot having made a set of arms for his own use, and another for sale to a rich one, by which means he procures two or three head of cattle, can hardly ever be induced to apply himself to the same labour again.

They are likewise very dexterous swimmers; but perform this in a manner different from other nations; for they beat the water with their feet, and raising themselves erect, paddle along with their necks and arms above the surface. They thus not only cross deep rivers, but proceed with great swiftness in the sea, dancing forward without the least apprehension of danger, in the manner which our swimmers call trading the water, rising and falling with the waves, like so many corks.

They are also very expert at fishing both in the sea and in the rivers; they are well acquainted with angling, and know the best baits for most sorts of fish. Before they became acquainted with the Europeans, their hooks were made by themselves; but now they are generally well provided with European fish-hooks. They are esteemed by the Europeans extremely dexterous at drawing a net. They use the spear in creeks and rivers, and are also very expert at taking of fish by groping or tickling, which they do in brooks, and the creeks and basins formed by nature among the rocks, in which are frequently found many fish upon the fall of the tide.

SECTION XI.

Of their offensive weapons, and the amazing skill with which they use them. Of the Manner in which they hunt the Elephant, Rhinoceros, Lion, Tyger, &c. The Art with which they intrap Elephants, and their Method of making War.

THE dexterity of the Hottentots in discharging an arrow, and throwing what they term the hassagaye

and rackum-stick, is very amazing. A Hottentot arrow consists of a small tapering stick, or cane, about a foot and a half in length, pointed with a thin piece of iron bearded, and joined to the stick, or cane, by a barrel. Their bows are made of olive or iron wood, and the strings of the sinews or guts of beasts fastened to a strong wooden or iron hook at each extremity of the bow. The quiver is a long narrow bag made of the skin of an elephant, ox, or elk, and slung over the shoulder by a strap fastened to it: on the upper end of the quiver is fixed a hook, on which the bow is hung when they go to war or to the chase. The hassagaye used by them is a kind of half pike; the shaft is a taper stick of the length and thickness of a rake handle, armed at the thickest end with a small thin iron plate, tapering to a point, and very sharp on the edges. The rackum-stick is a kind of dart, little more than a foot long, made of hard wood.

In the use of these weapons the Hottentots shew such quickness of eye, and sureness of hand, as perhaps no people upon earth have besides themselves. If a Hottentot sees a hare, wild goat, or deer, within thirty or forty yards of him, away flies the rackum-stick, and down falls the animal. They are equally expert in the use of the bow and arrow; for if there be no wind, they will hit a mark of the size of a silver penny at a considerable distance. They are no less perfect in throwing the hassagaye and slinging a stone. In all these cases they do not, like the Europeans, stand like statues to take their aim; but while they gather it, which they are not long in doing, they skip from side to side, and brandish and whirl the weapon about in a manner that seems nothing more than idle flourish; but on a sudden away it flies to the mark. In short their amazing dexterity on these occasions can scarcely be conceived, and is quite incredible.

When all the men of a village are out upon the chase, and discover a wild beast of a considerable size, they strive to surround him, which they generally do very soon, even though the beast takes to his heels. If they thus encompass a rhinoceros, or an elephant, they attack him with hassagayes; for these beasts, by the thickness of their skins, are fortified against a shower of arrows. If they do not lay him dead upon the spot, and he is able to return the attack upon the Hottentots, they form as large a ring as they can, so as to reach him with their hassagayes. The animal, on being wounded, runs with great noise and fury at the persons who threw the weapons. Others instantly attack him in the rear. He turns about to be revenged on the last assailants, and is again attacked in the rear. Again he turns about, and is again attacked. The hassagayes multiply upon his body. He roars, tears up the ground, and has sometimes before he falls a forest, as it were, of hassagayes upon his back.

When they thus encompass a lion, a leopard, or a tyger, they attack him both with their arrows and hassagayes. With flaming eyes, and the most wild and furious rage, he flies at those who discharge them. He is nimble, but they are still nimbler, and avoid him with amazing swiftness and dexterity, till they are relieved by others. He springs towards one with such rapidity, and you would think with so sure a paw, that you shudder for the fellow, from the apparent certainty of his being instantly torn to pieces; but, in the twinkling of an eye, the man leaps away, and the beast spends all his rage upon the ground. He turns and springs at another, and another, and another; but still in vain: they avoid him with the quickness of thought, and still he only fights with the air. Mean while the hassagayes and arrows are showering upon him in the rear. He becomes mad with pain, and tumbling from time to time to break the arrows and hassagayes fastened in his back and sides, he foams, yells, and roars in the most terrible manner. Nothing can equal the amazing activity and address with which the Hottentots escape the paws of the beast, and the incredible speed and resolution with which they relieve one another. If the beast is not quickly slain, he is soon convinced that there is no dealing with so active and nimble an enemy, and then makes off with his utmost speed; but having his back and sides transfixed with a multitude of hassagayes and arrows, some of which being generally poisoned, he can seldom run far, but falls and dies.

The Hottentots, however, seldom engage a rhinoceros or elephant in this manner. The elephants always going to water in troops in a line, make a path from the places they frequent to the water side; and in this path the Hottentots, without either spade or pick-ax, for they have no such tools, make a hole from six to eight feet deep; in the midst of which they fix a strong stake, which tapers up to a point almost to the top of the hole, and then cover the pit with small boughs, leaves, mould, and grass, so that no man living would suspect the trap. The elephants keeping pretty close to the path, one or other of them is sure to fall in with his fore-feet, when his neck or breast being pierced by the stake on which his whole body rests, the more he struggles, the farther it penetrates. The other elephants instantly make off as fast as possible. Mean while the Hottentots seeing the elephant thus caught, issue from their covert, get upon his neck, and either break his skull with heavy stones, or cut his large veins with their knives; then cutting the carcase in pieces, they carry it to the village, where all the inhabitants feast upon it. They also frequently take the rhinoceros and the elk in the same manner.

The Hottentots, like other nations, seek for redress in war upon invasions of their right and national affronts. Upon these occasions every Hottentot flies to arms, and assembles at the place of rendezvous; but before any acts of hostility are committed, deputies are dispatched to remonstrate against the injuries the others have committed, and to demand satisfaction. Upon the refusal or delay of justice, the injured nation marches in search of the enemy. The attack begins with the most frightful noise, showers of arrows are instantly discharged, the Hottentots continuing the battle in alternate sallies and retreats to the main body; for when one has discharged his arrow or hassagaye, he retreats a little to make room for another behind him, who takes his place; and, by the time his successor has discharged his weapon, has fitted to his bow another arrow, or to his hand another hassagaye; and if a third obtains not the ground before him, sallies forward and attacks again. Thus they continue sallying out, and retiring into the crowd behind, till the fortune of the day is decided, which in a great measure depends on the conduct of the chief, to whose command the whole army pays a strict and ready obedience. The conduct of the chief principally appears from his ordering when and where the backslayers, or fighting oxen, shall rush upon the enemy; for if they but once penetrate the main body, they make incredible havock, going, stamping, and kicking with incredible courage and activity; and when they are well seconded by the men, the enemy is soon routed.

Some Hottentot nations have peculiarities worthy of notice: thus the Chamtoours and Heykoms never cease fighting while their chief plays on a kind of flageolet, though their loss be ever so great; but the pipe no sooner ceases than they retreat, and as soon as he plays again march back and renew the attack. Thus if the enemy runs, and the flageolet continues playing, they pursue; but if it ceases, they let the enemy go.

Some Hottentot nations fight as long as they can see their general, and when he is slain or disappears, they betake themselves to flight.

A Hottentot army once put to the rout, has little or no notion of rallying: but they have an honesty in war peculiar to themselves; they touch not the slain of the enemy, either to insult or plunder them; for they seize neither the hassagayes, arrows, crossbats, or any thing else belonging to them. Having carried off their own slain for interment, they leave the rest to be taken from the field by the enemy, which is done as soon as the victors retire; but the prisoners taken in battle are instantly slain. They also put to death deserters and spies wherever they are found.

It ought not to be omitted, that in time of battle they ward off the arrows, hassagayes, and rackum-sticks, that are thrown at them, with the kirri, or kirry-sticks, which they only use as a defensive weapon.

In time of peace the old men frequently exercise the people in mock fights, in which they only throw a hassagaye now and then; these disputes being chiefly maintained by rackum-sticks, kirri-sticks, and stones. No-

thing can be more amazing than the dexterity with which the Hottentots ward off hassagayes, rackum-sticks, and stones, with the kirri-stick only; for a Hottentot no sooner sees himself in danger from a hassagaye, a rackum-stick, or a stone, than he stands stock still, under the guard of the kirri-stick, and with that turns it aside.

SECT. XII.

Of the Marriages of the Hottentots; their Laws relating to Divorces; their regard to Decency; their Delivery of the Women; Treatment of their new-born Children, and their Education before the Boys are made Men.

IF a person is disposed to marry, he discovers his views to his father; and if he be dead, to the next in authority of kindred; who, if he consents, attends him to the relations of the woman, whom they regale with a pipe or two of tobacco or dacha, which they all smoke. The lover's father then opens the affair to the father of the woman, who on hearing it usually retires to consult his wife; but soon returns with a final answer, which is generally favourable. If the lover's father receives a denial, which seldom happens, nothing more is said about it, and the lover at once tears the object of his affections from his heart, and looks out for another. But if it be complied with, he chooses two or three fat oxen from his own herd, or his father's, and drives them to the house from whence he is to take his destined bride, accompanied by all his relations of both sexes who live near him. They are received with caresses by the woman's kindred, and the oxen being immediately slain, the whole company besmear their bodies with the fat; after which they powder themselves all over with buchu, and the women spot their faces, as already mentioned, with a kind of red chalk. The men then squat on the ground in a circle, the bridegroom squatting in the center. The women assemble at some distance, and likewise squat in a circle round the bride. At length the priest who lives at the village where the bride resides, enters the circle of the men, and coming up to the bridegroom pisses a little upon him; the bridegroom receiving the stream with eagerness, rubs it all over his body, and makes furrows in the grease with his long nails, that the urine may penetrate the farther. The priest, who has for some time reserved his urine for this purpose, then goes to the other circle, and evacuates a little upon the bride, who rubs it in with the same eagerness as the bridegroom. The priest then returns to him, and having streamed a little more, goes again to the bride and scatters his water upon her: thus proceeding from one to the other till he has exhausted his whole stock, uttering from time to time to each, the following wishes, till he has pronounced the whole upon both: "May your life together be long and happy. May you have a son before the end of the year. May this son be your comfort in your old age. May he prove a man of courage, and a good huntsman."

The nuptial ceremony being thus ended, the oxen are cut in many pieces, some of which are boiled and the rest roasted in the manner already described. Dinner being over, what is left is set by, and they go to smoking, each company having only one tobacco pipe. The person who fills it, after taking two or three whiffs, gives it to his or her neighbour, and thus it goes round, the best part of the night being spent in smoking and meriment, till the bridegroom retiring to the arms of his bride, the company separate. The next day they again assemble, and feast and smoke as before; and this is continued every day till the provisions dressed on the day of marriage are consumed. Upon these occasions they have neither music nor dancing, though they are fond of both, and have only their ordinary drink, which is milk and water.

A Hottentot never has a hut of his own till after his marriage, and then his wife assists him not only in erecting it, but in providing the materials, which are all new, and in making the furniture; after which he leaves to her the care and fatigue of seeking and dressing provisions for the family, except when he goes a hunting or fishing: she also bears a part in attending the cattle.

The Hottentots allow of polygamy; but the richest have seldom more than three wives. They do not allow

of marriages between first and second cousins, and if these either marry, or commit fornication, they are immediately, upon conviction, cudgelled to death.

The men in their marriages have no view to the fortune of the bride, who has seldom any portion, but regulate their choice by the wit, beauty, or agreeableness of the woman; so that the daughter of the poorest Hottentot is sometimes married to the captain of a kraal or village, or to the chief of a nation.

A man may be divorced from his wife, and a woman from her husband, upon shewing such cause as shall be satisfactory to the men of the village where they live; for, upon suing to them for a divorce, they immediately assemble to hear and determine the affair. But though a man divorced from his wife may marry again when he pleases, yet a woman divorced from her husband cannot marry again while he lives. There is also a very singular custom, probably intended to prevent the women's engaging in a second marriage, which is, that for every husband she marries after her first, she is obliged on the nuptial-day to cut off the joint of a finger, and present it to the bridegroom, beginning at one of the little fingers.

The husband and wife have separate beds, and he never enters her's but by stealth. Before company they behave with the utmost reserve, and you would imagine there was no such thing as love or a conjugal relation between them.

Their modesty and regard to decency appears in some other instances; they are never seen to ease nature, and if an European takes the liberty to fart before them, they make no scruple of telling him he ought to be ashamed.

In every kraal, or village, there is a midwife chosen by the women of the village from among themselves, and she holds her office for life. When a woman is near her time, she is generally joined by two or three of her female relations or acquaintance; and when the midwife arrives, she lays her on a crossa, or mantle, on the ground. If her husband be at home he goes out, and cannot put his head into the hut till she is delivered, without being esteemed unclean, and forfeiting as a purification a sheep, and in some places two, to the men of the village, who eat the meat, and send the broth to their wives.

When the child is born, they first rub it gently over with cow-dung, and then lay it on a mantle either by the fire, in the sun-shine, or the wind, till it is so dry that it may be easily rubbed off. While this is doing some women go into the fields to gather the stalks of what they call Hottentot figs; and bruising them between two stones, obtain the juice, with which they wash the child all over, in order to promote the strength and activity of the body. The child is then laid as before to dry; and the moisture being soaked up, or evaporated, it is besmeared with sheep's fat, or butter; and when that has soaked well into the pores, they powder it from head to foot with buchu, which they imagine has very salutary effects. But first the child's navel-string is tied with a sheep's sinew so long that it hangs down a considerable length below the knot; and there it is to remain till it rots off. The belly-band is a narrow piece of sheep-skin. The mantle on which the woman was laid, and the placenta, are buried together in some secret place.

The child is soon after named by the father or the mother, when, like the ancient Troglodytes, whose manners they seem to imitate on many occasions, they give the infant the name of some favourite beast, as Hacqua, or Horse, Gamman, or Lion.

The men are not only obliged to retire out of the sight of their wives when in labour, but while they have the menses; and upon these occasions lodge and eat with their neighbours. When the woman is fit for the company of her husband, she rubs herself all over with cow-dung, by way of purification. This being rubbed off when dry, she smears herself all over with fat, and then powdering herself with buchu, waits within to receive him. The husband having also smeared himself with fat, and dusted himself all over with buchu, enters the house, and sitting down puts many endearing questions to his spouse concerning her welfare, and the manner in which she has passed her time in his absence; makes fresh professions of conjugal love, and entertains her with all the pleasing sprightly things he is able to utter.

At the birth of the first child the parents have a solemn festival, of which all the inhabitants of the village partake; and these rejoicings, if it be a son, are far superior to those attending the birth of their other children. The parents are then very liberal in providing cattle for the entertainment of the whole village, and every one congratulates them on their obtaining an heir. If a woman has at any time twins, and they are both boys, they kill two fat bullocks, and all their neighbours, men, women, and children, rejoice at their birth, as an extraordinary blessing. The mother alone is excluded from the entertainment, and has only some fat sent her to anoint herself and her infants. But if the twins are girls, there is little or no rejoicing, and they at most sacrifice only a couple of sheep.

On these occasions they frequently practise a most cruel custom; if the parents are poor, or the mother pretends that she has not milk sufficient to allow her to suckle them both, the worst-featured of the two is either buried alive at a distance from the village, cast among the bushes, or tied on its back to the under bough of a tree, where it is left to starve, or to be devoured by the birds or beasts of prey. Barbarous as these customs are, they were allowed among the politest heathen nations. The ancient Greeks and Romans frequently exposed their children in the woods and highways, as the Chinese who pride themselves in being the most civilized people in the world do at present, and nothing but the light of the gospel has been able to abolish these customs so opposite to natural affection and humanity.

A female infant thus exposed is sometimes found by an European; when if it be dead he generally stays to bury it; but if it be alive he always carries it home; and if he is unwilling to take care of it, he easily finds those who will take it off his hands. These children always receive a good education, and extraordinary care is taken to instruct them in the knowledge of the Christian religion, to prevent their falling off to the idolatry and nastiness of the Hottentots; but these generous labours have never, it is said, been attended by any lasting effect. It has never been found that the mind of a Hottentot is to be deprived of its native bias; for these females thus educated no sooner come to years of maturity, than flying to their own people, they constantly renounce the Christian religion, with the European manners and apparel, embrace the religion and customs of their ancestors, and ever after remain with the Hottentots.

The care and education of the children, till the boys are made men, and the girls are married, is committed to the wife. In a little time after her delivery she takes the infant and wraps it in a piece of an old crossa, with the head just peeping out, and tying it on her back, carries it about, both at home and abroad, till it is able to crawl. She even suckles it on her back; for her breasts, like those of the women in some other parts of Africa, are so long, that she can toss them upon her shoulder, and the child catching hold of the nipple, sucks till it is filled. While she has the child on her back, she is generally smoking dacha, and the wind often carries such a cloud of smoke in the child's face, as one would think sufficient to stifle it. It is very diverting to see the infant, when it is a little used to it, enveloped in a cloud of smoke. It shakes its head, and fights it very briskly while it is passing; and, when it is gone, smiles, sneezes, and stares very pleasantly. When the child is about six months old, she weans it, and then frequently putting her pipe, when almost out, into the child's mouth, holds it there from time to time, till its palate is seasoned to the smoke, and it catches a fondness for the pipe which it never loses.

The children of both sexes, as soon as they can walk, run after their mother wherever she goes, except prevented by the weather. The daughters when grown up, assist their mother in gathering of roots for food, and bringing home fuel. It is in the nursery, and by the women, that the children are taught the traditions and customs of the Hottentots. The institutions and opinions of their ancestors, of which the women are the grand repositories, are there fastened upon their memories, and there recommended to all their veneration, and to all their care.

S E C T. XIII.

Of the Custom of depriving the males of the left Testicle; the Ceremony of receiving them into the Society of the Men; the Honours paid to a Man who has singly killed a wild Beast; and the Ceremonies of their public Rejoicings: their removing their Villages; their Funerals; and their cruel Treatment of the Superannuated.

ONE of the most extraordinary customs observed by these people, is depriving all the males of the left testicle, which is generally performed at eight or nine years of age; but the poverty of the parent sometimes occasions its being deferred till the youth is eighteen years old, for it is attended with some expence.

This cruel ceremony is performed in the following manner. The patient, being first smeared all over with the fat of the entrails of a sheep newly killed, lies on the ground upon his back; his hands are tied together, as are his feet; on each leg and arm kneels a friend, and on his breast lies another. Being thus deprived of all motion, the operator, with a common knife well sharpened, makes an orifice in the scrotum an inch and a half in length, and squeezing out the testicle, speedily cuts and ties up the vessels. Then taking a little ball of the size of the testicle of sheep's fat, mixed with the powders of salutary herbs, particularly of buchu, he puts it into the scrotum, and sews up the wound with a fine slip of a sheep's sinew and the bone of a fish, shaped like an awl. The wound being thus sown up, the friends of the patient planted on his legs, arms, and breast, rise, and his hands are loosened. But before he offers to crawl away, the operator anoints him all over with the still warm and smoking fat of the kidneys and entrails of the sheep killed on this occasion; after which he administers the customary ceremony of scattering his water all over him with a plentiful stream, reserved for the occasion. The ceremony being now over, the patient is left lying on the ground, and is abandoned by every one; but near the place is a little hut, previously erected as a sort of infirmary; into this he crawls as soon as he can, and there remains about two days without any kind of refreshment; in which time the wound, without any fresh application, is finely healed, and his vigour returning, he sallies out with the speed of the wind over the neighbouring plains, in testimony of his recovery. Those who have never been under the knife are not permitted to see the operation.

When the operator and assistants abandon the patient, they repair to the house of his parents, where all the men of the village immediately assemble to congratulate them, and feast on the sheep that was killed on this occasion. They boil and eat the meat, and send the broth to their wives. The remainder of the day, and all the next night, are spent in smoking, singing, and dancing. The next morning they anoint their bodies with the remaining fat of the sheep, dust their heads with buchu, and return home, the operator receiving a present of a calf or lamb for his trouble.

This operation is supposed to contribute to the agility of the Hottentots. They have also a prevailing opinion, that a man with two testicles constantly begets two children, and, besides, think it so extremely indecent and wicked for a man or youth to cohabit with a woman before the performance of this operation, that was any man to do it, both he and the woman would lie at the mercy of the rulers, and the woman would perhaps be torn to pieces by her own sex.

But before they marry there is also a second act of legitimation, which is the receiving them with much ceremony into the society of the men. Till they are about eighteen years of age they are confined to the tuition of their mothers, and constantly live and ramble about with them. During this time they are not even to converse with their own fathers, or any other men; but, by this act they are freed from the tuition of their mothers, banished from their society, and from thenceforward are to converse with men. When a father, or the gene-

rality of the men of a village, resolve to call a young man into their society, all the inhabitants assemble in the midst of the village, and squat down in a circle. The young fellow to be admitted stands without the circle, and is ordered to squat upon his hams, and then the oldest man of the village rises, and asks, if the youth shall be admitted into their society, and made a man. To this all answering, Yes, yes; he leaves the circle, and stepping up to the youth, tells him that the men having esteemed him worthy of being admitted into their society, he is now to take an eternal farewell of his mother, and all his puerile amusements. That if he is but once seen talking to his mother, and does not carefully avoid her company, he will be considered as a child, and unworthy of the conversation of the men, from which he will be banished; that therefore all his thoughts, words, and actions, must now be manly. This he repeats, till he judges that he has fixed these admonitions in his mind. The youth having before well daubed himself with fat and foot, the old man discharges a stream of urine all over him, which the youth receives with eagerness and joy, making furrows with his long nails in the fat upon his body, he rubs in the briny fluid with the quickest motion. The old man having given him the last drop, utters aloud the following benedictions, "Good fortune attend thee. May'st thou live till old age. May thy beard speedily grow, and thou increase and multiply."

The youth is then solemnly proclaimed a man, and all the men feast upon a sheep provided by his friends, part of which is boiled, and part roasted; but the youth himself is not permitted to join the company, till near the end of the entertainment. If after this he is ever seen eating and drinking with the women, he is treated with the utmost contempt; he then becomes the jest and derision of the whole village, and is excluded from the conversation of the men, till the ceremony is performed over again.

A young Hottentot thus freed from his mother's care, may be so brutish and unnatural as to cudgel her, merely to shew his independence. It is even common for a young fellow, on his being admitted into the society of the men, to go and abuse his mother; and as a proof of the sincerity of his intentions to follow the admonitions he has received, to insult and triumph over her, on his being thus discharged from her authority.

The father having his son now immediately under his care, he compleats his education, by initiating him into all the manly exercises practised by the Hottentots; he instructs him in the use of their weapons, trains him up to war and to the chase; and if he is master of any handicraft, he teaches it him.

It has been already observed, that some of the Hottentots have a kind of honourable distinction in being allowed to wear bladders tied to their hair, as trophies of their valour; these are the persons who having singly encountered an elephant, rhinoceros, lion, tyger, leopard, or elk, are considered as heroes. Such a man, on his return home, squats down, but is soon visited by an old man, deputed by the rest of the village, to thank and congratulate him upon his having performed so beneficial an exploit, and to acquaint him, that the men of the village expect him, that they may confer on him the honours that are his due.

The hero instantly rises, and attends the messenger to the middle of the village, where all the men wait for him, and squatting down upon a mat spread for that purpose, all the men squat round him, while the hero's face is flushed with joy. The deputy then marches up to this distinguished person, and pours a plentiful stream of his own water all over him from head to foot, pronouncing over him certain terms, the meaning of which is not known. The brave man, as in other cases, rubs in the smoking stream upon his face, and every other part, with the extreme eagerness. The deputy then lights his pipe, and having taken two or three whiffs, gives it to whosoever he pleases in the circle; who having taken the same solace, gives it to another, and thus it goes round till only the ashes remain, which the deputy shakes upon the hero, who rubs them into the fat on his body with an eager motion, as if he would not lose a single particle.

The

The circle then rises, he follows their example, and every one congratulates him on the high honour he has received, and thanks him for the service he has done his country. The hero now considers himself as raised to the summit of human glory; and by the bladder of the beast he has killed, which he wears fastened to his hair, and the majestic port he ever after assumes, demands the homage and respect which the custom of the Hottentots assigns to his high dignity, and which he constantly receives from all his countrymen. The death of no wild beast gives such joy to the Hottentots as that of a tyger.

They have also some ceremonies of a general concern, as upon the overthrow of an enemy; on a considerable slaughter being made of the wild beasts that devour their cattle; on the removal of a village when the pasture becomes too barren to support their flocks and herds; to propitiate the deity when a disease prevails among their sheep, and when an inhabitant dies either by a violent or natural death.

When they intend to make a public entertainment, they erect in the center of the village a kind of booth, or arbour, sufficient to entertain in a commodious manner all the men, and this is made of new materials, alluding to their design of beginning on such occasions to lead a new life. On the morning of the day appointed for the solemnity, the women and children go into the valleys in search of the most beautiful and odoriferous herbs, flowers, and boughs of trees, and with these adorn the booth. The men kill the fattest bullock, part of which is roasted, and the other boiled. The men eat it in the booth, and the women are obliged to be satisfied with the broth alone. They then begin to smoke and dance, while a band of music composed of a kind of flutes formed of reeds, and a sort of drums, strike up at proper intervals. Some sing, others crack their jokes, and mirth triumphs in peals of laughter; but notwithstanding their being excessively fond of strong liquors, yet little or none of any sort is seen in these solemnities, which usually continue the remainder of the day, and the greatest part of the night.

When they are determined to remove a kraal, or village, on account of the barrenness of the pasture, they kill a fat sheep: part they roast, and part they boil, sending to the women the usual regale of broth. The feast is conducted with a great deal of mirth and good humour; and is considered as a thank-offering for the bounties of nature enjoyed in that place. When they have done, they demolish their cots, pack up their furniture, and remove at once, the men in one body, and the children in another, to the place appointed for a new settlement, where being arrived, in about two hours time they erect their circular village, and dispose of their furniture. A sheep is then killed by the women, and dressed as before; but they now eat the flesh themselves, and send their husbands the broth. Having anointed their crossas or mantles with the fat, they powder their hair with buchu, and go to several diversions among themselves, which they continue the rest of the day, and till pretty late at night. The sheep is here said to be considered as a sacrifice, and the unctions and powderings, as religious formalities, necessary to procure the prosperity of the village.

We shall now give those ceremonies that attend a person's departure out of life. When a man, woman, or child, is in the agonies of death, the friends and relations set up a terrible howling, and the breath is no sooner out of the body, than they form so dreadful a chorus of screaming, yelling, roaring, and clapping of hands, that it is impossible for an European to stay with safety to his brains, in the village.

The corpse is instantly wrapped up, neck and heels, much like the posture of a child in the womb, in the crossa of the deceased, so close, that no part of it is to be seen. The grave is generally either a cleft in the rock, or a hole made by a wild beast; for the Hottentots never dig one, when either of these is to be found at a convenient distance.

The burial is performed about six hours after the person's death, and the corpse being ready to be brought out, all the men and women of the village, except those who are employed about the corpse, assemble be-

fore the entrance of the hut, and squatting in two circles, the men forming one, and the women the other, they clap their hands, crying in most doleful accents, Bo, bo, bo, or Father, father, father. The covering of the hut being removed, the corpse is brought out from the back part of it; for it must not be taken out at the door. The bearers being first named by the captain of the village, or by the relations of the deceased, carry the body in their arms. When it is brought out of the hut, the circles before the door rise, and follow it to the grave, the men and women in separate bodies, all the way wringing their hands, howling out, Bo, bo, bo, and putting themselves in postures that appear so ridiculous, that it is difficult for an European who is present to forbear laughing. Having put the corpse into the hole, they fill it up with the mould of ant-hills, that it may be the sooner consumed, and cram stones and pieces of wood into the grave, to prevent its being devoured by wild beasts.

All the people then return to the village, and squatting again in two circles before the door, continue their lamentations for about an hour longer, till the word being given for silence, two old men, the relations or friends of the deceased, enter each circle, and sparingly dispense their streams upon each person, that all may have some, every one receiving their water with eagerness and veneration. Then each steps into the hut, and taking up a handful of ashes from the hearth, comes out by the passage made for the corpse, and strews the ashes by little and little upon the whole company. This they say is done to humble their pride, to banish all notions of distinction, and to shew that old and young, rich and poor, the weak and the strong, the beautiful and the disagreeable, will all be equally reduced to dust and ashes.

If the deceased left any cattle, the heir now kills a sheep, and some of his nearest relations, if they are able, do the same for the entertainment of the village. The caul of the sheep killed by the heir is well powdered with buchu, and put about his neck, and he is obliged to wear it till it drops off. The other relations likewise wear about their necks the cauls of the sheep they kill upon this occasion; these cauls being the mourning worn by the rich Hottentots. But if the relations be so poor that they cannot afford to kill any cattle for the entertainment of the village, they shave their heads in narrow stripes, leaving alternately a stripe of hair and another shaved.

The Hottentots, notwithstanding the many instances in which they shew that they are fully sensible of all the tender feelings of humanity, and of filial and parental affection, have a most horrid custom with regard to those of both sexes who are grown superannuated. While the old men or women are able to fetch in a stick a day, or can perform any office of kindness, care is taken to render their lives as easy and comfortable as possible; but when they can be of no manner of service, they are, by the consent of the village, placed in a solitary hut at a considerable distance, with a small stock of provisions within their reach, where they are left without any one to assist them, to die of hunger, or to be devoured by the wild beasts. Cruel as this custom is, they consider it as an act of mercy, and are filled with amazement at hearing the Europeans speak of it with horror.

S E C T. XIV.

Of the Government of the Hottentots; their Laws and the Manner in which they are executed.

EACH of the Hottentot nations has a chief, whose office is to command the army, and who has the power of making peace or war. His post is hereditary; but he is not allowed to enter upon it till he has solemnly engaged in a national assembly not to attempt the subversion of the antient form of government. He was formerly distinguished only by the beauty of the skins he wore; but the Dutch, soon after their establishment at the Cape, made a present of a brass crown to the chief of every nation in alliance with them, which they wear upon

upon solemn occasions: however, in time of peace the chief has little more to do than to govern the village in which he resides.

The captain of a village administers justice and preserves the peace, and in time of war has under the chief of the nation the command of the troops furnished by his village. His office is likewise hereditary, though he cannot execute it till he has entered into a solemn engagement before the people, not to alter or deviate from the antient laws and customs of the kraal or village. These village-captains were also antiently distinguished only by the fineness of the skins they wore, which were those of tigers, or of wild cats; but at present they have all a cane with a brass head given them by the Dutch, which descends along with the office. But neither the chiefs of the nation nor these captains have any revenue from the public, or any perquisite attending the execution of their office.

The captain of a village decides all disputes relating to property, and tries and punishes persons for murder, theft, adultery, and other crimes committed within his jurisdiction, he being assisted by all the men of the village, and from his sentence there lies no appeal; but state criminals are tried by a chief, assisted by all the captains of villages.

Whenever a dispute arises in relation to property, the captain summons all the men of the village into the open field, where they squat down in a circle. The plaintiff and defendant plead their own causes, and the witnesses on both sides are heard. The depositions being finished, the captain, after some debate, collects the voices, and immediately pronounces the decree according to the majority; upon which a full and quiet possession is instantly secured to the party in whole favour the decree is passed.

The criminal matters which employ the village-courts are adultery, robbery, and murder; for adultery is punished with death. When a Hottentot is known or suspected to have committed any of these crimes, notice is given to all the men of the village to which he belongs, who, considering themselves as officers of justice, watch with the utmost care in order to seize the suspected person; and it is in vain for him to think of finding sanctuary in any other Hottentot nation, for he would be taken up as a fugitive or spy. The criminal being apprehended, is secured till the men of the village can assemble, which is done the very day in which he is brought back.

The court being seated on their hams in a circle, the prisoner is placed in the middle, because the Hottentots justly observe, that in an affair in which a man's life is concerned, he ought to be allowed the best situation for hearing and being heard. The charge against him is then pronounced by the prosecutor, and his witnesses give their evidence. The prisoner then makes his defence, calling his own witnesses, who are heard with the utmost indulgence. At length the captain of the village, after some debates on the evidence, collects the voices, a majority of which acquits or condemns the prisoner. If he be acquitted, damages are assigned him out of the prosecutor's cattle: but if he be convicted, and judged worthy of death, sentence is immediately pronounced: the court rises, while the prisoner stands still without stirring a limb: for a minute or two, all is silent, till the captain flies at the prisoner, and with one blow on the head, with his kirri-slick, lays him on the ground. All the rest following his example, rush forwards, and striking him with all their strength, he in a moment expires.

Justice being thus executed, they bend the corpse neck and heels, wrap it up in his crossa, and bury it with every thing found about it, except the ear-rings and other ornaments, which are given to his family, or to his heir, who suffers nothing, either in his name, privileges, or property; for his family, relations, and friends, are treated with the same respect as before, and every thing proceeds as if no such misfortune had ever happened. Even the memory of the criminal is so far from being insulted, that his corpse is interred with the same ceremonies, and with as much pomp, as is shewn at the funeral of the richest and most virtuous among them.

All the wealth of the Hottentots descends to the eldest son, or, when a son is wanting, to the next male relation; and the younger sons, who are at home and unprovided for at the death of their father, are at the courtesy of the eldest, both with respect to their fortune and their liberty; for if a Hottentot has several sons, he can, on his death-bed, leave nothing to the younger, without the consent of the eldest. If he makes any provision out of his herd or flock, he must do it while he is in his vigour. As all the Hottentots have an ardent love of liberty, an elder brother's detaining the younger in servitude must be very painful; but such regard do the younger brothers pay to custom, that they constantly submit to it without murmuring, till the elder will give them their liberty. The elder brother, after his father's death, has the same power over his sisters: they cannot marry or leave him without his consent. He gives to each, when they marry, just what he pleases; and is not obliged to give them any thing at all. In short, the eldest son, or whoever inherits an Hottentot's cattle, is obliged to take care of the wife or wives of the deceased, till their death, or till they are married again.

Such is the government, and such the laws of the Hottentots. But it is here necessary to add, that the Dutch governor of the Cape is the arbiter of all the differences of a public nature that arise among the Hottentots; and by this means frequently prevents a war breaking out between the different nations. The chiefs often wait upon him for the renewal of their agreements with presents of cattle, and are always entertained in a very friendly manner; and receive in return for their presents of cattle, tobacco, brandy, coral, beads, and such other things as are known to be acceptable to them.

Notwithstanding what has been said of the government and laws, to which the Hottentots in general submit, there is a sort of banditti that infest all the nations about the Cape. These are troops of abandoned wretches, who, finding the laws and customs of their countries too great a restraint upon their inclinations, repair to the mountains, where securing themselves in almost inaccessible fastnesses, they fall out from time to time, in order to steal cattle for their subsistence: but these are so abhorred by all the Hottentot nations, that when any one of them is taken, though he be the eldest son of the chief of the territory, he is instantly put to death, none daring to interpose in his favour. The several nations of the Hottentots frequently send out large parties in quest of these robbers, and in this the Heycoms are more active than the rest. As these villains know that there is no mercy to be expected for them, should they be taken, they fight with the utmost fury and desperation, and a party of them seldom give way, but fight till they have either routed the enemy, or are all slain.

S E C T. XV.

Of the Religion of the Hottentots.

THE great secrecy with which the Hottentots conceal their religious opinions and ceremonies from the Europeans, long rendered their faith uncertain; but it is now known that they acknowledge, and firmly believe, that there is a Supreme Being, whom they call Gounja Gounja, or Gounja Tiquoa, or the God of Gods, the Governor of the world, endued with unsearchable attributes and perfections, who made the heavens and the earth, the sun, and every thing in them; who dwelling far above the moon, causes sunshine and rain; provides food for bodily sustenance, and skins of beasts for apparel.

But notwithstanding this belief, and their celebrating every event of life with offerings and solemnities, there is no festival or institution of worship amongst them that has an immediate regard to the true God. Their adorations are solely paid to those whom they esteem inferior deities dependant on the Supreme; for the most sensible Hottentots, when they are in a humour for answering the questions asked them on this subject, say, their first parents so grievously offended the God of Gods, that he cursed them with hardness of heart, on which account they

they know little of him, and have still less inclination to obey him.

They esteem the moon an inferior visible God, whom they call Gounja, or God, and maintain that he is the subject and representative of the Most High and Invisible. They assemble for the celebration of his worship at the change and full, let the inclemency of the weather be ever so great. They then throw themselves into a thousand different attitudes, scream, prostrate themselves on the ground, suddenly leap up, stamp and cry aloud, "I salute thee: thou art welcome. Grant us fodder for our cattle, and milk in abundance." They repeat these and other addresses to the moon, several times singing, Ho, ho, ho, with a variation of notes, accompanied with clapping of hands. Thus in shouting, singing, screaming, jumping, stamping, dancing, and prostration, they pass the whole night in worshipping this planet, which they consider as presiding over the weather.

They also adore as a benevolent deity a certain insect, said to be peculiar to the Hottentot countries. It is of the size of a child's little finger: on its head are two horns; it has two wings; the back is green, and the belly speckled with red and white. Whenever this insect appears in sight, they pay it the highest tokens of veneration; and if it honours a village with a visit, the inhabitants assemble round it with transports of devotion, singing and dancing troop after troop in the highest raptures, throwing to it the powder of buchu, with which they cover the circular area of the village and the tops of the cottages. They also kill two fat sheep as a thank-offering for this high honour, and imagine that all their past offences are buried in oblivion. If this insect ever alights upon a Hottentot, he is from thence-forward considered as a man without guilt, and ever after revered as a saint. The fattest ox is instantly killed for a thank-offering, and eaten in honour of the deity and the saint, who feasts alone on the tripe, which is boiled; while the men devour the meat dressed in the same manner, and the women are only regaled with the broth. He is obliged to be very careful of the fat, and while any of it remains must anoint his body and apparel with that alone. The caul of the beast, well powdered with buchu, and twisted like a rope, is put round his neck, and he is obliged to wear it day and night till it rots off, or till the insect at another visit lights upon another inhabitant of the village. The case is the same if the insect settles upon a woman; she instantly commences a saint, and the same ceremonies are performed; only here the women feast upon the meat, while the men are regaled with the broth.

The Hottentots will expose themselves to the greatest dangers to preserve this little animal from being injured. Mr. Kolben mentions a German, who had a country-seat about six miles from the fort, and having given some Hottentots leave to turn their cattle for a while into his lands, they removed thither with their village. A son of this German was amusing himself there, when the deified insect appeared: the Hottentots ran in a tumultuous manner to adore it, while the young gentleman resolved if possible to catch it, in order to see the effects his having it would produce. He seized it in the midst of them; but how great was the general cry and agony when they saw it in his hand! With looks of distraction they stared at him, and at each other. "See, see! cried they, what is he going to do? will he kill it? will he kill it? in the mean while every limb shook with terror. He asked why they were in such agonies for that paltry insect. "Ah, Sir, they returned with the utmost concern, it is a divinity! It is come from heaven; it is come on a good design. Ah! do not hurt it, do not offend it, we shall be the most miserable wretches upon earth if you do. This ground will lie under a curse, and the crime will never be forgiven." He seemed unmoved by their petitions, and appeared resolved to maim or destroy it; on which they stared and ran about like people frantic, exclaiming, where was his conscience, and how he dared to think of perpetrating a crime that would bring upon his head all the curses and thunders of heaven? But this not prevailing, they all fell prostrate to the earth, and with streaming eyes and the loudest cries besought him to spare the creature, and restore its

liberty. The young man now yielded, and let the insect fly; on which they capered and shouted in a transport of joy, and running after it, rendered it the customary honours.

The Hottentots also pay a religious veneration to their deceased saints and famous men, whom they honour not with tombs, statues, and inscriptions; but consecrate mountains, woods, fields, and rivers to their memory. On passing by any of these places, they stop to contemplate the virtues of the person to whose memory it was dedicated, and to implore his protection for them and their cattle.

The Hottentots also worship an evil deity, whom they imagine the father of mischief, the source of all their afflictions, and the instructor of the wicked Hottentots in the vile arts of witchcraft, by which they imagine that innumerable mischiefs are done to the persons and cattle of those who are good. They call him Touquoa, and say he is a little, crabbed, inferior captain, whose malice will seldom let him rest, and therefore they worship him, in order to avert the effects of his resentment, and wheedle him by offering him an ox or a sheep.

It is evident that the Hottentots believe that the soul survives the body, by their offering up petitions to their deceased saints, and by the custom which prevails amongst them of removing their villages upon the death of any man, woman, or child: for they believe that the dead never haunt any place but that in which they died, except any thing belonging to them be carried out of it; and then they apprehend that the departed spirit will follow a village, and be very troublesome. They therefore leave the hut in which a person died standing, without removing any of the utensils belonging to the deceased.

The Hottentots say, that their first parents came into their country through a door, and that the name of the man was Noh, and of the woman Hingnoh; that they were sent into the country by God himself, and taught their descendants to keep cattle, and do many other useful things. This tradition, which is carefully preserved among all the Hottentot nations, seems like a fragment of the story of Noah, who survived the flood, and descended from the ark by a door. They resemble the Jews in their offerings; in the regulation of their chief festivals by the new and full moon; in their legal defilements; their abstaining from certain sorts of food, particularly swine's flesh, and fish without scales; and their depriving the males of a testicle, may be a corruption of circumcision: but they have no tradition in relation to the children of Israel, to Moses and the law. In their religion and manners they also resemble the Troglodytes, the descendants of Abraham, by his wife Keturah, who observed all, or most of the customs in which the Hottentots agree with the Jews; with several others, as giving their children the name of favourite beasts: in their funeral ceremonies, and in leaving their old people in a hut to expire by themselves.

In every village is a priest, or rather master of the religious ceremonies; for he never offers up to Heaven the prayers of the people; nor instructs them in religion, his office being only to preside at their offerings, and to conduct their ceremonies. He performs the marriage and funeral rites; he deprives the male of one testicle, and heals the wound. But he has no revenue or certain perquisites; indeed he is sometimes presented with a calf or lamb, and out of respect, is invited to feasts and merry-makings, and these are all the emoluments of his office.

We have here given the strange and absurd system of the Hottentot religion, of which they are so fond, that it is not certain any one of them ever died a Christian. The Dutch indeed have sent missionaries among them, who have undergone numberless fatigues, and taken the utmost pains to make proselytes; but it was without effect, and they were compelled with sorrow to abandon so good a design, without having made the least impression on the minds of the Hottentots. In confirmation of this, Mr. Kolben gives the following remarkable incident.

Mr. Vander Stel, governor of the Cape, took an infant Hottentot, whom he educated in the knowledge of the

the Christian religion, and after the genteel manners of the Europeans, allowing him little or no intercourse or conversation with the Hottentots. He became well versed in the mysteries of religion, and in several languages; he was also richly dressed, and his manners were formed after the best European models at the Cape. The governor, finding him thus qualified, entertained great hopes of him, and sent him with a commissary general to the Indies, where he remained employed in the commissary's affairs, till that gentleman's death, and then returned to the Cape. A few days after, at a visit among his relations, he pulled off his European apparel, and equipped himself in the manner of his country. This done, he packed up his cloaths, ran with them to the governor, and presenting himself before his patron, laid the bundle at his feet, and addressed his excellency to the following purpose. "Be pleased, Sir, to take notice, that I for ever renounce this apparel. I likewise for ever renounce the Christian religion. It is my design to live and die in the religion, manners, and customs of my ancestors. I shall only beg you will grant me, and I am persuaded I shall not beg in vain, for leave to keep the collar and hanger I wear, and I will keep them for your sake." Here he stopped, and turning his back, fled swiftly away, and was never more seen in that quarter. This man, says the above author, I frequently conversed with up in the country, and found, to my great astonishment, that he had a surprising stock of Christian knowledge. But though I made use of the most persuasive and endearing language, to call him back into the fold of Christ, he continued deaf to all my reasoning and remonstrances.

However, with respect to morality, an essential part of Christianity, and those virtues which dignify and adorn human nature, the Hottentots in general excel; for in munificence and hospitality, they exceed all other nations. They take a pleasure in relieving one another, which they perform with such a noble simplicity and openness of heart, as is no where else to be found. A Hottentot can hardly enjoy himself, except one or more of his countrymen partake with him. If he has a good meal provided for him at home, he will rarely sit down to it without the company of two or three more of his neighbours. Has he a dram of brandy or arrack in his hand, his countryman who comes by, whether an acquaintance or a stranger, generally receives part of it. Is he smoking, he calls to his countrymen to stay and take half a dozen whiffs with him; for a Hottentot expresses as much joy at having regaled a number of his countrymen with his own pipe, as we usually do upon some valuable acquisition. They are all kindness and good-will to one another, and are charmed with opportunities of obliging. If a Hottentot's assistance is required by one of his countrymen, notwithstanding his natural indolence, he runs to give it; and if his countryman be in want, he relieves him according to his ability, with the utmost readiness. In short, the hospitality they shew to strangers who behave inoffensively, does not in general fall short of the surprising bounty and benevolence they shew to each other; they are generally moved at the sight of distress in persons of every complexion, and eagerly administer what relief they can, without any stipulation for a reward.

In short, they have a strict regard to truth, and are esteemed the most religious observers of national faith. They excel all or most nations in chastity; a most beautiful simplicity of manners runs through all the Hottentot nations: and many of them told our author, that the vices they saw prevail among Christians, their avarice, their envy, and hatred to each other; their restless discontented tempers, their lasciviousness and injustice, were what principally kept them from listening to the doctrines of Christianity.

SECT. XVI.

Of their Skill in Physic, Surgery, Music, and Dancing.

THOUGH many idle whims and superstitions enter into the Hottentot practice of physic and surgery, yet their doctors often succeed, and sometimes perform

great cures. The Hottentots, who apply to the study of medicine, are generally well skilled in the virtues of a multitude of herbs and roots produced in the Hottentot countries, and often apply them in very difficult and dangerous cases with wonderful success.

The two professions of physic and surgery are here united; for every physician is also a surgeon. They bleed, cup, restore a dislocation, and perform all the manual operations in their practice with surprising dexterity; and yet there are no other instruments used by the Hottentot surgeons than a common knife, a horn, and a bird's bone. They have salves, poultices, and many internal remedies, though they fall vastly short, in point of number, to those used in the European practice of physic and surgery.

In cholics and pains of the stomach they first seek relief by cupping, which is thus performed. The cup is an ox's horn, the rim of which is made very smooth. The patient lying on his back, the doctor applies his mouth to the part where the pain lies, and sucks; then clapping on the horn, lets it remain till he supposes the part under it is become insensible; then tearing off the horn, he makes two or three incisions about half an inch long, and afterwards claps it on again and lets it remain till it falls off, which it does when it is full of blood; and it is generally filled in two hours, and then they suffer the patient to rest. If the pain removes to another part, they rub that part well with hot fat; and if that does not ease the patient, they cup him again where the pain settles; and if this does not produce a cure, they proceed to inward remedies, giving him either infusions or powders of certain roots or herbs.

In plethories they let blood in the following manner: the operator binds with a strap the vein he would open, and then cuts it with his knife well sharpened. Having got as much blood as he judges necessary, he loosens the strap, closes the orifice with sweet mutton fat, and ties over it a leaf of some salutary herb. If bleeding does not set the patient to rights, they apply as before inward remedies.

Their method of restoring a dislocated joint is first to rub it with fat, and then to move the limb briskly up and down, pressing upon the joint, till it slips into its proper place: this rude method they complain is attended with dreadful pain.

In head-achs the Hottentots often shave the head; which they also perform with a common knife well sharpened. The fat continually on the Hottentot's hair, which is short and woolly, serves the purpose of soap; but they never shave off all the hair, but only make furrows in it, generally leaving as much on as they take off.

For a foul stomach the Hottentots take the juice of aloe-leaves, putting a few drops in a little warm broth. This is a good cathartic, and at the same time an excellent stomachic. If the first dose does not answer the purpose, three or four days after they take another, of sometimes twice the quantity of the first, and this seldom fails to produce the desired effect; for most other inward ailments they take powders and infusions of wild sage, wild figs, fig-leaves, buchu, fennel, garlic, and some other herbs.

The Hottentot amputations are only of the joints of the fingers of women, which they perform with such art, that nothing is ever hurt or disfigured beyond the amputation. Their method of performing this operation is by binding very tightly, with a dry sinew, the head of the joint next below that to be cut off, and then making the amputation with a common knife. They then stop the blood by applying to the end of the mutilated finger the juice of the leaves of the myrrh-tree, and wrap up the finger in the leaves of salutiferous herbs.

There is a physician in every kraal or village, and in the large ones are two; these are chosen out of the sages of each village, and appointed to watch over the health of the inhabitants; and the honour of the employment being judged a sufficient recompense for their trouble, they administer their medicines and perform their operations in surgery without fee or reward. All their salves, ointments, powders, and poultices, they pretend are of their own invention, and therefore keep the preparations very secret. But if a patient dies under their hands, they

Engraved for the second Edition of the New System of Geography.

*The Attachment of an Mohican to the Manners of his Country,
shown by the conduct of one of them bred from his Infancy among Europeans.*

always assert, that their remedies were rendered ineffectual by witchcraft, and in this they are sure to be believed.

There are also several old women in every village, who pretend to great skill in the virtue of roots and herbs, and readily give their advice to their neighbours; but these are held in great contempt by the doctors.

It ought not to be omitted, that all sicknesses that baffle the art of the physicians, all sudden inward pain, and cross accidents, and every artificial performance that is above their comprehension, the Hottentots ascribe to witchcraft. If one of them be seized with a pain, which he imagines arises from this cause, he sends for the physician of the village, who, on his arrival, orders a sound fat sheep to be instantly killed, then taking the caul, carefully views it all over, and having powdered it with buchu, twists it in the manner of a rope, and hangs it about the patient's neck, generally saying, "You will soon be better; the witchcraft is not strong upon you." The patient is obliged to wear this caul while a bit of it will hang about his neck. If the patient be a man, the men of the village feast upon the sheep; if a woman, the women; and if a child, the carcase is served up to the children alone, and none else taste a bit of it.

If the patient grows no better, the doctor gives physic; and if the patient dies, he boldly asserts it was occasioned by witchcraft; and that the charms of the witch, or wizard, were too strong for him or any one else to break; and for this he always finds sufficient credit.

Indeed, as we have already intimated, every thing above their comprehension obtains the name of witchcraft. "I have often, says Mr. Kolben, been looked upon by the Hottentots as a wizard myself. My magic lanthorn, burning-glass, and other instruments, producing effects which astonished them, were esteemed pieces of witchcraft. Once being surrounded by a good number of them, I poured a little brandy into a cup and fired it, and then asked if they would drink of it. They were astonished at the proposal; and when they saw me drink it myself, betook themselves to their heels in a fright, and ever after dreaded me as a great and dangerous conjurer. They have vanished out of my sight in an instant, upon my holding up a stick, and threatening to bewitch them with it."

However, it does not appear that the Hottentots have any notion of their wizards or witches entering into a compact with the evil spirit, whom they call Touquoa, or that their souls go to him at death; for they imagine, that the malice of this being is confined to this world, and that he cannot act beyond it.

This simplicity of the Hottentots, with respect to witchcraft, is not however very extraordinary, if we consider that it has prevailed among polite nations, enlightened by a Divine religion; among whom it must appear much less excusable, than among these untutored people.

We shall now give an account of their music and dancing; but shall first take notice of their language, which is so far from being harmonious, that it is considered as a monster among languages, the pronunciation depending upon such collisions or clashings of the tongue against the palate, and upon such strange vibrations and inflections of that member, as a stranger can neither imitate nor describe. Hence they are considered as whole nations of stammerers.

Their music, however, is much more tolerable than their language; for though it has but few charms for an European ear, and is but poorly provided with either instruments or tunes, it shews a genius and sensibility in the Hottentots, which entirely destroys the credit of those accounts which represent them as monsters of stupidity.

One of their musical instruments is called the gom-gom, and is common in several other nations: it consists of a bow of iron or olive wood, strung with twisted sheep-guts or sinews. On one end of the string they fix, when they play, the barrel of a quill slit, by putting the string into the slit, so as to run quite through the barrel. This quill they apply, when they play, to their mouths, much in the same manner as is done in playing on the

Jew's harp, and the various notes are owing to the different modulations of the breath. This is the lesser gom-gom.

The great gom-gom is made by putting on the string, before they fix it to the bow, a cocoa nut shell, about a third part sawed off; so that it hangs like a cup, with the mouth upwards, the string running through two holes near the brim. This shell is cleared and made very neat and smooth. When they play on this instrument, they hold the bow with one hand, and apply the quill on the string to their mouths; while with the other they move the shell nearer or farther from the quill, according as they would vary the sound, which rises or falls according to the motions of the shell. When three or four of these gom-goms are played upon in concert, by skilful hands, they make a very agreeable harmony, especially when it runs in the low notes, for there is a softness in the music that is extremely pleasing.

They have also a kind of flutes and flageolets, made of reeds, with which they make a tolerable harmony.

Another instrument of music is an earthen pot, which, like the common ones of the Hottentots, resembles a Roman urn; but is covered at the top with a smooth-dressed sheep-skin, and braced on with sinews and sheep-guts, like the skin on a kettle drum. This instrument is only used by the women, who play upon it with their fingers; but upon this instrument they perform only one tune, and that consists of but few notes.

The vocal music of the Hottentots consists of the monosyllable ho, which is sung by both sexes in their ceremonies of worship, in a small round of notes; and they have also a few songs. In this consists the whole of the Hottentot harmony, which, notwithstanding their often hearing European music at the Cape, they assert excels not only that, but all the music in the world.

We shall now take notice of the dancing of the Hottentots, in which both sexes take great delight. This is chiefly practised when a peace is concluded with a nation with whom they have been at war; when a member of a village has slain a wild beast, or escapes some imminent danger; or when some happy event has happened in favour of some particular person or family of the village. On these and the like occasions the whole kraal testify their joy in dancing, sometimes whole nights, without any manner of refreshment. In these public rejoicings the men of the village squat down in a circle, which is enlarged by their being joined by the women, for the better convenience of the dancers who perform within it, and that they may assist in the common, ho, ho, ho, and add their pot-drums to the music of the gom-goms. No sooner are the latter heard, than the women begin to play on the drums: those who have their mouths at liberty sing, and others clap their hands. Several couples then present themselves to dance, but no more than two couples dance at a time. When a woman starts up and shakes the rings upon her legs, it is to intimate that she wants a male partner, and she has one immediately. Two couple, that is two men and two women, having entered the ring, dance each man with his partner, the men using great activity with their legs, leaping a great height. When they begin, they are at the distance of about ten paces from each other, and they dance near a quarter of an hour before they meet; and sometimes, instead of meeting, they turn about, and dance back to back; but they never take hold of each other by the hands. When the women stamp in dancing, the rings on their legs make a noise resembling that of the harness upon the back of a coach-horse, when he shakes himself.

We shall conclude this account of the Hottentots with a history of the country; a concise view of the Capetown, and the government of the Dutch.

SECTION XVII.

A concise History of the Cape of Good Hope, from its Discovery by the Portuguese, including an Account of the Manner in which it was settled by the Dutch.

THOUGH the Cape of Good Hope was discovered by the Portuguese so early as the year 1493, none

of them landed there till 1498, when Rio d'Infanta, the Portuguese admiral, in his voyage to India, went ashore; and, on his return, gave such an agreeable account of the advantages of the place to king Emanuel of Portugal, that it was resolved to form a settlement there; but this was, however, neglected. At length Francisco d'Almeida, viceroy of Brazil, returning from thence with a fleet from Portugal, took his course by the Cape, and casting anchor, sent a party ashore to purchase cattle; but they were repulsed by the natives, who drove them back to their ships. The viceroy was, however, persuaded to land them again, with a considerable reinforcement, and, for the encouragement of the men, to put himself, with eleven captains of the fleet, at their head. His excellency consented with reluctance, and seemed to foresee the unhappy issue; for, on his entering the long-boat, he cried with a dejected look, "Ah! whither do you carry seventy years?" alluding to his own age. On their being landed, one of the men refusing to give a pair of brass buckles he had in his shoes to a Hottentot, who much admired them, his refusal was taken as an affront, and a sufficient proof of their being enemies: and thus this trifle became the foundation of a quarrel. The Hottentots who were present, exasperated at this behaviour, attacked the Portuguese with such spirit, that seventy-five of them were slain, among whom was the viceroy himself, and the rest escaped by flying in confusion to their ships.

The Portuguese, vexed and mortified at this disgrace, vowed revenge. But after smothering their resentment for two or three years, a fleet, in their way to the Indies, landed again at the Cape; and the Portuguese, knowing the high value the natives set on brass, landed a large brass cannon, charged with several heavy balls, and fastened to the mouth two ropes of great length. The Hottentots, in a transport of joy at receiving so large a piece of their admired metal, took hold of the two ropes in great numbers, as they were directed, in order to draw it along. Thus a considerable body of them extended in two files the whole length of the ropes full in the range of the shot; when the Portuguese suddenly discharging the cannon, a most dreadful slaughter was made, and those who escaped the shot fled in the wildest consternation up into the country. After this base and cowardly exploit, the Portuguese re-embarked at their leisure, and it seems that the Hottentots have ever since had an extraordinary dread of fire-arms.

We do not find that any Europeans landed afterwards at the Cape, till the year 1600, when it began to be visited by the English, French, and Dutch, in their voyages to and from the East Indies. However, in the year 1650, a Dutch fleet anchoring before it, Mr. Van Riebeck, a surgeon on board, observing that the soil of the country was rich and well stocked with cattle, the harbour commodious, and the people tractable; on his return to Holland laid an account of his observations before the directors of the East India company there, who, after a grand consultation, resolved to attempt a settlement without loss of time. Immediately four ships were ordered out on that design, with all the materials, instruments, artificers, and other persons necessary for such an expedition; and the surgeon was rewarded by being appointed governor and commander in chief of the intended settlement, with power to treat with the Hottentots in such a manner as he should think would be most advantageous to the company.

With these ships Van Riebeck arrived safe at the Cape, when he so charmed the natives by his address and good humour, and by the presents he brought them of brass toys, beads, tobacco, brandy, and other liquors, that a treaty was immediately concluded; and he giving them commodities and toys to the value of fifty thousand guilders, they gave the Dutch full liberty to settle there, resigned to them a part of the country, and a trade was established with them on a good and solid foundation.

Upon these wise regulations, in which so just and equitable a regard was paid to the natural rights of the natives, Mr. Van Riebeck raised a square fort, and built within the walls, dwelling-houses, warehouses, and an

hospital for the reception of the sick: to this fort he added proper out-works, to secure himself against being attacked by any of the European powers. He then set the seeds he had brought from Europe on a piece of land two leagues up the country, part on a hill, and part in a vale, dividing the ground into a vineyard, a fruit, flower, and kitchen garden.

As every thing prospered in a surprising manner, the company offered sixty acres of land to every man who would settle at the Cape, provided he would engage not only to maintain himself upon it within three years, but also contribute at a certain rate to the support of the garrison; leaving every one at liberty, when that time was expired, to sell or make over his land, and to leave the settlement.

Encouraged by these proposals, and by the assistance given to those who were unable to provide utensils, tools, and instruments of agriculture, a great number of people went to the Cape, and the settlement soon began to make a very considerable figure. But all this while there was a growing evil, against which no provision had yet been made: European women were very scarce, and those they had were wives who had settled there with their husbands; while the plantations swarmed with young fellows, each of whom was settled upon his farm, and in a way of thriving; but wanted wives as much for the sake of issue and domestic help, as for sensual gratification; and yet had no inclination at all to marry the Hottentot women. However, an account of this grievance being dispatched to Amsterdam, a fine troop of young women were raised, who, on their arrival at the Cape, were bestowed by the governor on those who wanted wives, with all the indulgence that could be shewn upon such an occasion to their several fancies and inclinations.

The settlement being thus firmly established, was now increased, by the addition of other settlers, to such a degree, that the Dutch in a few years extended themselves in new colonies along the coast.

They now form four principal settlements: the first, and most considerable, is at the Cape, where are the grand forts and the capital city, also named the Cape; the second is the Stellenbosch; the third the Drakenstein; and the fourth the Waverish colony.

The company have also provided for a future increase of people, by purchasing all the tract of land called Terra du Natal, which lies between Mosambique and the Cape; for which they paid in commodities, utensils, and toys, to the value of thirty thousand guilders: so that this part of the dominions of the Dutch East India company is of very great extent.

SECT. XVIII.

A Description of the City of the Cape, and of the Dutch Government.

WE shall now give the reader an account of the Cape town and its principal buildings. The town extends from the sea-shore to the valley, and is large and regularly built, containing several spacious streets, with handsome houses, many of which have large courts in the front, and beautiful gardens behind them. The streets, the court-yards, the houses, and every thing in them are, according to the custom of the Dutch, extremely clean and neat. The houses are of stone; but most of them only one story high, and none more than two, on account of the violence of the easterly winds which sometimes shake and damage the houses, notwithstanding their being so low, and for the same reason most of them are only thatched.

The Dutch company give great encouragement to building at the Cape. A man who is willing to erect a house, whether contiguous to the town or in the country, has ground allotted him gratis, of sufficient extent to have a court-yard, out-houses, and a garden, if he chooses to have them. The government receives no advantage from these houses till they are sold, and then, if the house be new, it becomes charged with a ground-rent, of the tenth

or

or twentieth penny of the rent it is supposed it would let for annually; but if it be old, there is only paid the fortieth penny of the rent.

The castle is a very strong and noble edifice, of great extent, provided with all manner of accommodations for the garrison, which consists of about two hundred soldiers. It covers the harbour, is an admirable defence towards the country, and is, in short, an excellent fortress. The superior officers of the company have here very spacious and beautiful lodgings, and within are the company's storehouses, which are large, commodious, and handsome.

The church is a plain, neat, and spacious edifice, built of stone; but both the body and steeple are thatched. They are, however, white-washed on the out-side, which gives this edifice an agreeable appearance from the sea, especially in fine weather.

The hospital for the sick is both an honour and an ornament to the town. It is situated near the company's garden, and so large as to accommodate several hundred patients. This is of extraordinary use, as few ships ever arrive at the Cape, either from Europe or the Indies, without having a considerable number of sick on board. A ship is no sooner at anchor than these are conveyed to the hospital, where they are very decently lodged, and supplied with fresh provisions and medicines. Those who are able to walk about have the liberty of the company's garden, which enjoys a fine air, and furnishes the hospital with roots and herbs. This hospital fronts the church, and is a very handsome regular structure.

The above garden is perhaps the most extraordinary in the world, it containing, as hath been already intimated, almost all the rich fruits, beautiful flowers, and valuable plants that are produced in Asia, Africa, and America. Nature has indeed little or nothing to set her off there besides her own charms and the hand of the gardener; but thus adorned, she is sufficiently lovely. Thousands of various flowers strike the eye at once, vying with each other for superior beauty. Here and there are fine groves of trees of a vast variety of kinds unknown in Europe, beautiful summer-houses, and shady walks. The garden is very spacious, and from most parts of it you have a delightful view of the country.

There are also many large and beautiful gardens about the town, which belong to the inhabitants: these, as well as that belonging to the company, are kept in fine order. It is very delightful to visit them, and they form a lovely appearance in several views of the town; while the millions of flowers in them all fill the air with the most delicious perfumes.

To return to the buildings, there is a large edifice called the lodge, for the use of the company's slaves, who are chiefly brought from Madagascar. It is divided into two wards, one for the lodging of each sex, and is provided with convenient store-rooms, with a very spacious room, where the slaves receive and eat their allowance, and a strong prison wherein the drunken and disobedient are confined and punished. It has likewise decent apartments for the officers set over the slaves, and a school for the negro girls.

The company have also a very handsome range of stables, capable of containing several hundred horses; and a great number of fine Persian horses are kept there for the service of the company and the use of the governor, who lives in great state, and has a master of the horse, an under-master, a saddler, coachman, and grooms. The governor's body-coachman is esteemed at the Cape a very considerable person.

The government is conducted by the eight following councils. First, the grand council, or, as it is sometimes called, the college of policy, consists of the governor, who is president, and eight others, who are generally the next principal officers in the company's service at the Cape. This council is the company's representative; it has the care of trade and navigation, makes peace or declares war with the Hottentots, and has the management of every thing relating to the safety and interest of the settlement. This council not only corresponds with the court of directors in Holland, but with the Dutch govern-

ment at Batavia and Ceylon. When the members enter or leave the fort, the garrison pays them the martial salute, an honour paid to no other at the Cape.

The next is the college of justice, which generally consists of the same members that compose the grand council. This court hears and determines in all civil and criminal cases of moment that happen among the Europeans at the Cape. But if an European, who is not in the service of the company, is either plaintiff or defendant, the three regent burgo-masters, who are magistrates annually chosen out of such as are not in the company's service, assist at the trial, to see that no partial judgment be given on the side of the company's servant. Appeals lie from the decrees of this court to the supreme courts of justice at Batavia, which is composed of persons eminent for their learning in the civil laws, and also to the supreme court of justice in Holland.

There is a petty court dependant on the last for punishing breaches of the peace, and determining trespasses and small debts. It consists of a member of the grand council, who sits as president, three of the burghers, and four of the company's immediate servants. One of the burghers is vice-president. No action is to be brought in this court for more than a hundred crowns. Copies of all the proceedings, both in this court and the college of justice, are, from time to time, transmitted to Holland.

The fourth is the court of marriages, which takes care that all contracts of marriage among the Europeans at the Cape are allowed by the parents or guardians of both parties, and that neither party is under any engagement or promise of marriage to another. It consists of the same members as the petty court for punishing breaches of the peace, and is held every Saturday evening.

This court, upon receiving satisfaction in the matters of its enquiry from the parties, their parents, or guardians; grants a warrant, authorizing the pastor of the parish where the parties live to publish the banns of matrimony from his pulpit on the three following Sundays; and then, if no person appears to forbid the banns, to join the parties in marriage.

It is customary for persons of distinction, who are upon the point of marriage, to invite all the officers of the court to make the inquiries at their houses, which is seldom refused, as they are sure of a splendid entertainment, and a present of ten or twenty crowns; and the clerk on these occasions has two crowns for his trouble: but at the castle, where the court is usually held, he has but one, and the court no gratuity.

The fifth is the chamber of orphans, which consists of the vice-president of the grand council, three of the company's servants, and three burghers. Orphans of fortune cannot marry at the Cape without the consent of this chamber, till they are twenty-five years of age.

The sixth is the ecclesiastical college for the reformed churches at the Cape, which are three in number, and for the proper application of the money given for the use of the poor. It consists of the three pastors, the two elders of each church, and twelve overseers of the poor, each parish having four.

This council is so careful in the application of the charitable collections, that there is not a beggar to be seen in all the settlement. The surplus of these collections is either put out to interest, or applied to the repairs of the churches, or the maintenance of the schools at the Cape.

In each of the colonies at the Cape is a court of common council, consisting of a certain number of the burghers. In the Cape town this council proposes matters in favour of the burghers to the grand council, and collects the taxes. In the colonies they hear and determine all causes relating to debts and trespasses not exceeding a hundred and fifty florins, and also try and punish most crimes committed within their jurisdiction, and all crimes committed by the slaves.

The eighth are the boards of militia, one of which is for the Cape towns, and the other for the colonies.

The company's immediate servants at the Cape are about six hundred in number; but they are not all lodged in

in the castle; many petty officers and a great number of the common servants living in several buildings belonging to the company in the town.

The company's servants at the Cape are divided into two classes, called the qualified and the unqualified. The qualified are all the officers in the administration, and the clerks under them: the unqualified are the soldiers, artificers, and common servants. We shall here give a particular account of the salaries of the former.

The governor is allowed by the company three thousand two hundred and fifty-five florins a year in salary, and board wages; besides which he is allowed monthly one thousand five hundred pounds of rice, thirty bushels of pulse, or five white rice, three hundred and sixty pounds of fine barley-flour, twenty pounds of European salt beef and pork, as much mutton as he pleases, one aum of African wine, two gallons of brandy, four of Canary, twenty-three of strong ship-beer, or Brunswick mum, twenty-five pounds of fresh butter, fifteen pounds of white wax candles, ten pounds of tallow candles, six pounds of spices, a gallon of salad oil, and whatever he pleases for the use of his household, which the company's stores can furnish, twenty-five per cent. cheaper than any body else. He has likewise a yearly allowance of five hundred florins for entertaining the commanders and other officers of the Dutch India ships with a grand dinner in their return to Europe; and yet he provides for them entirely out of the company's cattle, stores, and gardens.

The chief merchant, the fiscal intendant, the captain of the garrison, the three pastors of the colonies, and the store-keeper, have each one thousand six hundred and twenty-seven florins per annum in salary and board-wages.

The lieutenant of the garrison has a thousand and five florins per annum in salary and board-wages.

The ensign of the garrison, and twelve persons called under-merchants, have seven hundred and eight florins per annum each.

The book-keepers, and officers who attend the sick, thirteen persons, each five hundred and thirteen florins a year.

Twenty assistant clerks have three hundred and fifty-four florins a year each.

We have now given a very full and circumstantial account of the Cape of Good Hope, and of the Hottentots, and shall conclude with the character given of this fine settlement by the ingenious author of Lord Anson's Voyage round the world, which may serve both as a summary and confirmation of what has been already said of that delightful country. "The Cape of Good Hope," says he, "is situated in a temperate climate, where the excesses of heat and cold are rarely known; and the Dutch inhabitants, who are numerous, and who here retain their native industry, have stocked it with prodigious plenty of all sorts of fruits and provisions; most of which, either from the equality of the seasons, or the peculiarity of the soil, are more delicious in their kind than can be met with elsewhere: so that by these, and by the excellent water which abounds there, this settlement is the best provided of any in the known world, for the refreshment of seamen after long voyages, and by its extraordinary accommodations, the healthiness of its air, and the picturesque appearance of the country, the whole enlivened too by the addition of a civilized colony, was not disgraced on a comparison with the vallies of Juan Fernandes, and the lawns of Tinian."

SECTION XIX.

Of Caffraria Proper, and particularly that Part of it called Terra de Natal, containing a concise Account of the Country and of its inhabitants the Caffres.

THE northern part of Caffraria, distinguished by the name of Caffraria Proper, is in a manner entirely unknown; no European traveller has proceeded through it, and described its bounds, its produce, its natural curiosities, and the manners of its inhabitants. The little

we know of it is confined to the eastern part, which has obtained the name of Terra de Natal.

The country of Natal, which was thus called from its being discovered by the Portuguese on the day of our Saviour's nativity, is situated between the thirtieth and thirty-third degrees of north latitude, and is inhabited by the Caffres, who are a very different people from the Hottentots. This country extends to the Indian sea on the east, but how far it runs to the westward is yet unknown.

That part of the country which lies towards the sea is plain and woody; but within land it is diversified with many hills, intermixed with pleasant vallies, and large plains chequered with natural groves and meadows. There is no want of water, for every hill affords little brooks, which gliding down, some of them, after several turnings and windings, meet by degrees, and form the river Natal, which discharges itself into the eastern ocean in about the thirtieth degree of south latitude. This is the principal river of the country; though there are other streams which bend their courses northerly.

The woods are composed of several sorts of trees, many of which are tall and large; these are very good timber fit for any use. The meadows are covered with grass, and a variety of herbs and flowers.

The land-animals of this country are elephants, which feed together in great troops, a thousand or fifteen hundred being sometimes seen in the mornings and evenings in the meadows; but in the heat of the day they retire into the woods.

Here are also buffaloes, cows, deer, hogs, rabbits, lions, and tygers.

Here are fowls of various sorts, as ducks and teal, both tame and wild, plenty of cocks and hens, a large wild fowl as big as a peacock, adorned with many beautiful feathers, and abundance of wild birds, of which we have no other account, than that they are wholly unknown to us.

The sea and rivers abound with many sorts of fish, yet the natives seldom endeavour to catch them; but frequently take turtle when they come ashore at night to lay their eggs. They are said also to use a very odd way of catching turtle in the sea, by taking a living remora, or sucking-fish, and fastening a string to the head and another to the tail; they then let it down into the water among the half-grown or young turtle; and when they find that it has fastened itself to the back of them, which it will soon do, they draw him and the turtle up together.

The natives, who are of a middle stature, are well proportioned; their skins are black, and their hair woolly; their noses are neither flat nor high, but well proportioned; their teeth are white; their aspect is in general graceful, and, like the Hottentots, they are swift of foot.

The natives commonly wear only a square piece of cloth, made of silk grass, in the form of a short apron; at the upper end it has two straps to tie round their waist, and the lower end is fringed, and hangs down to their knees. They are said to have caps made of tallow about nine or ten inches high. These they are a great while in making; for the tallow must be very pure before it is fit for this use; besides, they lay on but a little at a time, mixing it among the hair, so that it never afterwards comes off their heads.

When they go a hunting, which is but seldom, they pare off three or four inches from the top of their caps; but the day after their return begin to build it up again, and this they daily practise till it is of the fashionable height. It would be a most ridiculous thing for a man here to be seen without this cap of tallow; but boys are not suffered to wear any before they arrive at maturity. The men make themselves very fine with feathers stuck thick into these caps; for this purpose they use only the long feathers of a cock's tail. They also wear a piece of a cow's hide made like a tail, reaching down from the waist to the ground. This piece of hide is about six inches broad, and each side of it adorned with little iron rings of their own making. The women have only short petticoats, which reach from the waist to the knee; but when

when it rains they cover their bodies with a cow's hide, thrown over their shoulders like a blanket.

Their chief employment is husbandry. They have many cows, which they carefully look after, and every man knows his own, though they all run promiscuously in the meadows. They have also Guinea corn, of which they make their bread, and a small sort of grain no bigger than mustard-seed, of which they make strong drink; and they fence in their fields to keep out their cattle. The people also drink milk, but generally prefer it when four. Their common subsistence consists of beef, ducks, and hens eggs.

No arts or separate trades are professed among them, but every one makes for himself whatever he wants. The men build their own houses, cultivate the land, and look after their cattle; while the women milk the cows, dress the provisions, and manage every thing within doors. Their houses are neither large nor well furnished; but are made so close, and are so well thatched, as to keep out the wind and rain.

They live together in small villages, in which the oldest man governs the rest. They are extraordinary just and civil to strangers, and have a king who governs the country.

Every man may have as many wives as he can purchase or maintain; and, as they have no money in the country, they buy them of the woman's father, brother, or nearest male relation, by giving cattle in exchange for wives.

The Caffres traffic with the rovers of the Red Sea, who bring them manufactures of silk for elephants teeth.

These manufactures the Caffres exchange for European commodities, particularly for tar, anchors, and cordage, which they exchange again with the rovers of the Red Sea; and such silks as they do not sell to the Europeans who touch at Natal, they dispose of to the inhabitants of Monomotapa.

Captain Vander Schelling, whom we have already mentioned in treating of the Hottentots, found an Englishman at Terra de Natal, who had deserted his ship, and settled among the Caffres, where he married two Caffre wives, by whom he had several children; he was dressed like a Caffre, and lived like them. He shewed the captain several piles of elephants teeth and some rooms of silk manufactures, intending to take the opportunity of embarking with those commodities for the Cape, and of abandoning his settlement, wives, and children: but the king of the country having notice of his design, sent for him, and reproached him with his intended treachery and ingratitude to a people who had received and cherished him after so generous a manner, representing the miserable condition to which his family would be reduced if he abandoned it, since he would take no care of it; and, in short, admonished him with such warmth on the affection and tenderness he owed to his wives and children, and the cruelty of deserting them, that being unable to resist the eloquence of this royal Caffre, he fell at the king's feet, and gave up his design. This he himself related to the captain, one of whose men he afterwards prevailed upon to desert the ship, and settle with him among the Caffres.

C H A P. VIII.

Of the inland Empires of MONOMOTAPA, and MONOMUGI.

S E C T. I.

The Situation, Extent, Climate, and Produce of Monomotapa; with the Persons, Dresses, and Food of the Natives.

THE inland country of Monomotapa is bounded by the maritime kingdom of Sofala on the east; the river Spiritu Sancto on the south; the mountains of Caffraria on the west; and the river Cuama on the north, which parts it from Monomugi. It is situated between the forty-first and fifty-sixth degree of east longitude, and between the fourteenth and twenty-fifth degree of south latitude; and is six hundred and seventy miles from north to south, and six hundred and fifteen from east to west.

The climate of Monomotapa is said to be temperate, though the far greater part of it lies within the southern tropic. The air is clear and healthy, the soil fertile, and so well watered by several fine rivers as to abound with pasture grounds, on which are bred a prodigious multitude of cattle, especially of the larger sort, on which the inhabitants set a higher value than on their gold. Their ground produces plenty of rice, millet, and other grain; but no wheat. They have a variety of excellent fruit-trees, and plenty of sugar-canes, which grow here without any culture. Their forests swarm with wild beasts, and various kinds of game; and their rivers, of which they have a great number, abound not only with fish, but with gold washed down from the mountains. They have neither horses nor any other beasts of burthen, except vast herds of elephants, which are mostly wild, and several thousands of them are annually destroyed for the sake of their teeth, which the natives sell to the Portuguese. They have a kind of flag of an extraordinary size and swiftness, and ostriches that are extremely large.

The natives are black, with woolly hair; but are well shaped, robust, swift of foot, and healthy. They delight

much in war, which they prefer to traffic; and the people of the lower class are extremely expert at diving, their chief business being to fetch sand or mud from the bottom of rivers, ponds, and lakes, in order to obtain the gold that is mixed with it, and which they exchange with the Portuguese for cotton and other cloths, and a variety of other merchandizes and trinkets.

The Monomotapas go naked almost as low as the waist; but from thence downwards are covered with a piece of cloth of various colours, and dress more or less richly, according to their rank and circumstances: the cloth worn by the common people is dyed cotton; but persons of quality usually wear India silks, or cotton embroidered with gold, over which they have generally the skin of a lion, or some other wild beast, with a tail hanging behind, and trailing on the ground.

Their chief food is the flesh of oxen and elephants, salted and dried fish, and a great variety of fruits. Among the last is one called cacaema, which is shaped like an apple, is very sweet, and of a bright violet colour; but is so pernicious in its effects, when eaten in too great a quantity, that it never fails of causing a violent dysentery and bloody-flux. Their bread is made of rice or millet baked in thin cakes, and their drink sour-milk or water; but the rich have palm-wine, and several kinds of fruit. Persons of wealth have their liquors commonly mixed with manna, ambergris, musk, and other perfumes, of which they are extremely fond, and use them both in their meat and drink and in their apartments. All the flambeaux burnt before the emperor are said to be perfumed in the same manner.

The men are allowed to marry as many wives as they please, or as they can maintain; but the first is always considered as the chief and mistress, and her children as the father's heirs; while the rest are only deemed as servants.

S E C T. II.

Of the Splendor in which the Emperor appears, and his Retinue when he goes abroad. The manner in which he treats the Princes who are his Vassals. Of his chief Wives, and their Employments.

THE emperor of Monomotapa is said to live in great state, and to have a considerable number of princes subject or tributary to him. Authors observe, that he neither allows himself nor any of his wives to wear any clothes that are manufactured out of his own dominions, for fear they should have some poison or charm concealed in them. His usual dress is a kind of long vest, which falls down to his knees, then crossing between his legs, is tucked up under his girdle. He also wears a brocaded mantle on his shoulders; his neck is adorned with a magnificent collar that falls below his breast, and is enriched with diamonds, rubies, emeralds, and other precious stones. Of the same rich materials is a band which encompasses his turban, and on his legs are buskins richly wrought and embroidered with gold and pearls.

Whenever he goes abroad he is either carried in a palanquin, or mounted on an elephant. His palanquin is borne by four persons of quality, and over it is a magnificent canopy richly embroidered and bespangled with pearls and precious stones. If the weather happens to be cloudy, or misty, four perfumed wax lights are carried before him. On these occasions, besides his other regalia, he affects to wear hanging at his side a small spade with an ivory handle, and an arrow in each hand. These he calls the ensigns of his royalty. The spade is said to be the emblem of industry, intimating that his subjects ought to apply themselves to the cultivation of their lands, lest by neglecting it they should be reduced to indigence, and thereby pilfer and steal; on which account one of the arrows in his hand shews his power to punish crimes, and by the other he declares himself the protector and defender of his people.

On his going abroad in this public manner, whether to war or for diversion, or to visit his dominions, his subjects, who pay him the most profound homage and respect, never fail of appearing in crowds to wish him all imaginable success, and at proper distances on the road through which he passes, sacrifice a deer or some other victim. Over this he rides, and his augurs, who always assist on such occasions, carefully observe the motions of the liver, heart, &c. of the dying creature; and from thence proclaim his enterprize or journey successful or otherwise. If the former, the people fill the air with shouts and acclamations; and if the latter, with doleful sounds: but these monarchs will seldom proceed farther on their journey or design when those soothsayers predict its being unsuccessful.

The emperor is served at table upon the knee. He is commonly attended at such times by a great number of officers, who keep a most profound silence. The plates, dishes, and bowls belonging to his table, are said to be a kind of porcelain curiously wrought with sprigs of gold.

As these sovereigns constantly keep a numerous standing army, they are the less liable to be disturbed either by the revolt of the many tributary princes, or by an invasion of the neighbouring nations. The emperor, as a farther security, also obliges his vassals and tributaries to send their sons in order to be educated in his court, where they are taught to acknowledge his authority, and are kept as hostages of the fidelity of their parents. To this double policy he adds a third, which is once a year sending ambassadors to all the grandees, who are vassals to the crown, to give them what is stiled the new fire. No sooner do these ambassadors arrive at the court of a vassal, than they order him, in the emperor's name, to put out his fire, on pain of being declared a rebel; which being complied with, he comes and lights it afresh at the fire brought by the ambassadors for that purpose: and should any vassal or tributary refuse to conform to this order, war would be immediately declared against him.

As the emperors of Monomotapa are thus careful to keep all their vassals within due obedience, so they are said to be no less solicitous to preserve the affections of their subjects by acts of benignity. The only tribute they exact from them is a small and inconsiderable free gift, when they apply to them for justice, or some other favour; this being esteemed a mark of respect due from an inferior whenever he approaches a superior. This custom is also observed by the merchants, who at their fairs, or other places of sale, commonly make the sovereign upon the throne a present of some of their wares, not by compulsion, but of their own accord; and if any neglect paying him this small homage, their only punishment is their not being permitted to appear before him, which is esteemed a great mortification and mark of contempt.

The emperor is said to have a thousand wives, and all of them the daughters of some of his vassal princes; but the first alone enjoys the title and honours of an empress or queen. Among these nine immediately take place after the empress, and enjoy some considerable employment at court. The first of them is stiled mazarira, or mother of the Portuguese, she being their advocate with his majesty. The next is the inahanda, who performs the same office in favour of the Moors. The other seven have likewise their respective titles and employments, and all of them their several revenues, which enable them to live in great state; and as soon as one of them dies, she in the next rank succeeds to her title, post, and income.

The empress, and as many of his other wives as the emperor invites, accompany him into the country to assist at the gathering in his harvest; and if he be hindered by war, or otherwise, the empress takes the whole care of it upon herself, and assigns to the other wives their several tasks. These are to overlook a certain number of the soldiers, or other subjects employed in that work, who are obliged to pay the emperor the service of seven days in thirty, and to bring their own provisions with them; though when he is present he commonly supplies them with oxen, sheep, and other eatables.

The emperor is always accompanied by a numerous band of musicians, jesters, and buffoons, each under their own captain or master of the revels. During the evening, and even for the whole night, he is sometimes entertained with vocal and instrumental music, or with the jests and buffooneries of those who endeavour to divert him.

S E C T. III.

Of the principal Officers of the Emperor's Court: the Manner in which Justice is administered: the Religion of the People; and a concise Description of the Metropolis of Monomotapa.

THE principal officers in his court are the ningame-sha, or governor of the kingdom, who is a kind of prime-minister; the mokomasha, or captain-general; the ambuya, or lord high-steward, who, among other privileges, has that of naming a new empress when the old one dies; but she must be either one of the sisters, or near relations of the emperor; the inahantore, or captain of the band of musicians, who has a great number of them under him, and is himself a great lord; the nurakaô, or captain of the van-guard; and the bukurumo, which signifies the king's right hand. All these are stiled lords, as are also the two chief cooks belonging to his majesty, who are generally his relations; and the under cooks are likewise men of quality; but none of these must be above twenty years old; for when they have arrived at that age they are preferred to greater posts.

All law-suits may be brought before the emperor by appeal, and the former judgments be either confirmed or annulled by his authority. He has no prisoners in his dominions, because every trial is summarily determined according to the evidence given by the witnesses, and every crime is punished immediately after conviction. If the complaint be of such a nature that it cannot be immediately proved, and there be any danger of the person accused

accused making his escape, he is ordered to be tied to a tree, and a guard is set over him till he is either acquitted or condemned; and if the latter, the sentence is immediately executed in the open fields.

Most of the inhabitants are idolaters. They call the Supreme Being Maziri, or Atuo, and believe him to be the creator of the world. Their principal festivals are on the first day of the new moon, and the anniversary of their emperor's birth. They pay great honours to a virgin they call Peru, and have a convent in which they shut up a number of young women.

The metropolis of the empire is called Benematapa, or Banematapa, and by others Medroga. The houses are built with timber, or earth, neatly white-washed both within and without, and the roofs are large and in the form of a bell. These are more or less lofty according to the rank of the owners.

The greatest ornament of the city is the imperial palace, which is a large and spacious wooden structure with four great porticos, where the emperor's guards stand century in their turn. The out-parts are fortified with towers, and the inside is divided into several spacious rooms hung with cotton hangings of very lively colours. Some pretend that the ceilings, beams, and rafters are gilt or covered with plates of gold; that the apartments are furnished with chairs, which are painted, gilt, and enamelled; and that candlesticks of ivory hang by silver chains.

It ought not to be omitted, that the Portuguese have several forts in the country, which one of the emperors allowed them to build out of gratitude for the service they had done him in assisting him to reduce some revolted vassals to obedience. They have likewise in most towns churches and monasteries of the Dominican order. In short, they not only exchange cloth, glass, beads, and other trifles for gold, ivory, and valuable furs, but have some of the most valuable mines of gold in the empire.

S E C T. IV.

A concise Account of the Empire of Monomugi.

MONOMUGI, of which very little is known, is another inland country said to be situated near the equator, and is bounded by Monomotapa on the south, and on the west by Congo; but it is so little frequented,

and so unknown to the Europeans, that it is impossible to ascertain its extent. There are several petty princes on all sides, who are either tributary or subject to this crown.

The climate is very unhealthy, and the air extremely hot; but the country abounds in gold, silver, copper, and ivory. The natives clothe themselves in silks and cottons, which they buy of strangers, and wear necklaces of transparent amber beads, brought them from Cambaya. Their monarch constantly endeavours to be at peace with the neighbouring princes, in order to keep an open trade with Mombaza, Melinda, and Quiloa, on the east, and with Congo on the west; from all which countries the black merchants resort thither for gold. The Portuguese merchants assert, that on the east side of Monomugi is a great lake, in which are many little islands inhabited by negroes, and abounding with all sorts of cattle and fowl. The country affords great quantities of palm-wine and oil, and such plenty of honey that above half of it is lost, the blacks not being able to consume it. The religion of the country is idolatry, and it does not appear that either Christianity or Mahometanism have got any footing there.

Neither the accounts of travellers nor the maps agree in the names of the kingdoms and towns of this country; nor are there any particulars known relating to these kingdoms and towns.

We shall therefore now proceed up the western coast of Africa; but here, particularly on the southern part, we find the same uncertainty; and we no sooner proceed to the north of the country of the Hottentots, than we meet with confused, ridiculous, and absurd accounts. The Portuguese writers, who about a hundred and fifty years ago described those countries, have all of them an air of romance that is extremely ill placed when treating of regions unknown; and the reader, who with impartial eye searches for truth, is surfeited with fictions, and amused with an account of nations of Amazons, and cannibals perpetually at war, whose shambles are filled with the limbs of their captives exposed publicly to sale; who, though extremely numerous, bury all their children alive, recruiting their armies with those taken in war. These are the only writers who have described Monomugi and Mataman, or Matapan, which last is represented as a desert waste, inhabited by these barbarians; at least no European nations have found it worth their while to settle colonies or even factories there.

C H A P. IX.

Of CONGO, including the Kingdoms of BENGUELA, ANGOLA, CONGO PROPER, and LOANGO.

S E C T. I.

Of BENGUELA.

Its Situation, Extent, and Rivers; with a concise Account of Old Benguela.

LEAVING the desert coast of Mataman, or Matapan, and proceeding to the north, four kingdoms extend along the west coast, which are frequently included by geographers under the general name of Congo, stretching from sixteen degrees south to four degrees and a half north latitude; that is, above twelve hundred miles in length, from north to south; but they in no part reach two hundred miles from the sea within the land. This extensive country is bounded by the kingdom of Benin and Negeria on the north, by the inland unknown countries of Africa on the east, and by the Atlantic ocean on the west.

But as these kingdoms are not subject to Congo, we shall give the situation and some of the most remarkable particulars of each separately; and, as they agree in their

natural history and in the manners of the people, we shall, to avoid repetition, give these under Congo Proper.

The kingdoms we are now to describe are those of Benguela, Angola, Congo Proper, and Loango. We shall begin with the first. Benguela is bounded on the north by Angola, by the kingdom of Matapan on the south, and by the ocean on the west; the coast of this kingdom begins at Cape Ledo in the north, and extends to Cape Negro on the south; that is from nine degrees twenty minutes to sixteen degrees thirty minutes south latitude, which is about four hundred and thirty miles.

Its chief rivers, beginning at the north, are the Longo, or Moreno, the Nica, the Catonbella, the Gubororo, or St. Francisco, which runs through the middle of it, the Farfa, the Cutembo, and the great river Cuneni, all which run from east to west.

The climate is extremely bad, for strangers and the Europeans settled there are said to look as if taken out of their graves.

The

The men wear skins round their waist and beads about their neck, and are armed with darts headed with iron, and with bows and arrows.

The women wear about their necks a heavy collar of copper, and have little copper bracelets round their arms reaching to their elbows; about their waist they have a kind of cloth made of the bark of the infandie tree, and on their legs they have copper rings.

The capital of the kingdom, named Old Benguela, is situated in ten degrees thirty minutes south latitude, and gives its name to a province that extends thirty miles along the coast. In this city the Portuguese have built a fort, encompassed with palisadoes and a ditch: the whole is surrounded with houses, and shaded with orange, lemon, bannana, and other trees. The bay of Benguela lies to the south of the town, and is about two leagues broad at the entrance; but before the town lies a sand-bank, which makes it necessary for ships to cast anchor at the distance of about a league from it.

About fifteen leagues to the south of Old Benguela is the town of Manikongo, which is large, and situated at the foot of a hill; it is very populous, and is well supplied with oxen, hogs, and other beasts for food. The Portuguese have a warehouse there.

SECT. II.

Of ANGOLA.

Its Situation, Rivers, and some Circumstances relating to the Manners of the People, particularly with respect to their Language, Trade, and Method of making War: with a concise Description of Loando, its Capital.

THOUGH this country is called by the Europeans Angola, among the natives it has the name of Dombo. This kingdom is bounded on the north by Congo Proper, on the east by Malemba, or Majemba, on the south by Benguela, and on the west by the ocean. The country is watered by several rivers, the most considerable of which is the Dande and the Coanza. The soil is fertile; it produces Indian corn, beans, oranges, lemons, and several other fruits; and is rich in mines of silver, copper, and other metals.

The inhabitants resemble those of Congo, which we shall particularly describe. They are, however, in general very lazy; and, though they have plenty of provisions, are sonder of dog's flesh than of any other meat, and therefore fatten them and sell their flesh in the shambles.

The people are divided into four classes, the first of which are noblemen; the second are stiled children of the dominion, these are natives, and for the most part artificers and husbandmen; the third are the slaves of the several lords, who are considered as a part of their property; and the fourth are the slaves taken in war.

They manure their ground by casting up the earth into a ridge, leaving a furrow on either side, into which, when the rivers are swelled by the rain which flows from the mountains, they cut their banks and let in the water, which having remained there for some time; they let it out into their canals, close up the banks, and soon after the earth becomes proper for receiving their seed, which soon grows up, and is fit to be reaped in three months time.

Polygamy prevails here, and the first wife is superior to the rest. While a child has no teeth, the woman keeps from her husband; but as soon as these appear, all the friends and acquaintance of both sexes carry the infant in their arms from house to house, playing and singing, to procure some gift for it, and are seldom or never put off with a denial. The husbands stay at home, and employ themselves in spinning and weaving cotton; while the women buy, sell, and perform the business which is generally done by men in other countries, and they are so jealous of their husbands, that if they observe them speak to any other woman, they are presently in a flame, and make the place ring with their clamour.

When any person dies, they wash the corpse, and winding it up, comb out the hair, and put on new cloaths: they then carry it to the grave, which is made like a vault, where it is set upon a seat made of earth, with many glass beads, and trifles about it. The

wealthy sprinkle blood upon the earth, and pour out wine, which is said to be done in remembrance of the deceased.

The language of Angola differs from that of Congo only in the pronunciation; but they are not acquainted with the use of characters for writing.

The trade of the Portuguese and other Europeans in Angola, consists in purchasing slaves. These are bought above an hundred and fifty, or two hundred miles up the country, and from thence sent down to the coast. All sorts of commodities are imported thither, particularly cloth, kerfies, ticking, Silesia and other linen, gold and silver lace, seamen's knives, linseed oil, all sorts of spices, brandy, white sugar, Turkey carpets, coloured yarn, sewing silk, needles, pins, beads, large fish hooks, Canary wine, and horse tails, which are much esteemed in Angola.

The king of Angola acknowledges no kind of subjection to the king of Congo, though the country was formerly subject to him; for about the middle of the sixteenth century, one of the nobles named Angola, by the assistance of the Portuguese, made war upon the rest of the nobility, and subdued them, till they all became his tributaries.

The military discipline of the people of Angola and Congo is nearly the same; for both of them usually fight on foot, and divide their army into several troops, forming themselves according to the ground, and displaying their ensigns and banners. The motions of their troops are regulated by the captain-general, who placing himself in the center of the army, by the sound of instruments gives his orders whether to advance or retire, turn to the right, or left, join battle, or perform any other warlike action.

They chiefly make use of three sorts of martial music. The first is a kind of drum, on which they beat with ivory sticks. The second is shaped like a bell reversed, and made of thin plates of iron; upon these they strike with wooden sticks. The third sort are elephants teeth hollowed, and blown at a hole made in the side, the sound resembling that of a horn. These several instruments are of different sizes, the larger are for the use of the captain-general, and the smaller for the inferior officers; so that when they hear the general's drum, horn, or bell, they answer in the same note, to signify that they understand his pleasure.

The commanders, on their march, wear square hats or bonnets, adorned with the feathers of ostriches, peacocks, &c. The upper part of their bodies is naked, only they hang over their shoulders iron chains, with very large links. They have linnen drawers, and a cloth which hangs down to their heels; but they occasionally tuck it up under their girdle, to which is fastened several bells, and on their legs they wear buskins.

Their arms are the bow and arrow, sword, dagger, and shield. The common soldiers, who go naked from the waist upwards, use bows and daggers, with hafts like knives; those they stick in their girdle. Their bows are three feet long, with strings made of the bark of trees; the arrows, which are of the same length, are not so thick as a man's finger, and have iron heads; they also use broad swords, musquets, and pistols, which they buy of the Portuguese.

They advance to war with beat of drum, and the sound of horns, and having discharged a flight of arrows, dexterously wheel about, and leap from place to place to avoid the arrows of the enemy. There are commonly some sturdy youths in the van, who with the ringing of the bells that hang at their girdles encourage the rest. After the first bodies have fought till they are weary, upon the sound of a horn they retreat, and others supply their places, till one side proves victorious.

The people fly as soon as their general is slain, and are never to be rallied. The king never goes to war in person; the strength of his army consists entirely in the infantry, he having few or no horses, and therefore the commanders are frequently carried on the shoulders of their slaves.

The chief town of Angola, and one of the most considerable belonging to the Portuguese settlements on this side of Africa, is named St. Paul de Loando; it is situated

ated on the isle of Loando, which is twelve miles in length, and three quarters of a mile in breadth, and stands in eight degrees forty-five minutes south latitude. The town is large and handsome, considering the country, and contains about three thousand houses built of stone, and covered with tiles; besides a vast number of the huts of the negroes made of straw and earth. It has a good harbour, defended by a fort, and is a bishop's see. The jesuits have a college here, and there are several other religious houses; but they have no fresh water.

The Portuguese, however, do not seem to be so much masters of the coast of Angola as they are of Congo Proper; for both the English and Dutch trade thither with the natives, and annually purchase a great number of slaves, which they carry to America.

S E C T. III.

Of CONGO PROPER.

Its Situation, Climate, Mountains and Minerals, Marbles, and Precious Stones. Of their Harvests, Agriculture, different Sorts of Grain and Pulse; and of the Mandioca, or Maniac Root, with the Manner in which it is ground into Meal.

THIS kingdom is bounded on the north by the river Zaira; on the east by a ridge of mountains, and the kingdom of Matamba; on the south by Angola, from which it is parted by the river Dande, and on the west, by the Atlantic Ocean. It extends along the sea coast from cape Dande, to the mouth of Zaira, which is about sixty leagues; but is said to extend to a greater length to the eastward, though its limits on that side are not determined.

The climate of Congo is said to be extremely temperate, considering its being situated very near the equator. The winter begins in March, when the sun enters the northern signs, and summer in September, when the sun enters the southern signs, and in this season it never rains; but during five months of their winter, that is, April, May, June, July, and August, they have but few fair days; the rain pouring down with prodigious force, the rivers overflow their banks, and lay all the low lands under water.

The winds in winter through all these regions blow from north to west, and from north to north-east, driving the clouds towards the mountains with great violence, where being gathered and compressed, they are seen on the tops of these eminencies, and soon after discharge themselves in showers. During their summer, the winds blow from the south to the south-east, and as they clear the southern skies, drive the rain into the northern regions. These winds cool the air, the heat of which would otherwise be insupportable. No snow falls in these countries, nor is any to be seen on the tops of the mountains, except towards the Cape of Good Hope, and some other hills, called by the Portuguese, the Snowy Mountains.

Copper is found in many parts of Congo, especially near the city of Pemba, where that metal has so deep a tincture of yellow, that it has been mistaken for gold. There are also mines of silver and iron.

The mountains of Congo in many places have quarries of excellent stone of various kinds, from whence whole columns, with their capitals and bases, may be dug of a prodigious size. There are even said to be whole mountains of porphyry, jasper, and marble of various colours, resembling those which at Rome are called marbles of Numidia, Africa, and Ethiopia. There is also a stone speckled with grains, or streaks, some of which contain beautiful hyacinths; for the streaks which are dispersed like veins through the body of the stone may be plucked out, like the kernels of a pomegranate, when they fall into grains and little pieces of perfect hyacinth. Beautiful columns may be formed of the whole mass, which is very sparkling. There are other stones, which seem inlaid with copper and other metals; these are very beautiful, and take a fine polish.

There are every year two harvests in the kingdom of Congo; for they begin to sow in January, and reap in April: the second seed-time is in September, and they reap what is then sowed, in December. In cultivating the earth, they make use of neither plough nor spade. The clouds no sooner begin to afford the least moisture, than the women set fire to the herbs and roots, and after the first heavy shower has fallen, proceed to turn up the ground with a slight hoe, which is fixed to a handle about two spans long; with this they cut into the earth with one hand, and with the other scatter the seed, which they carry in a bag by their sides. While they are employed in this exercise, they are generally obliged to carry their children upon their backs in swathing rolls, to prevent their being hurt by the number of insects that upon this occasion come out of the earth. They even do the same when they carry burthens.

As to their grain, here is a sort which the inhabitants call lueo, that nearly resembles mustard-seed; but it is somewhat bigger. It is ground with hand-mills, yields a very white meal, and makes fine, well tasted bread, not at all inferior to that made of wheat. There is also a kind of millet, called the corn of Congo, and another sort called Portuguese corn. They have likewise maize; but they give it to their hogs, and they are not fond of rice, of which they have great plenty.

They have various sorts of pulse for the most part unknown in Europe, among which is a sort not unlike rice; it grows upon a shrub, and will last two or three years, yielding fruit every six months in great abundance.

The oluvo may be preserved many years; it has a triangular ear, and its grain, which resembles millet, is red and wholesome.

Among many other sorts of pulse are the mandois; which grow three or four together like vetches; but under ground, and are about the thickness of an ordinary olive; from these they extract milk like that drawn from almonds. There is another sort of ground pulse, called incumbe, which is of the size and shape of a musquet ball, and is very wholesome and well tasted.

According to Dapper, they make bread of the root of what the natives call mandioca, or maniac root; reduced to meal; this plant is of various sorts, which differ in the roots, colour, and quality. The leaves resemble those of the oak, and are of a deep green, with many veins and prickles. The stem shoots upright ten or twelve feet high, spreading into many branches; but the wood is weak, like that of the willow, the blossom small, and the seed like Palma Christi, but of no value. When they cultivate this plant, they dig up the earth, beat it small, and throw it up into heaps, then lopping off twigs, or taking slips about a foot long, and an inch thick, set two or three in each heap, with the ends sticking out four or five inches above the earth. These instantly take root, and in about a twelve month's time, shoot up to the height of above twelve feet, with many branches, and a body as thick as a man's thigh. To make the root grow large, they keep the ground clean by weeding it, and when it is come to its perfect maturity, cut the stem close to the earth. The root being afterwards dug up, and the outside taken off, they reduce it to flour, by grinding it in a mill made like the wheel of a waggon. The fellics of the wheel are a span broad, and the bottom covered with copper, set with sharp points in the manner of a grater, and underneath is a trough, into which the meal falls. He who holds the root to the wheel, is attended by several little boys, who bring him the roots, and there are slaves to take the ground meal out of the trough, and dry it in copper pans over the fire. Many houses are built for this work, that are above a hundred feet long, and thirty or forty broad, with ten furnaces on each side. Every husbandman may make as much meal as he thinks fit, and if he has a house with twenty furnaces, he commonly employs fifty or sixty slaves in weeding, hoeing, grinding and drying.

Garden plants and roots grow here with little labour, particularly cabbages; but these are more open than with us, colliflowers, spinage, purslain, sage, hyssop, thyme, sweet-majoram, coriander-seed, turnips, potatoes,

toes, carrots, radishes, and many others, besides several unknown in Europe.

SECT. IV.

Of the Timber and Fruit Trees of Congo, and the neighbouring Countries, particularly the Ensada, and Mironne-Tree, the Mofuma Cotton-trees, the Maginette, and the Mignamigna. Of the Beasts, with a particular Description of the Dante, and the Njessé. Of the Birds, Reptiles, and Fishes.

THERE are trees here of an amazing size, the chief of which is called by the natives ensada, and commonly spring up with one thick body to a great height. At the top they shoot forth many branches, from which descend small strings of a yellowish colour, which on their reaching the ground, take root, and spring up again like new plants, and in a little time encrease to a large bulk, from whence fall new pendulums, which taking root again, spring up as before; so that sometimes a single tree will extend its boughs above a thousand paces, forming a wood large enough for several thousand men to shelter themselves under the branches, which grow so very close, that the sun-beams cannot penetrate them. The leaves of the young boughs resemble those of the quince-tree, they being of a whitish green, and woolly. The fruit, which is red both within and without, grows between the leaves of the young branches, like a common fig. Under its outermost bark, they find something like a thread or yarn, which being beaten, cleansed, and drawn out in length, the common people make into a kind of cloth. This and the following are evidently species of the Banyan-tree already described, in treating of Indostan.

The mironne nearly resembles the former; for the boughs also send down abundance of roots to the ground; the leaves are like those of the orange-tree, and it is generally planted near the dwellings of the inhabitants, who pay to it a kind of religious veneration.

By the river Zaira grows the mofuma-tree, of which the natives make canoes. The wood is so extremely light, that it will not sink tho' it be full of water. On these trees grow silk-cotton, which by sea-faring people is used instead of feathers. Cotton also grows wild.

Their fruits growing on shrubs are ananas, anones, bananas, aroldses, pompons, melons, cucumbers, &c.

Among the fruit trees are citrons, lemons, and oranges. There is here a fruit tree which bears the name of the count; the fruit resembles the giant-pear, its seed is like a bean, and its juice is exceeding pleasant.

The cola fruit is as big as a pine apple, and incloses other fruit like chestnuts within its husk. This fruit, besides its other qualities, is esteemed a sovereign remedy in all diseases of the liver.

The guajavas have some resemblance to pears; they have short stalks, are yellow without, and of a carnation colour within; they have a delicious taste; but are of so cold a nature as to be unwholesome.

The granate plum resembles the guajava; but is smaller, has a pleasing sharp taste, and is very wholesome.

The maginette is a grain resembling pepper, but is larger, and grows in bunches; within these grains are seeds, like those of a pomegranate, which, on being taken out, appear of a purple colour; but, on being dried in the sun, become black, and have a biting taste like pepper. There also grows a tree three or four feet high, with small and narrow leaves, the fruit of which resembles the coriander; it first appearing in green knots, afterwards in blossoms, and lastly in a kind of small grain. These berries, when grown ripe and dried in the sun, turn black and hard, and differ but little in taste from East India pepper, only they are not so hot.

There are here also several kinds of palm, date, and cocoa trees; there are likewise many trees that have medicinal virtues; but the most surprising of them all is the mignamigna, which is said to produce poison in one part, and its antidote in another; for if any person be poisoned, either by the wood or by the fruit, which resembles a

small lemon, he will then be cured by the leaves; and if he is poisoned by the leaves, he must then have recourse either to the fruit or the wood.

Among the animals the dante seems peculiar to this country. It is shaped and coloured much like an ox, though not so large; its horns are like those of a he-goat, but are blackish, very bright and shining, and the natives form them into a great variety of very pretty baubles. They make use of the raw hide dried to cover their shields, it being so tough that no arrow or dart can go through it. It is exceeding swift of foot, and when wounded will follow the scent or smoke of the gun-powder with such fury, that the hunters have no other way to avoid it, than by climbing a tree with all possible speed; and upon such occasions they always carry rope-ladders with them, which they fasten to some branch before they venture to fire. The wounded dante, finding his enemies out of his reach, stays at the foot of the tree for them, and flirs not from it till a second, or perhaps a third shot has laid him dead. Their flesh is esteemed delicate food, and both the natives and the wild beasts make continual war upon them; but nature has taught them to guard against the latter; they commonly go in large droves of seldom less than a hundred, which, on their being attacked, dispose themselves into a ring, with their horns outward, with which they defend themselves with surprising vigour and agility. They are of different colours like our cows, some black, others grey, and others brown.

The njessi is of the bigness of a cat; it is of an ash colour, and has two small horns on its head. This is said to be the most fearful creature that lives, it being ever in motion, and starting or running at the least noise or breath of air. Even when it is drinking, it swallows a single gulp, then runs away, as if pursued, and with the same fear returns, till it has quenched its thirst. It does the same when browsing on the grass, at every blade it crops. Its flesh has an exquisite taste, and the natives prefer its skin to that of any other creature, to make fliers for their bows.

There are here also the elephant and the rhinoceros, with red buffaloes, zebras, elks, lions, tygers, leopards, bears, wild boars, wolves, foxes, very large wild cats, catamountains, civet cats, apes, baboons, and the orang outang, which is of a middle species between the human and the baboon. These are also found in the East Indies, where we have given a particular account of them.

There are also here cows, sheep, goats of several kinds, hogs, fallow deer, roe-bucks, hares, and rabbits.

These and the neighbouring kingdoms afford a vast variety of both land and sea fowl. Among the former are plenty of ostriches of a surprising size. Their feathers, mixed with those of the peacock, which are here no less numerous, and exceeding beautiful, are used as ensigus and standards, and made into very splendid umbrellas. The king of Angola, we are told, keeps vast numbers of peacocks in a wood surrounded with high walls, and suffers none in his dominions to breed or have any of them, because he uses their feathers in his royal ensigus.

Turkish geese, hens, and ducks, both wild and tame, are also here in vast plenty; and pheasants are so numerous and familiar, that boys take them alive in their traps. The same may be said of the prodigious quantity of wood-cocks, pigeons, doves, and other smaller birds, which are common in all these countries.

They have a great variety of parrots, distinguished by their different sizes and colours, particularly a small sort not much bigger than a sparrow, but of a fine shape and the most delightful colours.

But the most esteemed are those distinguished by the name of birds of music. These are something larger than the Canary bird, and of different colours, some being all over red, others green, with only the feet and bill black; some are all white, others grey, dun, or black; these last have the sweetest note, and seem to talk in their singing.

In some places the pools are covered with white herons. There is also a sort of fowl like a crane, with the bill and feet red, and its feathers for the most part red and white; but some are of a dark grey. Birds of prey, as eagles,

eagles, vultures, falcons of various sorts, sparrow hawks, and others of the like nature, are here likewise very numerous.

With respect to reptiles, the country is infested with a variety of serpents, some of which the Portuguese priests have represented as of so incredible a size, as to swallow a sheep whole, or even a stag with its horns. There are rattle snakes, vipers, tree-serpents, and many reptiles of other kinds; and the houses are infested with scorpions.

Fish, as in other maritime countries, are here also in great plenty and variety, both in the sea and the rivers.

SECT. V.

Of their Persons, Dress, Manners, and Customs. Their Entertainments, Music, and Dancing.

THE complexion of the original natives is generally black, though not in the same degree, some being of a deeper die than others; and since their intermixed marriages with the Portuguese, they have varied from their native hue, some to a dark brown, some to an olive, and others to a blackish red. Their hair is black and woolly, and their eyes of a fine lively black; but they have neither flat noses, nor thick lips. Their stature is mostly of the middle size; and, excepting their black complexion, they much resemble the Portuguese, though some of them are more fat and fleshy than they.

In general they behave in a friendly manner towards strangers, and are of a mild, courteous, and affable disposition, easy to be overcome by reason; yet inclined to drink to excess, especially when they can get Spanish wine and brandy. In conversation they discover great quickness of parts and understanding, and express themselves with such good sense and humour, that persons of the greatest learning take delight in hearing them. But they are, on the other hand, proud, revengeful, and much addicted to poisoning one another on the smallest provocation; but if the offender be detected, he dies without mercy; and the enquiry is so strict, that it is very difficult to escape.

Lopez observes, that the king of Congo and his courtiers were formerly clothed from the waist downwards with palm-tree cloth, fastened with girdles of the same stuff. They also hung before them, by way of ornament, the skins of small tygers, civet cats, fables, martens, and other animals, in the manner of an apron; and on their heads a cap resembling a hood. Next their skins they wore a kind of surplice which reached to their knees, and was made of very fine palm-tree cloth, and fringed round the skirts. These surplices were turned up again, and tucked upon the right shoulder. They wore yellow and red caps, so small that they scarce covered their heads. Most of them went unshod; but the king and some of the great lords wore sandals, like those of the ancient Romans, made of palm-tree wood. The common people were dressed from the middle downwards in the same manner, only the cloth was coarser; but the rest of their body was naked.

The women used three kinds of aprons of different lengths, one of which reached to their heels, and was fringed round. They had also a sort of jacket, open before, that reached from their breasts to their girdle, and over their shoulders a cloak made of palm-tree cloth. Their faces were uncovered, and they had a small cap on their heads like those worn by the men. Women of inferior rank were dressed in the same manner, only their cloth was coarser; but the maid-servants, and the women of the lowest rank, had only a cloth round their waist, and all the rest of the body naked.

This was the dress of Congo before the arrival of the Portuguese; but after their conversion to the Romish faith, the great lords of the court began to follow their fashion in wearing cloaks, Spanish hats, wide jackets of scarlet silk, and leather or velvet slippers. But the common people, both men and women, retain the old habit through necessity. Women of figure also dress like the Portuguese, except their wearing no cloaks: they cover their head with a veil, over which they have a velvet cap adorned with jewels, and gold chains round their necks.

The natives chiefly live upon fruit, roots, grain, and pulse: their common drink is water, and they regale themselves with palm wine. They are fond of entertainments, and commonly celebrate their feasts in the evening, when they seat themselves in a ring upon the grass, and a large, thick, wooden platter is placed in the midst of them. The eldest person present gives to every one his share with great exactness, both as to quality and quantity, so that none have reason to complain. If any person whatsoever happens to be passing by where the guests are eating, he or she thrusts into the ring without ceremony, and has an equal share with the rest, even though he should come after the shares are allotted: in which case the carver takes some from every person's mess to make up that for the stranger. It is the same if the chance-comers are numerous; they may eat and drink as freely as if invited; and when they perceive the platter empty, they rise up and go away, without taking leave or returning thanks: nor do the people ever ask these intruders whence they come, or whither they are going.

These feasts are kept on several occasions, as on a marriage, the birth of a child, their advancement to some dignity, or the like, when every one makes his lord a present suitable to his ability, and also assists at the solemnity.

At these entertainments they sing love songs, and play upon an instrument of a very extraordinary shape; the body and neck resemble those of a lute, but the belly-part is not made of wood, but of a skin as thin as a bladder. The strings are hairs of the elephant's tail, or threads of palm-tree, reaching from the bottom of the instrument to the top of the neck, and tied to several rings placed some higher and others lower. At these rings hang thin plates of iron and silver, of different sizes and tones. When the strings are struck the rings shake, which moving the plates, the latter yield a confused kind of gingle. Those who play on this instrument tune the strings and strike them with their fingers like a harp, very skilfully, so that they make a sound agreeable enough.

Of the same kind is an instrument like a guitar, but without a head; instead of which are five small iron bows, which, when the instrument is to be tuned, are let more or less into the body of it. The strings are of palm-tree thread, and are played upon with the thumbs of each hand, while the instrument rests upon the performer's breast. Though the sound is very low, yet it is not disagreeable.

The most ingenious of their instruments, as well as that most in use, is thus described by Carli. They take a stick which they bend like a bow, and tying it, bind to it fifteen long, dry, and empty gourds, or calabashes, of different sizes to sound different notes, with each a hole at the top, and a smaller hole three fingers lower. This last hole they stop up half way, and cover that at the top with a little thin bit of board at some distance above it. They then take a cord, made of the bark of a tree, and fastening it to both ends of the instrument, hang it about their neck. To play upon it, they use two sticks, with the ends covered with a bit of rag, and striking upon the little boards, make the gourds gather wind; which being driven out of the half stopped hole, give sounds resembling those of an organ, and make an agreeable harmony, especially when three or four of them are played together.

They have also flutes and pipes, which the court musicians play upon very skilfully; the common people also use pipes with little rattles, and other instruments that form a very rude sound.

They make their drums in the following manner; they cut the trunk of a tree three quarters of an ell long or more, for when they hang them about their necks they reach almost to the ground. These they hollow within, and cover the top and bottom with the skin of a tyger, or some other beast, which makes a hideous noise when they beat it, after their manner, with the open hand.

Besides these great drums, which are used in the army, there is a smaller sort, made either of the fruit of the aliconda tree, or of a smaller piece of the trunk of a tree made hollow, with a skin over one end only: these they beat upon only with one hand.

When

When the people dance they keep good time with the music, clapping the palms of their hands together; but at court they generally move their feet in a kind of *Moresco* measure, with great gravity.

The chief pastimes of the Congo blacks are dancing and singing. They also play at cards, flaking small shells, which are their money. In the evening, when the women are returned with their children from the fields, they light a fire in the middle of their cottages, and sitting round it on the ground, eat what they have brought; then talk till they fall backwards with sleep, and thus spend the night.

SECT. VI.

Of their Marriages; the separate Employments of the Husband and Wife; the Treatment of their Children; their Funerals and Mourning.

THE people of Congo who have embraced the religion of the Portuguese, marry after their manner; but will not be restrained from keeping as many mistresses as they can maintain. When a young man expresses his desire to marry, his parents send a present to the relations of the young woman on whom he fixes his choice, requesting their daughter as a wife for their son. With this present an earthen pot of palm wine is also sent, and before the present is received, all the wine is to be drank by the girl's parents and friends, the father and mother drinking first. After this is done the father returns an answer, and his receiving the present is considered as a proof of his compliance. The young man upon this goes immediately with his friends and relations to the house of his mistress's father, and, having received her of her parents, conducts her home, where he lives with her in order to be satisfied whether she will have children; whether she will be diligent in her daily labour, and prove very obedient: and if, in two or three years time, he finds her faulty in any of these points, he sends her back to her parents, and has the present restored; but when the fault is on his side, he can recover nothing. The woman, however, is not considered in a worse light on this account, but generally undergoes another trial soon after.

If after a man's enjoying, during two or three years, all the privileges and endearments of the nuptial commerce, he at last ventures to tie the nuptial knot, he sends to all his and his bride's relations, who never fail to come on the day appointed, dressed in the most costly ornaments they can either purchase or borrow. Every one breaks out into congratulations and good-wishes. The priest, if any can be had, (for in some parts of the kingdom they are sometimes whole years without seeing a priest) comes in and performs the ceremony; then follows the dowry, and some mutual presents, suitable to their rank.

The marriage-ceremony is quickly succeeded by a sumptuous banquet, and upon these occasions they exert all their abilities. The repast commonly lasts till after sun-set, or rather as long as there are any victuals or liquor left.

No sooner are all the provisions eaten than every one diverts himself his own way, some by singing or dancing, others by drinking, smoking, or sleeping, which generally crowns the feast; and the next rising sun sends them all home.

In case of adultery the man is obliged to give the value of a slave to the husband, and the woman to ask pardon; and if this be not done, the husband may easily obtain a divorce from the Portuguese priest.

The husband is obliged to procure an habitation, to clothe his wife and children in a manner agreeable to his rank, to prune the trees, to grub up roots, and to carry home the palm wine as often as the vessel fills. On the other hand, the woman is to find provisions for her husband and children: she accordingly works in the fields till noon, and at her return prepares the dinner. If any thing is wanted, she must either buy it out of her own money, or barter cloaths for it. The man sits alone at table, while the wife and children wait to supply him

with what he wants. When he has dined the remainder comes to them; and though they may sit down to eat it if they please, yet they generally stand from the opinion that they ought to pay this mark of respect to him whom they are born to serve and obey.

The mothers of those who have not embraced the *Romish* religion present their infants as soon as they are born to their own priests, in order to know their good or ill fortune. The false prophet, then taking the child in his arms, makes his observations on the muscles and other parts of his body, and then tells the parents what he thinks proper. The same is done to sick persons, in order to know the cause of their distemper, and whether they will recover; and if they guess wrong, they never want an excuse.

It is customary for the parents, or the pagan priest, to order the young people to abstain from eating either the flesh of some particular wild beast, some sorts of poultry, or a particular fruit or root; and these orders are as inviolably kept, as they are strictly enjoined; for they would sooner fast for several days than taste the least bit of what has been forbidden.

When a person dies, they wrap up the corpse in a piece of cotton cloth; but the poor make use of straw mats, then bury the body in the fields, and distinguish the grave by placing a heap of raised earth upon it: others place upon this heap the horn of some uncommon beast; and others plant trees, and form arbours around it.

Both rich and poor observe a kind of mourning for their near relations, which begins with a close confinement and abstinence from all refreshment during three days: after which those of the common rank shave their heads, and anoint themselves all over with oil; upon which they rub such a quantity of earth, dust, and dry leaves of various sorts, as gives them a most frightful appearance. Those of higher rank content themselves with shaving the upper part of the head, binding about it a list of cloth, linen, or leather, and confining themselves in their houses eight days; after which they gradually return to their former way of life.

The widows are obliged to submit to a much longer retirement, especially at court, and in the populous cities, where it would be thought scandalous to be seen abroad in less than a year after the death of a husband; but in more remote places they are allowed to go about their own affairs much sooner. Upon their first appearance they are usually in black, with a cap on their head, which falls back upon their shoulders: their upper garment, which is generally woollen, is open on the sides, and reaches as low as the knee both before and behind. That of the women of quality is of the same stuff and colour, but fuller, and plaited about the neck. The widow slaves of St. Salvadore, Loango, and other places, are distinguished by a sharp pointed cap, about thirty inches high, which makes a strange appearance.

We shall conclude this section with a very barbarous custom which prevails at Congo. The people believe that the dying are just upon passing from a wretched and troublesome life into a state of ease and happiness; and from thence infer, that the most charitable office they can do them is to hasten their deliverance; and therefore, when a person is at the point of death, they strive who shall dispatch him soonest, by stopping his mouth and nose, and striking him upon the breast with their fists or knees, which they imagine an instance of kindness, as it shortens his last struggles and agonies, and speedily sends him into a state of rest and bliss.

SECT. VII.

Their Ignorance of the Sciences, and their Skill in several Arts, particularly in working Iron, and Weaving: their Carpenters, Joiners, and Potters: and their method of travelling.

THE inhabitants of Congo cultivate no sciences: they keep no histories of their antient kings, nor any records of past ages; for they have not the art of writing.

They

They reckon the year by winter seasons, which they begin upon the fifteenth of May, and end on the fifteenth of November: they also reckon the months by the full moon, but do not divide the days into hours and minutes.

Working of iron is much esteemed amongst them, not only on account of its extraordinary use, but from a tradition that its first inventor became afterwards king of Congo; and yet it has received so little improvement, that a stranger who saw them working at the forge, would find all the appearance of its being still in its infancy. The workman sits on the ground, or at best upon a stone; for they have no notion of standing to work, with an ill shaped hammer in one hand, a piece of iron in the other, and, instead of an anvil, a hard stone between his legs, upon which he beats and shapes one iron, while his foot is moving a wretched pair of bellows to heat another.

They do not dig the ore out of the mines, but content themselves with such a quantity as the heavy rains and torrents bring down in a kind of dust or dirt into the valleys and highways; and for receiving it dig holes and trenches. When it is settled at the bottom, and the water taken off or dried up, they cover the whole with charcoal; and by blowing it, when lighted, purge the metal from its dross, and melt it into a lump, which they afterwards fabricate in the above manner, performing the whole with so little art that the points of their lances, darts, and arrows, their scymetars, cutlasses, and other weapons, are clumsy and ill shaped.

Their method of weaving is still more rude and imperfect: and yet one would be astonished at seeing the curious works performed by such simple means. They have neither loom, shuttle, nor other instruments in use among them; but only fasten their threads at both ends to pieces of wood laid upon the ground at no considerable distance; for they never weave a piece of any greater length than will serve for one single dress. Having braced the threads of the woof as tight as they can, they conduct the cross-web between them with astonishing patience, as if they were rather darning then weaving; and yet some of them adorn their web with various works in checkers, diamonds, flowers, and net-work in different colours, with surprising neatness, considering the manner in which the whole is performed: but among us a weaver is able to do as much work in one day as they in twenty.

With respect to their joiners and carpenters, who at Congo are of one trade, their tools consist of a mishapen ax, the back of which serves for a hammer; at one end is also a kind of chissel, the other is sharp-pointed like a puncheon, and both are fastened to a wooden handle. The work they produce is clumsy and without art, and being performed with such awkward tools, is six times as long ere it is finished, as a better hand, with better tools, would be in making a more perfect work.

The potters for want of a wheel, shape their clay by the help of a piece of a gourd, which serves them as a mould; and, instead of an oven or a kiln, burn a quantity of straw over and about it.

In many cases, as in the making of their ordinary huts, boats, nets, and the like, every one works for himself.

Their artists have shewn but little skill in contriving vehicles for carriage. They have neither coaches, carts, beasts of burthen, or even saddle horses, mules, or asses; but the people are carried on the shoulders of their slaves, be it ever so far, or the roads ever so bad. The rich commonly travel in a kind of hammocs, with a covering over them to shelter them from the sun; and perhaps a slave runs with an umbrella to shade his master on the sunny side, and sometimes only for grandeur. The hammocs, some of which are made of net-work, and others of strong stuffs, are fastened at both ends to a pole, which is carried upon the shoulders or the heads of two stout slaves, who are relieved at proper intervals by two others, or more if their master can afford it; while he lies lolling at his ease, smoking, sleeping, or looking about him, with all the indolence that makes a part of African as well as Asiatic luxury.

Some of these carriages are borne by four slaves, and resemble the palanquins of India; they having an easy couch and a pillow, and above a canopy and curtains to shield the person, indolently reclined within, from the

sun, the rain, or the wind. These are more convenient than the other, and require a great number of slaves; on which account they are only fit for persons of high rank, and are therefore commonly embroidered with gold, silver, and silk.

On the other hand, those of the lower rank are contented with being carried sitting in a kind of open chair, or even a broad leather strap, hanging to a pole carried on men's shoulders, and holding an umbrella in their hand.

All these methods of travelling require, besides the ordinary relay of slaves, another set to carry provisions, tents, and other conveniencies for the journey; and those who have not a sufficient number of them may hire them of those who have.

Indeed, their best method of travelling is chargeable, inconvenient, and tedious; for even those who have the best opportunities for expedition, must let their porters and carriers rest so often, either upon real or pretended occasions, that they seldom make half the speed that might be expected. While the badness and difficulty of the roads, and the want of them in most parts of the kingdom, where they are obliged to cut their way thro' woods and thro' thickets of thorns and brambles; to cross pathless deserts and burning sands; to travel over high and almost impassable rocks and mountains, exposed to danger from wild beasts and venomous reptiles, must render the most delightful conveniencies for travelling disagreeable, when attended with delay. Add to this, their being frequently obliged to cross large and rapid rivers, sometimes only by means of a rope thrown over and fastened to a tree; and, at best, in some old boat, made of the bark, or cut out of the stump of a tree.

S E C T. VIII.

Of the Buildings and Furniture of the Congoese; with a Description of St. Salvadore, the Metropolis of the Kingdom.

THEIR houses are generally no better than round huts, low and ill built with wood and mud, without any floor besides the naked ground, or any ceiling; they are commonly ill contrived, and poorly thatched with straw or fern; but this is sufficient to defend them from the sun, rain, and wind. They have no windows, nor any light but from the doors, which are usually so low, that the shortest man must stoop to enter them, and the tallest can hardly stand upright within the little building. These tents are more or less spacious according to the largeness of the family, who live promiscuously in them, and at night light a fire in the center, the smoke of which makes its way through the thatch, while they lie round it with their heads towards the wall. The houses of the city of St. Salvadore, and some other of their towns, are however somewhat higher, better thatched, and white-washed both within and without: these are divided into apartments, the chief of which have their floors matted. Those which belong to persons of rank are still more capacious, and have a kind of hall to receive their visitors; besides distinct apartments for their wives, servants, and slaves, which stand like so many houses either adjoining to each other, or inclosed within the same cincture.

Those of the Portuguese must be excepted, they being commonly built of brick and mortar after the European manner, and for the most part pretty well furnished; but these have not been able to raise the emulation of the Congoese to endeavour to imitate them.

The furniture of the natives is much of a piece with their houses, it chiefly consisting of a few ill contrived instruments of agriculture; a hatchet to fell timber; a cutlass, which they usually carry about them when they are travelling, or going to war; a few calabashes, in which they store their provisions, as their roots, pulse, grain, and the like; and their kitchen furniture, which consists of a pot, a kettle, a ladle, a few earthen platters, a hand-mill to grind their corn, and some small calabashes, out of which they eat and drink. Their best bedding is a large coarse sackcloth filled with straw, leaves, or the like, with a slight covering, and perhaps a stump of wood for a pillow. If the meaner sort have any thing better than

than the bare ground to lie upon, it is only some straw, fern, rushes, or leaves; and as they are all obliged to kindle a fire at night, on account of the violent dews, it frequently communicates itself to their bedding, and in a few moments sets the whole house in a flame, even sometimes before they can have time to escape out of it; and it is not unusual for the flames to spread over a whole town or hamlet. Tables, chairs, and stools, with many other pieces of furniture esteemed necessary in Europe, are never used by the common people.

Indeed their princes and great lords, since the coming of the Portuguese, have endeavoured to imitate, in some degree, the richness of their furniture. But all their finery consists in having their floors neatly matted, or covered with a fine carpet, and their mud walls hung with tapestry: they have also a few large chests, in which they lay up their provisions, ranged about their apartments, and over them hang their arms and apparel in an irregular manner. Indeed in the palaces of some of the chief princes and viceroys the rooms are adorned with large and splendid umbrellas, and many pieces of furniture purchased of the Portuguese merchants, as pictures, looking-glasses, stately couches, easy-chairs, cushions, cabinets, caskets, drinking-glasses, China-ware, wardrobes filled with rich cloaths, and other costly household furniture. Those of the nobility who are unable to purchase these expensive pieces of furniture, content themselves with either imitating something like them in a less degree, or, which is more common, with despising them with a philosophic pride, as things unworthy the regard of a great mind.

After giving this account of the buildings and furniture of the natives, we shall add a description of the capital of the kingdom, antiently called Banza Congo; but it is now known by the name of St. Salvadore, which was given it by the Portuguese. This city is situated in the fourteenth degree twenty-five minutes east longitude, and in the fifth degree of south latitude, upon a very high hill mostly of solid rock, about two leagues in compass, and about a hundred and fifty miles to the east of the sea. It is shaded by a variety of fruit-trees, as the palm, lemon, and orange tree, and yields a delightful prospect all round it; as it commands the neighbouring country on every side as far as the sight can reach, without being obstructed by woods or mountains. The river Zaira runs on the south-east side, where the descent is very steep. The monarchs of Congo chose this city for their residence, on account of its being almost inaccessible to an enemy, and consequently not easy to be surprized or attacked. The common high way that leads up to it is broad, but winding, and the ascent about five miles in length.

It is seated almost in the center of the kingdom; and on the top of the mountain is a large plain, well watered and covered with farms; and there are also a great number of cattle, by which means the place may be easily supplied with provisions. The mountain has also some iron mines of singular use to the inhabitants, who there work that metal into weapons and instruments of agriculture.

St. Salvadore stands on an angle of the mountain facing the south-east; it enjoys a serene and healthy air, and, being strongly fortified by nature, has no walls, except on the south side. The houses stand pretty near to each other; most of them belong to persons of quality, who join such a number of little structures within one inclosure, that they appear like small towns. Those which belong to the inferior people run in a straight line, and form very handsome streets; these are mostly spacious, but their walls are all of straw, except some which the Portuguese have caused to be built of brick, and covered with stucco.

The royal palace is a spacious building, encompassed with a square wall, and has the appearance of a small city; but the wall that faces the Portuguese quarter is the only one that is built of stone and mortar, the other three sides being only of straw, though neatly enough disposed. The walls of the inner apartments are of the same materials, but covered with hangings or mats curiously wrought. The inner-court contains gardens and orchards, adorned with alleys, arbours, and pavilions that make a handsome appearance. Here are ten or twelve churches, of which the cathedral and seven others are within the town,

and three within the palace. The jesuits had some years ago a college, wherein four of them were constantly employed in teaching the Latin and Portuguese tongues, and in catechising the children. The town is supplied with plenty of fresh water by two fountains, one in the street called St. Jago, and the other in the palace; and, besides, there is on the east side, near the foot of the hill, a spring of excellent water, which serves to refresh the adjacent lands. They have here but few sheep and oxen, but great plenty of goats and hogs; and have a large market in a piazza before the great church well furnished with provisions. The rest of that square is encompassed by spacious houses mostly inhabited by noblemen, as are also many others in the suburbs of the city and the adjacent country. That part which is enclosed, and called the Portuguese city, is reckoned about a mile in compass, and the king's palace is nearly the same. The walls about each of them are very thick, but their gates are neither shut nor guarded.

SECTION IX.

Of the Government of Congo; the absolute Authority of the King, who possesses all the Lands; in what Manner the Kingdom is elective; and how the Election is performed. The Ceremony of the King's blessing the People, and that of his granting Investitures; the Grandeur of his Court; the Splendor with which the King goes abroad, and hears Mass. In what Manner the Affairs of Government are transacted. The King's Seraglio; his Forces; and the Manner in which the Laws are executed.

THE government of Congo is monarchical, and as despotic as any in Asia or Africa. The king is the sole proprietor of all the lands within his dominions, which he bestows upon whom he pleases, on condition of being paid a certain tribute out of them; and turns the people out of it upon failure of paying it, or even at his own pleasure. The princes of the blood are subject to the same law; so that there is no person, let his rank or quality be what it will, that can bequeath a foot of land to his heirs or successors; and when these owners under the crown die, they immediately devolve to it again.

The Portuguese, however, since their becoming masters of the country, have prevailed on the monarchs to permit the heirs and successors of the tenants to continue in the possession of such lands, and have obliged the tenants to pay their tribute more readily and exactly than they did formerly. The tribute affixed to the grant of lands to the governors of provinces, and to several marquises, counts, and other nobles, is expressly ordered to be brought to court once in three years at farthest; which, joined to the ambition and avarice of those lords, makes them oppress the people in a cruel manner, and not only strip them of all they have, but even sell, without the least mercy, their tenants, with their wives and children, for slaves.

The kingdom is partly hereditary, and partly elective. No person can be chosen who is not of the royal blood; but whether he be of a nearer or farther branch, whether by the male or female side, or whether born of the wife or one of the king's concubines, is not material, a bastard being esteemed as capable of succeeding to the throne as one born in wedlock; and therefore, upon the decease of a monarch, there seldom fails of being a great number of competitors, though the choice commonly falls on him who brings the greatest number of friends and forces with him to the field of election, provided he be of the church of Rome; for none else are permitted to stand as candidates for the crown.

As soon as they have agreed upon a successor, all the grantees of the realm are summoned to appear on a plain near St. Salvadore, whence they proceed in pomp to the cathedral, once a noble structure built by the Portuguese, but since run to decay; but on these occasions an altar is richly adorned, and near it is a splendid throne, on which the bishop or his vicar is seated; and near the other end of the altar is a chair of state, on which is seated an officer, who is to declare the person elected: he is surrounded

rounded by the candidates, who yet know not who they have pitched upon, and now wait with impatience to hear him declared; but, before he makes his proclamation, he rises from his chair, and kneeling before the altar makes a prayer, and then returning to his seat, pronounces a long speech on the duties of a monarch, and the many cares and difficulties with which it is attended; after which he declares to the assembly, that he and the other electors, having impartially weighed the merit of the candidates, have chosen such a one to enjoy the dignity of sovereign.

He then steps forward, takes the new sovereign by the hand, and bringing him to the bishop, they both kneel before him. While the king continues on his knees, the prelate gives him a short admonition, in which, among other things, he exhorts him to shew himself a zealous protector of the Christian religion, and an obedient son of the church.

The usual oaths are then administered to him, and he pronounces them with a loud voice; after which the bishop leads him by the hand to the throne erected for him, puts the royal standard into his hand, and a crown upon his head; upon which the whole assembly fall prostrate before him, acknowledging him for their king with loud acclamations; to which are added, the sound of martial instruments, and soon after the firing of artillery. The ceremony being over, the new king takes the name of one of the kings of Portugal, as all his predecessors have done ever since the reign of the first Christian king.

There are two remarkable ceremonies which follow that of the king's coronation; the most considerable of which is that of the new monarch's publicly blessing the people; the other is that of his granting the investiture of the principal posts and fiefs in his dominions.

The days fixed for each are proclaimed with extraordinary pomp and ceremony throughout the kingdom, and in St. Salvadore, by the firing of the artillery and the sound of musical instruments. The first of these ceremonies brings a prodigious concourse of people from all parts, for they esteem his blessing of such value, that they would think it a dreadful thing to be deprived of it.

The monarch appears on the day appointed in the utmost splendor, surrounded by his guards and a numerous court, with all the governors and nobles of his kingdom, magnificently dressed and attended. The ceremony is performed on a spacious plain, sufficient to contain the innumerable multitudes that flock to it, and on an eminence is raised a splendid throne covered with a canopy, from which he can see and be seen, and plainly distinguish his nobles and ministers, who are situated nearer or farther from him according to their rank. If there are any assembled who have incurred his displeasure, he casts his first looks upon them, and causes them to be driven from his presence, as wretches unworthy of his blessing; when the populace, emulous to express their zeal for their prince, lay violent hands on these obnoxious persons, and drag them away, treating them with such indignities, that many lose their lives before they can get out of the numerous crowd. By this means the king often gets rid of such bad ministers with the greatest ease, whom he could not have attempted to punish without imminent danger.

These obnoxious persons are no sooner removed, than the king, addressing himself to the rest of the assembly, exhorts them to preserve their loyalty to him, and promises them in return his favour and protection. Then rising from his throne, they prostrate themselves on the ground before him, and he gives them his blessing, not in words, but by a peculiar spreading of his arms over them, and gesticulation of his fingers; for which they, on their part, express their joy and gratitude by loud acclamations and clapping their hands. The whole ceremony concludes with the sound of various instruments, and the discharge of the artillery. From that time all who have survived the disgrace of being denied a share in the blessing, are regarded with horror and contempt, except they can, by means of their friends, by rich presents, and a submissive behaviour, regain the royal favour; which if they do, they are admitted to his presence, and his blessing wipes away all their former disgrace.

The ceremony of granting investitures is performed with much the same splendor. On the day prefixed the king appears with the utmost magnificence on his throne; while all who are candidates for a new post, fief, or investiture, lie prostrate before him, encompassed by vast crowds of spectators, in the same posture. At the third discharge of the artillery the candidates are regularly introduced to the foot of the throne, accompanied by all their relations and friends in the richest attire; there kneeling at the lowermost step of the throne, the grant is brought them by a chief minister; which having received with the deepest submission, the king informs them, in a set speech, of the greatness of the favour he bestows on them, the conditions upon which it is granted, and the duties he expects from them; to all which they take a solemn oath to conform themselves: after which the insignia of their dignity are delivered to them, which are a white bonnet, more or less rich, according to the dignity granted, a flag of honour, a chair of state, a scymetar, and a carpet. The whole concludes with prostrations, clapping of hands, and thankful acclamations, extolling the royal favour; though it is commonly saddled with such tribute, and other hard conditions, as are impossible to be performed but by the oppression of those who are under them.

The whole business being thus dispatched, the king rises, and the ceremony is closed, as it began, with the loud huzzas of the people, and the noise of the artillery and musical instruments; in the midst of which he is conducted to his palace.

As the court is fond of imitating the Portuguese, the nobility not only wear short cloaks, scarlet jackets, and long spados; but strive to outvie each other in their silks and velvets, gold and silver tissue, lace, fringe, and other finery; and, indeed, the whole court, with the retinue of the king, his table-furniture and attendants, his throne and ceremonials, are regulated after the Portuguese model. His table is covered with variety of the most exquisite meats, his side-board with the most delicate wines and other liquors, and he has tasters to examine every thing he eats and drinks. He has rich vessels of gold and silver, solely for his own use, and always eats alone; for he never suffers any person, though of the highest rank, to sit with him: their greatest privilege is to stand about him. The throne of state, on which he gives public audience twice or three times a week, has an ascent of three steps covered with Indian tapestry; and the chair of state on which he sits, as well as the table which stands before him, are covered with crimson velvet, adorned with bosses and nails of gold.

When the king goes abroad, he is attended by a numerous guard, some of which are armed with muskets, and others with lances, bows, and arrows; but they march before him without any regularity. These are followed by crowds of musicians, who may be heard at a great distance, and serve to give notice of his approach. Next to these are the officers of the household, followed by the knights of the Holy Cross, an order instituted by the first Christian king of Congo. The king appears next, preceded by two young pages of the noblest families in the kingdom; one bearing a royal shield, covered with a tiger's skin, and the sword of state adorned with precious stones; the other holds a staff which has a large knob of silver at each end, and is covered with red velvet. On each side of the king ride two officers, who keep fanning him with horses tails; and behind them is a third, who holds over his head a large umbrella of red damask, richly fringed and embroidered. The three last must also be of the most illustrious families of the kingdom.

He proceeds to mass with much the same pomp; and, upon his alighting at the church, is led by two masters of ceremonies to a chair, (in which he may sit when he thinks fit) and several velvet or damask cushions to kneel upon. As soon as he is placed, a lighted taper is put into his hand, which he gives to his next page, who holds it till the Gospel is read, when he takes it from him, and holds it up till that is ended, and then the priest brings him the Gospel for him to kiss it. At the offertory he walks towards the altar, where the priest gives him the patten to kiss; after which he makes his offering and retires to his place. At the elevation of the host he takes the

the lighted taper again, and continues upon his knees during most of the remainder of the mass; all which time the music continues playing, and the proper anthems are sung. The service being ended, the king sits down and receives the compliments of his court; and having given them his blessing, and his hand to kiss, returns to the palace in the same pomp and order.

The king's court consists not only of the officers of his household, but of all the governors of his kingdom, who, on their coming to pay their homage and tribute, appear with a large and splendid retinue; to which may be added, his generals and other military officers, who are obliged to come and give an account of the success of their arms and the state of his forces. He has also his auditors, judges of different tribunals, counsellors, and secretaries, whose business, however important and difficult, is soon dispatched, because every thing is transacted in a verbal and summary manner, without any writings: yet the multiplicity of affairs obliges them to appear frequently before him, and, as few of them can read, his decisions and orders can only be received by word of mouth, and be conveyed by them to their distant clients, by persons of known character, intrusted with some undoubted token that what they bring is the result of the royal will. However, if the distance of the place, or the nature of the message, requires a fuller discussion, the king's orders are sent in writing to the governor or officer concerned to see them executed; but then he is obliged to get some missionary or priest to read it to him, and to write an answer to it; which he must send by the same courier, to let his majesty know how punctually his orders have been obeyed; the least failure in which being reckoned such an offence as to cause him to be deprived of his office, or even of all he is worth. Thus these great officers, notwithstanding their vast authority and outward grandeur, are in fact as great slaves as those over whom they tyrannize, and live in continual dread of some signal token of his dissidence and resentment, either of which is sufficient to procure their destruction.

Though the king's palace, which was built by the Portuguese, is vastly spacious, grand, and commodious, yet the seraglio may properly be termed a prison. He is allowed but one wife, yet may have as many concubines as he pleases; and these, on entering the palace, are confined during the remainder of their life. Their apartments are surrounded either with strong high walls, or quickset hedges, of such a height and thickness, that no mortal can go over or through them. The government of this enclosure is usually committed to some favourite nobleman.

The lady who is married to the king is styled mistress of the women, on account of her being set over all the rest of his seraglio. Before his marriage a tribute is levied throughout his kingdom, for a dowry for the young princess: but this is not the only tax paid on this occasion; for, on his wedding-day, proper officers are ordered to measure the length and breadth of every bed, and the owner is taxed so much for every span. The marriage-ceremony is no sooner over, than she is conducted to her apartment in the royal palace, with all the young ladies that are to be her constant attendants, where most of their time is spent in diversions. The king has not only free access to her when he pleases; but makes no scruple of taking the same freedom with any of those young ladies, as he does with his other concubines, notwithstanding all the remonstrances of his father confessor, or of the most zealous missionaries.

His standing forces are neither numerous nor well disciplined, and are still worse armed and clothed; but they are all obliged to appear at their stated musters, where they are usually exercised and taught particularly how to use their defensive weapons, and cover their bodies, which are naked from the waist upwards, with their shields made of thick skins, with such dexterity, as to avoid the missile weapons of the enemy. They are also instructed how to fall on the foe with a desperate kind of bravery, which they generally do upon all occasions.

These musters are constantly made on St. James's day, when the vassal princes and the governors bring their offerings to the king; and he not only feasts them, but gives them his blessing, in the manner already described.

The army thus assembled, is divided into several bodies, before which the king marches, attended by his court, and taking a full view of them, commends or discommends, punishes or rewards them, as he sees occasion; after which these bodies engage in a sham fight, with as much seeming fury, as if they were attacking an enemy.

The ceremony of the fight being over, the king generally treats the combatants with a plentiful supper on the field of battle, which is greedily devoured by his hungry guests, though the dust they have raised is so thick that a stranger can hardly breathe or see through it. After they have consumed all the provisions set before them, the feast usually concludes with music, dancing, and other diversions: during which they drink till, overcome by the liquor, and the fatigue of the day, they all lie down upon the bare ground, and sleep till the next morning.

These troops are under the command of the governors of the provinces, and march under them in every expedition and incursion into an enemy's country; but when the king goes in person, they are obliged to repair to the royal standard, under their respective officers, with their arms and provisions; which last are but just sufficient to keep them alive two or three days: but in these excursions they seize on all that come in their way, without regard to friend or foe, as corn, fruit, cattle, beasts wild or tame, and even serpents, insects, and the bark and root of trees, leaving nothing behind them but the most dreadful devastation and misery, which appears where-ever they pass; for the poor inhabitants of the villages, at the first alarm of their approach, retire into the woods, mountains, or other places of safety, with their families, cattle, and what other effects they are able to carry off with them; and leave their houses and the rest of their goods to their mercy. But notwithstanding these dreadful ravages, vast numbers perish in their march through hunger, sickness, and many other accidents, so that the king frequently loses more than half his army before he comes in sight of the enemy; and is sometimes obliged to return, by the unfitness of the season, with less than one-third part of it, without having struck a stroke, or injured any but his own subjects.

They always endeavour, if possible, to engage the enemy in a spacious plain, and begin the attack with greater fury than regularity; for the commander's authority ceases to have any check upon them, from the moment the onset is begun. The fight continues with the same obstinacy, till one side begins to give way, which is no sooner perceived, than the rest take to their heels without paying any regard to the officers who endeavour to stop them. The flight of one army encourages the other to pursue, and the slaughter is continued without intermission; no quarter being given by either side, till the vanquished are out of their reach. They then return, plunder the enemy's camp, seize all the men, women, and children they find there, with all the stragglers that fall into their hands, and brand them as slaves, considering them as the most valuable part of the spoil, and gladly send them, the first opportunity, to be sold to the Europeans. As for the wounded, few, if any, survive the defeat; for their weapons being poisoned, wherever they draw blood the person speedily dies, unless provided with some extraordinary antidote, which is the case of few besides those of high rank.

A victory is generally followed by a peace; but it being concluded upon the victor's terms, it seldom proves of longer duration than till the vanquished have recovered sufficient strength to renew the war.

The Congoes have no written laws, but every province has what they term a royal judge, and has the power of deciding all causes in civil and criminal affairs; an appeal, however, may be made from his decision to the king, who presides twice a week at the supreme court, and determines all affairs by his absolute authority. The royal

royal judge has inferior ones under him in every town and community, from whose sentence the parties may appeal to him; but this is seldom done, except in matters of great moment.

Every judge chooses a number of assistants, which commonly consists of twelve; and, when the cause is brought before him, hears and examines the parties, and their evidence.

The plaintiff and defendant are the only pleaders; the former begins and endeavours to lay open his cause as well as he can, and the other answers him. If any think themselves incapable of pleading their own cause, they are allowed to nominate a friend to do it for them, who must be instructed in every thing before he appears in court. When both sides have been heard, sometimes once, and sometimes oftener, the judge recapitulates the whole evidence to his assistants, and asks their opinion; when, if any difference or dispute arises between them, he endeavours to bring them over to his side: but whether he does or not, he immediately pronounces sentence, and dismisses the parties; so that a law-suit is generally begun and ended in two or three hours time.

They use nearly the same method in criminal cases, in which only three offences are deemed capital; these are treason, murder, and forgery. In the former the offender's punishment chiefly depends on the will of the prince, who generally condemns him to lose both his head and estate; the latter of which is confiscated into the treasury. The man convicted of murder is immediately beheaded, unless some aggravating circumstances require a more severe death, or the relations of the deceased petition for his being punished with greater severity; in which case he is usually delivered up to them, that they may punish him in what manner they think proper; and this is generally done immediately after the sentence is pronounced. The pretended crime of magic, or forgery, is said by the Portuguese priests to be very common in the unconverted provinces, and is on that account punished more severely; the person whom they pretend to have convicted of it being immediately burned alive. Other punishments for smaller crimes are the bastinado, whipping, fines, and imprisonments; the two former generally falling to the lot of the poor, and the two last to that of the wealthy.

As for the Portuguese, they are allowed a judge of their own nation to determine not only all law-suits among themselves, but between them and the natives, who decides all controversies according to the laws of Portugal, a circumstance which must be considered as extremely unjust.

S E C T. X.

Of the Religion of the Natives of Congo.

THE religion of Congo, before the arrival of the Portuguese, was idolatry, which is still preserved in a great part of the country, where they acknowledge a Supreme Being, whom they call Nzambiam-pongu, and believe to be omnipotent. They ascribe to him the creation of their country; but imagine that he committed all sublunary things to the care and government of a multitude of subordinate deities, some of whom preside over the air, others over the fire, earth, and sea, the lakes and rivers, winds, storms, rain, lightning, and drought; men and beasts, fowls and fishes, fruits; and, in short, on all the blessings and curses to which this world and its inhabitants are subject. Hence arose an immense multitude of false subordinate deities, who had their idols and a prodigious variety of gangas, or priests, and superstitious rites, which are still used in those parts of the kingdom that have not yet received the Portuguese religion, especially towards the East; and indeed many of these superstitious rites are still practised among those who make an open profession of Christianity.

But though the ignorant people were taught to acknowledge such a variety of inferior deities, they were left entirely at liberty to choose which of them they pleased as the object of their worship and confidence, and to represent them in what shape they thought fit, whether of

lions, tygers, crocodiles, goats, or serpents; or of trees and plants of different kinds; or the statues or pictures of men, unskillfully carved or painted, some of which they worshipped in their houses, and others in mean temples erected to their honour. Their worship consisted in kneeling, prostrations, fumigations, and other rites: but what was most insisted upon by the gangas, as indispensibly necessary, was offering to them some of their most valuable effects, whether for food or apparel, or other useful purposes. In this the principal revenues of the gangas consisted, they selling them the favour of the deities at an exorbitant price.

These priests still persuade the people, that no public calamity, as earthquakes, inundations, pestilence, famine, and the like, happen but through the displeasure of their gods, between whom and them they pretend to be the sole mediators, and to know what sacrifices and oblations are necessary to disarm their anger; and when the calamities are removed, they demand new offerings by way of thanksgiving. If a person be sick, he must appease the offended deities by such sacrifices as the ganga prescribes.

As these idolaters are very numerous, and extend themselves towards the eastern parts of the kingdom, so they are divided into a multitude of sects, each of which have their peculiar gods, manner of worship, and different kinds of gangas; and every ganga has his particular office. Some are applied to for procuring blessings, others to avert judgments, to cure diseases, or to remove witchcrafts and enchantments; others are consulted about making war; on the success of their excursions, and on the proper time for sowing and reaping; in all which cases the people must never come empty-handed. They are generally so scrupulous, that they will not even venture to build a hut, without consulting a ganga, and putting the building under the protection of a deity; nor does the owner dare to enter into the possession of it, without having previously employed the ganga to make the proper sacrifices, fumigations, and other ceremonies, in order to secure that protection.

Except at their new moons they have no stated times of worship, but what the president of the gangas appoints, or as occasion is supposed to require, as after a victory, a good harvest, or any other public blessing. He alone has the privilege of appointing the sacrifices and other rites proper for the solemnity; and he likewise prescribes the ceremonies, feasting, music, and dancing with which they are to be crowned.

But the highest in power and dignity of the priestly order is a person stiled Shalome, whom they reverence as a kind of pope, and to him they offer the first produce of the land. No person of any rank is allowed to enter his house under the severest penalties, unless it be by his permission, or on some urgent occasions; for he there keeps his sovereign tribunal, not only for religious, but for civil affairs; for the dispatch of which he appoints a number of substitutes, over whom he presides in chief. Such is the regard paid by the people to this chief priest, that they are said to think it a capital and unpardonable crime to have any conjugal commerce with their own wives or concubines while he is absent from his usual place of residence, either upon public or private affairs, of which he always takes care to give them previous notice, as well as of his return. And this the natives though naturally libidinous, are generally careful to abstain from, for fear of putting themselves into the power of those females; for it sometimes happens that a woman, weary of her husband, will accuse him of incontinence at this time, merely to get rid of him and marry another.

Among the high notions which the people entertain of this chief priest is one that is not so advantageous, nor in all probability so agreeable to him; that is, that by the dignity of his office he is exempt from dying a natural death; and that should it ever happen otherwise to any of them, the world would soon be at an end. To prevent this fatal calamity, his life is no sooner perceived to be in danger, either through sickness or old age, than his successor is empowered to go and dispatch him with his own hand, either by knocking him on the head with a green cudgel, or by strangling him with a rope; immediately after which he is installed into his office.

The mokissos, or images, are for the most part formed of wood in the shape of a goat, with the head of a tortoise; and in these images some spirit to whom the Almighty has committed the government of a particular part of nature, is supposed to reside. Hence the priests dance around them, and ask them questions in relation to past and future events. Such regard do the pagans of these countries pay to these mokissos, which are made in various forms, that if a man, wearied with his burthen, throw it down in the highway, and leave a knot of twisted grass upon it, to shew that he has left it under the care of his mokisso, no pagan will venture to meddle with it.

In short, these pagan priests not only search into futurity, and offer up their prayers and praises to the spirits which they suppose reside in the idols, but also serve as physicians and surgeons, generally making use of simples; and if these fail, they pretend that a certain ominous bird flew over the head of the patient, and prevented the operation of the medicine; or its effect was destroyed by means of witchcraft.

Here, as well as in India, they have ordeal-trials, some of which are by fire, others by boiling water, others by a poisoned draught, which is to kill the person if guilty, or to prove harmless if he be innocent; but as the pagans have the whole management, they are said by the Portuguese to manage it so, that the guilty, if they bribe them high, shall escape unhurt; while the innocent, for want of that caution, shall be adjudged guilty.

The Portuguese pretend, that by their means Christianity is become the established religion of all the converted provinces of the kingdom: this indeed is saying a great deal; but it appears from the generality of writers, that the Congos have only changed their superstitions, and become more corrupt in their morals. Instead of receiving the Gospel, which breathes piety, meekness, and humanity, and which never was put into their hands, they have had before their eyes cruel and revengeful bigots, who have drawn the sword of persecution, and taught them cruelty, treachery, dissimulation, and those other vices which Christianity, much more than paganism, condemns.

Indeed, if we may believe the generality of writers, the greatest part of these extensive regions have little else but the bare name of Christian. Though popery has got a footing there, we find nothing of that pomp and religious pagantry practised in other Romish countries; no stately cathedrals, no cardinals, patriarchs, archbishops, rich abbeys, or well-endowed monasteries or convents. We hear nothing of their grand festivals and solemnities, except such as are rather of a secular nature; and on which the court and nobles of the kingdom repair to the church in great state, and sumptuous apparel, to hear mass. Some of the natives are represented as ardent hypocrites, who embraced the Romish religion only to ingratiate themselves with the Portuguese, while they retain all their old heathenish superstitions; and privately worship their idols. Others who have perhaps received more instruction from their living nearer the churches, and under the eyes of the Portuguese, will express a contempt for such senseless superstitions; and, in compliance with the church, will conform so far to the laws as to go regularly to mass and confession, and will consent to have but one wife; but could never be persuaded of the unlawfulness of having as many concubines as they can maintain. As to other immoralities, such as cruelty, fraud, oppression, excessive pride, and sloth, they see them more or less practised by most of the European Christians who live among them.

SECT. XI.

Of the Trade of Congo, and the barbarous Manner in which the Slaves are transported by the Portuguese from Congo and the neighbouring Kingdoms to America.

THE chief commodities brought by the Portuguese into Congo are either the produce of Brasil, or the manufactures of Europe. The former chiefly con-

sists in grain, fruit, plants, and other provisions; and the latter of Turkey carpets, English cloths, and light stuffs made of cotton, linen, and woollen for cloathing; copper and brass vessels; blue earthen ware; rings and ornaments of gold and silver; brass and baser metals; coral, glass beads, bugles, and other tinkets; a great variety of tools and utensils; tobacco, wine, brandy, and other spirituous liquors.

In return for these articles they carry off such a prodigious number of slaves for their plantations in America, that some make the yearly amount from this kingdom, and some other settlements on the same coast, to be near fifteen or sixteen thousand. Many of these indeed die in their passage, which is not at all surprising, if we consider the inhuman manner in which those poor unfortunate wretches are shipped off and conveyed from one country to another. Seven or eight hundred men and women are promiscuously squeezed like herrings into the hold of one ship, where they can lie only on one side upon the bare boards, and are often forced to lie double during the whole voyage, with no other provisions than horse-beans and water, suffocated for want of air, and with their own stench; some dead, others dying, and most of them labouring under some grievous disorder, if not under a complication of distempers; without any refreshment, except perhaps a little fresh air to breathe in once a day, if they are able to come upon deck; and without any better prospect, than that of ending their lives in the most miserable slavery.

This indeed is far from being the most melancholy side of the view that presents itself to the minds of these unhappy wretches; for there is a strange and dreadful notion, that all who are sold for slaves in America are immediately to be butchered on their landing, in some dreadful manner, in order to have their bones burned and calcined to make gun-powder with; and their flesh, fat, and marrow to be pressed into an oil, which they believe is the only sort the Europeans bring to Africa; and what confirms them in this opinion is, its being brought in skins, which they imagine to be those of the poor slaves from whose flesh the oil is extracted.

These notions are so firmly believed through all those parts, that the very threatening of the most obstinate and stubborn slave to sell him into America, is sufficient to terrify him into the most obsequious suppleness and obedience: the thoughts of being burnt into gun-powder, and melted into oil, being more dreadful to them than the most cruel punishment.

From these inhuman hardships, and these dreadful fears, one might wonder that so many should out-live the passage; but it appears still more amazing, that any creatures of the human form, and especially such as call themselves Christians, should be so hardened as to treat their poor fellow-creatures after so barbarous a manner, merely for the sake of reaping a little more profit by each voyage; for as one of them is bought in Congo, or Angola, for three or four pounds, and seldom sells for less in America than twenty-five or thirty, one would be apt to imagine, that, setting aside religion and humanity, the great profit obtained by them might procure those miserable objects a more compassionate treatment.

Besides the slaves continually brought from other parts into Congo and Angola, to be shipped off for America, there remains a sufficient number in the kingdom to do all the laborious works, as building of houses, felling and sawing of timber, carrying men and other burthens, and working at several businesses, as butchers, cooks, hunters, fishermen, and performing all the lower offices of families. Indeed, if we except a few moveables and cattle, slaves are reckoned the greatest riches which those of the inferior and even middle rank have to boast of, or to bequeath to their children and relations.

The Portuguese settled in this kingdom have taught the natives the use of weights and measures, of which they had not, till then, the least notion; nor have the majority of the people any great use for them, considering their poverty and way of life.

SECT.

S E C T. XII.

Of the first Discovery of Congo by the Portuguese, and by what Means they changed the Religion of the Country.

THE Portuguese had been for some years making discoveries along the coast of Africa, in order to find a passage to the Indies, when, in the year 1484, king John II. of Portugal, sent Diego Cam, one of the most expert Sailors in his service, and a gentleman of an enterprising genius, to make discoveries still farther to the south than any of his former navigators had been. Cam set sail with this view, and endeavouring to double the Cape of Catalina, fell insensibly into the rapid stream of the river Zaira, when its great breadth and depth soon determined him to sail nearer, and to cast anchor at its mouth, not doubting that it had inhabitants on each side. He had not rowed far up the river before he saw a number of the natives, whose shape, complexion, and hair greatly resembled those of the other negroes whom he had already seen; nor were they in the least alarmed at the appearance of these strangers; but coming up to them in the gentlest manner, presented them some of their fruits and other refreshments, which Cam gratefully accepted, and, in return, made them some equivalent presents. The misfortune was, that they had no other method of understanding each other but by signs; so that it was not without some difficulty that he was at last informed, that they were subject to a very powerful prince, who resided a few days journey up into the country.

Cam was extremely delighted with their account and behaviour, and no less desirous of being informed who this powerful prince was, and if possible of entering into an alliance with him; he therefore prevailed upon four or five of the natives, by means of his presents, to conduct an equal number of his officers to St. Salvadore. These were entrusted with considerable presents for the king and court, and allowed a certain time for their return: but the rapidity of the river, contrary winds, and other obstacles, added to the length of the journey, prevented his seeing them at the time expected; so that after having stayed double the time that had been fixed, he resolved to leave them behind, and to sail back to Portugal; but took with him four of the natives who were in the ship, who proved to be men of noble birth and excellent understanding, as hostages for his own countrymen. Some say they willingly offered to accompany him into Portugal: however, it is certain he took great care of them during the voyage; and, by the time of their arrival at the Portuguese court, they had made such a surprising progress in learning that language, that they could inform his majesty of several important matters which he enquired of them; with which king John was so highly delighted, that, having made them very considerable presents, he ordered Cam to sail with them back to Congo, and sent by him very valuable presents of European rarities to their king and his court, charging them to exhort their monarch, in his name, to become a convert to the worship of the only true God, and to permit the Christian religion to be propagated throughout his dominions.

Cam returning to Congo the following year, was highly pleased to find his men in good health, and perfectly satisfied with the kind reception they had met with at court, and from the natives in general. It was not long before he sent a formal embassy to the king, accompanied with the rich presents he had brought from Portugal. On the other hand, the four young natives, no less charmed with all they had seen, and the noble treatment they had received in that country, blazed abroad, both at their own court, and wherever they came, the magnificence of the Portuguese court and nation. In short, a firm alliance was soon concluded between the two crowns, which still subsists, though it has been suspended by some intervening wars.

While this alliance was transacting at the court of Congo, Cam set sail, and discovered the coast as far as the twenty-second degree south latitude; and then, returning back to Congo, went in great state to pay a visit

to the king, in order to thank him for the favours conferred on him and his nation, and was received with all possible magnificence. At his desire, he gave him a full account of the grandeur of his king's dominions; of the government, laws, customs, and more particularly of the religion of the Portuguese, in such terms as not only made that prince conceive the highest esteem and regard for that people, but express his earnest desire to become a member of that church; and, at Cam's departure, the king appointed Zachut, one of the young nobles whom he had before taken to Portugal, to go now as his ambassador at that court, with orders to entreat his Portuguese majesty to send some holy men to instruct him and his subjects in the Christian faith. He also sent some other young Congoes with him, that they might learn the new religion; together with a large quantity of elephants teeth, carpets, and cloths made of the palm-tree, as presents to his Portuguese majesty.

Cam soon after weighed anchor and departed. At his arrival at Lisbon he presented the Congoes ambassador and the other young nobles to the king, who was greatly pleased at the success of the expedition, and gave all these strangers a most gracious reception. They staid in Portugal near three years, during which great care was taken to instruct them, not only in the principles of religion, but in all the polite exercises suitable to their rank; and at length they were baptized at Beja, where the court then resided. The ceremony was performed with the utmost splendor and magnificence, the king himself standing godfather to the ambassador Zachut, to whom he gave his own name. Soon after this solemnity he sent them back into their own country in three ships, the command of which was given to Gonfalez de Souza, with whom he also sent several priests, with mitres, chalice, fonts, and other church vessels and ornaments of great value; but Gonfalez, dying in the passage, was succeeded by Roderigo Souza, his near relation.

This Squadron arrived at the city of Sogno, which is situated on the river Zaira, in August following, and they were all joyfully received by the governor of the province, who soon after their arrival was baptized by the name of Emanuel, which was that of the king of Portugal's brother. This ceremony was performed in the open country, in the presence of the Portuguese admiral, who had caused a magnificent altar to be erected for that purpose, where, after mass was ended, this nobleman, with one of his sons, and some of his officers, were received into the church before a vast concourse of the natives, who flocked thither on that occasion.

Admiral Souza, now taking leave of his noble converts, hastened to the court, and there gave the king an account of his uncle's conversion and baptism; with which he was so pleased, that he enlarged his dominions, and gave him power to destroy all the heathen temples and other monuments of idolatry within his government. His majesty was also highly delighted with receiving the sacred vessels and ornaments brought from Portugal; which he examined with great attention, and listened to the explication the priests gave him of their use; the result of which was, that he resolved to build immediately a sumptuous church in his capital for the reception of the Portuguese priests and utensils. This structure was soon completed; after which it was consecrated under the name of the Church of the Holy Cross.

Soon after the king and queen, with several of the nobility, were publicly baptized in his new church. The ceremony was performed with extraordinary magnificence: The king took the name of John, and the queen that of Eleanora, in compliment to the king and queen of Portugal, whose ambassador, as their representative, assisted at the ceremony. Their example was followed by many thousands of their subjects: the king the more zealously promoting it, as he was going to suppress a rebellion which broke out in one of the provinces of his kingdom. Upon this occasion Souza, the Portuguese ambassador, presented him a royal standard, on which a cross was embroidered; and, in his master's name, exhorted him to put his whole confidence in the divine Saviour whose religion he had now embraced, and to rely solely on his assistance for the success of that expedition, to which he himself would accompany him with an hundred

hundred armed Portuguese. The king gained a complete victory over the rebels, and was upon the point of entering their territories, in order to chastise them with the utmost severity, according to the custom of the country, when Souza diverted him from it, and by his timely meditation prevented that province being laid waste by fire and sword.

At Souza's departure, great civilities passed between him and the king, with whom he left a great number of Dominicans to carry on the affairs of religion, and particularly to preach to the people. About the same time, the king's eldest son returning from an expedition against some rebels in the southern provinces, over whom he had obtained a victory, was baptised by the name of Alphonso, and continued a zealous proselyte during his whole life; but his younger brother, named Panzo Aquitima, fond of the heathen superstitions in which he had been educated, became an irreconcilable enemy both to the Portuguese and their religion, and made use of such artifices to exasperate his father against those strangers, that he prevailed upon him, not only to apostatize, but to persecute all the Christian converts who refused to follow his example. Among these, prince Alphonso resisted all his caresses and menaces, and endeavoured, to the utmost of his power, to defeat all his brother's cabals; but in return was accused of treasonable practices, and being banished to a remote province, his younger brother was appointed his father's successor.

The king, however, soon after discovered the treachery that had been used against Alphonso, and not only recalled him from banishment, but gave him the government of one of the chief provinces of the kingdom. Alphonso, with his usual zeal, began his government by prohibiting the worship of idols, under the severest penalties; which not only drove a vast number of his own subjects to his brother, the declared patron of idolatry, but induced his father to order him to come to court, unless he immediately repealed the law he had made against worshipping the gods of his country. Alphonso excused himself from complying, and at the same time sent the king word, that the multitude of business he had upon his hands would not permit him to leave his government.

In the year 1492, the king being worn out with age and infirmities, was visibly hastening to his end, upon which Alphonso was advised by his friends to march against his brother, and to seize upon the capital, which he declined, till he had certain intelligence of his father's death, and then entered it in the night. The next morning he appeared upon the green before the royal palace, at the head of his friends and Christian forces, and, in a short speech, informed them of the king's death, and of his being the next heir to the crown; upon which he was proclaimed king, with the usual formalities.

Panzo, being then at the head of a numerous army, no sooner received the news of his brother's being seated on the throne, than dividing his forces into two columns, he marched directly against him. Alphonso, who had only a handful of Christian soldiers, and about forty Portuguese, expected him with undaunted courage, and both by his words and example inspired his men with such intrepidity, that they gained a complete victory, and drove the disconsolate Panzo, accompanied only by an old experienced officer, into a wood, where, in their flight, they both fell into a large trap designed to catch wild beasts. The prince died about two days after, partly by the hurt he received in his fall, and partly of grief and despair. Upon which the old officer sent a submissive message to the king, to let him know that it was indifferent to him whether he obtained his pardon, or an order for his execution; but begged, if his majesty chose the latter, he would permit him first to be received into the Christian church by baptism; adding, that as he could not help looking upon the late victory over so superior an enemy as altogether miraculous, he earnestly requested, that he might die a worshipper of the great God from whom he had obtained it.

Whether his behaviour was sincere, or merely an artifice, the king was so highly pleased with it, that he freely pardoned and promoted him; and having caused

him to be instructed, he was received into the Christian church. The rest of Panzo's army readily offered to submit; but he refused to suffer them to take the oaths of fidelity to him, except those who were idolaters consented to change their religion.

Many of the Congoese now made a profession of embracing Christianity; and if any credit is to be given to the Portuguese writers, this king was a most excellent preacher, and frequently made long discourses upon the truth and excellency of the Christian religion, the certainty of future rewards and punishments, and on other subjects of the highest moment. But what greatly contributed to the promotion of the Christian religion, was the great regard he shewed to all the Portuguese in general, and especially to the Dominican monks who had been sent to convert his subjects. To the former he granted the privilege of settling in what part of his dominions they liked best, gave them considerable lands and immunities, and enacted severe penalties against such of his subjects as should dare to molest them. He took the Dominican friars under his immediate protection, built them several new monasteries and churches in several parts of his kingdom, and omitted nothing that could render them respected. He even studied the Portuguese tongue, in order to interpret to his people the sermons of those preachers, and afterwards strove to inculcate them the deeper by some remarks of his own.

Some time after Alphonso, at the desire of Emanuel king of Portugal, sent his son and a number of young noblemen to Lisbon, where Emanuel spared neither pains nor expence to procure them the ablest teachers.

The same year his Portuguese majesty sent a splendid embassy to Congo, accompanied with magnificent presents, particularly a noble standard, with a coat of arms, which the king and his successors were afterwards to bear, richly embroidered upon it in their proper colours. This consisted of a cross argent, upon a ground gules, cantoned with four other escutcheons of the same, charged with five torteaux sables, fawterwise: and these arms the kings of Congo have borne ever since.

This prince died in the year 1525, and was succeeded by his son Don Pedro, who also distinguished himself by his zeal for the Portuguese and their religion; and dying without issue in 1530, left the crown to his brother Francisco, who was also a friend to the Portuguese; but dying, after a reign of only two years, he left the crown to his first cousin, named Diego; who also dying without children, the Portuguese were become so numerous, and so opulent from the great privileges that had been granted them under the three former reigns, that they resolved to fill the throne with a person of their own choosing: but the princes of the blood, the governors of the principal provinces, and the rest of the Congoese nobility, considered this as an open and avowed attempt to subvert their constitution and government, and to reduce the whole nation to slavery; and rising up in arms, the Portuguese were too weak to withstand their fury, and all who engaged in this conspiracy were cut off, except the clergy and missionaries, who were spared, from a regard to religion.

This bloody execution restored to the natives the freedom of electing their own monarchs; a new king was chosen, and an embassy sent to Sebastian king of Portugal, who boldly complained of this attempt to overturn their constitution and government; and represented to his majesty, how odious his subjects had made themselves to the natives, by their intolerable pride and avarice, and the tyranny with which they treated them in all the parts of the kingdom where they were settled. In short, he gave so many instances of their misbehaviour, and backed them with such irrefragable evidence, that Don Sebastian, who was preparing to send a powerful army to revenge the slaughter of his subjects, was easily persuaded to listen to more amicable terms, and to live in peace and friendship with the new king and his subjects.

Mean while, king Sebastian, being informed that there were several rich mines of gold, silver, and other metals in that kingdom, sent some skilful men thither to search for them: but king Alvarez, who was then on the throne of Congo, being dissuaded by his honest confessor Francisco Barbuto, a Portuguese, from suffering those mines

to be discovered, lest it should tempt that monarch to make himself master of them, and by degrees of his whole kingdom, instead of telling those artists where they lay, sent them into other provinces where there were none to be found. Upon this king Sebastian and his Portuguese subjects, being disappointed of their high expectations, soon altered their behaviour towards him: the wealthy Portuguese merchants abandoned his dominions, his splendid embassies at the court of Lisbon were received with a formal coldness, and his most earnest intreaties for a fresh supply of missionaries were answered by affected delays. But it is not our design to give a particular history of the progress of the Christian religion in Congo. It is sufficient to add, that it was a long time after these events, before the Portuguese clergy obtained the power of chusing the king, and in a manner new modelling the government, in the method already described. From that time we do not find that any great efforts have been made to convert the natives; for tho' many still make a profession of Christianity, ignorance and vice, as hath been already intimated, prevail, and all their religion consists in a few forms and ceremonies.

S E C T. XIII.

*Of the Kingdom of LOANGO.**Its Situation, Extent, Provinces, Climate, Fertility, Plants, and Animals.*

THE kingdom of Loango, or, as others write it, Loanga, extends along the African coast, from the Cape of St. Catharine, under the second degree of south latitude, to the small river of Lovanda in the fifth degree, and is situated between twenty-eight degrees thirty minutes, and forty degrees ten minutes of east longitude: it is therefore a hundred and eighty miles from north to south; but it is said to extend near three hundred miles from east to west. This country, as well as Angola, was formerly a part of the kingdom of Congo, but has been long dismembered from it. It is watered by many small rivers, and divided into four principal provinces, named Lovangiri, Lovango-mango, Chilongo, and Piri; in all which are abundance of towns and villages: but we know little more of them than their names, and indeed they appear to have but little worth our notice, either with respect to their populousness, manufactures, commerce, or elegance of building.

Though Loango is situated almost in the midst of the torrid zone, the climate is healthy and pleasant, and the soil fertile and capable of improvement: but the natives, like all the others along this coast, are naturally lazy, and too averse to the fatigues of agriculture to plant or sow more than will barely suffice the current wants of each year: whence it frequently happens, that a bad season is followed by a famine, for want of their laying up a proper store against times of scarcity. They are commonly contented with bread, fish, and such fruits, greens, and pulse, as the earth naturally produces; and which being the same as grow in Congo, and other of the neighbouring countries, need not here be repeated. We shall only observe, that they have several sorts of pease and beans, with large and small millet, of all which the ground annually yields three crops. Their palm, banana, and other trees, produce excellent fruit, of which they make different sorts of wine, which they prefer to that which comes from Europe. The cotton and pimento trees grow wild, as well as the grain of paradise, though the last is in smaller quantities. The enzanda, alicandi, and metamba afford them plenty of materials both for building and covering their houses, for making their ships and smaller vessels, for cloathing, and other uses. Sugar-canes, cassia, and tobacco, grow here plentifully; but there are few oranges, cocoas, and lemons, which are not much regarded by the natives. They make bread of a variety of fruits, herbs, grain, and roots, which, with a little more industry, might be produced in such abundance as to prevent their ever suffering by famine.

They have very few cattle of any sort, except goats and hogs; but poultry is said to be so extremely cheap,

that sixpennyworth of beads will purchase thirty good chickens. Pheasants, partridges, and other wild fowl, are still more numerous, and hardly bear any price. They have a land bird bigger than a swan, which in shape resembles a heron; its feathers are black and white, and it has a bare place on the breast: this is probably the pelican. Among the wild beasts they have the zebra and a multitude of elephants, whose teeth they exchange with the Europeans for iron, of which they make warlike instruments and tools.

They catch on the coast great quantities of fish; and for this purpose, it is said they daily watch a large fish of the size of a grampus, which constantly comes to feed along the shore, driving whole shoals of the smaller kind before him, which are then easily caught. If one of these large fishes runs himself a shore, the natives immediately endeavour to free him again, which is as much as four or five strong men can do. These they call sea-dogs, and will not suffer any man to hurt them. In the bays, rivers, and in shallow water, they catch fish with mats made of rushes, some of which are three hundred yards long. These are set afloat on the surface, with pendant rushes on the sides, which frighten the fish, and make them leap upon the mat, where they are easily caught.

S E C T. XIV.

The Persons, Manners, and Dress of the Inhabitants.

THE natives, who are called Bramas, are tall, well-shaped, strong, and very civil. They use circumcision, without knowing why, and trade chiefly among themselves. They are industrious and vigilant where gain is to be got, and are at the same time friendly and generous to one another; are extremely fond of palm wine, yet despite that of the grape. They are libidinous to a high degree, and very jealous of their wives. They carry on a variety of trades, and have among them weavers, smiths, carpenters, potters, canoe-makers, fishermen, and merchants; but these handicraftsmen are so fond of their old ways, and ill contrived tools, that, like those of Congo, they take ten times more time and pains in performing an imperfect piece of work, than they would take in finishing one with better tools.

They commonly dress in cloth of their own manufacture, made either of the leaves of the palm or some other tree; but the better sort are all made of the former: for this purpose the young palm shoots are lopped off, dried, then soaked in palm wine, and well rubbed with the hand, by which means they obtain a kind of flax, which, being spun and wove, is made into suits for those in easy circumstances, and hang round the body from the girdle down to the feet. They have four sorts of this cloth. The richest, which is flowered with different colours, is worn only by the king and those whom he permits to wear it. The second sort is not half so finely spun, yet at a small distance appears almost as beautiful, it being figured much in the same manner, and it will require a nice eye to distinguish them, except they are examined on the wrong side, where the difference is more visible. The two other sorts, which are wove plain, are still coarser, and only worn by the common people and slaves. These, like the former, reach down from the girdle to the ancles; but those of the slaves only to the knee. The rest of the body, from the girdle to the head, is naked; yet they wear bracelets, according to their rank, which are of gold, silver, brass, or coarser metals, in the form of chains; others are of ivory, glass-beads of several colours, and the like.

The men are also obliged to wear the skin of a wild or tame cat; and the wealthy have them of marten, beaver, and other valuable furs: some of them, called enkinies, are beautifully spotted; but these are only worn by the king and those of his court to whom he grants that privilege. Both he and they frequently wear five or six sorts of them neatly sewed together, and stuck with the feathers of parrots and other birds of various colours, dispersed in the form of a rose, and hanging just before. The skirts of the furs are hemmed with elephants hair, to which they hang a number of little bells, which, at

every motion of the body, and at every step they take, make a tinkling. These garments are tied round the waist with a rich girdle that encompasses it several times. Those of superior rank wear two of these girdles, one above the other, richly adorned and variegated. They wear round their necks, wrists, and legs, several circles of beads of coral and ivory, round shells of beautiful colours, chains of copper, tin, or iron, of a triangular form, and brought from Europe. Over their shoulders they have a kind of sack knotted about three quarters of a yard long, with a hole just big enough to put their hand in; and this serves to hold their calabash, provisions, pipes, and tobacco. Their heads are covered with a knit cap, which fits close to it; and, as they never go without arms, they commonly hold in their hand a cutlass, sword, or bow.

The women dress in much the same manner, only they wear no girdle, and their petticoats are much shorter; but the rich will throw over them a piece of some fine European stuff or linen. The head and upper parts of the body, as well as the legs, are naked, except their wearing collars, bracelets of coral, and other trinkets about their necks, arms, and legs. Both sexes wear rings of richer or baser metal, according to their rank, which they consider as amulets and preservatives, and both colour their bodies all over with a red wood, called takeel, ground upon a stone.

SECT. XV.

Of their Marriages, and the Slavery of the Women. An Account of a People called White Moors. Of the Religion of the Natives, and their Funeral Rites.

THEY allow of polygamy, and authors say, that the rich have ten, twelve, or more wives; and those in inferior circumstances seldom less than two or three: but, if this be the case, they must have abundantly more females than males born among them, or else the poor can have no chance of being married. The consent of the parents, and paying the price agreed on for the wife, is all the formality and courtship used in their marriages.

Some are so curious as to buy them, when six or seven years old, and breed them up to their hand; but the wiser sort of parents will not part with them till they are become marriageable, at which time they set a mark upon them that seldom fails of bringing a number of young gallants, especially if they are handsome. This mark is shaving their heads, and leaving only a circle of hair.

The young females have, however, little encouragement to enter the matrimonial state, which, besides their being obliged to have many rivals in it, and the extreme jealousy of the husband, reduces them to the most melancholy servitude. They alone till and manure the ground, gather in the harvest, grind the millet and other grain, make the bread, dress the provisions, make wines and other liquors, and take care of all the other household affairs. They must stand at a due distance while their husbands eat, and take their leaveings when they are gone. They must approach him when he comes, in words and gestures expressive of their joy and respect, and speak to him and receive his commands upon their bended knees. They are liable to be turned out of doors upon the least suspicion of infidelity; and, if proved guilty, undergo a severe punishment, though the man with whom they have transgressed commonly escapes with only some pecuniary fine; and whoever takes her in after her husband has turned her away is obliged to pay the like fine, or another woman in exchange for her. But though this is the slavish state of the wives of this country, there is a particular law by which the children follow the condition of their mothers; that is, they must continue slaves if the wife be such, though the father be free; and are free born if the mother be so, though the husband be a slave.

The children of the natives are born white, but in two days time become as black as their parents. This often deceived the Portuguese at their first settling in these parts; for, having had a commerce with the negro women, they vainly imagined the child to be theirs.

But, what is much more extraordinary, here are a white people, who have grey eyes, red or yellow hair, and a complexion that resembles chalk. Their eyes, in-

stead of a lively sparkling, seem fixed in their sockets; and they appear to have hardly any sight, except in the dusk of the evening, or by moon-light. Though the negroes look upon these as monsters, and have the utmost hatred and aversion to them, they are well received by the king, who causes some of their children to be educated as footsayers, and is never without some of them about his person and his court. They are called Dondos by the negroes, and Albinos, or White Moors, by the Portuguese. There is a kind of continual war between the negroes and them, in which the former always attack them in the daytime, when their sight is the most imperfect; and these take their advantage of them in the night, when it is at the best.

These white people not only make a part of the king's council, but are the chief persons employed in all religious affairs and superstitious ceremonies: yet neither they nor any of the Loangoese have any tolerable ideas of a Supreme Being; and though they seem to acknowledge his existence, under the name of Sambian Pongu, they neither pay any adoration to him, nor seem to have any notion of his nature or attributes. All their worship and invocations are, like those of the Congoeze, directed to subordinate spirits, who, they imagine, preside over the different parts and powers of nature. These pretended deities they represent in the form of men, women, or other living creatures; some coarsely carved, and others modelled in clay. Some images of a small sort are worn in little wooden boxes pendant about their necks; but the larger they set up in their houses, and adorn their heads with the feathers of pheasants, parrots, and other birds, painting them all over of various colours, and hanging little bits of cloth, small shells, pieces of iron, and other baubles on their bodies. These are placed in an earthen vessel, somewhat like a stone mortar, in which the figure stands half in and half out.

The persons consecrated to the service of these imaginary deities, are usually advanced in years, and chosen by the enganga mokisso, or chief of the magicians, with many ridiculous ceremonies before a numerous assembly; and it is said, as soon as these are ended, the candidate begins to look wild, to distort his face, and put his body into several indecent attitudes, uttering loud and terrible shrieks. Authors tell us, that he then takes fire in his hand, and bites it without burning himself; and that some of them run with prodigious swiftness into some desert place, whither they must be sought out by beat of drum, and when one of them is found, he appears with his body covered with leaves, and is brought home by his relations, who dance around him, while he acts the part of a person possessed by some demon. At his return, he is asked to what demon, law, and particular observation he intends to bind himself; and as soon as he has named one, a buckle or ring is fastened round his arm, which he must always wear, to remind him of his promise; and afterwards he never swears by any thing but the ring, or the demon, to which he hath dedicated himself.

The common people have likewise one or more small idols, which those of high rank wear in great numbers.

The inhabitants of Loango entertain various notions of the nature of the human soul. The royal family are persuaded, that the souls of their deceased relations transmigrate to the bodies of those who are afterwards born in the family. Others imagine, that the departed souls become heroes, household Gods, and guardian spirits, and from that opinion make little niches under the roof of the house, where they place their idols, which are generally a span long, and offer them a share of their meat and drink, before they venture to taste it themselves. Others assign the soul a residence under the earth, where they suppose it enjoys a new kind of life in a higher or lower rank, according to the degree of merit it possessed while on earth. Another sort think, that souls die with their bodies, unless they are kept alive by the witchcraft of an enemy, in order to render them serviceable to his avarice and interest. They are all persuaded, that their mokissos, or as the Portuguese call them fetissos, that is the spirit to whom they have been dedicated at their birth, has power to inflict punishments, or even death, on those who neglect or break any of the observances to which they have bound themselves. Hence when a person enjoys perfect health, and worldly prosperity, he flatters himself, that his God is well satisfied with his behaviour; but when matters go other-

otherwise, he thinks it high time to look about him, in order to find what has displeased his mokisso, and what is the properest method of regaining his favour.

In this kingdom they have many temples, in which their idols are placed; the most considerable of which is that of Therico, a large village, where the temple is very spacious, and the pillars, as well as the mokisso, have the figure of a man. The enganga or priest, who is lord of the village, performs the service every morning, by striking a fleece of wool with his staff, and muttering some words, to which a youth who assists him, makes regular responses; after which he addresses his petitions to the mokisso, recommending to his care the health and prosperity of the king, the welfare of the country, the fertility of the land, and the good success of their traffic and fishery.

When a common person dies, they express little concern till his breath is out of his body, and then every one begins to howl and cry, to crowd about the corpse, bring it out of the house, and ask it the cause of his death, whether want of food or other necessities, or any enchantments. This tumult commonly lasts two or three hours, during which some of the relations are busily employed in washing, combing, shaving, and staining the corpse with red wood, particularly his nails, and getting ready such of his goods as are to be thrown into his grave; while others are employed in digging it of a sufficient size to contain both him and them. When every thing is ready, they suddenly snatch up the corpse, and run away with it, with all possible speed, the company following with the same haste; and when they come to the place, throw the body and goods into the grave. These goods are generally some of the deceased's cloaths, weapons, and tools; and when these are too many for the grave to contain, they hang them upon short posts stuck into the ground, after having first torn, or otherwise injured them, to prevent their being stolen. The mourning lasts six weeks, during which the deceased's relations meet at the grave morning and evening, to bewail his death.

A person of rank no sooner falls sick, than the strictest enquiries are made, whether his disease be not caused by enchantment. Upon this the engangas are consulted, and if they pronounce him bewitched, counter-charms are used for his cure. If none of these avail, and the patient dies, much the same ceremonies are used as at the death of a person of meaner rank, only they extend the corpse on the floor of some large chamber, and not in the street, and instead of three hours spend three days in lamenting his death, and preparing for his interment. All this while his male relations utter their lamentations about his corpse, while the females are dancing in another room, and singing his panygerics, expatiating on the nobility of his lineage, the greatness of his estate, the grandeur in which he lived, and the number of his friends and enemies. The mention of his enemies by name seldom fails to create a suspicion that some of them have caused his death by witchcraft, especially if the engangas have intimated any thing to that purpose. Upon this stricter enquiries are made, and if no certainty can be obtained, they unanimously resolve to consult one of the mokissos, and every one contributes something to defray the expence of the enquiry. On the third day, the corpse with the goods are hurried away with precipitation to the burying-place, and there they throw the body and other utensils, as an earthen pot, an arrow, a lance, a wooden shovel, a calabash, a drinking cup, a pipe, a tobacco box, a staff, and other things of the like nature; and, as hath been observed before, what is not thrown into the grave, is suspended on posts set round it; after which the mourning lasts two or three months, during which the friends and relations make their morning and evening lamentations at the grave, and the enquiry after the cause of the person's death is carried on by the relations.

No strangers are suffered to be buried in this kingdom; for when they die they are conveyed in a boat two miles from the shore, and thrown into the sea. This, they pretend, was occasioned by the following incident. A Portuguese gentleman dying, and being buried there, had not lain in the ground above four months, before a

famine, occasioned by want of rain, induced the inhabitants to consult the mokissos in relation to the cause; and were answered, that a Christian had been buried among them, and must be taken up and thrown into the sea before they would obtain any rain. The people obeyed, and a plentiful rain happening to fall three days after, they have never since permitted any Christian to be buried there.

S E C T. XVI.

Of the Government of Loango, the Power and State of the King; the Ceremonies observed at Court; the Funerals of the Kings of Loango; the Order of the Succession; and a concise Account of the Laws.

LOANGO was anciently a part of the kingdom of Congo, as hath been already intimated; but the governors of its several provinces revolted from it, and raised themselves to the dignity of independent princes, till one of them grew so rich and powerful, as to subdue all the rest, and not only assumed the royal title and dignity, but took several other provinces from the king of Congo; by which means he rendered himself so absolute, as to be worshipped in some measure as a deity.

The king of Loango is still reckoned very powerful, and capable of bringing great armies into the field; for all his subjects that are able to bear arms, are obliged to appear at the usual musters, in order to perform their exercises before him, and to follow him or his general to the wars, wherever he commands them. His troops are armed with darts, which have large heads of iron; and have a handle about the middle of the staff, by which they throw them with great force and justness. They have also a kind of dagger, which in some measure resembles the head of their darts. Their targets are so large as to cover almost the whole body, and so strong, as to repel an arrow or dart, they being made of hard and thick hides.

It is here reckoned a capital and unpardonable offence to see the king eat or drink. He generally contents himself with two meals a day, and is said to have two houses appropriated to that purpose, the one for eating, and the other for drinking; to the first he usually repairs about ten o'clock, which is his dinner-time, and there finds his victuals ready, brought in a kind of baskets, a servant going before with a little bell, to give notice that the king's table is going to be covered. The high steward has no sooner placed the meat before him but he retires, and locks the door after him, leaving neither man nor beast to see him eat, his numerous court waiting all the time in an antichamber, in order to follow him to his drinking-house, to which he generally adjourns immediately after dinner.

This is the noblest apartment in the whole palace, and is encompassed by a spacious court inclosed with palisadoes of palm trees: this is also the place where he administers justice to his subjects. The room is hung with rich tapestry, about eight feet high, and at the farther end of it is the royal throne, which is formed of fine palmetto pillars white and black, curiously wrought in the manner of basket work. The front of the apartment is open to let in the fresh air; and about twenty feet beyond it, a screen or partition runs quite across to keep the palm wine which he drinks concealed. On each side of the throne are two large baskets of black and red palmetto, in which the natives say, the king keeps the images of the familiar spirits who guard his person. On each side of him stands one of his two cup-bearers, and when he wants to drink, he beckons for the cup, upon which one of them reaches it to him, and the other, who holds two iron rods, resembling drum-sticks, strikes them together to give notice that he is going to drink, and then all the nobles, both in the hall and out of it, fall with their faces to the ground; but the cup-bearer who presents the wine turns his back. In this posture all continue, till notice is given, by the ceasing of the signal, that he has drank, upon which they immediately rise and express their joy and good wishes by clapping their hands.

No one is permitted to drink out of his cup, or to eat of the provisions which he leaves, after having dined or supped; but all that is left is carefully put together, and buried in the earth. It is a mark of respect, when any person is allowed to drink in his presence, for that person to turn his back to him.

As causes are heard, and affairs of the greatest importance are discussed in this hall, he often stays in it till about an hour after sun-set, or, in other words, till about seven o'clock; but, if there be nothing of that nature, he commonly retires to his seraglio, and passes the rest of the afternoon with some of his wives. About seven o'clock, or soon after, he repairs to his eating-house, where he sups with the same ceremonies used at dinner, and then adjourns to the drinking hall, where he usually stays till bed-time, which is at about nine or ten in the evening, and then retires to rest.

This prince seldom or never stirs out of his palace, except on some grand festival, or some solemn occasion; as receiving an embassy, or hunting some mischievous leopard that lurks about his capital; quelling some revolt, or seeing his people begin to plough and sow his lands; and when his vassals come to pay him their usual homage and annual tribute.

Upon these occasions he publicly repairs to a spacious green that faces his palace, in the center of the city, where is erected a throne of white and black palm-tree wickers, artfully interwoven, and adorned with curious embellishments. On the back of the throne is spread a kind of escutcheon, or shield, hanging to a pole, and on each side of the throne are set about eight umbrellas, neatly wrought with the finest of their country thread, and fixed at the end of poles, which run through the center of each. These umbrellas are of the form of an hemisphere, and about two yards in diameter. The staff to which they are fixed is about as thick as a man's arm, and two or three yards in length, with a large tassel or bushy tuft above, and several others under the concave. These, and several other pensile ornaments of different materials, being whirled about horizontally with great vehemence, by proper persons appointed for that purpose, raise an artificial breeze that is very refreshing and delightful to all within its reach.

Before the throne the ground is covered with a large carpet, or cloth, of quilted leaves, about forty yards long, and twenty broad, on which none but the king or his children may set their foot, but round it there is room sufficient for two or three persons to pass; and beyond that the nobles and officers of the household are seated cross-legged, some on the ground, and others on carpets or cushions, each holding in his hand a buffalo's tail, and waving it about. A great number of servants surround their masters on the outside, all seated in the same posture; and at proper distances are placed the musicians, who have three sorts of instruments, one made of ivory like our hunting-horns, but of different sizes and bores; these joined together yield a loud, yet pleasant sound. The second sort is the drum, which is of various sizes, and is made and beat after much the same manner as those of Congo and Angola. The third resembles a tabor, shaped like our large sieves, with a drum skin instead of a piece of lawn or wires. The hoop about it has holes, in which are fastened flat pieces of tin or brass, which make a kind of gingle whenever the tabor is moved or beat with the hand.

Before the above carpet a number of dwarfs sit with their backs towards the throne; these are chosen for their deformity, and especially for the disproportionate largeness of their heads. Their cloathing is suited to their appearance, it being only the skins of beasts tied about their waists. These the king causes to be intermixed by way of contrast with a number of White Moors, and both together in their motions and antic gestures make a very grotesque appearance.

The king is no sooner seated on his throne, than the music plays, and a set of officers, or gentlemen, begin a dance, called kilomba, round the royal carpet, in which they toss about their arms, and shew all possible activity with their bodies; and when any of them has been so happy as to please his majesty by his performance, he lets him know it by opening his arms; on which the

dancer draws nearer the throne, and, after rolling himself several times in the sand, to express his gratitude and subjection, is sometimes allowed to clap his hands upon the king's knees, and his head in his bosom. The nobles have the privilege of saluting the king in this manner: when approaching his person they take several large steps or bounds in the air backwards and forwards; and as these have their separate seats on each side of the throne, they cause their own vassals who attend them on these occasions to perform the ceremony to them: this is called the leaping salute, and is always used upon grand occasions, particularly when the king's vassals come to pay him their homage and tribute.

The next grand solemnity is termed the feeding-time, and is kept on the fourth of January, when the men and their wives appear before the king, in order to till and sow his lands. The men appear in arms, while the women are busied in breaking up the ground, which is a service to which they must all submit, and from which none can absent themselves without incurring a penalty; and the king himself repairs in person at about three in the afternoon to encourage them, and see that this work be well done. In the evening they are all invited to sup at his expence; and this is esteemed a grand festival. Every vassal is in like manner obliged to send his wives to till the lands of his lord, and when they have performed his service, they are at liberty to work for themselves on what waste piece of ground they like best, for all the rest of the lands are held in common; but when any one has begun to cultivate one spot, it is not lawful for another to interfere with him in it.

The king also shews himself in public on the hunting of a leopard within the neighbourhood of his capital. These animals being numerous, the nobles are allowed to summon all their vassals to hunt and destroy them; and when any has killed a leopard, he gives notice of it to the king, by bringing its tail to Loango, and hanging it on a palmetto pole before the royal palace.

But if any of them are discovered within the neighbourhood of that capital, the king, upon the first notice of it, orders all the inhabitants, by sound of trumpet and beat of drum, to appear in arms and accompany him to the place where it is lodged. If it be too far for him to walk, he is carried in a wicker chair, borne upon four men's shoulders. When they come to the leopard's den, or to the wood in which he lurks, some of the people beset the avenues, armed with their bows and javelins; while others lay their traps, or spread their nets, to catch him alive. A third sort beat the bushes, sound their trumpets, and make a hideous noise to frighten the beast; who, in order to break his way through the volleys of darts and arrows discharged at him on every side, is forced into the trap, where every one strives to dispatch him in the presence of the prince.

This is no sooner done than he orders him to be flayed by one of his officers; after which the skin is carried in triumph by the huntsman to the palace, where the ceremony is closed with singing, dancing, and variety of other pastimes.

The king's funeral is performed with great pomp; but, instead of the inhuman custom practised in some of the neighbouring parts of Africa of interring the king's wives, relations, domesticks, and slaves alive with him, they surround the funeral-seat, on which the corpse is placed with little images of clay, wood, or wax; yet some slaves are said to be slaughtered upon these occasions, and buried in the same or some adjoining vault. These vaults are made so large as to contain not only the corpse of the king, which is always dressed in the most pompous manner, but a great number of utensils, as pots, kettles, pans, pitchers, cups, linen, and cloaths. The above slaves are said to be buried with their masters, not only to attend them in the next life, but to bear witness when they come before the God of the other world how they have lived and behaved in this.

With respect to the succession of the crown, it descends not to the king's children, but to those of his sister. Some care is necessary to prevent confusion and disputes about it; therefore those who claim a right to ascend the throne have particular towns or villages assigned for their

residence nearer or farther from Loango, according to their being nearer or farther from the succession: they have likewise their titles from those towns; thus the next heir to the crown is called Manikay, from the town of that name, about five or six miles north-west of the capital. The next to him is called Mani-bocke, and lives at that town, which is between fifteen and sixteen miles farther up the country. Mani-sallaga, or Salag, the third in rank, lives at Salag, thirty miles from Loango. Mani-kat, the fourth, lives at Kat, a village about fifty miles distant: and Mani-inyami, the fifth and last, resides at a hamlet on the southern borders of the kingdom. Hence, when the king on the throne dies, Mani-kay, who succeeds him, removes to Loango, and the other four remove one stage nearer to it, according to their rank, and a new one is nominated to succeed Mani-inyami.

Their laws are much more gentle than in other neighbouring states, except in crimes committed against the king's person, dignity, or honour. Thus they never condemn a man to suffer death for theft, but content themselves with obliging the offender to restore what he has stolen, or its value, and with exposing him with his hands tied behind him to a tree or post, to the sport and derision of the spectators.

It is said that adultery is only punished with a fine; but this indulgence is so far from extending to the king's wives and concubines, that if any of them be debauched, or suspected to be so, both she and her paramour are burnt alive without mercy, in sight of each other. The number of his wives is indeed prodigious, because he is obliged to keep those of his predecessors, as well as his own, so that they sometimes amount to a very great number. All these he keeps confined in his teraglio, and singling out some of them for his pleasure, obliges the rest to employ themselves in some useful work; but should any of these be found pregnant, she would be put to the torture to make her confess her partner; but these women sometimes cause an innocent person to share their dreadful fate, in order to save the man they love.

S E C T. XVII.

A Description of Loango, the Capital of the Kingdom, and the Trade carried on by the Natives.

THOUGH the bay of Loango is esteemed a pretty good one, it has a bank on the north side of its mouth, or entrance, that runs about half a league along the coast, and has not above two fathoms and a half water; but having got over it, you come into five fathoms and a half, which continues till within a small cannon-shot of the land, where the vessels commonly anchor in three fathoms, on a reddish bottom. The bay is easily known by the high reddish mountains on the sea-side, that are different from all the others on that coast. The many large rivers that come down from the continent cause the currents to be so strong and rapid towards the north, that it is difficult to weather them and gain a southern course: but this may be done with greater ease and safety in the months of January, February, March, and April; during all the rest of the year the currents flow so strong, that even the coasters are obliged to keep at least ten or twelve leagues off the land. The port, or landing-place, is at the small village of Kanga.

The city of Loango is situated in the province of Loango-mongo, in four degrees and a half south latitude, and about five or six miles from the sea-coast. The houses are for the most part oblong, and covered in such a manner, as that the middle part of the top is flat, and the rest of the covering comes down with a slope. The whole is supported by strong wooden pillars and cross

beams; those that support the highest part being ten or twelve feet higher than the side ones, and the last of a height proportioned to the size of the building, for the houses are higher or lower according to their length or breadth. They have usually three or four rooms; but have none above the ground-floor. The houses are fenced round with a hedge of palm twigs, canes, or the like materials; and some of these hedges enclose seven, eight, or more buildings. The families within them commonly live together in a peaceable and friendly manner, and are ready upon all occasions to assist each other, except when they suspect any one of magic.

Their chief furniture consists in a variety of pots and kettles, baskets, calabashes, mats, and benches, on which they lay their cloaths, weapons, and other utensils.

The streets are wide and kept very clean, and before each side is a row of palms, bananas, or bacavas, which agreeably shade the fronts of the houses; and most of those which belong to persons of superior rank have the same behind, or even quite round.

In the center of the city is a square of a prodigious size, on one side of which is the royal palace, which is a mile and a half in compass, and surrounded by stately palms. It consists of a vast number of detached buildings, or houses, among which are those of the king's women: The houses of the king, his halls of audience, and other offices are on the west side, and face the above square, in which he holds his councils of war; he there also feasts his prime officers, and sometimes his whole army. From this square there likewise runs a wide street, some musquet-shots from the palace, where a considerable market is kept every day, in which are sold great quantities of palm cloths; as also corn, meal, poultry, fish, wine, and oil; and there were formerly sold in the same place elephants teeth, but these are now removed to the port of Kanga. In this market is also a famous temple and idol, called Mokisso a Loango, which has been held in great veneration both by the king and people.

The trade of this country chiefly consists in slaves, which are esteemed the greatest riches of the inhabitants; and this trade is carried on much in the same manner as at Congo. The natives also sell considerable quantities of ivory, tin, lead, iron, and copper, brought from the mines of Sundi, which are situated far to the east. The smiths and artists in mines set out from Loango in September for the kingdom of Sundi, and being arrived at the mountains where the copper-mines are, set their slaves to work in them. They melt the ore on the spot; but as they have not the art of purifying it from other metals, their copper is neither so pure nor so valuable as it might be. At that work they are employed till the month of May following, at which time they bring elephants teeth and tails; but the former are only of a small size, and the latter the Portuguese carry to Loango, where the negroes of that town have the art of weaving the hair into girdles, bracelets, collars, and other ornaments that are exceeding neat and beautiful. These two last articles the Loangoese purchase of one of the inland nations, in exchange for salt, palm oil, Silesia ticking, cutlasses, looking-glasses, beads, and other things, which they obtain from the Europeans.

The Portuguese also export from Loango several sorts of cloths, the manufacture of the country, some of which pass for money both there and in other neighbouring kingdoms.

Those European merchants who are desirous of trading at Loango, are obliged to obtain a licence for it from the king, which can only be done by presents made, not only to him, but to his mother, the queen, and some of his ministers, which renders it chargeable and difficult. Besides, as the inhabitants understand no language but their own, it is necessary to hire some of their fishermen, who have commonly a smattering of Portuguese, to serve for interpreters and brokers.

C H A P. X.

Of the Kingdom of B E N I N.

S E C T. I.

*Its Situation, Extent, Face of the Country, and Climate ;
Vegetables, Beasts, and Birds.*

THE kingdom of Benin is of considerable extent, but its limits are very imperfectly ascertained; it is, however, bounded by Loango on the south, by the gulph of Guinea and the Slave coast on the west, by part of Gago and Biafara on the north, and by Mujac and Makoko on the east. It begins in the first degree of south latitude; but how far it extends from south to north, and from east to west, cannot be well ascertained.

The first discovery of this kingdom is generally attributed to Juan Alphonso de Aveiro, who gave the name of Formosa to the river Benin, from the verdure and beauty of its banks. For several leagues up the country the land is low and marshy; but its banks are every where adorned with tall, straight, and spreading trees: the adjacent country affords a delightful prospect, the land being even, without hills, yet rising by gentle degrees; and the trees are disposed by nature in such regular order, that they seem as if planted by design.

But, notwithstanding the apparent satisfaction the country affords from the pleasing landscapes presented to the eye, the air is noxious and pestilential, which is owing to the gross vapours exhaled by the heat of the sun from its marshes; and there are such quantities of mosquitos as render life intolerable, from the sharpness of their bite, and its seeming poisonous effects, producing violent heat and inflammations, with convulsions, vomitings, and other dangerous symptoms.

The soil at a small distance from the river Benin is extraordinary fertile, and whatever is planted or sowed there grows well, and yields a rich crop. Among the fruits of the earth is the large sort of millet; but as the natives are not fond of it, little is sowed; it grows very luxuriant, and yields a prodigious quantity of grain. They sometimes employ the Andra women to brew beer with it.

There is little or no rice cultivated at Benin, though the morasses near the river seem proper for it.

There are not many potatoes; but there is great plenty of yams, which they eat with their other food instead of bread, and are careful to plant them in their proper season.

Among the fruit-trees are two sorts of cocoas, bananas, wild figs, and some others.

With respect to tame animals, here is no want of horses, cows, sheep, dogs, and cats. The cattle, though small, are good and cheap; and the negroes prefer the flesh of the dogs and cats to that of any other beast. The natives also sometimes kill wild swine and harts with their javelins; but this is very seldom. The country also contains a vast number of elephants, and a few lions and tigers; with many jackalls, baboons, and all sorts of apes.

Among the feathered kind, they have great plenty of poultry, which are equally good and cheap; pheasants, green and blue partridges, turtle and ring-doves, crooked-bills, snipes, divers, water-hens, and a sort of crown birds.

S E C T. II.

Of the Dress, Manners, and Customs of the Natives; their Food, Marriages, Treatment of their Wives, Punishment of Adultery, and Regard to Decency. The Circumcision of their Children. Twins reputed happy Omens; but at Archa are put to Death. The Treatment of their Sick, and the Burial of the Dead.

THE dress of the natives of Benin is neat, and greatly exceeds that of the negroes of the Gold coast. The

rich wear first a white calico or cotton petticoat, about a yard in length, and half a yard in breadth. This they cover with another fine piece of calico of sixteen or twenty yards in length, which they plait in a becoming manner, wearing over it a scarf a yard long and a foot wide, the ends of which are adorned with a handsome lace or fringe. The upper part of the body is mostly naked. This is the dress in which they appear in public; but at home their cloathing is more simple, and less expensive, it only consisting of a coarse cloth worn round their waist, covered with a large painted cloth of the manufacture of the country, and worn in the manner of a cloak.

The women of rank wear fine calico beautifully checkered with various colours, fastened round the waist. The dress is long and open, either on one side or behind, just as fancy directs. The face and upper part of the body is covered with a thin veil, which they remove among their friends and intimates of either sex. They adorn the neck with strings, and chains of coral agreeably wrought and disposed. Upon their arms and legs they wear bright copper or iron bracelets of a mean workmanship, and all their fingers are crowded with rings of the same metal. Upon the whole, their persons are not disagreeable, after custom has rendered them familiar to the eye; and, except their rings and bracelets, the dress does not appear unbecoming.

The meaner degrees, both of the women and the men, differ from those of high rank only in the quality of their cloaths, the form being the same. The men neither curl nor adorn their hair, but suffer it to fall naturally, except in two or three parts, which they buckle in order to suspend a bunch of coral to each lock. The women, on the other hand, use great art in dressing their hair, which they reduce into a variety of different forms, great and small curls, high and low fore-tops, sometimes plaited up behind, at others flowing in wanton ringlets down the neck, but generally divided on the crown of the head, by which means the curls are brought into exact form and order. Some anoint the hair with a kind of oil, which they express or roast out of oil-nuts; and this oil, it is said, at length gives it a beautiful green or yellow, of which they are fond.

The natives of Benin are, in general, a good-natured, civil, and gentle people, from whom, by kind usage, any thing may be obtained: If they receive presents, they return double the value; and they will even steal to enable them to shew their gratitude. If a stranger asks a favour of them, he is seldom refused, however inconvenient it may be for them to grant his request: but though they are easily wrought upon by soft means, they are inflexible to all kinds of severity and rough usage; for by courtesy their pride is flattered, their self-importance raised, and therefore a person of an obliging behaviour will succeed in points which a blufferer would in vain try to effect. To think of forcing any thing from them, says Mr. Bosman, is to dispute with the moon.

They are quick and alert in business, greatly attached to their ancient customs, in which, if we comply with them, they are very easy to deal with, and will not be wanting in any thing on their part requisite to a good agreement. They are however very tedious in their dealing, for it frequently happens that a bargain for elephants teeth will take up some weeks before it is concluded; but this is managed with so many ceremonious civilities, that it is impossible to be angry with them; yet with each other, where they repose a confidence, no people make greater dispatch. Mr. Bosman complains of another inconvenience, which is, that on the arrival of the Europeans, they are obliged to trust them with goods to make paans or cloth of; for the payment of which they frequently stay so long, that from the advancement of the season,

fealen, the consumption of provisions, and the sickness or mortality of the men, they are obliged to depart without their money. However, upon their return, they are honestly paid the whole.

Those of the natives who can afford it feed well. Their common food is beef, mutton, or fowls, with yams for bread, which, after boiling, they beat into a sort of cake. They frequently make entertainments for each other, and what is left is constantly distributed among the poor. People of mean rank content themselves with smoked or dried fish, which they eat with a kind of bread made of yams, bananas, and beans, mixed and beat up together. For their drink they use water, or water mixed with a bad wine called pardon; but the rich drink at their meals water and European brandy.

They are well skilled in making several sorts of dyes, as red, yellow, green, blue and black. The blue they prepare from indigo, great quantities of which grow here; but the other colours they extract from certain trees. They spin cotton, and weave cotton cloths, with which they not only supply all the inhabitants, but export a great deal. They make soap, which is better than any made in Guinea. Their other workmen are chiefly smiths, carpenters and leather-dressers; but their workmanship is very clumsy.

The men marry as many women as their circumstances will permit, the laws limiting them to no determinate number. If a man loves a virgin, he discovers his passion to the most considerable person among his relations, who goes to the house where she lives, demands her of her friends, and, if she be not already engaged, seldom meets with a refusal. As soon as the consent of the parents is obtained, the match goes on, the bridegroom presenting his future bride with a suit of cloaths, bracelets, rings, and necklaces proportioned to the degree of his wealth. After having treated the relations on both sides with a handsome collation, the marriage is ended without any other ceremony.

The natives are jealous of each other to a degree of madness, but never take offence at any liberties taken with their wives by Europeans, thinking it impossible that the taste of the women should be so depraved as to allow them to grant unbecoming favours to a white man. Among people of rank, the women live after the manner of the Eastern nations, cooped up from all conversation with the males of their own complexion and features; but are otherwise treated with great tenderness, in order to alleviate the misfortune of the loss of liberty. If the master of the house receives a visit from any of his acquaintance, his wife immediately retires, unless the stranger prove an European, in which case she is desired to remain in her seat. The women use every female artifice to engage their husband's affections, from their being fully sensible, that all their happiness depends upon his love.

Adultery is punished three different ways; if among the lower class a husband suspects his wife's fidelity, he tries every method to surprize her in the fact, without which he can inflict no other punishment than ill usage. If he succeeds in detecting her, he immediately becomes possessed of the real and personal estate of the gallant, which he may from that instant seize and enjoy as his own. The offending wife is disciplined with a cudgel, driven out of the house, and left to seek her fortune, which is commonly very unhappy; for few persons will choose to receive her into their houses, and fewer still will marry a woman who has so grossly violated her faith. They therefore usually retire into a country where they are not known, where they either pass for widows, and watch for a second opportunity of marrying, or else subsist by their labour, or by engaging in trade.

Among persons of rank the crime is atoned for by a sum of money advanced by the wife's relations to prevent the scandal annexed to adultery. After this she passes with her husband and all her acquaintance for a woman of virtue, proportioned to the money received by the husband.

The governors and ares-de-roes, or street-kings, punish this crime with the utmost severity; for if the woman and gallant are taken in the fact, they are, without any form of law, immediately put to death, and their bodies thrown out as a prey to the birds of the air and the beasts of the

field. From the severity of these punishments the violation of the marriage-bed is less known in Benin than in any other country.

In general the negroes of this country are libidinous, which is indeed the case of the inhabitants in almost all warm climates. Their conversation is, however, free from all obscenity; the rites of love are held as sacred, and to be only spoken of in places destined for that purpose; and their conversation is enlivened with well contrived fables and chaste families.

The pregnant wife is forbid the caresses of her husband till after delivery. If the infant proves a male, it is presented to the king, as properly and of right belonging to him, but the females are the property of the father, and are entirely under his power till marriage.

About eight or fourteen days after the birth of their children, both the males and females are circumcised: the latter by the loss of a small part of the clitoris. The infants have besides several incisions made all over their bodies, in a regular manner expressive of certain figures: but the females are more tortured with these unnatural ornaments than the males. But before this, when the infant is only seven days old, the parents imagining that it has escaped the greatest danger, give an entertainment; and, to prevent the evil spirits, doing them an injury, strew the roads with provisions.

When a woman bears two children at a birth, it is esteemed a happy omen, the king is made acquainted with it, and public rejoicings are ordered to be kept, in which they make use of a variety of wretched music, vocal and instrumental. As it is esteemed too difficult a task for the mother to suckle both children, the father is obliged by the laws to look out for a nurse who has lost her own child; and, that no advantages may be taken of him, her price is settled by authority.

Yet at Arebo, a town a considerable distance up the river, twin-births are deemed a bad omen, and attended with great grief to the unhappy parents; for they sacrifice both the mother and her children to a certain demon, which, they imagine, haunts the village. Though the husband happens to be ever so fond of his wife, he can no otherwise purchase her life than by sacrificing a female slave in her stead; but there is no possible means of redemption for the poor innocent children. Hence the circumstances of having twins is so much dreaded, that those whose abilities are able to support the expence, usually send their wives to be delivered in another country.

A wood supposed to be frequented by this evil spirit is held so sacred, that no foreign negroe of either sex is permitted to enter it. If a native of Arebo accidentally falls into any path leading to this wood, he is obliged, however pressing his business may be, to proceed forwards to the end of it, without looking back, the violation of which custom, or of the cruel one of murdering their wives and children, they imagine would be attended with a plague, famine, or some other public calamity. Nyendael informs us, that notwithstanding this riveted superstition, he frequently went a shooting there, and to ridicule their stupid credulity, often turned back before he had proceeded half way in the track leading to the wood. At first they imagined he would instantly fall down dead, or be seized with some violent disorder; but perceiving that his boldness was attended with no ill consequences, their faith was somewhat staggered. Their artful priests, however, destroyed all his endeavours to undeceive them, by their subtleties, affirming, that no inference could be drawn from the practice of a white man, their God having no concern with him; but if a negroe was to attempt it, the consequence would certainly be fatal.

The females of this country are extremely prolific; a barren woman is very uncommon, and esteemed contemptible, while a fruitful woman is much admired.

The inhabitants of Benin appear less terrified at the approach of death, than the other people of the same coast. They ascribe the duration of life to the determination of the Gods, and yet use the proper means to prolong it. Upon their being seized with any disorder, they have recourse to the priest, who here, as in several other countries on this coast, performs the office

of physician. He first applies some green herbs, and if these prove ineffectual, he has recourse to sacrifices, and appeasing their Gods.

The reputation of the priest is greatly augmented by the recovery of the patient; but if, after all his endeavours, the person dies, the priest is never at a loss to defend his practice. But, notwithstanding the great confidence they place in their priests, they are generally rich only in fame; for the patient's gratitude continues no longer than the disease, and the sacrifice, which is offered at the priest's expence, frequently amounts to more than his fee.

When any person dies, the body is carefully washed; but when the natives of Benin breathe their last, they are with the utmost caution brought to the place of their birth; the body being first dried over a slow fire, then put into a close coffin, and sweetened with aromatics. As it frequently happens that no conveyance can be obtained for several years, the body remains all this while unburied, nor can the funeral rites be performed with propriety in any other but their native soil.

The nearest relations of the deceased express their grief in various ways; some shave their hair, others their beards, and others but half of either. The public mourning is usually limited to the term of fourteen or fifteen days. Their complaints and lamentations are accommodated to the sounds of certain musical instruments with long intermediate stops, during which they drink plentifully. When the last obsequies are performed, every man retires to his own house, and the nearest relations, who continue in mourning in the above manner, bewail the deceased at stated periods, during the time limited by custom. Husbands and parents usually prolong this mourning to three or four months.

The funeral of a king is performed with several very extraordinary ceremonies. A well is dug before the palace so deep, that the workmen are sometimes suffocated in the pit themselves have made, and yet it is so narrow at the top, that a stone five feet in length, and three in breadth, will conveniently cover it; but its dimensions at the bottom are considerable. Here the king's body is first laid in the presence of a prodigious concourse of people of both sexes, all of whom contend for the honour of being buried with him. Such as are chosen for this high dignity are put in with him, and the grave closed by a stone. The next morning the nobles return, and removing the stone, dip their heads into the water with which the pit is generally filled, and ask the persons buried with the king, Whether they have met with their royal master? and on their making no reply, conclude that they are attending him in his flight to the other world; upon which the solemnity is closed. Barbot adds, that the first minister immediately goes to the king's successor, who then coming to the grave, orders the tomb-stone to be laid, and upon it a banquet of the most delicate wines and sweet-meats. Every one eats and drinks till night, when the mob, intoxicated with liquor, run about the streets committing the wildest excesses and riots, putting every one to death that obstructs them, whether men, women, children, or brute animals, and cutting off their heads, carry them to the royal sepulchre, and throw them in as offerings to the deceased king, together with all the cloaths and effects of those persons they have sacrificed to his manes.

SECT. III.

Of the Religion of the Natives of Benin.

AS to the religion of the country, it is fraught with a strange mixture of good sense and absurdity. The fetiche, or mokisso, is worshipped here, as in all the other countries on the western coast of Africa; but the deities, which they suppose inhabit these idols, they consider as subordinate, and acting as mediators between men and the great God, of whom their ideas are less gross and unworthy. To the Supreme they ascribe the

attributes of omniscience, omnipresence, omnipotence, and invisibility, believing that he actuates every thing, and governs the world by his providence. As he is invisible, they think it would be absurd to represent him under a corporeal form, and thus to make an image of what we never saw, and cannot comprehend. To every evil, they give the name of wicked spirit, imagining that an evil disposed and malicious being presides over all that is bad; and this being they worship out of fear, and to prevent his injuring them.

Dapper observes, that they have very just notions of the supreme goodness, majesty, power, and wisdom of the great God, who created both heaven and earth, and continues to govern them. This being they call Ovisla, and think it unnecessary to pay their adorations to him; because his nature is good and benevolent, while the evil spirit requires constant worship, in order to check the malignity of his disposition. Nyendaël however asserts, that both are worshipped by sacrifices and offerings.

The negroes of Benin firmly believe in apparitions, and that the ghosts of their deceased ancestors walk the earth unseen; but chiefly appear to them in their sleep, in order to warn them of some danger which they are to obviate by sacrifices; and the day no sooner returns, than they comply with the supposed suggestions of the spirit. They make offerings, and if they are very poor, will even borrow to enable them to perform them. These are, however, of no great value, they only consist of yams mixed with oil, which they place before the idol. Sometimes they sacrifice a cock; in which case the blood is spilt for the fetiche, while they keep the fowl for their own use.

They have annual sacrifices, which are performed by the great with all imaginable pomp, and in these they slaughter a great number of bulls, cows, sheep, and all other kinds of cattle. All their friends are invited to the festival, which generally continues for several days, and ends in distributing valuable presents to the guests.

These people place the seat of their future felicity or misery in the sea. They consider the shadow of a man as a real existence, which will one day give testimony of their good and evil actions. They call this appearance passadoor, and bribe it by sacrifices and offerings, as by its evidence they may be raised after death to the highest dignity and pleasures of paradise, or sunk into the lowest abysses of wretchedness, where they must perish through poverty and hunger.

Though their houses are so filled with idols, that it is difficult to find a vacant spot, they have particular huts or little temples appropriated to the residence of the Gods, where they receive the offerings of their votaries. Their priests pretend to be acquainted with the evil spirit, and with the art of penetrating into futurity, by means of a pot pierced at the bottom in three different places. Nothing is however undertaken without consulting the priest; but if he meddles with politics, and utters oracles that affect the state, he is punished with death; and the priests of the provinces are prohibited under severe penalties from entering the capital.

The high priest of Loebo, a town situated at the mouth of the river Formosa, is particularly famous for his profound skill in magic. All the natives, the king not excepted, believe that his power extends over the air and sea; that he can foresee and prevent the arrival of ships, shipwrecks, and innumerable other important events. His majesty of Benin, struck with the miracles one of these priests is said to have performed, complimented him with the town of Loebo, and all its dependencies. He is considered as the head of the priesthood, and is so revered, that no one approaches him without trembling; nay, the royal ambassadors dare not presume to touch his hand without leave, and without shewing tokens of the greatest awe and veneration.

Among their other superstitions, the people are said to stand in profound dread of a certain black bird, which they worship, and are prohibited to kill, under pain of death. These birds have priests appointed to attend, feed, and worship them in the mountains consecrated to their use.

The Benians divide the time into years, months, weeks, and days, and each division is distinguished by its proper appellation. The year is composed of four months, and the sabbath or day of repose, which returns every fifth day, is celebrated as a festival, with sacrifices, offerings, and entertainments. They have also many other days consecrated to the purposes of religion, particularly an annual feast in memory of their ancestors. But the greatest festival is called the Coral feast, at which the king appears in all his grandeur, marching at the head of his women, who sometimes exceed six hundred, and are the most beautiful that can be found. He proceeds to the second area of the palace, where his throne is placed under a rich canopy. About him are ranged his women and officers in their richest attire. The king leaves his throne to sacrifice in the open air to the gods, which is accompanied by the loud shouts and acclamations of the people. Having paid his devotions, he returns to his throne, and stays there till all his people have performed theirs. After which he retires to his chamber, and the remainder of the day is spent in mirth and feasting.

S E C T. IV.

A Description of the City of Benin, and of the King's Palace; with the Manner in which that City was reduced to a ruinous State.

THE palace of the king is situated in Benin, the capital of the kingdom, which stands in the seventh degree thirty minutes north latitude, and in the fifth degree four minutes east longitude from London. The streets are extremely long and broad, in which are variety of shops filled with European merchandize, as well as the commodities of the country; and markets are kept in them for cows, cotton, and elephants teeth. It was formerly very close built, and extremely populous, as appears from the ruins of the houses; but at present they stand widely distant from each other. They are all built with clay walls, and covered with reeds, straw, or leaves, there being no stone in the country. The city is divided into districts, each governed by its respective officer, called King of the Street; and is enclosed on one side by a double fence of large trunks of trees, ten feet high, set close in the ground like a pallisado, and fastened together by spars fixed across, and the space between the two rows is filled up with red clay; which at a distance looks like a good thick wall, very even and smooth: but the other side of the city is defended by a large ditch and hedge of brambles; which are ten feet high and five broad, are made of one piece of wood, and hang, or rather turn, on a pin in the middle. Each has a guard of soldiers, and opens to the country through a suburb. The women keep the streets neat and clean, in which respect the inhabitants of Benin are not exceeded by the Dutch; for here, as in Holland, every woman cleans her own door.

A principal part of this city is taken up by the royal palace, which is of prodigious dimensions; but neither elegant nor commodious. There first appears a long gallery, sustained by fifty-eight square pillars, rough and unpolished, each above twelve feet high, and three in circumference. On passing this gallery you come to a high mud wall, which has three gates; that in the center is embellished at the top with a wooden turret of a spiral form seventy feet high, and upon the extremity of this turret is fixt a large copper snake, well cast, and bearing marks of a proficiency in the arts. Within the gate is an area of fine turf, a quarter of a mile in length and near as broad; at the farther end of which is another gallery, in the same taste as the former, only supported by pilasters, ornamented with human figures, and many of them cut out in that form, but in a very awkward manner. Behind a canvas curtain are shewn four heads cast in brass, neither resembling the human nor brutal form, and each supported by a large elephant's tooth.

On passing through this gallery and another gate, you have the king's dwelling in front, which is far from

dazzling the eye by its pomp and magnificence. Over the porch is another snake, probably done by the same artist who made that on the turret. In the first apartment is the king's audience-chamber, where, in the presence of the chief nobility, or officers of the court, he receives foreign ministers and ambassadors. His throne is of ivory, and over it is a canopy of rich silk. This chamber of audience has also the appearance of being his majesty's warehouse; for the king is engaged in trade as well as his subjects, and it is filled with loads of elephants teeth, and other commodities, lying in a confusion that plainly shews they are not intended for ornament. The room is, however, hung with fine tapestry, and the floor covered with mats and carpets of an indifferent manufacture.

The decay of the city was occasioned by the tyranny of one of the kings of Benin, who being jealous of obtaining the wealth of two petty princes of the street, ordered them to be seized and put to death, under the pretence that they had conspired against his life, and then confiscated their effects to his own use. They gave the clearest proofs of their innocence; but nothing is so deaf to the cries of pity as avarice.

Soon after, another person's wealth made the king meditate his destruction; but this nobleman, being apprised of his majesty's intention, quitted the city, and with him went three-fourths of the inhabitants. His majesty immediately assembled an army, and pursued them; but was so warmly received by the fugitives, that he was forced to retreat with loss and disappointment. After this, he made a second attempt to force them to return; but was defeated and pursued by the nobleman, who entering the city sword in hand, plundered the whole, except the palace; and for ten years he continued with his fugitive band to harass, plunder, and molest the inhabitants of Benin, till at length, by the mediation of the Portuguese, a peace was concluded, by which he was granted a free and full pardon, and even requested to return to his habitation; but as he did not choose to put himself into the power of a prince whose disposition he was but too well acquainted with, he fixed his residence at a place three days journey from the capital, where he kept a court that greatly eclipsed that of the king. In vain were all endeavours used to bring his adherents back to the city; they preferred poverty with freedom to wealth and dignity with servitude, whence Benin has ever since remained in a manner depopulated.

S E C T. V.

Of the Government of Benin; the Succession of the Crown; the Revenues and Forces of the King; with the Arms of his Troops. The People divided into several Classes; with a concise Account of the Laws of Benin, with respect to Inheritances, and the Punishment of Crimes.

AS to the government of Benin, it is perfectly despotic. The empire is divided into an infinite number of petty royalties, all of them subject to the king of Benin; but though the people boast of their being born free, nothing can be more servile than the blind obedience they pay to the king's authority; for they are proud of being considered as his slaves, and this title they esteem a distinguished honour.

The succession to the crown is regulated after the following manner: When the monarch on the throne perceives his end approaching, he calls one of the onegwas, or great lords, and lets him know which of his sons he nominates to fill the throne, with an injunction not to reveal the secret upon pain of death, till after his decease.

As soon as his breath has left his body, the onegwa takes into his custody all the royal jewels, treasure, and effects; and the young princes, who are in the utmost uncertainty as to their fate, come and do homage to this minister, as the ruler of their destiny. When the time limited by law for declaring a successor draws near, the minister sends for the high marshal, and lets him know the last will of the king, which the other, to pre-

vent mistake, repeats six times, and then returns to his own house with a solemnity adequate to the importance of the secret in his possession. The next day the minister orders that prince to be called for whom the crown is intended, and desires him to intreat the marshal to nominate a successor. The prince obeys, and with a supplicating air solicits his request. Six days elapse, during which the minister and high marshal concert the necessary measures for proclaiming the king, and then the people being assembled, the high marshal takes the prince by the hand, names him six times, and pausing after every repetition, asks the minister if he has made any mistake. At length, the other princes are called, who kneeling down, are informed of the last will of their father. The young king having returned thanks to the minister and marshal, for the integrity with which they have discharged their office, is immediately invested with the badges of royalty, and receives the homage of the great officers and nobles.

The ceremony being thus ended, the new king retires to Ofebo, a town some miles distant from Benin, in order to be instructed in the art of government, and the duties of a king. During this interval, the queen mother, the minister intrusted with the king's last will, and the grand marshal, hold the reins of the government, and their decrees are not to be revoked by the successor, without their consent.

The young monarch, having finished his studies, takes possession of the palace at Benin, where his first care is to secure his tranquillity, by the murder of his brothers, whose bodies are, however, interred with all imaginable pomp; this cruel and bloody act being considered as a necessary sacrifice for the public good.

The revenues of the crown of Benin are pretty considerable, every governor being accountable to the king for a certain number of bags of bougies, or blackmoor's teeth, which are esteemed as much as gold and silver, and answer the purposes of money. The inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Thus the court is continually supplied with all kinds of necessaries, the overplus is sold, and the money put into the royal coffers. Certain duties are also laid upon foreign trade, besides annual taxes paid to the governor for the privilege of commerce, which amounts to a great sum; but only a sixth part of this tax goes to the king. However, notwithstanding these incumbrances on trade, the Europeans are treated with great respect.

Some authors represent the king of Benin as so powerful, that in a day's time he can assemble twenty thousand men, and in a few days more a hundred thousand, on which account he is greatly feared and respected by his neighbours. While his general is in the field his pay and dignity are very considerable; but he has no share in the booty taken from the enemy, which solely belongs to the king. Such strict discipline is maintained among the troops, that a man's quitting his place for a minute, without leave, is said to be punished with death; yet Nyendaël observes, that they are unacquainted with the art of war, and their want of courage and conduct frequently exposes the kingdom to the incursions of pirates and robbers.

The arms used by the natives of Benin are swords, poniards, javelins, bows, and poisoned arrows. Every soldier has a buckler composed of reeds, which can afford but a slender defence. The nobles wear in the field a scarlet robe to distinguish their quality: others have a suit of armour formed of the elephant's hide, adorned with the teeth and claws of a leopard, and the head covered with a kind of helmet of the same materials, adorned with a scarlet fringe and binding, to which is suspended a tail that reaches down to the waist. The military standards and colours are made of fine silk, generally red, and are carried in the front and center of each division of the army. The soldiers also wear sashes of silk, to which they hang their bucklers, which are their only defence against the poisoned arrows of their enemies.

The state of Benin is divided into three classes of men, besides the king, whose will is a law. Next to him are three great lords, who are always about his person, and to whom all must address themselves who want to apply to his majesty; but as they inform him of only what they

think proper, the whole administration of the government may be said to be lodged in them.

Next to these are the *ares-de-roes*, or street kings; some of whom preside over the commonalty, others over the slaves; some over military affairs, and others over the affairs relating to cattle and the fruits of the earth. From this class of men are chosen the viceroys and governors of the provinces subject to the king, who are recommended by the three great lords, to whom they are responsible; and out of this class a particular supervisor is also chosen over every branch of trade, manufacture, farming, and every thing relative to the civil or military government. The king, as an ensign of the dignity of all these officers, presents each of them a string of beads, on their being raised to their posts; and this string is equivalent to any order of knighthood in Europe. This they are perpetually to wear about their necks, without ever daring to put it off on any account whatsoever; and if they are so unhappy as to lose it, or to suffer it to be stolen, they are condemned to suffer death, without the possibility of being reprieved by the king. These badges of honour are kept by the king in his own possession, and the counterfeiting or having any of them without his grant is punished with death. They are made of a sort of pale red earth, and are so well glazed, that they look like marble speckled with a variety of beautiful colours.

The third order of state consists of the *siadores*, who likewise wear the string of beads, but with some distinction of subordination and inferiority to the *ares-de-roes*. Besides the *siadores*, under the same class are ranked the *mercadores*, or merchants, the *pleaders*, and the *elders*; all of them distinguished by their different method of wearing the string of beads.

The king, great lords, and every viceroy and governor, support, according to their ability, a certain number of poor. The blind, the lame, and infirm are the objects of their charity; but as to the lazy, if they refuse to supply their own wants, they are suffered to starve. By this excellent police, there is not a beggar or vagrant to be seen; for the public officers keep the idle constantly employed, to prevent those diseases which are the consequence of poverty from increasing the tax upon themselves; and by this means, in spite of the natural indolence of the people, there are but few indigent. Liberality and generosity are the distinguishing qualities of the natives of Benin; but they frequently accompany their donations with an ostentation that destroys the grace and beauty of the action.

With respect to their laws, the right of inheritance devolves in the following manner: When a person of rank dies, the eldest son succeeds as sole heir; but presents a slave by way of tribute to the king, and another to the three great lords, with a petition that he may succeed to his father's estate. The king grants his request, and the fortunes of the younger children depend entirely on his pleasure; but the widow is allowed by the laws a jointure proportioned to the estate and her rank and quality. The son takes home his father's other wives, and, if he pleases, uses them as his own; but those by whose charms he is not affected he sets to work, that they may support themselves with credit, and as little expence to himself as possible; but, on the failure of male heirs, the king inherits.

If a thief be taken in the fact, he is obliged to make restitution, and if he happens to be rich is fined; but if poor is beaten. If a public officer be robbed, the offender is punished with death. However, the crimes of burglary and robbery are seldom practised in this country: murder is still less frequent; but whoever kills a man is punished with death; yet if the murderer be the king's son, or some other considerable person, he is only banished under a strong guard to the extremity of the kingdom, and none of these being ever heard of afterwards, the people conclude that the guard has conveyed them to the mansions of the dead.

If a person dies by an accidental blow, his death is not esteemed violent when no blood appears, and the offence is atoned for by burying the dead with decency, and sacrificing a slave to appease his ghost. This slave the offender touches with his forehead upon his bended knees,

in which posture he remains till the slave is dead, and the sacrifice is duly performed. Afterwards he pays a sum, in proportion to his circumstances, to the three great lords; upon which he retains his freedom, and the friends of the deceased remain satisfied with his having fulfilled the law.

All other crimes, except adultery, of which we have already treated, may be atoned for with money; and, where that is wanting, the deficiency must be supplied by corporal punishment.

When the accusation is not clearly proved, and the crime remains doubtful, there are five different methods of purgation, four of which are admitted in civil causes and trivial offences, and the fifth in capital cases. In the first method of purgation, the accused is carried before a priest, who pierces his tongue with a cock's feather well greased; when if it passes easily through, the person is esteemed innocent, and it is thought the wound will close up and heal without pain; but should he prove guilty, they suppose the quill will remain fixed in his tongue, and the wound canker.

In the second method of trial the priest takes an oblong piece of turf, and sticks in it seven or eight small quills, which the accused draws out one by one, when if they come out freely he is acquitted; otherwise he is found guilty of the crime and subject to the penalty.

The third method is injecting the juice of certain green herbs into the eye of the suspected person, when if it becomes red and inflamed, he is pronounced guilty, otherwise he is imagined innocent.

The fourth trial consists in the priest's stroking the person's tongue with a hot copper bracelet, when its escaping without a blister is a certain criterion that he is not guilty of the crime laid to his charge.

The fifth kind of trial, which is taken by none but persons of rank, seldom happens. The accused is carried by the king's order to a river, whose waters are supposed to have the extraordinary quality of gently wafting the innocent plunged into them to land; while the guilty, they say, never fail to sink, whatever skill they have in swimming. It is indeed amazing that, among nations endowed with common understanding, trials so ridiculous and absurd should be deemed proofs of innocence or guilt; yet we find they have prevailed in all nations, as if folly had dictated those laws which are most essential to society, to the happiness of mankind, and the dignity of human nature.

The fines charged on these crimes are thus divided: the person injured by theft or robbery has restitution made him, either by returning the goods stolen, or out of the criminal's effects. The governor has next a certain proportion, and the remainder of the fine goes to the three great lords. The king has no share, though the great lords always make use of his name; and if they are dissatisfied with what they receive, send to acquaint the governor with the king's indignation at the small proportion of the fine allowed him. This has its effect, and never fails of doubling the sum.

SECT. VI.

The principal trading Towns of Benin to which the Europeans resort; with the cruel Massacre of the Natives of Meiburg.

ON the banks of the river Benin, or Formosa, are some towns where the Europeans, and particu-

larly the Dutch, have settlements: these are Boededo, Arebo, and Agatton.

Boededo, the first of these villages, consists of about fifty houses, or cottages, built with reeds and leaves. It is governed by a viceroy, assisted by some grandees, who, under the king, govern the district under its jurisdiction; but their authority extends only to things of small importance, as civil causes, and collecting the revenues: but if any thing considerable happens, or any capital crime be committed, they are not permitted to decide it, but must send to court, and wait for orders from thence.

Arebo, which is now the center of the commerce of Benin, is situated sixty leagues up the river, and, notwithstanding that river branches out into innumerable streams, ships of burthen can sail a great way higher, and anchor in fine large creeks and sandy bays. Arebo is a large and populous city, of an oblong form; the houses are much larger than those of Boededo, though built in the same manner. The English and Dutch had a settlement, agents, and factors here, but the former have abandoned it.

Agatton, or Gatton, has also been considerable for its extent, and commerce, and the number of its inhabitants; but the ravages of war have almost ruined it. It is situated on a small hill, about thirty miles to the north of Benin, the capital of the empire.

The last of the commercial towns we shall mention was Meiberg, a name given to it by the Dutch, who once carried on a great trade, and maintained a considerable settlement there, and rendered it famous by a very tragical event. Beeldsyder, a Dutch factor, having a violent passion for one of the women belonging to the negro governor, carried her away. The governor, transported with rage, attacked the Dutch settlement with a body of troops, and forced the factor to retreat on board a vessel that lay in the road, after his having received a wound, of which he died soon after. Upon this the Dutch director-general, being ill informed of the circumstances, resolved to revenge the death of the factor, and fitting out a brigantine for that purpose, surprized the blacks at Meiberg, and killed or took prisoners every person of the village that could not escape by flight. The news of this event soon reaching the court at Benin, his majesty demanded an explication of the causes of this bloody massacre; and, after being informed, instead of turning his resentment against the Dutch, who had broke through all the laws of justice, hospitality, and humanity, he sided with them, from views of policy, and with the most horrible circumstances of barbarity, ordered the innocent governor, and his whole race, to be extirpated. This was done; their dead bodies were cast out as a prey to the wild beasts, and their houses razed to the ground, with strict orders that they should never be rebuilt.

It is remarkable, that all the male slaves of this country are foreigners; for the natives cannot be sold for slaves, but are all free, and alone bear the name of the king's slaves. Mr. Nyendaël even asserts, that it is not allowed to export any male slaves sold in this country, for they must remain there; but they may do what they please with the females.

C H A P. XI.

Of G U I N E A.

S E C T. I.

The Situation, Extent, Climate, and Divisions of Guinea in general; with a concise Account of that Part of the Slave Coast which includes the Kingdoms of Coto, and Great and Little Popo.

THE coast of Africa, from the Cape of Good Hope to Guinea, extends from north to south; but here it runs out to the west, extending from the fifteenth degree of east to the fifteenth of west longitude from London, or one thousand eight hundred miles from east to west, and between the fourth and tenth degree of north latitude; it is therefore no more than three hundred and sixty miles in breadth from south to north. This extensive country is bounded on the north by Nigritia, or Negroland, on the east by the unknown parts of Africa, and on the south and west by the Atlantic ocean.

This country probably derived its name from a town called Ginhy, which the Portuguese touched at on their first visiting this part of Africa.

As all this country lies within the tropic of Cancer, the air is extremely hot; and the flat country being overflowed a great part of the year by the periodical rains, it is esteemed very unhealthy: the ships frequently lost half their crews by fevers; but since Dr. James's powders have been carried thither, this voyage has been as safe to the English as those to any other hot countries; and the effects of a climate which used to fill people with terror have been found to be easily removed.

The winds of this coast sit directly contrary to the trade winds, and blow from west to east; except in the rainy season, between the vernal and autumnal equinox, when they have violent hurricanes, attended with thunder and lightning: and these storms blowing from the south, the ships on the coast are in danger of being wrecked on the shore, on which a surf constantly beats, in the calmest weather, that renders landing not only very difficult but dangerous.

This whole coast is much frequented by the Europeans; by whom it is usually divided into the Slave, the Gold, the Ivory, and Grain Coast.

The Slave Coast is bounded by the kingdom of Benin on the east, by the Gold Coast on the west, and by the Atlantic Ocean on the south, comprehending the kingdoms of Coto, Popo, Whidah, and Ardrah; but authors are not agreed about the limits of these kingdoms. According to Bosman, the Coto coast is frequently called by the natives the Land of Lampi.

The country is flat, sandy, dry, barren, and without wood or trees, except the palm, great numbers of which grow there. It is, however, pretty well provided with cattle, of which it has as many as will abundantly supply the inhabitants. There is no want of river fish; but they can get none from the sea, on account of the prodigious surf on the coast.

The natives are good-natured, civil, and obliging; in politics, religion, and æconomy, they nearly resemble the inhabitants of the Gold Coast, whose manners we shall soon describe, but differ from them in the number of idols kept at Coto; for in the multiplicity of these their wealth consists. A negro who is not possessed of at least a dozen idols is reputed poor, and his riches are thought to increase in proportion to the number of his gods; indeed the houses, roads, and bye-paths are filled with idols.

Their language resembles that spoken by the negroes of Acra. Their trade is small, and they are very poor. Their most advantageous employment is a very iniquitous one: this is making excursions up into the inland countries, and stealing men, women, and children, which they sell to the Europeans; but the profits they draw

from the sale of these slaves is said not to diminish their natural poverty, from their laying out what it produces in the purchase of idols, or materials for making them.

The kingdom of Popo, or Papa, extends from Cape Monte to the borders of the kingdom of Whidah, which is about ten leagues, and is divided into two provinces, Great and Little Popo. According to Bosman, a barren tract, ten miles broad, lies between Coto and Little Popo, in which the country is flat, without hills or trees, and covered with sand, in which an incredible number of rats burrow like rabbits.

The town of Little Popo stands on a beach four leagues to the west of the town of Great Popo, in full view of the sea. The natives live on plunder, and on the slave trade. In the former they are more successful than the inhabitants of Coto, from their being more active, bold, and resolute. Their slave trade is not, however, very considerable, it frequently requiring a residence of some months to complete a cargo. The natives are uncommonly artful and fraudulent, it being the usual practice to draw the merchant or factor on shore, under the pretence of viewing a number of slaves they have ready for sale, and then to detain him, till they have actually procured the number he wants, which they oblige him to take at the price they think proper to fix upon them.

At the distance of four miles from Little Popo are the boundaries of Great Popo. In the inland country are found plenty of beasts, birds, fruits, and roots: but the sea-coast is marshy, and almost inaccessible, the sea beating with such violence against the shore, that, during the greatest part of the year, neither boats nor canoes dare approach it.

The harbour of Little Popo is five leagues distant from that of Great Popo. In sailing eastward the latter of these ports is visible at a considerable distance, particularly two flags upon two points formed by the banks of the river Torri, or Tarri; the Dutch factory stands behind the east flag, and at the mouth of the river is the town of Great Popo, built in an island formed by a creek and marshes, that give the country the appearance of a spacious lake; hence it is called by the Portuguese, Terra Annegada, or the Drowned Land.

The mouth of the river is blocked up by a kind of bar, which canoes, however, can easily pass. The town is divided into three parts; but the houses, or rather huts, are small: yet this is the only place in the dominions of Great Popo that merits the name of a town, all the rest being only little hamlets of two or three houses each.

The royal palace is a large court composed of an infinite number of small huts or cabins, the principal apartment being seated in the middle. The king's house is adorned with a large saloon, reserved for public audiences and the entertainment of strangers. As he always eats alone, foreigners are entertained by the lords and principal officers of the court. His majesty keeps a great number of women, two of whom always attend his person, to cool and refresh him with fans neatly made of reeds and feathers. His constant amusement and sole employment consists in smoking tobacco, toying with his women, and conversing with his officers upon the most trifling subjects. All the women honoured with the royal affection, are entertained in the palace with a great variety of dainties.

All the country, except this island, is thinly inhabited, owing chiefly to the perpetual incursions of the negroes of Whidah: hence the land is uncultivated, provisions often scarce, and the people in danger of being famished; but they obtain supplies from their most bitter enemies, who run the hazard of an illicit trade for the sake of the great profits they obtain.

The natives of Great Popo trade in slaves, and if no foreign ships arrive on their coast, dispose of their stock

to the sovereign of Little Popo, who exchanges some of his European commodities for them. But the greatest trade of the kingdom arises from the fish caught on their coast, which they prepare and sell both to the people of the neighbouring kingdoms and to foreigners.

The inhabitants of Popo, like all the other negroes on the coast, have a blind confidence in their priests, whom they call Domines, a Latin term which they doubtless borrowed from some European nation. These priests are generally clothed in long white robes, and always carry in their hands a kind of crozier. All the ships that trade there pay them a sort of duty, under the name of a present, in order to encourage the negroes, by these marks of respect to their priests, to exert their diligence in completing their cargoes. These weak and superstitious creatures, persuaded that nothing but the intercession of their priests can procure them the favour of the Deity, obey all their commands; and the priests, finding it their interest to oblige the Europeans, leave no means untried to render them honest and industrious. While these are assisting the Europeans in loading or unloading the ships, a priest stands on the shore, and pours on their heads a handful of consecrated gravel, which they esteem an infallible security for their canoes in passing the dangerous bar at the mouth of the river; and if after this any man has the misfortune to be lost, it is attributed to the mixture of some profane particles of sand with those that are consecrated.

SECTION II.

Of the Kingdom of WHIDAH.

Its Name, Situation, Extent, and Rivers; the Inconvenience of its Coasts, and the Beauty of the Country: its amazing Fertility and Populousness; the Division of the Country, and the great Market carried on at Sabi.

THIS kingdom is called by the natives, the English, and Portuguese, Whidah; while the French call it Juda, and the Dutch Fida. It is bounded on the west by the river Solta; on the south by the Gulph of Guinea; on the east by the kingdom of Ardrah; and on the north by the country of Dahomay. It extends about ten leagues along the shore, and its center reaches seven miles within land; after which it branches into two arms, each of which is in some places ten or twelve leagues broad, but in others much narrower.

This country is watered by two rivers, which likewise run through the kingdom of Ardrah. The most southern is called the Jakin, and is only navigable by canoes: its waters, which are of a yellowish cast, are generally about three feet deep, and in many places much shallower. The other, which is called the Euphrates, washes with its stream the city of Ardrah, and then passes within a mile of Sabi, the capital of Whidah. It is deeper and wider than the Jakin, and were not the passage blocked up by some banks of sand, would be navigable for large ships. From time immemorial the kings of Whidah have exacted a sort of custom of two bougies paid to officers stationed at the fords, without which none are permitted to cross the river. At its mouth is the port where ships load and unload, but, like the rest of this coast, it is incommodious and dangerous, on account of the high surfs and a swelling sea, particularly in the months of April, May, June, and July, when accidents frequently happen, boats being overturned, goods sunk, the men lost, and the ships themselves are in danger of being driven from their moorings upon the shore. The natives are indeed so expert in swimming, that few of them are lost.

Besides this high sea, a strong tide runs east and west, with such strength that no boat or shallop can stem it by rowing; they therefore push them forward with long poles, which is a method so slow and tedious that the ships are detained twice as long as the trade would otherwise require.

But having once got on shore, the scene is changed from a dreadful swelling surf to most beautiful meadows and fields, enamelled all the year with the finest verdure; and rising by an easy and equal ascent towards the interior parts, affords the most delightful landscapes. The height of the ascent is bounded by a chain of moun-

tains that defends the country from its neighbours to the north-east. All the Europeans, who have been in Whidah, speak with raptures of the country, which they extol as the most beautiful in the world. The trees are straight, tall, and seem dispersed in the most regular order, representing to the eye fine groves and extensive avenues, clear of all brush-woods and weeds. The meadows enamelled with flowers, the richness of the fields covered with three different kinds of corn; and with beans, roots, and fruit, add to the agreeableness of the place. Every inch of ground is converted to some use; except the parts destined by nature for pleasure, where the woods spring up spontaneously in the most exquisite rural simplicity.

Here spring and autumn swiftly succeed each other; for no sooner has the husbandman cut his corn, than he again plows and sows the ground; yet it is so far from being worn out, that the next crop springs up with the same vigour as the former. With all these advantages Whidah is so populous, that one single village contains as many inhabitants as several intire kingdoms on the coast of Guinea; and yet these villages stand so close, that it is almost inconceivable that the most fertile land on earth can produce food sufficient for the great number of people contained in so small a compass. The whole kingdom may be compared to a great city, divided, instead of streets, by gardens, lawns, and groves; for there is not a village which has not another within the distance of a musket-shot. Some belong to the king, some to the viceroy, and others are built and peopled by particular private families. The former are the largest and best built, but the latter best cultivated. In short, it is impossible to enumerate all the perfections of this delightful country, without raising some suspicion in the reader, that we indulge a warm imagination at the expense of strict historical truth.

This kingdom, notwithstanding its small extent, is divided into twenty-six provinces, which take their names from their capital towns, and are distributed among the chief lords of the kingdom, who are their hereditary governors. The king of Whidah, who has the supreme authority, presides particularly in the province of Sabi, or Xavier, which is the principal province in the kingdom, as the city of the same name is the capital of the whole.

In the city of Sabi, a great market is held every fourth day; but the principal are on Wednesdays and Saturdays, when, to prevent confusion and disturbance, the market is removed to the distance of a mile from the walls, and is in a fine large plain, several parts of which are adorned with groves, that afford a refreshing shade to the people half stifled in the crowd, and scorched under the burning heat of the sun; and here the king's women attend to sell their cloths, and other manufactures. A judge, attended by four armed officers, is appointed by the king as inspector of all goods, with power to hear and determine grievances, complaints, and disputes.

The market-place is surrounded with places of refreshment, in which are sold certain sorts of meat, as beef, pork, goats, and dogs flesh. Other huts are kept by women, who sell bread made of maize, millet, rice, and other corn. There are shops, in which they sell pito, a kind of pleasant, wholesome, and refreshing beer; palm wine, and spirits purchased of the Europeans; are kept in other shops, with restrictions on the sale, to prevent drunkenness and riots. Here slaves of both sexes are bought and sold, also oxen, sheep, hogs, dogs, birds and fish of various kinds. Silks, woollen cloths, linen, calicoes of European and Indian manufacture are here in great abundance; likewise china-ware, and glass of all sorts, gold in dust and ingots, iron bars, hard-ware, sheet lead, and a variety of European, Asiatic, and African productions, may be purchased at these markets at a reasonable price. The chief commodities of the country-manufacture are cloths, umbrellas, baskets, pitchers, plates and dishes of wood, boards finely ornamented, white and blue paper, also palm oil, pepper, salt, &c.

The slave trade is conducted by the men; but all other things are sold by the women, and all of them are extremely expert in the art of selling and reckoning.

The money used in all bargains is gold dust, the value of which they compute very readily: bougies pass for small money; for in the kingdoms of Whidah, Ardrah, and many other places on this coast, these serve equally for ornament and specie. They pierce each shell with an iron made for that purpose, and string forty of them upon a thread, and by these strings the exchange of gold dust is rated, and the price of slaves determined.

SECT. III.

Of the Fruit, Beasts and Birds of Whidah; with an Account of a Bird remarkable for changing its Colour whenever it moults. The Persons, Dress, and Manners of the Natives, who in their Ceremonies, Industry, and other Particulars, greatly resemble the Chinese. Their Ignorance of Chronology, and Skill in Arithmetic and Music.

HERE are all the fruits produced on the Gold Coast, besides which are abundance of citrons, tamarinds, and some others. European seeds grow up to great perfection, and the finest salad gardens in the world might be planted here.

Their cattle are cows, sheep, hogs, and goats, which are all but little different in shape and size from those of the Gold Coast, but are more fleshy, and have a more agreeable taste. Their horses are, however, very indifferent ones. Farther within land are elephants, buffaloes, tygers, hares, several sorts of deer, and vast numbers of apes of different kinds. These are remarkably fat, and no flesh is more esteemed at Whidah than theirs; it sells at a higher price than mutton, and is always preferred to it. Even the European sailors soon overcome their prejudices, and eat it with a peculiar relish.

The only sorts of tame fowl are a few geese and turkeys, ducks, cocks and hens, of which last there are great plenty, and though small, they are fat and good. The whole country seems covered with wild fowl, as geese, ducks, turtle-doves, snipes, and many other sorts of birds that are both good and cheap.

Among the rest is one that is very remarkable for changing its colour whenever it moults; so that those which are black this year, will be blue or red the next; the following year they will be yellow, and afterwards green; but they never vary from these five colours, which are always very bright, and never mixed.

The negroes of Whidah are in general tall, well made, straight, and robust. Their complexion is black; but not of such a glossy jet as that of the people on the Gold Coast.

The people of this country are in general better dressed than any other nation on the coast; but they are little acquainted with the use of ornaments made of gold and silver, their country producing none of those metals. The dress of the king, and that of the great officers is nearly the same, and different from that of the common people. It consists of a piece of white linen about three ells long, which is wrapped round their waist in a decent and becoming manner, and then hangs down to the feet like a petticoat. Upon this they wear a silk garment of the same size and form, and over this last have a richer piece of silk, six or seven ells in length, which they tie by the two corners, and making a great bunch on the right hip, the rest hangs down to the ground, so as to form a train; but none are allowed to wear red, except the royal family. Some authors say, that the king and the great officers wear necklaces and bracelets of pearl, gold, and coral, with gold chains. Most of the people never wear any thing on the head to shelter them from the rain, or the heat of the sun; but the great men cover their heads with an European hat and feather.

The common people have generally only a few herbs, or a cotton cloth fastened round their waist; but the women of the same rank have five or six cloths round the middle, the longest of which covers half the leg, and the others which are over it, are each shorter than the other.

The wives of the king, and those of the great men are, like the rest, naked from the girdle upwards, and from the waist downwards have two or three coverings of cotton and silk, the longest of which reaches to their ankles, and the others are a little shorter. All these are very large, and form a roll about the hips, that makes them appear as if they wore a hoop petticoat. They are adorned with necklaces, and with strings of pearl, gold, and coral, from the wrist to the elbow, and wear on their heads a cap of plaited and coloured straw, which is very light, and has some resemblance to the Pope's tiara.

The Europeans, the nobility of Whidah, and all the rich negroes, are carried when they go abroad in hammocks or palanquins; these are an excellent defence against the heat of the climate, which, according to Phillips, is so great, that an European could not walk a mile in the middle of the day, without extraordinary fatigue.

Bosman says, that the inhabitants of Whidah exceed all the negroes he had seen in good and bad qualities. People of all ranks treat the Europeans with extreme civility, courtesy, and respect. Other negroes are incessantly soliciting presents; but the Whidians seem more willing to give than receive. Indeed, when the Europeans trade with them, they expect they should return thanks for the obligation; but their making a present to a white man, they value as nothing, and are displeased at any acknowledgment for what they think so trifling. They have an obliging manner of addressing each other, and in several respects perfectly resemble the Chinese. When any one visits, or accidentally meets his superior, he instantly drops upon his knees, kisses the earth three times, claps his hands, and wishes him a good day or night, which the other returns in the posture in which he then happens to be, by gently clapping his hands, and wishing him the same. The like respect is shewn to the elder brother by the younger; to fathers by their children; and by women to their husbands. Every thing is delivered to or received from a superior on the knee, and the clapping of the hands together is esteemed a mark of still more profound respect. When persons of equal rank meet, they each drop down, clap their hands, and mutually salute, while the same ceremonies are observed and imitated by their several attendants; so that above a hundred persons may sometimes be seen down on their knees, and might easily be mistaken for their being engaged in some public act of devotion. If a superior sneezes, all round him fall on their knees, clap their hands, and wish him happiness. It is surprising, says a late author, how a nation confined to so small a spot of ground, should differ so widely in their manners from the surrounding kingdoms, with which they keep up a constant intercourse. One would almost imagine that they had a soil, a climate, and a nature peculiar to themselves, and different from that of the people who are only a few miles distant.

They also use the utmost external respect to strangers; and if a native of Whidah meets an European twenty times in a day, the same ridiculous train of ceremonies is repeated, the neglect of which is punished with a fine. A late king of Whidah carried this respect to foreigners to such an extravagant height, that one of his principal officers was beheaded for presuming to lift his cane in a menacing manner over the head of a Frenchman; and though the chief director of that nation used all his influence to get the punishment mitigated, the king was inexorable, and nothing less than his life could atone for such a notorious breach of hospitality.

They excel all other negroes in vigilance and industry; and though idleness is the favourite vice of the Africans, people of both sexes are here so laborious and diligent, that they never desist till they have finished their undertaking, carrying the same spirit of perseverance into every action of their lives. Besides agriculture, from which none but the king and a few persons of distinction are exempted, they employ themselves in several kinds of manufactures. They spin cotton yarn, weave fine cotton cloths, make wooden vessels, plates, and

and dishes, smiths work, and offensive weapons, in a more perfect manner than any other people on the coast. While the men are thus employed, the women not only brew a kind of ale, but till the land, and dress provisions, which, with their husbands merchandize, they carry for sale to market. The meaner sort carry goods from the shore, and with a burthen of a hundred pounds on their heads, run in a kind of continual trot, and it is difficult to keep up with them without any load at all. Both sexes are employed in search of gain, and their emulation is equal to their industry. Hence they not only live well, but splendidly, when compared with the other negroes of the Coast. Labour is cheap, the profits solely rising from the unwearied industry of the labourer.

The Whidans also resemble the Chinese in their dishonesty, and their expertness at stealing, in which they use extraordinary address. Mr. Bosman having obtained an audience of the king, his majesty told him, that his subjects did not at all resemble those of Ardrah, and the other neighbouring kingdoms, who on the least offence would poison an European. "This," added he, "you have not the least reason to apprehend; but I would have you take care of your goods; for my people are born expert thieves, and will steal from you while you are looking at them." This caution he soon found to be just in many instances. There is no security against their pilfering; but if complaint be made to the king, he orders the offender to be punished.

Like the Chinese too, they are extremely addicted to gaming; and after having lost their whole substance, they play for their wives and children; and when they have lost them, stake their own liberty, and thus become slaves to their own countrymen.

These people are in some instances extremely ignorant, while in others they shew an extensive genius. They have no divisions of time, nor distinction of years, hours, weeks, or any other stated periods. They know the time of sowing by the moon, or rather sow as soon as they reap. Yet without pen, ink, or the assistance of artificial arithmetic, they calculate the largest sums with surprising accuracy, state shares with great exactness, and perform the operations, not only of the first elements, but of the more complex rules of arithmetic, with astonishing truth and quickness. Yet Des Marchais observes, that the wisest among them cannot tell his age; and if any man be asked, when such a person was born, he tells you, it was about the time that such a ship, or such an European factor came to Whidah.

Their music is much the best of any to be met with in these countries, and one instrument, which resembles a harp, is really musical. It is strung with reeds of different sizes, which they touch with great dexterity, accompanied with a sweet voice, and dance to their own music in exact time, and with an agreeable air and manner. They have also flutes, and several wind instruments; and in war use a kind of trumpets and kettle-drums.

SECT. IV.

Of their Polygamy, nuptial Ceremonies, Divorces, and Treatment of the Women. Of Circumcision and Customs in Relation to their Children, and to Burials and Mourning.

THE people of this country allow of a plurality of wives, and in this are said to exceed all the neighbouring nations. No people upon earth perform the connubial rites with less ceremony; for all contracts, portions, and jointures, are here entirely unknown. The other negroes of the coast purchase their women with cattle, fish, and other commodities, and are allowed to dismiss them if they do not prove to be virgins; but here their ideas and practice are totally different. Fruitfulness is so highly prized at Whidah, that she who has given proofs of it before marriage is always preferred; but it costs nothing to obtain her.

When a man likes a girl, he demands her of her parents, who never refuse their consent, provided she be of the proper age, but conduct her to the house of the bridegroom, who immediately presents her with a new dress, which is probably all she possesses, for she leaves every thing else at her father's house. The husband then kills a sheep, which he eats in company with his wife and her parents; and this is the only time in her life when she is admitted to this honour; and the parents having drunk freely of pito, return home: thus the marriage is concluded, without any other ceremony.

A husband may divorce his wife with as little ceremony as he married her: he only thrusts her out of the door: and if he has certain proofs of her incontinence, the separation is legal. Another law, which is very severe upon the women, is a strict prohibition, under pain of death or slavery, to enter the house of a great man while under their periodical disorder. No sooner do they perceive themselves in this situation than they quit the house, and avoid even the sight of men, every family having a house to which the women retire during that period, where they are under the care of an ancient matron, and stay till they have washed and purified themselves; after which they return to their husbands. Those women who are remarkably handsome are excused from labouring in the field, and never permitted to go abroad but in the company of their husbands; nor can they receive any male visitors at home.

As they are very subject to jealousy, their laws against adultery are very severe. When the wife of a great man is taken in the fact, he may kill both her and her lover, or may sell her to the Europeans for a slave. If he chooses the former, he causes her head to be cut off, or has her strangled by the public executioner; and is acquitted on informing the king of what he has done, and paying the executioner's fee. But as he has no power over the man who has dishonoured him, unless he catches him in the very act, he is obliged to apply to the king for justice, who never fails to consent to the death of the guilty.

This severity extends to none but married women. A man runs no danger in being caught with one who is unmarried, and nobody blames him. She is supposed, in this case, to be her own mistress; and it is so far from being infamous for her to have children before marriage, that she is sure this will cause her to be sooner married; because it is a proof of her fruitfulness, which is a very valuable qualification in a country where the fathers consider children, especially the males, as the greatest riches, and the support of their families.

According to Des Marchais, no people on earth shew greater indulgence to their children, whom they never sell for slaves. On the other hand, the children treat their parents with the most humble respect and veneration, and never address them but on their knees.

All their children, male and female, are circumcised; but none of them know whence they derived this custom. This operation is performed at no certain age, some undergoing it at four, others at five, six, or ten years old.

No difference is made between their legitimate and natural children, but the younger pay great respect to the elder brother, though but little regard is paid to the mother. Among the women the ceremonies of address are the same as those we have mentioned of the men, only they carry their politeness to a greater length. At the death of a father, the eldest son not only inherits his effects, but his women, with whom he lives from that day in quality of husband. His own mother is alone excepted, who becomes her own mistress, has a house appointed for her, and a certain fortune for her sustenance. This custom prevails both in the royal palace and among the people.

The natives are so fearful of death, that they cannot support the sound of the word without visible emotion; and it is a capital crime for a negro to pronounce it upon any occasion before the king. Bosman observes, that in his first voyage he waited on the king before his departure for an hundred pounds, which his majesty owed him; and, at his taking leave, asked that prince, Who should

pay

pay him when he returned, in case of his death. The by-standers were shocked at the bluntness of the question; but the king bid him not give himself any concern about that, for he should always live; when the Dutchman, perceiving his error, abruptly took his leave.

The burying-place of the kings and nobles is in a long vault, erected by the sons for their father: here the body is deposited in the midst of the vault; and with it the sword, buckler, bow and arrows of the deceased; but though they use guns and pistols, they are never laid in the tomb. The heir always mourns during an entire year, roaming about; he secludes himself from society, lays aside his usual apparel, with his bracelets, chains, and rings; and though he is at liberty to enter upon the possession of his estate from the day of his father's death, yet so strong is his affection, grief, or prejudice, that he steadily pursues the custom of abandoning it, till the time of mourning is expired.

SECT. V.

Of the Right of Succession to the Crown of Whidah; the Ceremonies which precede and attend the Coronation of the King; the luxurious Manner in which he lives; the Cruelty with which those are punished who have been caught with any of his Wives; and the Servility with which he is addressed by his Nobles.

THE crown of Whidah is hereditary, unless the great men have some extraordinary reasons for excluding the eldest son, and placing the crown on the head of one of his brothers, as was the case in the year 1725. But though the king's eldest son is presumptive heir of the crown, he must have been born after the king's accession; for those he had before his ascending the throne are only considered as private persons.

They have here a very extraordinary custom that is never to be violated, which is, that the successor is no sooner born than he is carried by the great men into the province of Zangua, on the frontiers of the kingdom, where he is educated as a private person, without knowing his birth, or having the least knowledge of state affairs, and none of the great men are allowed to visit or receive visits from him. Those charged with his maintenance are not ignorant of his birth, but are prohibited, under pain of death, from giving him the least hint of his quality, or treating him otherwise than as their own child. One of the kings who lately sat on the throne was found at his father's death attending his governor's hogs. He was filled with incredible surprize when the nobles made him acquainted with his fortune, nor could they for a long time prevent his imagining it a mere delusion. By this means the prince, on his ascending the throne, knowing neither the interest nor maxims of the state, is obliged for a long time to abandon the government to the management of the nobles and their successors, for their posts are hereditary, and their eldest son always succeeds them.

The young king generally passes several months, and frequently some years, before he is crowned. The nobles who have the power of fixing the time when this is to be done, prolong it, but must not exceed seven years; and during this interval, the government of the kingdom is entirely in their hands: the king's name is not even so much as mentioned in their public acts; while the prince is attended with all the external badges of majesty, without daring to leave the palace.

At length the long expected day for his coronation being arrived, he assembles a council of the nobles, and approving their conduct during their administration, ratifies all the laws and acts of the interregnum. At about eight at night a discharge of eighteen pieces of cannon gives notice that the council is broke up, and then instantly a shout of joy is heard through the capital, which is soon communicated to the remotest parts of his dominions.

The next morning the high-priest waits on the king to remind him of the homage due to the great setiche, or serpent; and tells his majesty, that as this deity is dumb, he cannot be surprized at his making known his intentions by the tongue of his minister. On the coronation

of Amer, the late king, the high-priest asked a horse, a cow, a sheep and a towl. These were sacrificed before the palace, and carried with great ceremony to the most public parts of the city. On each side of the sacrifice were two millet-cakes, baked in palm oil: the high-priest erected with his own hands a staff nine feet long, and upon it a large silk flag; and the whole ceremony was accompanied by the music of tabors, flutes, and the acclamations of the people; after which the carcases were abandoned as a prey to the birds, the negroes not being permitted to meddle with any part of them, on pain of death.

While the victims were thus exposed to public view, the king's women, who from age, or other reasons, were incapable of administering to his pleasure, marched out of the palace, escorted by a file of musketeers, and preceded by music. The chief of the women led up the rear, carrying in her arms the statue of a child in a sitting posture, which, on her arrival at the place of sacrifice, she laid down upon the victims; each of them then sung a hymn, and was accompanied by the instrumental music. While they passed, all the people prostrated themselves on the ground with loud shouts, and their return was made known to the king by a general discharge of the artillery.

The next day the nobility usually go to the palace, with all the state and magnificence of dress and equipage, preceded by a large band of music, and followed by a great body of armed slaves; and having prostrated themselves before the throne, retire in the same order in which they advanced. The women, in the mean while, abandon themselves to the most riotous mirth, the cannons incessantly roar, and the whole kingdom is filled with tumultuous joy.

The nobles have no sooner paid the homage, than they dispatch one of their number to the king of Ardrah, attended by a splendid retinue, to entreat his majesty to send a certain nobleman of his kingdom, in whose family the honour is hereditary, to crown the king of Whidah. This nobleman of Ardrah is supported at the expence of the young monarch, and treated on his journey with the most profound respect.

When he comes, he must stay four days in the village nearest the capital, during which none of his attendants are permitted to enter the city on pain of death. He here receives the compliments of the nobility of Whidah, and the king sends twice a day great quantities of wine and provisions by his discarded women, who carry it in vessels on their heads, guarded by a strong convoy, and preceded by music. The king at length sends an ambassador to invite him to the capital, and assure him that he will be received with joy. The nobleman of Ardrah receives the ambassador with great solemnity and respect; but observes, that he must wait for instructions in relation to the treaty concerning the reparation of the great gate of Assem, the capital of Ardrah. Immediately the king sends commissioners to that kingdom to see the gate repaired, and upon their return with a proper officer to certify their having executed the treaty, the Ardran nobleman is conducted to Sabi by all the nobility, and prodigious crowds of the populace, who meet him on the road; and he is received by the discharge of cannon, the acclamations of the king's women, and the shouts of the mob. The king himself congratulates him on his safe arrival, and orders him to be attended by his own officers and servants.

During the first five days he neither receives nor makes any visits to the nobility, who are employed in processions to the temple of the Grand Snake, imploring that divinity that the young monarch may reign with the mildness and equity of his predecessors, cultivate trade, observe the laws, and maintain the people in the full enjoyment of their rights and privileges.

On the evening of the fifth day the people are informed by the firing of nine guns, that the coronation will begin on the morrow; and, at the same time, the prince sends to desire the European factors to favour him with their company at the solemnity. The preceding night is spent by the nobility in the company of the Ardran nobleman, where the conversation is grave and polite, interrupted by frequent prayers to the setiche by way of interlude,

The next day, at five in the evening; the king, attended by his favourite women, comes out of the palace, dressed in rich silk robes, and adorned with gold necklaces, ear-rings, and bracelets. The king is also dressed in a magnificent manner, wearing on his head a gilt helmet, adorned with red and white feathers, and crossing the great court before the palace, seats himself on his throne, which is no more than a large elbow chair. Here the English, French, and Dutch factors have chairs seated for them, while the Portuguese director is forced to stand with his head uncovered.

Before the king stand two dwarfs, who alternately represent to him the qualities of his predecessors, exhort him to follow their example, to render his people happy, and to build his own security on their affections; concluding with wishes for his prosperity, long life, and the happy continuance of his reign.

The Ardran ambassador then enters the court, attended by music, a grand retinue, and repeated discharges of the artillery. He approaches the throne with no other mark of respect but a slight bow, and after a speech on the ceremony he is about to perform, takes the king's helmet, and turns it towards the people. Upon a signal given the music ceases, and is succeeded by a profound silence; then the Ardran cries with a loud and clear voice, "O people, behold your king! Be faithful to him. Pray for him, and your prayers will be heard" "by the king of Ardrah, my royal mailer." This he repeats three times, then puts the helmet on the king's head, and, stepping back, prostrates himself before him. The great guns, the musketeers, the music, and the acclamations of the people now rend the skies: the ambassador retires, and the king, with his women, returns to the palace; the Europeans attending him to the gate.

A day or two after the king distributes presents among the nobility, which are returned by others of much greater value. Five days are spent in rejoicing, and these are concluded by a solemn procession to the temple of the Snake.

Notwithstanding the person and education of the king are so neglected before he ascends the throne, yet no sooner is he crowned than he is no longer considered as a man, but becomes in an instant a kind of deity, who is never approached but with the most profound reverence. The nobles of the first rank are sometimes permitted to eat in his presence; but never with him, for this honour is reserved for his women alone. It is never known in what part of the palace the king sleeps; and if that question be asked of the captain of his guard, or any of those nearest to his person, they constantly answer, "Do you imagine that the deity sleeps?"

The ignorance and meanness in which he is bred gives him a high relish for pleasure on his thus rising by one step to the throne; and he usually lives in a most slothful, luxurious, and debauched effeminacy among his women, without seeking or ever enjoying the conversation of men, or those exercises that are adapted to strengthen his mind, and give vigour to his body.

The king is said to have three or four thousand wives, who are divided into several classes; and she who has brought forth the first male infant is at the head of the first: this is the queen, or, as they term her, the king's great wife. She is treated by all the others with respect, and all in the seraglio are under her command, except the king's mother, whose credit is greater or less, according to the degree of his majesty's affection for her, or her power in managing him.

If a man touches by accident any of the king's wives, his head, or at least his liberty, is forfeited; she is considered as defiled, and, being unfit to return to the palace, both are doomed to perpetual slavery. They alone serve his majesty, and no man is permitted to enter their apartment. When any of them go to work in the fields, which they do by hundreds, if they see a man they call out, Stand clear; on which he instantly falls on his knees, or flat on the ground, and thus continues while they pass by, without daring even to look at them. On the least disgust the king sells eighteen or twenty of them; but this does not lessen their number, for the officers, to whom the government of the seraglio is entrusted, supply their places with fresh women; and whenever they

see a beautiful virgin, present her to the king, none daring to oppose them. If one of them happens to please him, he does her the honour to lie with her two or three times; after which she passes the remainder of her life like a nun, which in this warm climate is considered by the women as the most dreadful of all punishments.

The king never appears in the hall of audience but when his nobles, or the directors of the companies, have affairs to communicate to him, and are to receive his orders: or when he would administer justice to his subjects. He passes the rest of his time in his seraglio, accompanied by his women, six of whom usually entertain him at a time. These are magnificently adorned, and kneel before him, with their heads almost touching the floor. In this posture they endeavour to divert him. They also dress him and wait upon him at table, using every art to render themselves beloved. When he would be alone with one of them, he touches her slightly, and gently claps his hands. The five others instantly retire, and having shut the door, guard it on the outside, till the happy woman leaves the room. Then six others take the places of the former, and thus they relieve each other.

The people of Whidah are extremely jealous, and punish adultery with death; but if a man be surprized with one of the king's wives, nothing can save him, for the king himself pronounces sentence against them both on the spot. The officers of the palace instantly cause two pits to be dug six or seven feet long, four broad and five deep, so near that the criminals may see and speak to each other. In one of them a post is fixed, to which the woman is fastened, with her hands tied behind her. Two wooden forks are fixed at the ends of the other pit, and the man being stripped quite naked is fastened with iron chains to an iron bar, resembling a spit. The king's wives then bring faggots, which they put into the pit, and, before they are lighted, the spit to which the man is fastened is put upon the two forks, and fire is put to the wood, which is so far below that only the extremity of the flames can reach his body. Thus the miserable wretch is left to burn by a slow fire, a cruel punishment that would last for a considerable time, had not they the charity to turn him with his face downwards, in which situation he is speedily stifled by the smoke. When he no longer gives any sign of life they undo his chains, and letting him fall in the pit cover him with earth.

The man being thus put to death, about fifty or sixty of the king's women escorted by a party of musketeers, and accompanied with drums and flutes, come from the palace, each carrying on her head a large earthen pot of scalding water, which each pours one after another, on the head of the woman who is tied to the post, and throws the pot on her head with all her force; whether dead or not, all the water, and all the pots, are thrown on this unhappy woman; after which they cut the cords, pull up the post, and bury her in the pit, under a heap of earth and stones.

The natives are unable to approach the king without subjecting themselves to the most humbling ceremonies. The greatest lords of the kingdom are obliged to submit to them as well as others, and none but the chief captains of the seraglio and the high-priest can enter the palace without leave. When one of the great men has obtained the king's permission, he goes to the palace attended by all his servants in arms, and with trumpets, drums, and flutes. On his arrival at the gate of the hall of audience, his men make a general discharge of their muskets, the drums, trumpets, and flutes strike up and all the men give a loud shout. In this manner he enters the first court, where stripping off all his cloaths, he hides his nakedness with herbs put round his waist; he likewise takes off his bracelets, necklaces, rings, and all his jewels. In this condition he walks to the hall of audience, where prostrating himself, he advances creeping to the foot of the throne, speaks with his face towards the earth, and when his audience is ended, retires creeping backward, without changing the posture with which he entered. On his rejoining his men in the court, he dresses, puts on his ornaments,

ments, and the king is informed of his departure by the firing of guns, the sound of musical instruments, and the shouts of his attendants.

But notwithstanding the servility with which the king is treated by his subjects, when the directors of companies or the captains wait upon him, he receives them in the hall of audience, causes easy-chairs to be brought them, and sometimes drinks and smokes with them.

Trade has introduced into Whidah the elegancies and luxuries of Europe; the king's palace is now provided with European furniture, and all the nobility and rich merchants endeavour to furnish their houses in the same manner. The palace is adorned with canopies, magnificent beds, easy-chairs, looking glasses, and in short with every ornament fit for a house in that climate. The king and nobility are furnished with cooks intrusted by those of France, so that when an entertainment is given to an European, he finds the tables of the negroe lords served with as many delicacies as those of Europe. Wine is brought them from France, Spain, Madeira, and the Canaries; they are also supplied with brandy, sweetmeats, tea, coffee, and chocolate; and their tables have lost all the remains of their antient simplicity. They are covered with fine linen, and have vessels of silver and services of china. This elegance and politeness is, however, confined to the great and wealthy, for the common people still preserve their antient manners.

S E C T. VI.

Of the Religion of the Inhabitants of Whidah.

THE most sensible people of Whidah believe in one spiritual God, who punishes vice and rewards virtue; who causes the heavens to thunder, the sky to be covered with lightning, the clouds to pour down rain, and the sun to shine; and maintain that his residence is in the heavens, whence with infinite justice and goodness he governs the world. They have also confused notions of hell, of a wicked spirit, and of the existence of the soul after it has left the body.

But with these just sentiments they mingle others that are the most absurd and ridiculous; they suppose that it would be presumption in them to address their petitions to the great Creator, and have therefore several inferior deities. Besides the fetiches which they have in common with the other negroes on the coast, they have four principal objects of religious worship; the serpent, which holds the first rank; the trees, which are of the second class; the sea, which is of the third rank; and Agoya, whom they term the god of counsels.

They thus account for their worshipping the serpent: the inhabitants of Whidah being ready to give battle to the king of Ardrah, a great snake came from the enemies' army to theirs, and appeared so gentle that, far from biting, it fawned upon every body; which the high-priest observing, ventured to take it in his hands, and to hold it upon high, to shew it to the whole army; who, being amazed at the prodigy, fell on their faces before the harmless animal, and then attacked the enemy with such courage and resolution, that they gained a complete victory. This the credulous soldiers attributing to the serpent, they took it away with them, built a house for it, brought it provisions, and in a short time the new god eclipsed all the others, even the fetiches, which were the most antient idols of the country.

As its worship increased in proportion to the imaginary favours they received from it, the snake did not long remain in the first house they had built it: they erected one in the most sumptuous manner, with many courts and spacious lodgings; it had an high-priest, an entire order of marabouts, or priests, to serve it; they dedicated to it the most beautiful women, and that it might never want servants, chose new ones every year.

It is surprising that very sensible negroes gravely assert, that the snake they now worship is the very same that came to their ancestors, and gave them the celebrated victory which freed them from the oppression of the king of Ardrah. This serpent has multiplied extremely, and its posterity have not degenerated from its good qualities.

They do no injury to any one; but permit the people to put them about their necks, into their bosoms, and into their beds. The only resentment they ever shew is against the venomous serpents, which they always endeavour to destroy; and the people are in no danger of mistaking the one for the other, for those which are destructive are here black, and resemble vipers; and, though they are four yards long, are only an inch and a half in diameter: but the beneficent serpent seldom exceeds seven feet and a half in length, and yet is of the thickness of a man's leg. Its head is large and round, its tail pointed, and its skin very beautiful; it being of a whitish colour, with waves of brown, blue, and yellow.

The natives think themselves happy when one of these honours their house with its presence; they not only give it a bed, but, if it be a female with young, make for her a little house, to which she retires to bring them forth; and when she or her young want food, bring it them, till they are big enough to take care of themselves. If any one should venture to kill one of these reptiles he would suffer a cruel death.

Of this the English, according to the testimony of Barbot and Bosman, had a tragical instance. When the English first settled at Whidah, the captain having landed his goods, the sailors found at night one of these snakes in their magazines, which they ignorantly killed and threw upon the shore, without dreaming of any ill consequence. The negroes soon discovering the pretended sacrilege, the inhabitants of the whole province assembled, attacked the English, massacred them all to a man, and consumed their bodies and goods in the fire they had set to the warehouse.

It is well known that snakes multiply extremely, and live for a long time, it might therefore be imagined, that the earth would be covered with them; but neither the black snakes nor the swine pay any regard to their divinity, but kill and eat them, which greatly diminishes their number; but it always costs the life of those animals when they are caught in the fact: nothing in particular can save a hog from being immediately put to death; the people have no respect to those to whom they belong; for though they are the king's, they are killed on the spot, and their flesh belongs to those by whom they are slaughtered.

The serpent of Whidah from which the others of the same species are said to be descended, is worshipped in his house or temple upon various occasions; but the offerings and sacrifices made to him are far from being confined to bulls and rams, to loaves of bread or fruit. The high-priest frequently prescribes a considerable quantity of valuable merchandize, barrels of bougies, gold rings, powder, brandy, hecatombs of bulls, sheep, fowl, and sometimes even human sacrifices, all which depends on the fancy and avarice of the priest.

The marabouts, or priests of the grand serpent are all of one family, of which the high priest, who is one of the grandees, is the chief, and all of them pay obedience to him. Their habit is not at all different from that of the common people, though such as can afford it wear the dress peculiar to the nobility. They have no settled revenues, yet their income arising from the ignorance and superstition of the people is very great. Like the other negroes, they engage in trade, and by the number of their women, children, and slaves, are able to cultivate large plantations, and to feed a multitude of cattle; but their most certain resources consist in the credulity of the people, whom they pillage at discretion.

But besides these priests, there are a number of priestesses, who are frequently more respected than the priests themselves, and claim the privilege of being called the children of God. While other females pay the most slavish obedience to the will of their husbands, these arrogate to themselves an absolute and despotic sway over them, their children, and effects; and receive no less homage from their husbands, than other husbands receive from their wives. This makes the men decline those holy matches, and prevent, if possible, their wives being raised to that honour, which is the height of their ambition.

With respect to their other deities, Agoya, or the god of counsels, is consulted by the people before they

they undertake any thing of importance. This is a little idol of black earth, which rather resembles a misshapen monster than a human being. It is represented seated or crouching, on a kind of pedestal of red earth, on which is a piece of red cloth adorned with cowries, with a scarlet band, to which hang four cowries about his neck. His head is crowned with lizards, serpents, and red feathers. This idol is placed on a table in the high-priest's house, and before him are three calabashes, in which are fifteen or twenty balls of hard earth. Those who would consult this idol apply to a marabout, tell him the subject that brought them thither and having given him the offering designed for the god, and the price of consulting him, the question is determined by throwing the balls from one calabash into another, a certain number of times; when if an odd number be found in each, the marabout boldly declares, that the oracle has pronounced in his favour, and the man may undertake the affair on which he came to consult the deity.

Whenever the sea is agitated in such an uncommon manner, that merchandize can neither be embarked nor brought ashore, they consult the high-priest, and by his advice, sacrifice a bull or a sheep on the bank, suffering the blood to run into the water, and throw a gold ring as far as they are able into the waves. The blood and the ring are lost; but the beast that is sacrificed belongs to the priest and is accordingly carried to his house.

There is still less expence in rendering the trees favourable. The sick have commonly recourse to them, and make them an offering of millet, maize, or rice, which the marabout places at the foot of the tree to which the sick man pays his devotions.

However absurd and extravagant this religion may appear, it has been equalled in folly by the religious systems of the wisest, the most learned, the most powerful nations of the earth; and the warm admirers of the ancient Greeks and Romans, ought rather to lament the weakness of the human mind, than to despise these ignorant negroes for such absurdities, when they consider, that the Romans offered sacrifices to *Æsculapius* in the form of a serpent; that both they and the Greeks, as well as the people of Whidah, had their oracles, to which they applied for advice. They too sacrificed to the sea, under the name of Neptune; and they had also consecrated trees and groves, inhabited by dryades and hamadryades, to whom they offered milk, oil, honey, and wine. What a conformity do we here find between the religion of nations esteemed the most savage and the most polite!

S E C T. VII.

A concise Account of the Conquest of Whidah, by an inland Prince.

WE shall conclude this account of the kingdom of Whidah, with a concise relation of a revolution which has lately happened in that kingdom. The wealth of this nation rising from the fertility of the soil and its commerce, produced effeminacy and luxury. The king of Whidah abandoned himself to women, to pleasure, and indolence, while the nobility, in order to possess an unlimited power, flattered all his passions.

This prince was thirty years of age when the king of Dahomay, an inland country, sent ambassadors to him to desire permission for his subjects to trade to the sea-coast, with an offer of paying a yearly tribute of a certain number of slaves, or a certain duty upon each slave sold to the Europeans, or to the natives of the coast. His request was denied, with a haughtiness that made the king of Dahomay, who was named Truro Audati, vow revenge. But his menaces were disregarded by the king of Whidah, who, when Snelgrave, an Englishman, told him of the great preparations that were making against him, vainly replied, that he would not, according to the custom of the country, cut off the king's head, but make him his slave, and employ him in

the meanest and most servile offices. But how different was the event!

Truro Audati was a brave and politic monarch, who in a short time had extended his conquests towards the sea as far as Ardrah; after which, he proposed to enjoy the blessings of peace, and secure his conquest; but the above treatment rekindled his ambition, while it raised his resentment. To this was added another circumstance; the king of Ardrah had a brother, a prince of great hopes, whom he treated with severity. This young prince, whose name was Hassar, being unable to raise a sufficient party in the kingdom to shake off the yoke, and procure his liberty, had recourse to Truro Audati, whom he promised a large sum of money, if he would revenge the insults and indignities under which he laboured. That prince entered heartily into young Hassar's cause, as if actuated alone by motives of sympathy and compassion. His designs were not long a secret to the king of Ardrah, who had recourse for assistance to the prince who governed Whidah; but he was too fond of his ease to attend to the danger that threatened his neighbour, and consequently himself. Audati was suffered to enter Ardrah with an army of fifty thousand men, and cutting in pieces the forces that opposed his passage, made the king prisoner, and, according to the savage custom of those nations, caused him instantly to be beheaded.

At that time there was at the court of Ardrah, one Mr. Bullfinch Lamb, an English factor, who being presented to the conqueror, he expressed the utmost surprise and satisfaction at the sight of a white man, and ordering him to be conducted to his court, appointed him a house, domestics, and women. During his stay, Mr. Lamb frequently dissuaded the king from invading Whidah, which he represented as inhabited by a numerous and powerful people, accustomed to fire arms and closely connected with the Europeans, who would not fail to exert themselves in their defence.

Audati at length dismissed Mr. Lamb, who returned to the factory loaded with gold and rich presents; when that politic prince, learning from his spies in Whidah, the sloth and indolence in which the king was sunk, attacked the most northern province of that kingdom, which was governed by a chief, who immediately sent to demand succours from the king; but having enemies at court, they rendered that indolent monarch deaf to his remonstrances, when finding he could obtain no reinforcement he submitted to Audati, and, by his voluntary homage, procured very favourable terms from the conqueror.

A free passage was now opened through the kingdom of Whidah to Sabi the capital, and nothing was left to oppose the enemy but a river. The king of Dahomay encamped on the opposite bank, not doubting but that the passage would be disputed; but he was mistaken. The effeminate people of Whidah placed their security in their number, and their gods, and in the morning met the priests on the banks of the river, where having sacrificed to the grand serpent, they returned to the city, fully assured of the efficacy of what they had done to stop the progress of the enemy.

Audati now sent to assure the Europeans, that if they remained neuter, they should not only be treated with kindness, but their trade freed from those duties and restrictions, which had been laid upon it by the king of Whidah; but if, on the contrary, they took up arms against him, they must expect all the horrors of war, and the most cruel effects of his resentment. This threw the Europeans into the utmost consternation and perplexity. Some proposed retiring to wait the event in their forts on the sea coast, a few miles distant from Sabi; but others apprehending that this retreat would irritate the king of Whidah and set a bad example to his subjects, proposed to stay in the capital, and to this they agreed.

Truro finding to his great astonishment, that the defence of the river was committed to the snakes, detached two hundred men to sound the fords, and this body gaining the opposite shore without resistance, instantly marched towards the capital, attended by a great number of warlike instruments. The king of Whidah,

heart

hearing of their approach, fled precipitately out of the palace, with all his women and court, to an island disjoined by the river from the continent, and the rest of the inhabitants having no canoes to transport them, were drowned by thousands, in attempting to swim after him while one half of the people took shelter in the wood and thickets.

The small detachment sent by Audati having entered the city, and meeting with no resistance, set fire to the palace, and sent word to the king, that nothing prevented his approach to the capital. The whole army now began their march, and were inexpressibly surprised at finding that a whole nation had deserted their liberty and property, their wives, children, and gods, without one attempt to defend them. The Dahomans were far from paying the same regard to the snakes as the people of Whidah; for finding them tame and numerous, they took them in their hands and jeeringly desired them if they were gods, to speak and defend themselves; but as the snakes made no reply, they cut off their heads, gutted and broiled them upon the fire, saying they had never before dined upon divinities.

Audati thus took possession of the capital in the year 1727, and having received the submission of the chief men of Whidah, returned to prosecute a war he had engaged in with the king of Yos, the ally of Ardrah, when some losses he sustained there, and the busy disposition of an European factor at Jachen, was very near restoring the former prince to the throne. Governor Wilfon having quitted Whidah in 1729, committed the management of the affairs of the English to one Testefole, a foreigner, but of what nation is not known. This man had made frequent visits to the king of Dahomay, and was always received with affability, and particular marks of distinction; but now imagining that he was weakened by his late losses, and his too extended conquests, applied to the king of Popo, who approved his design; for as since the late revolution, the channel of commerce between the kingdoms of Whidah and Popo, had been entirely blocked up, nothing could be more agreeable to the king of Popo, than the restoration of the king of Whidah, and the usual commerce between the nations, and joining in the confederacy, he raised an army of five thousand men, which he put under the command of the deposed king.

Audati was in the mean while employed in repairing his cities, and settling the conquered country of Ardrah; it was a long time before he was apprised of the revolt, the news of which he received with the utmost astonishment; being amazed that a prince so negligent in defending his rights should attempt by force of arms, to regain them. He was now in no condition to make a fresh war; but suddenly assembling a great number of women, he had them clothed and armed like men, and forming them into companies, gave to each the proper officers, colours, and music.

This army marched against the king of Whidah, the first line of every company being composed of men, the better to sustain the first shock of the enemy. But the news of this march no sooner reached the Whidan camp, than those timorous and effeminate soldiers, being filled with a sudden consternation, abandoned their colours; nor could all the endeavours of their unfortunate king bring them back to their duty. In this extremity he was forced a second time to retire to his barren and desolate island, while Testefole took sanctuary in the English fort, whither he was pursued by the Dahoman women, who cut off a considerable number of his men; after which he shut himself up in the French fort at Jachen.

While this last fort was surrounded by the Dahoman army, several overtures for a peace were made by the king, which Testefole rejected with an insolence that little became a petty factor, blocked up by a powerful monarch. One day the Dahoman ambassador being with him, and endeavouring to bring him to reason, some words arose; upon which Testefole struck the ambassador, at the same time saying, that were his king in his power, he would use him in a different manner. This being afterwards told to the king of Dahomay, he replied with more than usual composure, "This man must certainly have some extraordinary reason for his enmity

"to me. It is because he is unable to repay the many favours and civilities I have conferred on him?" Testefole was, however, soon after taken, and being carried bound hand and foot, was put to the most cruel tortures, and afterwards slain: a punishment which he brought upon himself by his rashness and disrespectful conduct to a prince from whom he had received many obligations.

In this situation is at present the famous kingdom of Whidah: it is now a province dependent on the king of Dahomay; but the inhabitants enjoy the full and free use of their antient religion, laws, and government.

SECTION VIII.

Of the Kingdom of ARDRAH.

Its Situation, Extent, and Face of the Country. The Dress, Food, Language, Marriages, Education of the young, Funerals, and Religion of the People.

THE kingdom of Ardrah is of small extent on the coast, where Whidah and Popo are taken out of it; for it reaches only twenty-five leagues along the shore, but within land it is said to be above a hundred leagues broad, and to extend still farther in length from north to south.

The air is in general unhealthful, and disagrees with Europeans; but the country is pleasant, and produces wheat, millet, yams, potatoes, lemons, oranges, coconuts, and palm wine; and the low and marshy grounds produce salt. Between all the cities are great roads, which are extremely commodious for traders and travellers; and deep canals are cut from one river to another, which are constantly filled with canoes either for pleasure or business. But however commodious for trade and industry the fine roads and canals of Ardrah may be, they were the great means of its conquest, since they enabled the brave Truro Audati, king of Dahomay, not only to march his army into the country, but to supply himself with provisions, and every other necessary.

The inhabitants of the sea-coast employ themselves in fishing and making salt, which they send to the interior countries. Those within land are all husbandmen and graziers. They literally cultivate the earth by the sweat of their brow; for here they are eased by no ploughs or other instruments of husbandry, all is performed by the spade and mattoke; whence the ground being more thoroughly broke, and the grain better covered, the fruits are proportionably better, according to the superior degree of care and labour. Wherever husbandry is alone pursued, the country discovers evident marks of the skill of the labourer. Every thing is conducted with the nicest order. Here stands a plot of maize, there a field of wheat; on one side grow peas and cabages, on the other potatoes and other roots, every separate article being divided by a double row of fruit-trees, and the whole inclosed by tall straight trees, either for ornament or use, the boughs affording a pleasing shade to the labourer, spent with fatigue, and the too ardent beams of the sun.

The dress of the inhabitants has some resemblance to that of the Whidans: that of the courtiers consists of two silk or brocade paans or petticoats, with a broad scarf drawn across the breast and shoulders in the manner of a sash. The people of inferior rank wear five or six paans, one over another; these are of cotton cloth manufactured in the country; and those who can afford it have them adorned with gold studs, hanging round in a loose manner. Though it is the general custom to leave the upper part of the body naked, yet many persons of distinction wear over their shoulders a short satin mantle, by way of morning dress: but in visits, and upon ceremonious occasions, this is laid aside, and the natural black skin preferred, as more beautiful and becoming. The high-priest has a long piece of white cotton wrapped round him, plaited in a pretty taste. He likewise wears long cotton drawers, and has on his feet slippers or sandals of red leather: on his head he wears either a cap or an European hat; by his side he has a large couteau with a gilt handle, and has a cane in his hand. The high-priest alone stands covered in the king's

king's presence, but the nobility pull off their caps and slippers before they enter the presence-chamber.

The women carry their passion for dress and finery to a very extravagant height. You may see them clothed with the finest sattins, chintzes, and brocades, adorned with a profusion of gold, and panting under the weight of their ornaments. This is not solely owing to the vanity of the women, since the men never think a woman genteelly dressed without being loaded with a quantity of superluous silk or sattin. Both sexes have the most scrupulous regard to cleanliness, and preserving their bodies neat and sweet. They both wash and perfume themselves every morning and evening with civet and aromatic herbs; and a woman never presumes to receive the caresses of her husband till this is performed.

The usual food of the inhabitants is beef, pork, mutton, goats, and dogs flesh; with rice, fruit, roots, pulse, and many kinds of vegetables. Their bread is made into cakes, and their drink is their beer called pito, and water.

The people prefer the language of Alghemi to their native tongue, esteeming it more elegant, sweet, and sonorous. No written characters of either of these languages are in use; but the great men speak, read, and write the Portuguese fluently.

The men are allowed the same liberty as at Whidah, of taking as many women as they are able to support. Little ceremony is observed in love affairs; the unbounded liberty enjoyed by single women, whose general carriage is loose and lascivious, affords abundance of opportunities for making and receiving addresses. Birth and fortune are seldom regarded; for the men of the lowest class address those of the highest quality; love sets all degrees upon a level, regulates the conduct of parents, and makes all parties happy. But, notwithstanding this toleration, men seldom seek for wives out of their own class. The nobility marry young ladies of quality, of nine or ten years of age, whom they take home to their houses; but defer the consummation of their nuptials till nature indicates their maturity. The marriage-feast is then kept, which consists of a great quantity of provisions, drink, and riotous mirth. Liquors are also distributed to all the relations, acquaintance, and neighbours of either party.

Their method of courtship is extremely concise, the man using no other ceremony than presenting the object of his love with a callico pan, and her relations with some pots of pito. He then declares to the company, that he will marry the woman whom he names; she grants her consent, and the courtship and marriage are at once ended.

But though polygamy be permitted, adultery is no less frequent here than in countries where the men are confined to one woman. This arises from the strong desires of the women, ungratified by their husbands, who generally confine their favours to one or two of them; on which account the women assume the most wanton airs and lascivious manners before all other men; though in the presence of the husband they seem full of respect, awe, and submission.

Some authors observe, that the climate of Ardrah is unfavourable to the propagation of the species, it seldom happening that one woman has more than two or three children; but this may perhaps rather proceed from the inconstancy of the men, and the number of their wives, few of whom can attract his regard for any considerable time.

In every town the wives of freemen are by turns sent to certain schools, where they are taught female accomplishments, in a house belonging to the high-priest. Old women instruct them in dancing and singing, the voice being accompanied by the jingling of bits of iron and copper, suspended to their legs and arms, with which they beat time. They are forced to dance and sing with such violence, and so long together, that their spirits being fatigued, spent, and exhausted, they drop down with faintness. Parties succeed each other day and night in this frantic and extravagant employment; nor can any woman return better recommended to her husband, than by having acquired the ability of holding out longer than any other in the company.

With respect to their funeral ceremonies, the people of Ardrah are said to be interred under their own houses, where there is a vault appropriated for the dead. All funeral obsequies are performed with great pomp and ceremony; for let the person be ever so much despised while living, he is respected at his death.

The religion of Ardrah is very different from that formerly observed at Whidah, and, in particular, they are so far from worshipping the tame and gentle serpents, that they search for them, in order to kill and eat them. They have almost an infinite number of priests, and persons of the highest distinction esteem it an honour to have them at their tables. The great marabout, or high-priest, appoints the fetiches worshipped by every family. Those of the court are certain black birds resembling the crows of Europe; with these the gardens of the palace are filled, and they are fed as well, though they are not treated with the same respect, as the serpents of Whidah. Among private persons some have a mountain, others a stone, a tree, a piece of wood, or other inanimate substance, which they call their fetiché, and regard with a kind of religious respect.

Notwithstanding their being plunged in the grossest idolatry, they have some confused ideas of a Supreme Being, who directs the time and occasions of their birth and death, and he has the power of rendering them happy or miserable on earth; but seem to be entirely void of all ideas of a future state. They shrink at the thoughts of death, and are alarmed at the smallest accident. The great marabout is held in the highest esteem and veneration, and is believed to be able to foretell future events by conversing with an image of the devil, which is of the size of a young child of about four years old, and is kept by him in his audience-chamber. This image is painted white; for they constantly maintain that the devil is of that colour, and will by no means allow of his being black.

The priests here, as well as in other places on the coast, are the only physicians the country affords. They make decoctions of healing herbs, and sacrifice animals for the recovery of the sick in their respective dwellings. The fetiché is rubbed with the animals blood, and the flesh eaten or burnt. Snelgrave mentions an extraordinary instance of respect for those doctors of the soul and body. It is an inviolable law, that in whatever house near the palace a fire happens to break out, the master of that house, with all his family, suffer death. Unjust and cruel as this law is, it is attended with happy consequences, fewer accidents from fire happening in Ardrah than in any other kingdom, for the law is executed with unrelenting rigour on people of all ranks: yet when the royal palace at Jachen was burnt to the ground, though the fire was well known to begin in a priest's house, and he was strongly suspected to have purposely set it on flames, the affair was hushed up, and no enquiry made.

S E C T. X.

Of the principal Towns of Ardrah, particularly Jachen, Offra, Great Foro, and Ajem, the Capital. With an Account of the Trade of Ardrah; the Manner in which it is conducted, and the Goods proper to be carried thither.

THE coast from Whidah to little Ardrah is low and flat, but rises by a gentle ascent as you proceed to Jachen. This last town is a league north north-east from Praya, or Little Ardrah, and before its being surrendered to Audati, was governed by a phidalgo, or prince, who resided there in a splendid manner, in a palace that was extremely magnificent, considering the country and his confined dominions. Jachen is fifteen hundred fathoms in circumference, and is surrounded by a deep ditch supplied with water from a rivulet which runs into it. The Dutch and English had factories here, but of late years the latter is withdrawn. After the conquest of Ardrah, the palace of Jachen was burnt to the ground, notwithstanding the prince submitted to the king of Dahomey; but how the accident arose, we are not informed.

To the north of Jachen stands the city of Offra, where the English and Dutch have each a handsome factory; the Dutch in particular carry on a great trade in the city, and live with a splendor proportioned to their profits.

Farther still to the north, is situated Great Foro, a populous town, but inferior in beauty to the others. What is very extraordinary in this country is, its having an inn for the accommodation of passengers, who are there plentifully supplied with all such eatables as the country produces, and Pito beer, which is remarkably good.

Still farther to the north is the metropolis, called Assém by the natives, and Great Ardrah by the Europeans. This city was the residence of the kings of Ardrah, and was five or six leagues in circuit. The royal family had two palaces within it, one of which was only inhabited, and the other was reserved for a place of retreat, in case of fire, or other accidents. Both these palaces are surrounded with high walls of earth and clay that bind like cement, and are as firm and smooth as plaster. They consist of large courts, with long wide galleries, supported by beautiful pillars finely ornamented. Under these piazzas the natives are allowed to walk. The buildings are two stories high, with long narrow slips of windows that are perfectly adapted to the climate, as they occasion a great draught of air. The floors of the apartments are covered with silk carpets, or fine mats, made in a pretty taste; and before its being conquered by the king of Dahomay, in each room was a single armed chair, a variety of silk and brocade cushions, tables, folding screens, Japan cabinets, and the finest China-ware: the windows were hung with taffety curtains, and fasted with white cloth, glazed in a manner that admitted the light, while the damp air of the night was excluded. The gardens are spacious, and laid out in the most delicate taste; and in particular, some authors say, there are fine long walks shaded by odoriferous trees, and lined on each side with shrubs and flowers of a fragrant smell, and pleasing colours; and nothing can be more beautiful than the elegant parterres, the fanciful grass-plats, joined by serpentine walks, refreshed by a cooling stream, which gilds over shining pebbles.

D'Elbee, who visited this city in 1669, says, that you enter it by four gates, the walls which are of mud, are high and thick, and as firm and compact as if built of stone and lime. The gates front each other, and are defended by deep ditches on the inside. Over these you pass by means of a draw-bridge, which may either be raised up, or entirely taken away at pleasure. Over each gate is a guard-room, for the accommodation of the officers and soldiers entrusted with the keys of the city, and upon each side stands a file of musketeers, with drawn swords in their hands. The buildings are only of clay covered with straw, and yet the streets are kept in the utmost order, free from filth and every inconvenience.

The Europeans are treated with great civility by the natives, and have apartments appointed them in the palace, where each nation has its distinct quarters. The Dutch carry on a considerable trade with Ardrah, and that of the English, without being so extensive, is extremely profitable. Captains of European ships, who are conducted and introduced to court by the Fidalgo or governor of Praya, present the king with coral, cypress, cloths, morees, and damask, for custom and liberty of trading. The queen, the prince, and the high-priest, are also presented with coral, damask napkins, and armoisin. Beads or brass rings and bougies are given both to an officer called the captain of white men; to the court dancers and to the porters.

Upon the captains return from Assém, licence to trade is proclaimed at a village four miles to the south south-west of Praya, called by the Dutch Stock Vis Dorp, and warehouses are appointed for lodging and selling the goods. The hongas, or captain of the bar, who directs the landing of all goods, is paid for a canoe's going twelve times to and fro from the ship, to the value of a slave in effects. When the sale is ended, the king receives a second present, consisting of two muskets, twenty-five pounds of powder, with merchan-

dize to the amount of nine slaves. In short, the customs and duties paid by each ship, amount in the whole to seventy or eighty slaves. The king has the first choice of goods, whether in the payment of duties, or in exchange for slaves; the hereditary prince the second; the merchant prince the third; the marabout the fourth; and afterwards the great officers of the court. With respect to the people, the general price of goods is regulated by a tariff; and when differences arise, they are terminated by the king's decision.

The slaves annually exported amount to three thousand: these are prisoners made in war; contributions levied upon tributary princes; criminals whose punishment are changed into slavery; slaves born, or the children of slaves; insolvent debtors, whom they cruelly sell for the benefit of the creditor; or the wives and relations, to a certain degree, of all who incur the displeasure of the prince.

We have already, in treating of Benin, mentioned the inhuman manner in which the Portuguese transport their slaves from thence to America; and it will not be improper to add, before we take leave of the Slave Coast, that the Europeans, before they purchase these slaves, examine every limb, with the greatest care, and the invalids and maimed being set aside, the remainder are numbered. In the mean while, a burning iron, with the arms or name of the companies, lies in the fire, and with this hot iron, both the English, French, and Dutch, brand these poor unhappy wretches, both men and women, to prevent their being exchanged. After this they are confined and kept on bread and water, at the expence of those who bought them, till they are ready to be taken on board; before which, their former masters strip them entirely naked, in which condition they are stowed in the holds of the ships, and carried to America, where they are again sold to the planters. A commerce which every unprejudiced mind must surely consider as inconsistent with Christianity, and dishonourable to human nature.

The goods proper for importation are large white beads, large glass or crystal ear-rings, gilt hangers, iron bars, sailors knives, copper bells of a cylindric and conic form, copper and brass basons of all kinds, guns, Indian silks, coloured taffeties, fine coloured handkerchiefs, striped pink silks, looking-glasses, large umbrellas, long white horse-tails, and English and Dutch crowns. By the last great profits are gained, ten crowns being the highest price for a slave; but bougies, or cowries, which are chiefly brought from the Maldivia islands are the currency of the country, and the best commodities. Europeans in all bargains for slaves pay half in bougies; or, if they are scarce, a third in bougies, and the remainder in goods.

SECTION XI.

Of the GOLD COAST.

The second Division of Guinea. Its Situation and Extent; the places where Gold is found, and the Manner in which it is gathered. Of the Vegetables, with a particular Account of the Palm Tree, and the Manner of extracting Palm Wine.

THE Gold Coast, which is thus named from the abundance of gold found there, is bounded by Nigritia on the north, by the Slave Coast on the east, by the ocean on the south, and by the Tooth or Ivory Coast on the west; extending only about a hundred and eighty miles along the shore.

The principal river in this division is the Cabra, or Ancobar, also called the Gold River, which bounds it on the west, and falls into the sea near the Dutch fort of St. Anthony, a little to the westward of Cape Three Points.

It includes several districts, in which are a few town or villages lying on the shore. Some of these districts have the title of kingdoms, though they contain only a small tract of land. The chief towns which give their names to so many petty kingdoms or states, beginning with

with the east and proceeding to the west, are Aquamboe, Agona, Acron, Fantyn, Sabo, Fetu, Commany, Jaby, Adom, Anta, and Axim.

That part of the country where most of the gold is found, is situated at some distance from the coast; and the best gold is gathered in or between some particular hills, where the negroes dig pits, and separate the gold from the earth dug up with it. It is likewise found about some rivers and water-falls, where the violence of the torrents caused by the heavy rains, wash it down from the mountains. Gold is also gathered on the seashore, more particularly at Mina and Axim, where are small branches of rivers into which the gold is driven from the mountainous places.

In the morning succeeding a rainy night these places are sure to be visited by hundreds of negro women, who have no other covering but a cloth tied round the waist: each is furnished with two calabashes, one of which they fill with earth and sand. This they wash with many waters, by turning the calabash round, the water with the lightest of the mud washing over the brim; while the gold, if there be any, sinks by its own weight to the bottom. Thus they continue till two or three spoonfuls are only left; and this they put into the other calabash: then fill the other again, and continue washing till about noon, when the calabash that receives the settlements, being pretty well filled, is taken home, and what remains diligently searched, when they sometimes find as much gold as is worth half a guinea, sometimes the value of a shilling, and sometimes none at all.

The gold either thus found or obtained by digging is of two sorts, gold dust, which is the best, and pieces of different sizes; some being hardly the weight of a farthing, and others weighing as much as twenty or thirty guineas; but few are found so large as these; though the negroes say, that in the country they have pieces that will weigh one or two hundred guineas: but the many small stones always adhering to them, occasion great loss in the melting.

We shall now consider the vegetables of this part of Guinea. Of the corn there is millet, and maize, or Indian wheat; but there is little rice or other corn on this coast.

Of the leguminous plants are several kinds of beans, one species of which is of a bright red, and grows in pods three quarters of a yard in length, and another species grows on trees of the size of a gooseberry-bush.

The palm tree is of singular use to the natives, who draw wine from the tree, and press oil from its nuts. These trees are said to abound more in Guinea than in any other country. The trunk of the palm tree, when at its full growth, is as thick as a man's body, and six feet in height; but its branches shoot upwards of twenty feet from the stem. The leaves are an ell long, and about two inches broad, terminating in a sharp point; and with the branches the natives frequently cover their huts. There are indeed a great variety of palm trees, some of which are not half so thick as this.

When the natives perceive that a tree is of a sufficient age to yield a good quantity of wine, they cut off all its branches; and having let it stand a few days stripped of its ornaments, they bore a hole in the thickest part of the trunk, and fixing in it a hollow reed, or pipe, the wine trickles out into a pot set to receive it; but so slowly, that they do not get above two quarts in twenty-four hours; but it will run for twenty or thirty days successively, according to the goodness of the plant: and when it has almost done dropping, they make a fire at the bottom of it, which forces out something more. After this the palm dies, and is good for little but the fire; though in the countries where they are satisfied with drawing small quantities, a tree will last several years after its being tapped.

This tree is reckoned in its prime at ten or twelve years growth, when it yields ten, fifteen, and some near twenty gallons; of which an anchor, or five gallons, is usually sold on the coast for about an English half crown. A great deal is brought down from the inland countries, and its cheapness shews that there must be a prodigious number of palm-trees up in the country. This wine, when first drawn, is extremely pleasant, and yet

strong; but the negroes, who bring it to the coast, frequently mix and adulterate it.

There are here also cocoas, oranges, limes, bananas, the cabbage tree, ananas, or pine-apples, water melons, and several others.

Among the trees fit for timber are many of an extraordinary height and size, and others of different coloured wood, fit for the finest cabinet-makers work.

Among the roots are yams and potatoes. The yam is shaped like a parsnip; but is thicker in proportion to its length, it being commonly about twelve inches long, and as many more in circumference at the top. When roasted it tastes like an English potatoe; but their potatoes resemble ours only in shape, they being of a sweet maulish taste, and not half so agreeable as the yams. They have also several other roots fit for food, as well as different kinds used in medicine.

S E C T. XII.

Of the Beasts, Birds, Reptiles, Insects, and Fishes of the Gold Coast.

IN the inland parts of the Gold Coast are a great number of cows and goats; but few of them are brought to the coast; however, great herds of them are bred at Acra, Elmina, and Axim; but they are so small, that a full grown cow seldom weighs more than two hundred and fifty pounds; and both the beef and veal are very indifferent meat. There are many sheep along the coast; but they are dear, and not above half the size of ours; they have hair instead of wool, and their flesh is dry and disagreeable. The goats are indeed innumerable, and, though they are exceeding small, are fatter and more fleshy than the sheep of Europe. There are also many hogs; but they are greatly inferior to those of Whidah.

They have no horses near the coast, though there are great numbers of them in the inland country; but they are small and ill shaped. If a tall man rides one of them, his feet almost touch the ground. Their heads and necks, which they always hang down, resemble those of an ass; they hobble along, but will not stir without being forced on with blows; but there are no want of asses, which are larger and handsomer than these horses.

The negroes here are so fond of dog's flesh, that they willingly give a sheep for a large dog. Bosman observes, that the European dogs, on being brought here, degenerate extremely; their ears growing long and stiff like those of the fox, to which colour they also incline: so that in three or four years time they become very ugly creatures, and in three or four descents their barking turns into a howl: but it does not appear that the cats change at all.

Among the wild beasts the elephant, on account of its size, deserves to be first mentioned. These are here twelve or thirteen feet high, and are very prejudicial to the fruit-trees, particularly to the orange banana, and fig-trees; and, with respect to the two last, eat both the fruit and the stem. But though these are used in the Indies both in war and as beasts of burthen, none of them are here tamed; and yet, when unprovoked, they seldom hurt any man; and it is sometimes not very easy to enrage the elephants of this coast.

Tygers are here numerous and of several species, some of which are very large, and they are all extremely fierce and ravenous; but happily for the natives, they will not attack them, while they can satisfy their hunger by feeding on the flesh of brutes.

The jackal is here scarcely less fierce than the tyger, and so bold as to devour both man and beast.

The apes are extremely numerous, and of a great variety of species. The most common sort are of a pale mouse colour, and those which are full grown, when they stand on their hind legs, are about five feet high. The negroes are persuaded that they can speak if they please; but will not, for fear of being set to work. These are very ugly, and extremely mischievous; and there is another species which exactly resemble them but are so small, that four of them put together would not weigh one of the former. A third sort is very beautiful: these grow

grow to the height of about two feet; their hair is as black as jet, and about a finger's length; and they have a long white beard. There are also many other kinds of apes.

There are an incredible number of harts all along the Gold Coast, especially at Anta and Acron, where herds of a hundred together are sometimes seen. There are about twenty different sorts of deer, some as large as small cows, others no bigger than cats; most of them are red, with a black list upon their back; some of them red, beautifully streaked with white. All of them are very good to eat, and are esteemed delicate food particularly one sort about two feet long, the flesh of which is much admired. Among these animals there is one of a red colour and extraordinary beauty: those of this species have small black horns, and are so little that the legs of some of them are said by Mr. Bosman to be no bigger than the small part of a tobacco-pipe.

These last seem to be the beautiful antelopes described by Mr. Smith in his Voyage to Guinea. These pretty creatures, says he, seem rather to vanish than run by us among the bushes; they are nevertheless often caught and shot by the natives; and, when young, are sweet venison. A brace of these bucks may very well be eaten at a meal by a man of a good stomach, they being about the size of rabbits. The Europeans often tip their feet with gold to make tobacco-stoppers of them. They are so very tender, that it is not possible to bring them alive to Europe.

There are also hares and porcupines. These last, as well as the former, are esteemed good food; they are great enemies to the snakes, and will attack the largest and most dangerous of those reptiles. Mr. Bosman says, that some of his servants going into the country beyond Mouree, found a snake seventeen feet long and very bulky lying by a pit of water, near which were two porcupines; between which and the snake began a very sharp engagement, each shooting very violently in their way, the snake his venom, and the porcupines their quills: but his men having seen this fight a considerable time without being observed by the combatants, who were too furiously engaged to take notice of them, they loaded their muskets, and let fly upon the three champions with such success, that they killed them all, and brought them to Mouree, where they and their companions eat them as very great delicacies.

Here are three or four sorts of wild cats, of which the civet cat is one; these are sometimes sold very young to the Dutch, who give about eight or nine shillings sterling for one of them. A great deal of care and trouble are necessary in order to bring them up: they feed them with pap made of millet, and a little flesh or fish. They produce civet when very young, but that of the male is better than that of the female.

There are other wild cats which are spotted like tigers, and are as fierce; these do a great deal of mischief among the poultry whenever they get among them. Besides these there are several other quadrupeds.

Among the feathered race there are cocks and hens; those at Axim are fat and good, though small; but in several places on the coast they are extremely dry and lean. There are likewise tame and wild ducks, pigeons, a great number of partridges, pheasants, snipes, herons, and parrots. There are a variety of other large and small birds, some of which are very beautiful, their plumage being finely variegated with the brightest colours, and the heads of some of them crowned with tufts of feathers. There are likewise falcons, kites, and many of the other birds of Europe, as well as those that seem more peculiarly the natives of the torrid zone.

It will not be proper to pass over the birds without taking notice of the two sorts of crown birds found on the Gold Coast. The first is about the size of a parrot: it is green about the head and neck; the body is of a fine purple; and the wings and tail are scarlet tipped with black.

The other, which is about three feet high, is shaped like a heron, and feeds on fish: its colour is black and white, and it is crowned with a bunch of feathers that resembles the tassel of a coach-horse.

Among the amphibious animals and reptiles are the crocodiles, with which the rivers swarm: there is also an animal of nearly the same form, though it seldom exceeds four feet in length; its body is black, speckled with a round sort of eyes, and the skin is very tender. It injures neither man nor beast, but sometimes makes great slaughter among the poultry. All the Europeans who have tasted its flesh agree that it is much finer than that of a capon.

The lizards are every where extremely numerous, especially by the walls of the forts; and there are various species of them, which differ in size, shape, and colour; and also many camelions, which are far from living on air alone, and of which we have given a very particular description in treating of Syria.

Frogs and toads are no less numerous than in Europe; but Mr. Bosman asserts, that the latter are in some places as large as a pewter plate. These are mortal enemies to the snakes, with which they have frequent engagements. There are great numbers and a prodigious variety of these last reptiles, some of which, if we may credit the above author, are of an amazing size. He observes, that the largest of those taken while he was on this coast was twenty feet long, and that he believes they are still larger within land; and we have frequently found, says he, in their entrails not only harts and other beasts, but also men. What credit is to be given to Mr. Bosman in this particular we will not say; we shall only observe, that the above gentleman's work is universally reckoned one of the best descriptions of Guinea; and that the Portuguese have mentioned serpents on this coast of a still larger size.

Most of the snakes are venomous, but one is so to an extraordinary degree; this is scarce a yard long, but is two spans thick, and variegated with white, black, and yellow. The snakes not only infest the woods, but the dwellings of the negroes, and even the forts and bed-chambers of the Europeans.

There are here abundance of scorpions, some very small, and others as large as a cray-fish; but the sting of either causes intolerable pain, and too often proves mortal. There are also many centipedes, whose bite occasions a violent pain for several hours, but is not mortal. Spiders of a monstrous size are also found here, and are said to be venomous.

But none of the insects of this country appear more extraordinary than the ants. These are of three sorts, the red, the white and the black. The first are of the same size as those in Europe; but the two last are much larger, they being above half an inch long. They build sometimes in great hollow trees, and sometimes on the ground, throwing up hillocks seven or eight feet high, so very full of holes, that they seem like honey combs. These ant-hills are of a small circumference in proportion to their height, and, being sharp at the top, look as if the wind would blow them down. "I one day," says Mr. Smith, "attempted to knock off the top of one of them with my cane, but the stroke had no other effect than to bring some thousands of them out of doors, to see what was the matter. Upon which I took to my heels, and ran as fast as I could, well knowing that they have often attacked our hens, and sometimes our sheep, if lame or wounded, in the night, with such success, that before morning nothing was to be seen of them but the skeleton, picked so very clean, that the most curious anatomist upon earth could not do the like." They frequently enter the forts in such swarms, as to oblige the Europeans to leave their beds in the night. The sting or bite of the red ant raises an inflammation that is extremely painful. The white are as transparent as glass, and bite with such force, that in one night they will eat through a wooden chest of goods.

As the natives have but little flesh fit for food, they are obliged to subsist principally on fish, and by a particular favour of Providence the sea and rivers seem to contend which shall produce the best. There are many of the sorts found in Europe, as pike, thornback, plaice, flounders, bream, lobsters, crabs, prawns, and shrimps; and likewise sharks and sword fish; with a

great

great variety of excellent fish that seem peculiar to these seas.

S E C T. XIV.

Of the Dress of the Natives of the Gold Coast, their Marriages, and the Customs relating to their Women and Children; their Skill in the manual Arts; their Treatment of the Sick, and their Funerals.

THE richest of the natives adorn their hair with a kind of coral, called conte-de-terra, which they esteem more valuable than gold, and with a sort of blue coral called by the natives acory. They set a great value on our hats, for which they will pay a very high price. Their arms, legs, and waist, are likewise adorned with gold and coral; and particularly on their arms they have rings of gold, silver, and ivory. Round their waist they wrap three or four ells of silk, cloth, perpetuana, or other stuff, which hanging down covers half the leg. They also wear strings or chains of gold, silver, and shells round their neck. Their caboceros, or chief men, who have a share in the government, wear only a handsome cloth round their waist, a cap of deer skin, with a string of coral about their heads, and are never seen without a staff in their hands.

Some of the common people have an ell or two of cloth round their waist, while others have only a sort of girdle, to which is fastened a piece of stuff that passes between the legs, and is tied to the girdle before, and just serves to cover their nakedness. The fishermen add to this a cap made of deer skin, or only rushes, or some old hat bought of an European sailor.

The women of distinction appear to have much more skill in the ornaments of dress than the men. The cloth which encompasses their waist is longer, and fastened with greater neatness round their bodies. Their hair is more beautifully adorned with gold, ivory, and coral; and their necks with gold chains and strings of coral; but their arms, legs, and waist, are in a manner covered with these ornaments; besides, on the upper part of their bodies they frequently cast a veil of silk, or some other fine stuff.

While the kings are in their own houses, they are distinguished by no marks of grandeur, and their cloaths are sometimes so mean as to be scarce worth a shilling. They eat the same food as the meanest of their subjects, for bread, oil, and a little fish are their usual fare, and water their most common drink; but they have brandy which they purchase of the Europeans, and palm wine which they receive from the inland country. They have no guard at the palace-gates, nor are attended by any other officers than their own wives and slaves; and even when they go abroad in their towns they are generally attended by only two boys, one of whom carries the king's sabre, and the other his seat. But if they visit a person of high rank in another town, or receive a visit from some other great man, they take care to shew their grandeur. On these occasions both they and their wives are richly adorned, umbrellas are held over their heads, and they are accompanied by armed men.

Marriage is never obstructed by previous ceremonies. If a man likes a young woman, he has no more to do than to ask her of her parents, who seldom refuse so reasonable a request, especially if he be agreeable to the daughter. The bride brings no fortune with her; but the husband keeps an exact account of the expences of the wedding day, and of all the presents he makes to the bride or her friends, that in case she should ever become so far disgusted with him as to leave him, he may demand the whole again. But if he divorces her, he can demand nothing either of her or her relations, except he produces very good reasons for his dismissing her.

They allow of a plurality of wives, and some are said to have even twenty, in which number are doubtless included all their female slaves. Their wives are obliged to cultivate the earth, and to dress provisions for their husbands, who commonly spend their time in loitering about and drinking palm wine. However, the men of

wealth have two wives exempted from labour. These are the first wife, who is invested with the chief command, and the care of housekeeping, and the second, who is consecrated to their fetiche, and is called the fetiche wife. Of this last they are frequently very jealous; they lie with her on the night following their birth-day, and on that day of the week which they term their fetiche day. Each wife generally endeavours to please the husband, in order to obtain the greatest share of his affections; and she who is so happy as to be pregnant, is sure to be respected and waited on by him.

The women of all this coast are delivered with very little pain, even without the assistance of a midwife; and the child is no sooner born, than they usually go to wash themselves in the sea. Immediately after the birth of the infant, a priest is sent for, who binds a number of cords, pieces of coral, and other things about the infant's head, body, arms, and legs. These are to secure it from sickness and ill accidents, and are all the cloaths it is to wear till it is seven or eight years of age, when it puts on a sort of apron formed of half an ell of cloth. The number of females born in these countries is said greatly to exceed that of the males, which, if true, may render their having such a multitude of wives somewhat more excusable.

As the heat of the country naturally renders the natives inactive, they are masters of few manual arts: however, besides building their huts, making their canoes, and being skilled in managing them, and in fishing, they employ themselves in making earthen vessels and wooden bowls, and in forming chains and rings for the arms and legs, of gold, silver, and ivory. They also perform smiths work, and by means of a small pair of bellows, with two or three pipes, which is entirely their own invention, they, with a great stone for an anvil, make not only swords, and other offensive weapons, but instruments of agriculture, fishing hooks, and harpoons, knives, and tools for making their canoes, the largest of which are about thirty feet long. They likewise make several sorts of musical instruments, which resemble those we have already described, in treating of the other parts of Guinea.

The negroes are commendable for their having no beggars among them; for one of them no sooner finds himself so poor, that it is difficult for him to procure subsistence, than he binds himself for a certain sum of money, or his friends do it for him; and the master for whom he engages to work, sets him a task that is far from being slavish, he being usually obliged to defend him in case he should be attacked, and to spend his leisure time in assisting him to cultivate the earth. Yet all the people in general, from the king to the meanest subject, make no scruple of begging of the Europeans whatever they like.

When the natives are sick, they in the first place have recourse to remedies; but not esteeming those alone sufficient to restore health and preserve life, they apply to their superstitious worship. The same person being both priest and physician, he easily persuades the relations of his patient that he cannot be recovered without some offerings, and therefore proposes a sheep, a hog, a cock, or what he likes best; but always proportions the sacrifice to the circumstances of the person whom he endeavours to cure. If the disease continues to increase, more expensive offerings are made. Frequently one physician is discharged with a good reward, and another called in his stead; and this change of physicians is sometimes repeated twenty times or more successively, each of whom makes fresh offerings, and appropriates them as they always do, to his own private use.

The boys who are slaves or servants to the Europeans, when fond of their master, will, on his being seized with the least indisposition, go without his knowledge, and make offerings for him, that he may recover his health; and accordingly there are sometimes found on the beds, or in the chambers of the Europeans, things consecrated by the priest, and laid there to preserve their master's lives; but as they are sensible that the Europeans are offended at their shewing such marks of their gratitude and affection, this is always done privately, and so well.

well concealed, as seldom to be discovered before the person's death, when they have not time to take them away.

The principal medicines used here, are grains of paradise, lemon or lime juice, about thirty sorts of herbs endued with sanative virtues, with the roots, branches, and gums of trees; and with these very extraordinary cures are sometimes performed.

A person has no sooner breathed his last, than his relations and friends set up a dismal cry, while the youth of his acquaintance now usually fire muskets, to shew their respect. If the deceased be a man of rank, his wives, instantly cause their heads to be close shaved, then smearing their bodies with white earth, they put on an old worn-out garment, and run about the streets, making dreadful lamentations, continually repeating the name of the deceased, and the great actions of his life; and this they continue several days successively, till the corpse is interred.

While the women are thus lamenting abroad, the nearest relations sit by the corpse, making a dismal noise and at the same time are employed in washing themselves; the distant relations also assemble from all parts to be present at these mournful rites. The town's people, and the acquaintance of the deceased, likewise come to join their lamentations, each bringing a present of gold, brandy, fine cloth, sheets, or other things, to be carried to the grave with the corpse; and the larger the present is, the more it redounds to the person's honour who makes it.

During this ingress and egress of all sorts of people, brandy is very briskly filled out in the morning, and palm wine in the afternoon; whence the funeral of a rich negro is very expensive. The body is afterwards richly dressed, and put into the coffin with fetiches of gold, the finest corals, and several other things of value, which it is imagined the deceased will have occasion for in the other world. After two or three days, the relations and friends all assemble, and the corpse is carried to the grave, followed by a number of men and women, without the least order, some crying and shrieking, and others silent. Many young soldiers running about at the same time, load and discharge their muskets, till the deceased is laid in the ground.

The corpse being interred, the multitude go where they please; but most of them return to the house, in order to spend their time in drinking and mirth. This continues several days, during which every thing rather resembles a wedding, than a time of mourning.

A king, or very great person, is sometimes kept a year above ground; when, to prevent the putrefaction of the corpse, they lay it upon a wooden frame like a grid-iron, that stands a considerable height over a gentle clear fire, which dries it by slow degrees. When a prince is to be publicly buried, notice is first given, not only to the inhabitants of his own country, but to other nations, which brings a prodigious concourse of people, all of whom are as richly dressed as possible. Several of the slaves of the deceased are said to be slain at these funerals, that they may serve him in the other world; as are also those whom he has dedicated to his false gods, with one of his wives, and one of his principal servants: even some poor wretches whom the infirmities of age, or other accidents have rendered incapable of labour, are bought in order to encrease the number of these horrid offerings, and are put to death with every circumstance of inhumanity. With the utmost horror, says Mr. Bosman, I saw eleven persons killed in this manner; among whom was one, who, after having endured the most exquisite tortures, was delivered to a child of six years of age, who was ordered to cut off his head, which he was about an hour in performing, he not being strong enough to wield the sabre. But these inhuman sacrifices are only in use among the negroes who are at distance from the European forts.

They generally erect a small cottage, or plant a little garden of rice on the grave, into which they put some of the deceased's goods, but none of his household furniture.

SECT. XV.

Of the Religion of the Negroes on the Gold Coast.

MOST of the negroes on the Gold Coast believe in one God, to whom they attribute the creation of the world, and every thing in it; but, like the other negroes, make their offerings, and offer up their prayers to their fetiches. They have different opinions concerning the creation; many of them believe, that in the beginning God created black as well as white men, and immediately offered them two sorts of gifts, gold and the knowledge of the arts of reading and writing; and allowing the blacks to choose first, they made choice of gold, and left the knowledge of letters to the whites. God, they say, granted their request; but, being offended at their avarice, ordered that the whites should for ever be their masters. Hence they believe, that there is no gold in any other country besides their own; and that no blacks have any knowledge of letters, nor any notion of the extent of the world, but what they obtain from our informations.

However, it is certain that this opinion of the creation cannot be very antient; for if by the white men are meant the Europeans, they could have no idea of there being any such before the Portuguese discovered their coast.

It appears that all the negroes, and even the inhabitants of Madagascar, have their fetiches; though in different countries these kind of idols have different names and are formed of different substances. Those of this country give that name to some ornament worn on the head, or any other substance dedicated to some invisible spirit. Besides, each feticheer, or priest, has here a peculiar fetiche, prepared in a different manner; which is mostly a large wooden pipe filled with earth, oil, blood, the bones of dead men and beasts, feathers, hair, and the like. By these mixtures the priest probably supposes that he forms a kind of necromantic charm or talisman, by which he can prevail on some spirit to perform what he desires.

If a negro is to take an oath before this fetiche, he first enquires of the priest what is its name, each having a peculiar one; then calling the fetiche by it, he repeats what he is to confirm by an oath, desiring that he may be punished with death, if he swears falsely: then going round the pipe, he stops in the same place, and repeats the oath a second time, in the same manner as before, and so a third time. After this the feticheer takes some of the ingredients out of the pipe, with which he touches the person's head, arms, belly, and legs; and, holding it above his head, turns it three times round. He then cuts a bit of the nail of one finger on each hand, and one toe on each foot, and some of the hair of the head, all which he puts into the pipe; and thus concludes the ceremony.

Public religious exercises are sometimes performed by a whole town or nation, on account of great floods, or an extraordinary drought. Upon these occasions the chief persons of the town or nation assemble, and advise with the priest about the course most proper to be taken to remove the calamity; and what he orders is immediately commanded or forbidden throughout the land, by a public cryer; and whoever presumes to act contrary to this order, incurs a large pecuniary penalty.

Almost every village has a small grove, in which the governors and principal people frequently repair to make their offerings, either for the public good or for themselves. These groves are esteemed sacred, no person presuming to defile them, or to cut or break off any branches of the trees.

They have particular days in which they refrain from drinking wine, and each person is forbid to eat a particular kind of flesh: thus, one eats no mutton, another no goats flesh, another no beef, another no pork, wild fowl, or cocks with white feathers; and this restraint lasts as long as their lives.

They, like other negroes, imagine that their fetiches inspect their course of life, reward the good, and punish the

the wicked; but their rewards generally consist in a multiplicity of wives and slaves, and their punishments in the want of them, though the most terrible punishment they can imagine is death. Their ideas of a future state are very different: most of them imagine that immediately after death a person goes to another world, where he lives in the same manner as he did here, and makes use of all the offerings his friends and relations made at the time of his decease; but few of them have any idea of being rewarded or punished for the good or evil actions of their past life.

Some however believe, that the deceased are instantly conveyed to a famous river situated in the inland country, where their god enquires what sort of a life they have lived; whether they have religiously observed the holidays dedicated to him; whether they have abstained from all forbidden meats, and inviolably kept their oaths; which if they have, they are gently waited over the river to a delightful country, abounding with every thing that can contribute to their happiness. But if, on the contrary, the departed hath sinned against any of these rules, his god plunges him into the river, where he is drowned and lost in eternal oblivion.

In this part of Guinea they have a very extraordinary annual ceremony, which consists in banishing of the devil out of all the towns. This is preceded by a feast of eight days, accompanied with singing, dancing, mirth, and jollity; and in this time they are allowed freely to sing of all the faults, villanies, and frauds of their superiors, as well as inferiors, without the least punishment; the only way of stopping their mouths being to ply them well with liquor, upon which they alter their tone, and turn their satirical ballads into songs in praise of those who treat them.

This time of licence being ended, they hunt out the devil with an horrid cry, running after one another, and throwing stones, dirt, and every thing that comes in their way at the supposed fiend. When they have driven him far enough out of town, they return to their houses; on which the women immediately wash and scour all their wooden and earthen vessels, to cleanse them from all pollution.

S E C T. XVI.

Of the Kingdoms and States on the Gold Coast; and first of Aquamboe, Agonna, Acron, Fantin, and Sabu: with the European Forts in each.

WE shall now give a description of the several kingdoms or states into which the Gold Coast is divided, and at the same time take notice of the factories of the Europeans.

The country of Aquamboe, on the most eastern part of this coast, is situated chiefly within land, and is one of the greatest monarchies on the coast of Guinea: the maritime part of this kingdom, which is distinguished from the rest by the name of Acra, indeed extends only twenty miles along the shore; but it stretches ten times as far within land. The Aquamboe negroes are haughty, arrogant, and warlike; and the neighbouring nations are continually infested by their incursions, in which they plunder and rob all before them.

In this kingdom the English, Danes, and Dutch have forts, but their authority is very small, and confined within their own walls; for should they make any attempt on the negroes, they would probably end in their destruction. Each fort has a village adjacent, distinguished by its particular name. It might be reasonably conjectured, that these three companies trading here might be sufficient to cause dissensions fatal to their commerce; but here is such plenty of gold and slaves, that none of them is in danger of wanting a share, especially as each is stocked with commodities which the other has not. The king and his nobles, or rather favourites, are so very rich in gold and slaves, that this country is said to possess greater treasures than all the rest of the Gold Coast put together.

The chief employments of the inhabitants, besides that of war, are merchandize and agriculture; but though the soil is sufficiently fertile, yet they generally fall short

of provisions towards the end of the year, and are therefore obliged to fetch them from other places.

At Acra stands the Danish fort of Christiansburg, situated in five degrees thirty minutes north latitude, and is the only one they possess on this coast. This fort, Mr. Bosman says, would be too strong for the united force of the English and Dutch forts. It is a square building, strengthened with four batteries, and appears very beautiful. As the roof is flat, cannon may be conveniently planted on all parts of it.

Within a cannon-shot above this lies the Dutch fort Crevecoeur, on the extremity of a high rock, the beach for landing being under the fire of the artillery and musketry of the fort. The building is square and flanked with batteries, joined by long curtains of a very irregular construction. Mr. Bosman asserts, that it surpasses the English fort in size, and in the goodness of the guns, but does not exceed it in strength, the walls being thinner, and consequently not so good a defence.

Within a cannon-shot above this fort is that of the English, called Fort-James. This is a well-built square edifice, with four bastions: its walls are high and thick. It is built on the top of a steep rocky cliff that hangs over the sea, and has a battery just under the wall next the water, where may be planted twenty pieces of heavy cannon; besides which the fort has four strong and large flankers, on which are mounted twenty-seven pieces of ordnance.

Round these forts is a delightful champaign country, which, not being so woody as the others, is by far the most pleasant on the Gold Coast. There are salt-ponds belonging to the fort, which yield a sufficient quantity of salt to supply not only the whole Gold Coast, but also all the ships that trade thither.

Farther to the west are the kingdoms of Acron and Agonna, the first of which has a Dutch fort in the middle of the coast that has two batteries, on which are mounted eight pieces of cannon, and under it is a small village inhabited only by fishermen. The people of Acron seldom or never engage in war; for having chosen the Fantinians, their next neighbours to the westward, for their protectors, none dare to injure or attack them, which affords them an opportunity of tilling their land in quiet; and hence they have annually a plentiful harvest, a great part of which they dispose of to other countries.

About a mile to the eastward is a very high hill, termed The Devil's Mount, which is said to contain vast quantities of gold, a great deal of which is washed down by the violent rains. About this hill begins the country of Agonna, which surpasses Acron in largeness, power, and riches, though they are nearly equal with respect to fertility and the pleasantness of the countries.

The next country to the westward is Fantin, which extends about nine or ten miles along the sea-side, it having on its western extremity the Iron Mount, which is a quarter of a mile long at the base, and has from its bottom to its summit a delightful walk, so thick shaded with trees, that the light is obscured at noon-day. The inland inhabitants are employed in trade, tillage, and the making of palm-wine; and the country, besides its being rich in gold, produces all the necessaries of life, and more especially corn, which the inhabitants sell in large quantities to the ships that arrive there. The government is in the hands of a chief commander, whom they term their brasso, or leader. This is a kind of chief governor, whose power is superior to that of any other single person in the country; yet his authority is restrained by the old men, who form a kind of parliament.

In this division the English have a small, neat, and compact fort named Anamaboa. This is a large edifice flanked by two towers, and secured on the sea-side by two bastions of brick or stone, well cemented with lime. It stands upon a rock at the distance of thirty paces from the sea. It is mounted with twelve pieces of cannon and two pateraroes, and defended by a garrison of twelve whites and eighteen blacks, under the command of the chief factor. The greatest inconvenience attending the situation, arises from the difficulty of landing from the ships, the shore being covered with rocks a small distance into the sea, or rendered equally dangerous by a continual high

high surf. The ships are therefore forced to come to an anchor on the outside of the rocks, and the goods are landed by canoes upon a sandy point, surrounded by a wall built at the expence of the company, and rendered very convenient by there being lodgings for the negroes under the cannon of the fort.

The fort of Anamaboa was abandoned in the year 1733; but the English afterwards resumed the settlement, and have continued in it ever since.

The country round Anamaboa is mountainous, but the hills are at a sufficient distance from the town. Five of them are remarkably high, and serve at sea as landmarks to determine this division of the coast. They being covered with wood, the multitude and variety of the trees form an agreeable prospect. Palm wine is here made in great perfection, especially that which they call quacker. The country is also populous, and exceeding rich in gold, slaves, and all the necessaries of life; but more particularly in corn, large quantities of which they sell to the Europeans.

A little below Aga stands the village of Little Cormantin, thus named to distinguish it from Great Cormantin. This village is situated upon an eminence, easily distinguished by a lofty tree that grows upon its summit. Hither the French and Portuguese formerly carried on a great trade, and the Dutch had also a share in it, till it was discovered that the negroes adulterated the gold. This first gave the Dutch a dislike to the trade, and at length drove away most of the Europeans. Afterwards the trade was resumed by the Dutch, about the year 1682, when they greatly enlarged and strengthened Fort Amsterdam, which was the chief residence of the English, till they were driven thence by De Ruyter in 1665.

This is a square stone building, strengthened by four bastions, mounting twenty pieces of cannon. In the center is a tower, on which the Dutch flag is fixed. This tower affords fine views of the sea and country: the apartments of the officers and soldiers are neat, clean, and commodious; the parapets are spacious, and the fort is well supplied with water by means of large cisterns that contain an incredible quantity of rain. The garrison is composed of twenty-five white men and a number of blacks, who live happily and at their ease, and make fortunes with very little trouble.

About a cannon-shot from this fort stands Great Cormantin, a large and populous town, situated upon a high hill under the cannon of Fort Amsterdam. The number of merchants and fishermen in the town exceed twelve hundred, besides the other inhabitants, who have different employments.

The next kingdom to the west is that of Sabu, which is of very small extent; but produces an amazing quantity of Indian corn, potatoes, yams, oranges, lemons, bananas, and other fruit, besides palm oil. The natives are esteemed the most industrious people on the Gold Coast, being perpetually employed either in tilling the earth, fishing, or trading with the Europeans or Acanese, who exchange gold for the fruits and fish of Sabu.

The city of Sabu, in which the king resides, stands two leagues from the coast, and is described as a long and populous city. The first place to the eastward of it is the English fort on Queen Anne's Point, which is built of stone and lime, upon an eminence about a mile from Fort Royal, and two miles from Nassau Fort. It is defended by five pieces of cannon, and a garrison of five white, and as many black men.

At a small distance stands Mawry, or Mouree, a village which tho' situated upon an eminence, is very unhealthy; its market is bad, and every thing in it, even palm-wine and fruits, scarce and dear. The chief trade of the place consists in gold dust, with which canoes arrive every day from all the sea-port towns. Before the Dutch fixed their residence here, it was an inconsiderable place; but now it carries on a flourishing trade, and contains above two hundred houses, which surround three sides of the Dutch fort of Nassau. The greatest part of the inhabitants are fishermen, four or five hundred of whom go every morning in canoes to catch fish; and, upon their return, are obliged to pay every fifth fish to the Dutch factor in the town, by way of toll or tribute. The houses stand at a great distance from each other, and the inter-

vening space is generally filled up with a rock, which renders the passage from one to another incommodious, and sometimes dangerous. This place is called The Grave of Dutchmen, on account of the great number who have died there; yet it is still in a flourishing condition, as all the ships bound to the Gold Coast are forced to wood and water here.

Fort Nassau, the most considerable Dutch settlement in Guinea, except Elmina, is situated upon a rock, and is watered towards the south by the sea. Its form is nearly quadrangular, the front being rather the largest side. It has four batteries, and eighteen pieces of cannon; and, if we except Elmina, has the highest walls of any fort on the coast. The curtain comprehends the two sea-batteries, and is very spacious and convenient; but its greatest ornament and strength consists in four towers at the angles, well provided with artillery, muskets, and stores. At a small distance from the fort the company have a fine garden, kept in excellent order, and neatly laid out in groves of fruit-trees and parterres.

S E C T. XVII.

Of the Kingdom of Fetu, with a particular Description of Cape Coast Castle, the principal settlement of the English, and St. George Elmina, the chief Settlement of the Dutch on the Coast of Guinea.

WE now come to the kingdom of Fetu, or Fetou, which is bounded on the west by the river Benja and the kingdom of Commendo, on the north by the country of Ati, on the east by Sabu, on the south by the ocean, and, according to Bosman, is a hundred and sixty miles in length, and near as much in breadth. The hills are covered with trees of various kinds, and the vallies watered by a number of rivulets; and it is extremely well situated for European settlements.

On the eastern part of this kingdom is Cape Coast, in five degrees north latitude, and under the same meridian as London. This is the chief English settlement upon the coast of Guinea. It is said to have received its name from a corruption of Cabo Corso, by which it was called by the Portuguese. The Cape is formed by an angular point washed on the south and east by the sea, and upon it stands the English fort, nine miles from Elmina. The Portuguese settled here in 1610, and built the citadel upon a large rock, that projects into the sea; but a few years after they were dislodged by the Dutch, and in 1664, it was taken by admiral Holmes. The next year, De Ruyter, the Dutch admiral, having orders from the States to revenge the insults committed by the English, attacked all the settlements of this nation along the coast, with a squadron of thirteen men of war, and even took, burnt, and sunk all the ships belonging to the English company; but after all, was unable to take this fort, which was afterwards confirmed to the English by the treaty of Breda; and the king granting a new charter in 1672, the directors of the African company applied all their attention to fortify and render it commodious.

The walls, which are thick and high, particularly on the land side, are built partly of stone; but chiefly of brick, which the English made at a small distance. To the height and strength of its walls, the fort owes its principal security, and the neighbouring negroes dependent on the company, a protection against the incursions of the Fantins. The interior parade, which is raised twenty feet, forms a quadrangular space, cooled by gentle refreshing sea-breezes, to which it lies open, and is agreeably situated on account of its having in view Queen Anne's point, and all the shipping in the road of Anamaboa. This platform is defended by three pieces of large cannon; and the three other sides of the square contain spacious and handsome lodgings, with offices, and other conveniences; particularly on the south side is a handsome chapel. Three pieces of artillery on the platform, command the road and its entrance, nor is the landing-place less exposed to the fire of the musketry behind the rocks. The fort has four bastions, mounted with twenty-nine pieces of cannon. On the battle-

battlements are ten more, and upon the wall towards Tabora are six, which are of no other use than to keep those negroes in awe.

The prospect of this fortress is extremely beautiful towards the sea; the fortifications are happily imagined, and all the assistance that art could give is added to nature. You enter it by a large gate, that leads to the square parade just mentioned, which is capable of receiving five hundred men drawn up. The four bastions have a communication with each other, by covered ways and curtains, forming a beautiful chain of batteries of fifteen cannon pointed towards the road. According to Smith, all the artillery of the fort amounts to forty pieces of large cannon, exclusive of demi-culverins; and Phillips says, that the garrison is composed of an hundred men. The gates are shut every evening at eight o'clock, and defended by a regular guard.

The soldiers at Cape Coast are lodged in the best barracks of any upon the coast of Guinea, and daily receive their pay in gold dust. There are likewise convenient apartments for the slaves, with forges for smiths, sheds, and workhouses for carpenters and other mechanics, with a convenient public kitchen.

The first story is ornamented with a handsome balcony, which extends the whole length of the front, and the counting-house is large and convenient. Near the gate is a prison for murderers, traitors, and other criminals convicted of capital crimes, where they are detained till an occasion offers of sending them to take their trials in England. In short, there is cut in the rock beneath the platform, a large vault for the confinement of slaves; an horrid dungeon divided into a number of cells, so contrived as to prevent their revolting, or forming conspiracies. None are confined there but such as are purchased for exportation; an iron grate in the roof serves to admit the air, and as much light as is thought necessary, and the number of ships which frequent the coast prevent those unhappy wretches being so long detained as to contract the distempers that proceed from close confinement. The cistern for preserving the water by which the fort is chiefly supplied, is hewn out of the rock, and is capable of holding four hundred hogheads.

The company's gardens are said to be no less than eight miles in circumference, but are without walls, or any other inclosure. Here the soil is fertile, and produces all the fruits found in warm climates, as citrons, plantains, lemons, oranges, bananas, tamarinds, pine-apples, cocoa-nuts, cinnamon, mangos, water-melons, cucumbers, and all kinds of sallads and roots. It is thought that the cinnamon-tree would grow here to great perfection, were it properly cultivated. When Phillips was at Cape Coast, the African company had two gardens, the first a large one, which is probably that mentioned by Smith; the other the pleasure-garden of the factory, in which they had a pleasant summer-house, whither the gentlemen of the fort used frequently to retire.

The country is filled with mountains, which, without having any extraordinary height, render the vallies narrow by their standing so close to each other. They are over-run with a sort of low thick briar, that renders them impassable, except where the paths are cut. The negroes do not cultivate one tenth part of the ground, and six months interruption will produce a new crop of briars in the places they had entirely cleared.

The English have built two forts in the neighbourhood of Cape Coast, the one called Phillips's Tower, and the other Fort Royal, or Queen Anne's Fort; each of them are three quarters of a mile distant from Cape Coast, the first standing on an eminence on the side of the garden, south-east of the fort. In Bosman's time, Phillips's tower was garrisoned with six men, and intended to keep the negroes in awe, and to guard against the incursions of the neighbouring nations, by means of some pieces of cannon.

Queen Anne's fort stands near the village of Manfro, on a hill called Danistein, where Fredericksburgh formerly stood. This is a square building mounted with sixteen pieces of cannon, twelve of them on a platform, and guarded by six white men, and an equal number of

blacks. According to Des Marchais, it is accessible only by a crooked path, that forms a kind of spiral street, on each side bordered by negro huts.

The town of Manfro is of an oval form, situated on the banks of a river, and almost inaccessible, by its being surrounded by rugged rocks. The inhabitants are constantly employed in agriculture, fishing, and making salt.

In the kingdom of Fetu is also the Dutch fort of La Mina, or St. George Elmina, a name which it received from the Portuguese, but on what account is not easily determined, as there are no mines in the country. Bosman however supposes, with great probability, that the name rose from the great abundance of gold sent thither from the interior country, which made them imagine that it was produced in some neighbouring mines. The natives call the town Oddena; but the Europeans in general give it the Portuguese name. It is of great length, but narrow, and the houses are built of stone, hewn out of a neighbouring rock. It stands on the river Benja, in five degrees twenty minutes north latitude, upon a low flat peninsula, formed by the sea on the south, the river on the north, Commendo on the west, and the famous citadel of St. George Elmina on the east. Towards Commendo it is fortified by a strong wall of large stones, brought from an adjacent rock, a deep ditch, and several pieces of cannon mounted on each side of the gate. The wall extends from the sea to the banks of the river which separates the town from a fort on mount St. Jago, called Conradsburgh, which the Dutch built for the security of Elmina, on a situation that commands both the town and their chief factory.

The natives of this town are well limbed, of a robust and warlike disposition, but more civilized than other negroes, from their familiar acquaintance with the Europeans. They are usually employed in trading, fishing, and making palm wine and oil. They bring their fish to market about noon, and pay the Dutch a fifth by way of custom. Their commerce extends along the coast even to Whidah.

In Elmina are a considerable number of neat artists, who work in metals in a manner little inferior to the artists of Europe. They cast and carve in gold and silver, make sword hilts, buttons, plain or filigree rings, chains, and other ornaments, and are acquainted with the method of cutting, grinding, and polishing glass and crystal, and of giving them all shapes and forms. They have great address in adulterating gold, and pretend that they learned that art from the Portuguese; but if this be true, they greatly excel their instructors.

The town contains about two hundred houses, in most of which are some mechanics. It is divided into three districts, each of which has its particular privileges, and is governed by a chief, whom the negroes call brasso, under whom are caboceroes, and certain inferior officers, who, in ordinary cases, are the ministers of justice. The three chiefs, with their councils, form the regency and legislative part of this small republic.

The citadel of Elmina, which stands in the center of the Gold Coast, is commodiously situated for the purposes of trade, and the security of the traders. It is seated upon a rock, and is bounded on one side by the ocean, and defended by strong bastions. The building is square, surrounded by a high stone wall, cannon proof. The fort, exclusive of the out-works, is forty yards in length, and thirty-two in breadth, encompassed by four grand bastions, or four interior batteries, two of which point towards the sea, and are of a prodigious height, the peninsula on which they stand being there a high perpendicular rock: the other two front the river, where the land descends by a gentle declivity. Upon these four batteries are mounted forty pieces of heavy cannon, with a greater number of swivels and pateraroes. A little below stands another battery of large iron cannon, chiefly used for salutes and public rejoicings.

On the land side are two canals formed in the rock, serving for the security and convenience of the citadel, which they supply with fresh water, at the same time

that by means of a draw-bridge and two redoubts, mounted with eight pieces of cannon, it is rendered in a manner inaccessible. As it is here least fortified by nature, art has supplied that defect by portcullises, strong barricadoes, and iron rails of prodigious weight. The guard-house, which is placed just behind, is a strong building, well defended with swivels, and a number of slits in the walls, by which the musketry have the entire command of the river.

The principal building is a magnificent square stone house, the upper part of which is appointed for the residence of the governor, and to his apartments is a grand flight of steps of black and white marble. On the top are placed two swivels, and a variety of smaller artillery, defended by a strong guard of soldiers. In the way thither is a fine long gallery, beautifully ornamented with stucco work, and with Venetian windows handsomely glazed. There is a spacious chapel, with a rich altar, where prayers are said every day, and all the officers are obliged to attend under the penalty of forfeiting about a shilling for each time of absence, and double that sum on Sundays and Thursdays. The infirmary for the sick and wounded, which is placed along the ramparts by the river side, is capable of containing an hundred persons, and is attended by the surgeons of the fort. The magazines for stores, provisions, and merchandize, are large, convenient, and always well stocked; nor is the factory, or the residence of the agents neglected, where there are accommodations for sixty persons, the number of servants, exclusive of soldiers, retained by the company. All merchandize and goods enter the fort by a gate towards the sea, where is erected a crane and other machines for unloading the ships. In short, Smith affirms, that this citadel is larger, more convenient, and beautiful than Cape Coast; but less pleasant on account of the situation.

On the north side of the river Benja is Fort Conradburgh, which stands on Mount St. Jago: the fortifying of this hill was judged necessary for the security of Elmina, though, if it once fell into the hands of an enemy, they would soon oblige that citadel to surrender. The fort of Conradburgh is of a quadrangular form, with a strong bastion at each angle, and a curtain between each, built of stone, twelve feet high, behind which are four batteries mounted with forty-eight cannon. The interior edifice consists of a tower that commands all the adjacent country, and affords commodious lodging for the garrison, which consists of twenty-five soldiers, with their officers, who are relieved every day from Elmina; and upon extraordinary emergencies are increased to double the number.

As this is a post of the utmost importance, it is always well supplied with stores and provisions, and the fortifications kept in constant repair. On the side next Elmina it is of easy access, a fine road being cut with an easy ascent out of the rock; but it cannot there be attacked by an enemy, who would be between two fires, that from Elmina and the post of St. Jago. But towards Fetu and Commendo nothing can be stronger than the situation, which is a high perpendicular rock. The bridge over the river, which forms the communication between the two forts, is in the Dutch taste, with a draw-bridge in the middle.

Below Mount St. Jago, on the north side, the Dutch company have a very fine garden, enclosed by high stone walls, and divided into beautiful alleys and parterres by rows of orange, lemon, cocoa, and palm trees. They have here all the fruits, pulse, and roots that are natives of the country, as well as those that are the natural growth of Europe. In the center is a magnificent dome, or temple, encompassed by lofty trees that afford the most delightful cooling shade and fragrance.

S E C T. XVIII.

Of the Kingdoms of Commendo, Jaby, and Anta; with their Towns and European Forts.

THE kingdom called by travellers Commendo, Commany, Agnesto, and Guaffo, is situated to the east

of Fetu, and extends about five miles along the sea coast, and about as much up the country. This kingdom produces but little rice, yet the valleys are no less fertile than agreeable; and the hills are covered with wood, which affords the most delightful prospects. In the center on the strand stands Little Commendo, or Commany, behind which the land rises by a gentle ascent into little hills beautifully clothed with woods of a perpetual verdure; and at the bottom are meadows and plains disposed in the most agreeable manner, and filled with fruit-trees of various kinds.

The natives, who are of a warlike disposition, are so numerous, that the king is able to raise in this little kingdom an army of twenty-thousand men, and his usual guard is composed of five hundred stout fellows well armed.

We shall begin with describing Little Commendo, which stands upon the banks of a fine rivulet that discharges itself into the sea, where there is a little oblong harbour for canoes. The natives are in general turbulent, cunning, and deceitful, much addicted to lying and stealing. They are chiefly employed in fishing or in commerce, and their neighbours employ them as brokers and factors. Every morning seventy or eighty large canoes may be seen upon the coast fishing or trading with the European ships in the road. About noon, when the south-west winds begin to blow, they put to shore, for the facility of unloading, and securing a market for their cargoes, either at Great or Little Commendo; whither the inland negroes assemble with the commodities of their several countries; and no markets upon earth are better supplied with all sorts of grain, fruit, pulse, roots, and fish.

Here the English and Dutch have forts: that of the former is a regular spacious square, with twenty-four pieces of iron cannon, and is well supplied with water. According to Smith, this is the principal fortification the English possess on the Gold Coast next to Cape Coast, and is defended by a garrison of sixty men, including negroes. The Dutch fort of Wedenburgh is only a musket-shot distance; but the advantages arising from so near a vicinity have been destroyed by the quarrels and jealousies of both nations, who, according to Smith, never live upon a footing of friendship.

The fort of Wedenburgh was built in 1688, and is a square building, defended by good batteries capable of mounting thirty-two pieces of ordnance. In 1695 it was attacked by the negroes in the night, at a time when twenty out of the small garrison, commanded by Bosman, were laid up with sickness; but, after an engagement of five hours, they were repulsed with considerable loss. Though the negroes poured their shot into the embrasures, which could not be close shut, they were such bad marksmen that Bosman lost only two men: but they returned a second time to the charge, resolving to enter sword in hand. Bosman sent for relief to Elmina, and a seasonable reinforcement arrived just as the negroes were cutting down the port-holes with their swords. An obstinate engagement ensued between this detachment, which endeavoured to force a way into the fort, and the negroes, who strove to oppose them. After a warm action, which lasted only half an hour, the Dutch were defeated; but a considerable number of them finding means to enter the fort, the spirits of the garrison were raised, and the negroes discouraged from prosecuting the siege. Bosman asserts, that his gunner had the treachery to nail up his cannon, which had like to have occasioned the loss of the fort. When the siege was raised, this villain, who had so basely acted contrary to his trust, was sent in irons to Elmina to be punished according to his deserts; instead of which, the director-general not only set him at liberty, but promoted him to a place of greater trust and profit.

The chief commodities for which there is a great demand by the negroes of Commendo, are glass beads, woollen stuffs, linen cloths, brass bells, and buttons; but these articles are sold only by retail, and such a variety of factors, brokers, and agents are employed by these negroes as makes trading with them very tedious. When they are at war with a neighbouring nation, great profit may be made by trading thither for slaves; for they

they hurry to dispose of their prisoners, in order to save the expence of maintaining them.

A little farther to the west lies the country of Jaby, or Jabab, where the king is so poor that Bosman advised the European merchants not to trust him with goods to the value of ten pounds sterling, not from any distrust of his principles, but of his ability to pay. The fertility of the soil would soon enrich the inhabitants, were they not exposed to the continual inroads of their neighbours, who spoil and destroy what they are unable to carry away.

Anta, which lies farther to the west, is bounded on the north by the country of Adom, on the west by Axim, and on the south and south-east by the ocean, it extending about ten leagues from east to west. The country is mountainous, and covered by large trees, among which stand a number of villages. The land is well watered; the valleys rich and extensive, producing abundance of rice, the best sort of maize, sugar-canes, yams, and potatoes. The soil along the banks of the river of Bourtry is as fine as can be met with in any part of the earth, and the country is equally rich and beautiful; but by the continual wars in which the people have been engaged with Adom and their other neighbours, they are far from being a potent and populous people, as they once were; the country is thinned of its inhabitants, and these are become entirely dispirited, sheltering themselves under the cannon of the Dutch fort, and leaving the greatest part of the land uncultivated. Every thing is, however, exceeding cheap; and this country enjoys the advantage of having the most healthful situation on the coast.

The most considerable villages of this country are Bourtry, or Botro, Tocarary, Suconda, Anta, and Sama, all of which deserve particular notice. The river that washes Bourtry is navigable for only four miles up; its banks are covered with stately trees that spread a melancholy shade over the water; and, where it ceases to be navigable, its course is interrupted by rocks and prodigious falls of water, which, though they diminish the conveniency of that river, add to the beauty of the scene. On both sides you see infinite numbers of apes, tygers, wild cats, and some elephants; and also horses, cows, sheep, hogs, fowls, and a great variety of birds of different species. Its waters are filled with delicious fish; but the catching them is rendered dangerous by the multitude of crocodiles and sharks with which the river is infested.

Bourtry is situated upon this river, at the foot of an eminence, on which the Dutch have built an irregular and mean fort, of an oblong form, divided into two parts, each defended by four small pieces of cannon. This fort is called Badenflyn: its batteries command the village of Bourtry, which has no other commerce than the gold trade carried on with the negroes of Adom. The inhabitants, who are of a mild and gentle disposition, are fond of the Europeans, whom they regard as their protectors.

Tocarary, or, as it is called by the English, Tocarado, is the principal village on the coast. It is situated on a hill which advances into the sea, and is surrounded by a number of rocks, some below and others above the surface of the water, for two miles along the shore; and those rocks are rendered very remarkable by the prodigious waves that dash against them. The town, which lies behind these rocks, is on the land-side embellished with plains and delicious valleys, with large trees and thick groves. Here was a fort which successively passed through the hands of the Portuguese, Danes, Prussians, Dutch, and English; but only the ruins of it are now to be seen.

The inhabitants of Tocarado are said to build the best canoes of any in Guinea; these are frequently thirty feet long and eight broad, formed of the trunk of a single tree. The European ships who frequent these coasts usually load and unload with these canoes, which are in such reputation, that they are never sold for less than forty or fifty pounds sterling.

Suconda is a rich and pleasant village about six miles distant from Bourtry, and before the wars which laid waste this country, was esteemed the finest village on the whole coast. The country for eight or ten miles round is as beautiful as can be imagined. The French had formerly

an establishment here, but the English and Dutch are at present the only Europeans who maintain forts at Suconda. That of the Dutch, which is called Orange Fort, was built in 1682; the English fort was erected a few years before. Both these forts were taken by the natives, and recovered from them; but in the year 1700 there remained only the walls of the English fort; but though the Dutch possessed the whole trade, they drew but little advantage from it, because the efforts of the English to restore themselves greatly disturbed their operations. At last, however, a re-establishment was effected, and a new fort rose out of the ruins of the old, with more splendor and strength than the former. Smith represents it as larger and better fortified than Dick's Cove: it is of a quadrangular form, situated upon an eminence about fifty paces from the sea, between the Dutch forts of Tocarado on the west, and Sama on the east. It is built of brick, and mounted with several pieces of cannon, the garrison consisting of five white and twenty black men. The Europeans at Suconda enjoy this advantage, that as the fort stands so near, the factors of both nations, when they live in friendship and harmony, have constant opportunities of enjoying each other's company, an advantage of inestimable value to social beings placed in a barbarous and ignorant country.

Sama is situated on an eminence, and its fort watered by the river St. George, that discharges itself into the sea. This town consists of about two hundred houses, which seem to form three villages, one of which is under the cannon of the Dutch fort of St. Sebastian. The sole employment of the natives is fishing.

The Dutch fort is built nearly upon the same plan as that of Bourtry, the apartments are convenient, and the situation for trade exceeding favourable.

S E C T. XIX.

Of the Country of Axim; the Manner in which it is governed, and of the European Forts in that Country.

THE next country to the west is that of Axim, which was formerly a powerful republic; but on the arrival of the Brandenburgers, one party, in expectation of an easier government, put themselves under the protection of those strangers, while the other adhered to the Dutch. This country produces a very great quantity of rice, ananas, water-melons, cocoas, bananas, lemons of two different kinds, with abundance of other fruit, and vegetables of all sorts; and the country is subject to almost continual rains. The natives export rice to all the kingdoms of the coast, bringing home in return palm oil, millet, yams, and potatoes. Axim also produces great numbers of cows, sheep, goats, and tame pigeons, as well as other fowls. The country is filled with populous villages, some of which are by the sea-side, and others far up the country. The intermediate lands are well cultivated, and the soil is so fertile, that it richly repays the labour of the husbandman.

The capital, which is named Achombone, stands under the canon of the Dutch fort, and behind is secured by a thick wood that covers the whole declivity of a neighbouring hill. All the houses are separated by groves of cocoas and other fruit-trees, planted in parallel lines, each of an equal width, and forming an elegant vista. These avenues, with the extensive prospect, renders the Dutch fort one of the pleasantest establishments in Guinea. This advantage is greatly diminished by the moisture of the air and the unhealthiness of the climate, particularly during the rainy season.

The government of this little republic is composed of two bodies of the natives, the caboceroes, or chiefs, and the maneroes, or the commons. The cognizance of all civil affairs belongs to the caboceroes, but whatever is of general concern equally comes under the cognizance of both members of the state. Thus, making peace or war, treaties or alliances, imposing taxes, levying or paying tributes to foreigners, are determined upon by both bodies composing the legislative power. Their constitution seems to have some resemblance to that of Britain, where nothing passes into a law that has not the assent of both the lords

and commons. These last in some respects enjoy superior privileges to the caboceroes, who are often impeached before the bar of the commons; but no maneroes can be tried for crimes of a public nature, but by their own assembly. However, in common affairs justice is usually administered by the caboceroes, who are said to be greatly influenced by the bribes that are offered them, which they receive, and (except in very notorious cases) usually decide in favour of him who brings the most gold or brandy.

The plaintiff, sometimes finding that the sentence will be either tedious or unfavourable, redresses himself by seizing on the gold or slaves of the aggressor; but in this method of retaliation keeps strictly within the bounds of justice, apprehending no ill consequence, provided he does but live in another town or village, where he is sure of being supported by his townsmen. Thus a private quarrel is often terminated by a civil broil, which can be no otherwise appeased than by the sword, or an agreement between the original opponents. Should the sentence of the caboceroes happen to be equitable, or the cause be decided by the Dutch governor, the dispute is amicably concluded; but if neither party produces sufficient evidence by witness, or probable circumstances, the defendant, who clears himself by oath, is acquitted. The oath of purgation is always preferred to that of accusation; but if the plaintiff proves his charge by two, or even one witness, the purgation oath is not permitted to be taken.

All crimes are atoned for by fines; but murder is punished either by death or a pecuniary mulct. The former is however seldom executed, except where the criminal is poor. These fines are of two sorts, that for the murdering of a slave being trifling in comparison of that exacted for the life of a freeman. At Axim all fines are paid into the hands of the Dutch factor, who in a manner assumes the supreme executive power. These fines he distributes to the injured person, after having first deducted his fee, which is no more than eight crowns for determining the most important suit that comes before him.

The only punishment for theft is restitution, and paying a fine proportioned to the quality of the offender; but in cases of debt the creditor may seize the property of the debtor, to the value of double the sum due to him; but the execution of this law being esteemed oppressive, they usually settle the account by arbitration, or by restoring the goods bought.

The Dutch fort of St. Anthony stands on a high rock, which projects into the sea in the form of a peninsula, and is so environed on that side by dangerous shoals and funk rocks, as to be inaccessible to an enemy, and by land it is fortified by a parapet, a draw-bridge, and a battery of heavy cannon. The building is but small, on account of the narrowness of the rock on which it stands; but it is neat, strong, and commodious. At some distance at sea it resembles a large white house; but for two miles along the shore nothing can be more agreeable than the fort in perspective with the village of Achombone, the wood behind, and the multitude of rocks of unequal heights, which border upon the coast.

This fort is of a triangular form, and has three batteries, one towards the sea and two towards the land, on all which are mounted twenty-four pieces of iron cannon, besides redoubts. The gate is low, and secured by a ditch hewn out of the rock, and, as hath been already mentioned, a draw-bridge, behind which is a platform capable of holding twenty men ranged in military order. The house of the factor, or president, is of brick; it is of the same form as the fort, and has three fronts, each of which has an esplanade adorned with orange-trees. The garrison is generally composed of twenty-five white men, and an equal number of blacks, under the command of a serjeant.

Three leagues to the east of Achombone is Mount Manfore, near which is a large and populous town called Pockeso, where each house is surrounded with a grove of cocoa-trees. Mount Manfore is an excellent situation for a fort, it being the first point of Cape Tres Puntas; and here the Brandenburgers or Prussians have their principal factory called Fredericksburgh. This fort is extremely well built, strong, and beautiful, mounting forty-six cannon

upon four batteries. But Bosman observes, that the cannon are too small, considering the importance of the settlement, and the gate too large. On the east side is a beautiful out-work; yet it only serves to diminish the strength of the fort; its greatest fault is the breast-work's being too low; for as it reaches no higher than the knee, the garrison, in case of an attack, would be exposed to the fire of the enemy.

According to Des Marchais, this fort was quitted by the Prussians in the year 1720, when they put it into the hands of the king of Cape Tres Puntas; soon after which the Dutch attacked the place, under pretence of a prior contract with the Prussians; but the king received them with such spirit and address, that after the loss of a hundred and fifty-five men, they were forced to quit the siege, and embark with great precipitation: but some time after the Dutch made a more successful effort, took it from the natives, and have kept possession of it ever since.

Cape Tres Puntas received its name from the Portuguese, on account of its being composed of three points projecting into the sea. These points, which are little hills, are separated by small bays that afford good anchorage, and each of the hills is covered with beautiful woods, which are seen at sea at a great distance. Upon the shore of the two bays are three villages, Acora, Acron, and Infiamma; to the last the English give the name of Dick's Cove. The village of Acora is situated at the bottom of the most westerly bay, Acron on the declivity of the middle point, and Dick's Cove on a small gulf formed by the land between that point and Acron. All this coast is mountainous and woody; the most esteemed timber it produces is a yellow tree much used in tables, chairs, and other household furniture.

Near Acora stands the little fort of Dorothea, which consists of one flat-roofed house, defended by two batteries of ten guns each, and divided into a great variety of convenient apartments.

Dick's Cove is situated two miles to the east of Dorothea. It borders on the sea, is of a quadrangular form, built of stone and mortar, and is described by Smith as a complete and regular fortification, with four bastions, mounting twenty pieces of ordnance, and adorned with gardens equally pleasant and useful.

S E C T. XX.

Of the TOOTH COAST.

Its Situation, Name, and Division; its Vegetables; the Face of the Country, and the Animals; with a Description of the Sea Devil, the Zingana, and the Sea Bull, or Horned Fish.

WE come now to the third division of Guinea, called the Ivory or Tooth Coast, which takes its name from the elephants teeth found here, and is bounded by Nigritia on the north, by the Gold Coast on the east, by the ocean on the south, and by the Grain or Pepper Coast on the west; but both geographers and seamen are divided in their opinions concerning its extent and limits, some confining it between the river Suera da Costa and Grova, two miles to the east of Cape Palmas; but others stretch its boundary from the last-mentioned cape to Cape Tres Puntas, or Three Points, all that shore being known to mariners under the name of the Tooth Coast. Others again represent its limits as contained within Cape Apollonia to the east, and Cape Palmas to the west.

Cape Apollonia, thus called by the Portuguese from their discovering it on St. Apollonia's day, stands, according to Des Marchais, in four degrees fifty minutes north latitude, half way between the river Suera da Costa and Cape Tres Puntas. It is remarkable for its height, and the lofty trees with which it is covered. It points a little southward, appearing low along the shore, and rising behind into three lofty mountains, that in clear weather may be seen at a great distance at sea. Upon each of these mountains are groves, and in the intermediate valleys are three or four pretty villages built close to the sea-side. In general, excepting a few capes, all the coast from Cape Apollonia is so low, equal, and straight, that it is difficult for ships to distinguish places; and,

and indeed, besides these capes, the only distinct landmarks are the heights and mountains round Drewin.

The Tooth Coast is by some authors divided into the Quaqua, the Malagantes, and the Ivory Coast.

The Dutch have given the eastern part of this coast the name of Quaqua, from the natives, on their seeing a ship approach, repeating that word, which Villault imagines expresses a kind of welcome, and observes, that the master of an entertainment usually repeats it to his guests; but Smith affirms, that Quaqua, in the language of the country, signifies no more than teeth or ivory.

All the countries within the limits of the Ivory Coast are fruitful in rice, pease, beans, cocoa nuts, oranges, citrons, and gooseberries; and the natives frequently bring on board large sugar-canes, which is a proof that sugar might be cultivated there to advantage. The Ivory Coast is indeed one of the finest divisions of Guinea, the prospect of the mountains, and vallies filled with villages, is very delightful, most of those little towns being encompassed with groves of lofty palms and cocoa-trees. The soil of the high lands is a reddish earth, which, with the perpetual verdure of the trees, forms an agreeable mixture of colours. Cotton and indigo are the spontaneous growth of the provinces of St. Andrew and Great Drewin, which are indeed the richest of the whole. Palm wine and oil are very plentiful, as is also a species of fruit that grows on a kind of palm-tree, called by the natives tombo. This they eat with great pleasure, drinking at the same time a wine drawn from the same tree mixed with water; for its strength is said to render it unfit for being drank alone.

In this part of Guinea are elephants, which are very numerous in the inland countries; there are such numbers of cows, sheep, goats, and hogs, that they are sold for a trifle; and the coast supplies the natives with a great variety and abundance of fish: but the most remarkable are the sea-devil, the zingana, and the sea-bull.

The sea-devil is said to be about twenty-five feet long, and proportionably thick; but what is most remarkable are the angles which project from its body, and are of a hard horny substance. The tail, which is long and taper like a whip, is armed with a sharp point, which he frequently darts backwards, and his back is covered with hard excrescences two inches high. The head, which is large, is joined immediately to the body without the smallest appearance of a neck, and is furnished with flat teeth. Nature has bestowed on this animal four eyes, two of which are near the gills, and are large and round, but the two others on the forehead are of a smaller size. On each side the gullet are three horns of an equal length and thickness: that on the right side, which stands between the other two, is about three feet in length, and an inch and a half in circumference at its insertion, gradually terminating in a sharp point; but, as it is yielding and flexible, it is capable of doing little hurt, and affords but a feeble protection to the animal. In short, the flesh is tough and ill-tasted, though much sought after by the negroes.

The zingana is a voracious animal, with a flat head, large red fiery eyes, and two rows of strong teeth; the body, which is round, terminates in a strong tail covered with a tough skin, spotted and not scaly. The fins are strong, and assist him to dart with incredible rapidity at his prey. Nothing comes amiss to the voracious appetite of this animal; but he is said to be particularly fond of human flesh.

The sea-bull, also called the horned fish, is about three feet long, exclusive of the tail. His body is square, of an equal thickness at both extremities, it being every where about five feet in circumference. The head has some resemblance to that of a hog, but terminates in a proboscis, which is somewhat like that of an elephant; it has no other passage for its food than through this trunk, and nothing is to be found in his stomach but small fishes and sea-weeds. His eyes, which are large, are fringed with a kind of strong hard hair, and his forehead armed with two horns, which are bony, strong, rough, pointed at the extremity, and about six inches in length. His skin is rough, strong, and filled with pointed knobs; but not prickly or covered with shells. It is every where spotted with different colours, and has a

mixture of grey, violet, and white. On his back rise two excrescences about three inches high, which run from the base of the horns almost to the tail, which is composed of two parts, the one fleshy and covered with a continuation of the skin of the body, being in fact a part of the vertebrae of the back, but more flatted and pliant; the other a thick fin of a brown colour, streaked with parallel lines of white, and serves both for its defence and for a kind of rudder.

S E C T. XXI.

Of the Persons, Manners, Customs, and Trade of the Inhabitants of that Part of the Tooth Coast called Quaqua.

THE natives of the eastern part of the Ivory Coast, called Quaqua, are rather above the common stature, clean-limbed, and well-proportioned; at the first glance their features appear hideous, but, notwithstanding the prejudices naturally conceived from their disagreeable aspect, several authors agree in representing them as the most rational, civilized, and polite people in all Guinea; and this character they also bear among all their neighbours.

They drink a kind of beer called piro, and wine drawn from the Tombo palm, mixed with water; and Des Marchais says, that drunkenness is among them a crime of so odious a nature, that the laws have prohibited it under the severest penalties; it being a maxim among them, That to destroy one's reason or health is to level man with the brute, to prejudice society by robbing it of its useful members, and to destroy the effects of all laws and government; for a man void of reason cannot be influenced by laws, as he is ignorant of the propriety of his actions. Their food is, however, said to be very coarse and indelicate, and to be principally composed of different mixtures of rice, fish, fowl, kid and elephant's flesh, all kept till they stink.

They are said to look upon long nails as a great ornament, to dress their hair in tresses, which they keep separate by a paste of palm oil and a kind of red earth; and they daily anoint their bodies with the same kind of paste. They wear round the small of their legs large rings of iron, and are charmed with the jingling sound of those rings and of bells fastened to them, in the multitude of which consist all their dignity and grandeur.

The common people have no other cloaths but a piece of cloth fastened round the waist; but the wealthy have a sort of cloak, or surplice, with long sleeves, which hangs down below their knees; and by their side they wear a hanger, or short sword.

Their women, according to Villault, setting aside their complexion, which is jet-black, would pass for beauties in Europe from the regularity of their features, the brilliancy of their eyes, and their tall, slender, genteel shape. Some of them adorn their hair with little gold plates, in the making of which the artists of that country endeavour to excel. These plates are sometimes large, but in general they are thin, small, and of little value; however, some women wear such a number of these trinkets, that the whole is worth a considerable sum. Those who are unable to adorn their heads with such splendor, divide the hair or wool into an infinity of small tresses, which they adorn with ivory, bougies, or cowries, pieces of oyster-shells, and other shining bangles, which are also worn by those who have plates of gold. The only dress of the women is a cloth without any particular form, and which falls over the fore part of their bodies, the back being entirely naked.

These negroes have an aversion to the custom which they observe among the Europeans, of the men kissing each other after a long absence, or at parting; this they consider as an unnatural action, and an affront to the other sex. Their form of salutation is laying hold of the fingers, and making them crack.

It is here, as well as in India, a constant rule, that the son follows the profession of his father, the son of a weaver being always bred a weaver, and that of a smith, a smith. This regulation is so firmly established, that the whole country does not perhaps furnish a single

instance of the contrary; but this custom is so far from improving them in the knowledge of the mechanic arts, that they are still but very indifferent workmen; and, according to Atkins, a common lock is such a curiosity, as to draw a whole country together to see it; a watch still increases their admiration, and making paper speak, as they term it, is quite miraculous. If they are sent with a note, and told the contents before they go, they frequently make the experiment, whether the Europeans deceive them, in pretending to interpret the thoughts of an absent person by those crooked characters. This they do, by asking the contents; but their surprize is inconceivable on hearing the note read. Of this they can form no idea, and they are ready to believe, that the white men have some familiar spirit that acts as factor or broker on these occasions.

The usual trade carried on here consists of ivory, cotton cloths, gold, and slaves. All the countries behind Quaqua furnish great store of elephants teeth, and this is esteemed the most beautiful ivory in the world; whence it is constantly bought up, as soon as brought to the coast, by the English, French, Dutch, and sometimes by the Danes and Portuguese; but though the commerce of this country is free to all nations, the English and Dutch enjoy the greatest share of it. The inland countries so abound with elephants, that notwithstanding the perpetual war waged against them by the negroes, the elephants are so numerous, that according to several authors the natives are forced to dig their habitations under ground. However, their number is said to have been greatly diminished by a distemper that has crept among them, and made terrible havoc, as well as by the constant endeavours of the natives to extirpate them.

According to Villault, the negroes manufacture a sort of strong stuff, striped blue and white, three quarters wide, and about four ells long; and as these sell well on the Gold Coast, the Europeans purchase them here for that market.

The country produces abundance of good cotton, which the negroes of the interior countries manufacture. The cotton pieces made here are not only extremely fine, but beautiful in their colours. The negroes on the coast act as brokers for those of the inland countries, sell their stuffs for them, and receive a certain share by way of commission. The Quaqua negroes likewise manufacture a kind of plant resembling hemp into a strong cloth, to which they give beautiful colours, and such flowers and designs as shew them to be no bad artists in this way. They have also a very considerable trade in salt with their inland neighbours, to whom they sell it at a high price, on account of the distance and expence of carriage.

The Europeans divert themselves with seeing the canoes filled with men crowding round the ships, and each mouth uttering Quaqua, quaqua. One of them is no sooner hoisted on board, than the anxiety of the rest is extremely visible, from their looking about with the utmost impatience, as if waiting the fate of their companions. It is, indeed, with extreme difficulty that any of them are induced to come on board. It is probable, that some outrages have been committed by the Europeans, which have ever since inspired them with fear and suspicion. They are particularly afraid of the English, while they repose great confidence in the French. "It is certain, says Mr. Smith, that they never approach an English vessel without dread of being carried away into slavery:" whence it is probable, that some attempt of this nature has been made.

The natives usually come five or six in a canoe along the ship's side; but seldom more than one or two have the resolution to come on board, before they have seen how their companions are treated. They usually enter the ships two at a time, with a couple of elephants teeth, and other goods, and these return to the canoe before the rest leave it. Those who come first narrowly examine the ship, observe whether the sailors are armed, and what number of them are upon deck; but no intreaties can prevail on them to go below deck. When they have sold their goods they return, and let their friends know the usage they have received. Such dread

have they of fire-arms, that several of them flung themselves into the sea upon Smith's firing a gun to bring to a ship he had discovered in the offing; and he observes, that if they discover any arms on board, they instantly scud away to the shore with all possible expedition.

It is extremely difficult and tedious trading with a people so jealous and timorous, whose language is unintelligible to the Europeans, and all the European languages no less so to them. Every thing is transacted by signs, or placing a certain quantity of merchandize near the ivory or gold wanted in exchange. They are in general extremely fond of presents, however trifling, as if they considered them as pledges of esteem and affection. A knife not worth six-pence, a brass ring, a glass of brandy, or a biscuit, the richest negro will receive with pleasure; but the liberality of the Europeans seems to render them avaricious; Smith therefore recommends great caution in the manner of making these presents.

S E C T. XXII.

A Description of the River St. Andrew, the adjacent Country, and the Manners of the Natives.

AS the Europeans have no settlements on the Ivory Coast, and usually trade with the natives in their ships, a regular account of this country cannot be expected. The writers who have described it, have followed the method frequently observed in giving descriptions of countries they have never seen, by representing the natives as the most savage and barbarous, and particularly being fond of devouring all the white men whom they can get into their power; but the falsehood of such ridiculous assertions have been frequently demonstrated, by a better acquaintance with nations so misrepresented; for the people of many countries, who, when little known, were described as anthropophagi, or man-eaters, have been found to be friendly, benevolent, and enemies to cruelty; we shall therefore confine our observations of this country to such parts of it as are tolerably known.

The river of St. Andrew is a fine deep stream, increased near its mouth by being joined by another river. The entrance is surrounded by lofty trees, fine meadows, and rich fields of great extent. Nature seems to have intended this place for a fortress; for about five hundred paces from the mouth of the river, a peninsula extends a great way into the sea, and is joined to the continent by a slender neck of land, about five or six fathoms broad. The whole peninsula is a high level rock, and has a platform four hundred feet in circumference, that commands all the neighbouring country. It is surrounded almost entirely by the sea; the rock is perfectly steep and inaccessible on the south, east, and west sides; and the neck of land may be so easily defended, that a battery of five guns would render it impregnable. Besides, to the north of this neck of land there is a fine spring of fresh water, capable of supplying a large garrison, and of being secured by the cannon of a fort.

The land-marks in this place are so distinct, that it is impossible they should be mistaken. Here are lofty, thick, and shady trees, with three or four large villages that strike the eye all at once, they being within the distance of half a mile of each other. All the meadows and fields round the mouth of this river are watered by pleasant streams that fertilize the ground, and render it fit for producing all kinds of corn, fruit, and roots, especially maize, millet, rice, peas, yams, and melons. There are here fine natural groves of citrons, oranges, limes, and cocoa-nut trees, whose boughs are so closely intermingled, that all these several fruits might be imagined to be the produce of one large tree. Here the sugar-cane, with a thousand other plants, spring up in the greatest perfection without cultivation; but are abandoned to the ravages of the elephant, and afford a shelter for other wild beasts. In short, whatever the Gold Coast produces, is found here in greater abundance and perfection.

As to the natives of this part of the Ivory Coast, the men, like those we have just described, are well-made; the women are small, but neatly proportioned; their features are regular, their eyes lively, and their teeth white, small, and even. The men wear a loose dress, resembling a surplice, which reaches to the knees, and the women a narrow cloth round their waist, but many go perfectly naked. The rich men wear a poniard or long knife by their sides, and are not deficient in courage and understanding; but the European traders having carried off some of them, they are become so suspicious, that nothing can prevail on them to come on board, before the captain of the ship has gone through the ceremony of putting a drop of sea-water in his eye, which they also perform as a kind of declaration, that they wish the loss of their eyes, if they are guilty of a breach of faith, and a solemn engagement that no injury shall be offered on either side; however, they cannot be prevailed upon to go under the hatches, or enter the cabin.

They are extremely fond of rings of ivory and iron, mounted with little bells, which they put round their arms, and the small of each leg. These bells give them an additional joy in dancing, of which both they and all the negroes are passionately fond. Every district has a particular mode of dancing, with different contortions and grimaces, which they prefer to those of their neighbours. It is said, that our best European masters would, in this country, pass for awkward and clumsy, and might find some attitudes and postures among the negroes which might improve their art. The women in general dance with a fine, easy, graceful air; but it is frequently intermixed with ridiculous and burlesque grimaces.

To the east of the river St. Andrew are at least a dozen craggy and broken hills, which stretch three or four miles along the coast; yet the intermediate fields being watered within this short space by near twenty little rivulets, they are rich and fruitful; and were the inhabitants more civilized or less timorous, no country on earth bids fairer for a profitable trade. The elephants must be of an enormous size, since many of their teeth weigh above two hundred pounds. Slaves and gold are likewise in great plenty; but the Europeans can never learn by what means they procure the latter; for this they preserve an inviolable secret; but if they are pressed to explain themselves, they point with their finger to the mountains on the north-east, intimating that it comes from thence.

There are several towns and villages along the coast, the most considerable of which appears to be that of Laho, which is situated on the cape of the same name, in five degrees ten minutes north latitude; and is equally distant from Cape Palmas and Cape Tres Puntas. Laho is a large and populous place, extending about a league along the coast, which is covered with a beautiful yellow sand, and against which the sea beats with great violence. The neighbouring country affords all kinds of provisions, which are here extremely cheap; and the natives, who are of a mild, tractable, and gentle disposition, are visited by traders of all nations.

On the east side of Cape Laho, between two villages, the one called Jack a Jack, and the other Corby Laho, is a small lake of salt water, to which the English and Dutch have given the name of the Bottomless Pit, from its extraordinary depth, several unsuccessful attempts having been made to sound it; but at length it was found to be no more than sixty fathoms, its supposed depth arising from a current at the bottom, which carried away the lead faster than they could furnish line.

S E C T. XXIII.

Of the MALAGUETTA or GRAIN COAST.

Its Name, Situation, Vegetables, and Animals; with a particular Description of Guinea Pepper. Of the Natives, their Persons, Manners, Language, Arts, and Government.

THE Europeans gave this Coast its name from observing that it produced this species of pepper in greater abundance than any other part of Guinea; and

indeed, the names of all the other parts of the coast were given from the chief commodities they afford. For instance, the Slave Coast is thus named from its furnishing a greater number of slaves than any other country; the Gold Coast, from the great quantity of that metal found there; and the Ivory Coast, from the prodigious cargoes of elephants teeth annually brought from thence by the Europeans; though slaves, gold, and ivory are purchased through the whole coast of Guinea, and there are few places which do not produce some of this pepper.

Strictly speaking, the Malaguetta, or Grain Coast, is contained between the river Sestos and Greva, a village two or three miles to the west of Cape Palmas, and extends about fifty miles along the shore.

The productions of the earth are pease, beans, gourds, oranges, lemons, bananas, dates, and a kind of nut with an exceeding thick shell, the kernel of which is esteemed a most delicious fruit, for which neither the natives nor Europeans have any name. The palm wine of this country is perhaps in greater perfection than in any other part of the globe. But what constitutes the principal wealth of the Grain Coast is the abundance of Guinea pepper it produces, for which they have a great trade, not only with all the neighbouring inland nations, but with the Europeans.

The plant on which this production grows differs in size, according to the nature of the soil, and other circumstances. It shoots up like other shrubs, and like ivy runs up some neighbouring tree: what grows upon the plant thus supported has a finer flavour, and a hotter and more pungent taste than what grows wild in the fields. The leaf, which is soft and pointed, is twice as long as it is broad, and in the rainy season has a delicate smell; soon after which it fades, and at the same time loses both its beauty and flavour; but the leaf and buds, when in perfection, on being bruised between the fingers, have an agreeable aromatic smell. Under the leaves and all along the stalk are small filaments, by which it fixes itself to the nearest tree. Its flower cannot be described, as it buds in those seasons when no trade is carried on with the coast. It is however certain, that it does flower; the fruit succeeds in long, slender, red shells, or pods, separated into four or five cells, and covered by a rind which the negroes believe to be poisonous, and is only a thin film that soon dries and crumbles.

Besides the Guinea pepper, this country produces another species of fruit, which resembles the cardamom both in its figure, taste, and quality. They have here also pimento, a species of pepper common in the West Indies, and known in England by the name of Jamaica pepper. The Dutch purchase it here in great quantities, and it is said that a fleet of five or six sail have sometimes left the coast with little or no other merchandize; but this trade is at present much declined. The English still purchase some Guinea pepper; but the chief commerce of the Grain Coast consists in ivory and slaves.

Cows, hogs, sheep, and goats are here in great plenty; as are also most of the other animals found in those parts of Guinea already described.

The people have in general handsome features, and are well shaped; their dress is a piece of cloth round the waist. When any of them travels out of his own little district, and is met by a stranger, they mutually embrace, closely pressing each others shoulders, and pronouncing the word towa; then they rub each other's arms up to the elbow, still repeating towa; after which they crack each other's fingers, and finish their extraordinary salutation with crying out, Enfanemate, enfanemate.

Their language is so difficult, that it is not only utterly unintelligible to the Europeans, but to the nearest neighbouring nations, none of whom are able to act as interpreters. The natives of this division are guilty of no excesses in eating or drinking; yet freely admit the Europeans to the beds of their wives and daughters: they are also said to be extremely addicted to stealing.

Among these people are some excellent mechanics, particularly smiths, who perfectly understand the art of tempering steel and other metals, making arms, and all instruments of steel; and they have workmen who build their canoes of different sizes upon certain regular principles.

ciples. Experience has taught them many useful improvements in husbandry, particularly with respect to the cultivation of rice, millet, and Guinea pepper.

Their taba-feil, or king, has an arbitrary and despotic power over his subjects, and never appears abroad but with pomp and magnificence. His people entertain for him certain implicit sentiments of natural submission, and that awe with which they would regard a superior being. Their religion is that of paganism; but they have some ideas of a future state, as appears by the ceremonies performed to the souls of the deceased. They welcome the new moon with songs, dancing, and diversions; and have a superstitious regard for their priests.

S E C T. XXIV.

A Description of the Country round the River Sestos, and its Inhabitants.

THE country round the river Sestos having been more accurately examined by Europeans than any other part of the Grain Coast, we shall give a concise description of it. Phillips, who took great pains in founding the different bays and creeks near the mouth of that river, observes, that the anchorage is very good and secure; but that the sea is rough, and the currents strong towards the south-east and the north-west of the channel: it is besides obstructed by blind rocks covered with six feet of water, and by two rocks that rise in sight. The true channel is between the rock that stands in the middle of the largest eastern branch, where the breadth is half a cable over, and the depth thirty seven fathoms; beyond which the river is broad, and ships of an hundred tons may securely anchor.

It is said that barks and small craft may pass about twenty miles up the river, after which it is filled with rocks and flats, that render it impassable to any other vessels but canoes. Its banks are adorned with fine trees, and planted with villages refreshed with streams of fresh water, that fall from the higher grounds, and discharge themselves into the river. All the country on both sides is extremely fertile, and abounds with wild fowl. Here is also found a beautiful kind of flint or pebble, which is said to be more transparent than agate; it resembles a diamond in hardness, and, when well cut, almost equals it in lustre.

Barbot, who in 1687 visited the king of the country, describes the place where he resided as a small town of thirty or forty houses on the banks of a pleasant rivulet; they were built of mud, and surrounded by a rampart of earth. Every house was at least one story above the ground-floor, some of them three, and all of them whitened with a lime made of calcined shells. Their floors are made

of rough beams, or branches of palm, laid close to each other, which renders it difficult walking across the upper rooms without stumbling. The roof is composed of the same materials, covered with banana and palm leaves. Barbot, to his great surprize, saw in the council chamber the figure of a woman holding an infant in her arms, cut in basso relievo.

The king, when Barbot was there, had an agreeable aspect, and a tender disposition, but a weak judgment. The town had hardly any other inhabitants besides the women, children, court, and slaves of the king. His wives and concubines amounted to thirty, one of whom was extremely well proportioned, and her arms, legs, and other parts of the body were marked with the figures of beasts and birds; ornaments which in that country are reckoned striking beauties. The king and all his children wore a cap made of osier twigs, the only badge that distinguished them from the subjects; for the children labour in the same employments as the meanest negro. The negroes of Sestos are extremely civil and obliging, a glass of brandy being a sufficient inducement or reward for the most important services. They are of a tall stature, well made, robust, and have a martial air; their courage is frequently exerted in their excursions against the neighbouring inland countries in search of slaves.

According to Des Marchais, the people never wear any covering on their heads, nor any thing more on their bodies than a small cloth before to cover their nakedness. Their diet is no less simple, their chief nourishment being from vegetables.

The sole employment of many of the natives is fishing, and every morning there are large fleets of canoes ranged along the shore for that purpose. Their usual method of catching fish is by a hand-line and hook, which they seldom draw empty out of the water.

The ships employed in the slave-trade touch at Sestos to take in rice, which they buy at the rate of two shillings per quintal in exchange. The European merchants send their merchandize to the council-room, such as copper vessels, lead, and powder, which they exchange for goats, fowl, and other provisions.

Authors have given a very particular account of the marriages and funeral ceremonies of those people; but as they all profess themselves both ignorant of the language, and but little conversant with the people, they can deserve but little credit; since they do not give us the least intimation by what means they acquired such knowledge of a people whom they cannot understand.

We have now taken a view of the west coast of what may properly be termed South Africa, and of the coast of Guinea; we shall therefore, before we proceed with the continent, describe the principal African islands within this compass.

C H A P. XII.

Of the Islands of ST. HELENA, ASCENSION, ST. MATTHEW, ANNABON, ST. THOME, PRINCES ISLAND, and FERNANDO PO.

S E C T. I.

Of ST. HELENA.

Its Name, Situation, Extent, Fortifications, Produce, Buildings, and Inhabitants.

ST. Helena, so named by the Portuguese from their discovering it on St. Helen's day, is situated in sixteen degrees south latitude, about six hundred leagues north-west of the Cape of Good Hope, almost in the mid-way between the continent of Africa and America; but is nearer to that of Africa, from which it is distant about twelve hundred miles.

This island is about twenty-one miles in circumference,

and consists of such high and mountainous land, that it may be discovered at sea at above twenty leagues distance. It is indeed formed of one vast rock, on every side as steep as a church steeple, and resembles a castle in the midst of the ocean: its natural walls are so high, that it is impossible to scale them; nor is there any landing, except at a small valley on the east side of it.

It is defended by a battery of forty or fifty guns, planted level with the water; and as the waves are perpetually dashing on the shore, it is always difficult landing even here. There is, however, one little creek where two or three men may land at a time; but it is now defended by a battery of five or six guns, and rendered inaccessible. There is no other anchorage about the

the island, but at Chapel Valley bay; and as the wind always blows from the south-east, if a ship over-shoots the island ever so little, she cannot recover it again.

Though the island appears on every side a hard barren rock, yet it is covered with earth a foot, or a foot and a half deep, and produces not only grafs but fruits, herbs, roots, and garden stuff; it is agreeably diversified with hills and plains, adorned with plantations of fruit-trees, and kitchen-gardens, among which are interspersed the houses of the natives. In the open fields are herds of cattle always grazing, some of which are fatted to supply the shipping that touches here, and the rest furnish the dairies with milk, butter, and cheese. The country also abounds in hogs, goats, turkies, and all sorts of poultry; and the sea is well supplied with fish. But amidst all this affluence, they have neither bread nor wine of their own growth; for though the soil is extremely proper for wheat, yet the rats which harbour in the rocks, and cannot be destroyed, eat up all the seed before the grain is well out of the ground; and though the vines flourish, and afford a sufficient quantity of grapes, yet the climate is too hot for making wine. Indeed no good wine is produced from grapes within the torrid zone, for neither very hot nor very cold countries are proper for that liquor.

Besides grapes, they have bananas, figs, plantains, and the other fruits usually produced in hot countries. They raise kidney-beans, and other kinds of pulse in their gardens; and the common people supply the want of bread with potatoes and yams.

A little beyond the landing-place, in Chapel Valley, is the fort where the governor resides, with a garrison; and in the same valley is a pretty town, consisting of forty or fifty houses, built after the English manner, to which the people of the island resort when any ships appear, as well to assist in the defence of the island as to entertain the seamen, if they are friends; for the governor has always sentinels on the highest part of the island to the windward, who give notice of the approach of all ships, and guns are fired to summon every man to his post. It is impossible for any ship to come in the night-time, but what has been discovered the day before. The above fort and the town, which has the same name as the island, is situated in six degrees thirty minutes west longitude from London, and in the sixteenth degree of south latitude.

The natives of this island are remarkable for their fresh ruddy complexion, and robust constitutions. In all other places near the tropics the children and descendants of white people have not the least red in their cheeks; but the natives of St. Helena have generally an agreeable mixture of red and white, and are pretty healthful, which is ascribed to several causes, particularly to their living on the top of a mountain, always open to the sea breezes, which constantly blow; to their being usually employed in the healthful exercises of gardening and husbandry; to their island being frequently refreshed with moderate cooling showers; and to there being no fens or salt-marshes to annoy them with their unwholesome steams. They are likewise used to climb the hill between the town in Chapel Valley and their plantations, which is so steep, that they are forced to have a ladder in the middle of it; whence it is called Ladder-hill, and they cannot avoid ascending it without going three or four miles about; so that they seldom want air or exercise, the great preservers of health.

As to the genius and temper of the natives, Mr. Salmon, who was there, assures us, that they seemed to him the most honest, inoffensive, and hospitable people he had ever met with, having scarce any tincture of avarice or ambition. He says he asked some of them, if they had no curiosity to see the rest of the world, of which they had heard so many fine things, and how they could confine themselves to a spot of earth separated from the rest of mankind, and scarce seven leagues in circumference: to which they answered, that they enjoyed all the necessaries of life in great plenty; they were neither scorched with excessive heat, nor pinched with cold; they lived in perfect security, in no danger of enemies, robbers, or wild beasts, and were happy in a continued state of health:

that as there were no very rich men amongst them, scarce any planter being worth more than a thousand dollars, so there were no poor in the island, and hardly a man worth less than four hundred, and consequently were not obliged to undergo more labour than was necessary to keep him in health: that should they remove to any other country, they supposed their small fortunes would scarce preserve them from want, and they should be liable to innumerable hazards and hardships, which they knew nothing of here but from the report of their countrymen.

There are about two hundred families upon the island, most of them English, or descended from English parents, and a few French refugees. Every family has its house and plantation on the higher part of the island, where they look after their horned cattle, their hogs, goats, and poultry, fruit, and kitchen gardens. They seldom come down to the town in Chapel Valley, unless it be once a week to church, or when ships arrive, when most of the houses in the Valley are converted into punch-houses, or lodgings, for their guests, to whom they sell their cattle, poultry, fruit, and garden stuff. But the inhabitants are not allowed to purchase any merchandize of the ships that touch there; for whatever they want of foreign growth, or manufacture, they are obliged to buy at the company's warehouse, where they may furnish themselves twice every month with brandy, European or Cape wines, Batavia arrack, beer, malt, tea, coffee, sugar, china, and Japan ware; woollen cloth and stuffs, linen, calicoes, chintz, muslins, ribbons, and all manner of clothing; for which they are allowed six months credit. English money and Spanish dollars are the coin chiefly current here.

There is said to be no town, either in England or in any other part of the world, where there are fewer disorders committed than in that of Chapel Valley; for tho' the people appear with an air of freedom, not known in other governments, yet an exact order and discipline are observed, and universal quiet and satisfaction seem to reign in the island.

The history of St. Helena may be contained in a few words: it was discovered in 1502 by the Portuguese, who stored it with hogs, goats, and poultry, and used to touch at it in their return from India for water and fresh provisions; but it does not appear that they ever planted a colony here; or if they did, they afterwards deserted it, and the English East India company took possession of the island in 1600, and held it without interruption till the year 1673, when the Dutch took it by surprize. However, the English, under the command of captain Munden, recovered it again within the space of a year; and, at the same time, took three Dutch East India ships that lay in the road. The Dutch had fortified the landing-place by batteries of great guns to prevent a descent; but the English, being acquainted with the small creek where only two men could go abreast, climbed up in the night to the top of the rocks, and appearing the next morning at the backs of the Dutch, they threw down their arms, and surrendered the island without opposition.

SECT. II.

A concise Account of the Islands of Ascension, St. Matthew Annabon, St. Thome, Prince's Island, and the Island of Fernando Po.

THE island of Ascension lies in eight degrees south latitude, upwards of two hundred leagues to the north-west of St. Helena, and in seventeen degrees twenty minutes west longitude from London. It received its name from its being discovered by the Portuguese on Ascension-day. It is about four leagues in length, one in breadth, and eight or ten leagues in circumference; and some of it is high lands, but very barren. This island has scarce any wood, fruit-trees, plants, or herbage; and neither the Portuguese, nor any other nation, have yet thought fit to plant it. The European ships, however, usually call here in their way from India, particularly such of our East India ships as have missed St. Helena, when they make use of this island as a place of refreshment; it having a safe and convenient harbour. Here are a few wild goats, but they are lean; and several sorts of birds,

but they are so ill tasted, that none will eat them: yet, as it abounds in turtle, the sailors sometimes stay on shore, feeding upon them ten or fifteen days together; they also here frequently take a large supply of these amphibious animals on board. The sailors, going ashore in the night-time, frequently turn two or three hundred of them on their backs before morning; and are sometimes so cruel, as to turn many more than they use, leaving them to die on the shore; for if once turned upon their backs on the level ground, they can never turn upon their feet, and must thus perish for want of food.

On this island is a place called the Post-Office, where mariners leave letters, which are generally put in a close corked bottle. This the next that comes breaks, and leaves another in its stead. The island of Ascension has no fresh water, and that gathered from rain sinks in twenty-four hours.

The island of St. Matthew is situated in the first degree forty minutes of south latitude, and in nine degrees twelve minutes west longitude from London, a hundred leagues to the north-east of the ile of Ascension; and was also discovered by the Portuguese, who planted and kept possession of it for some time; but afterwards deserting it, it now remains uninhabited, this island having little to invite other nations to settle there, except a small lake of fresh water.

The four following islands are situated in the gulph of Guinea, between Congo and Benin; all of them were discovered by the Portuguese, and are still in the possession of that nation.

Annabon, or Happy Year, a name which it received from its being discovered on New Year's day 1571, is situated in two degrees south latitude, two hundred miles to the west of Congo, and is about thirty miles in circumference. This island is mountainous, and abounds in rice, Indian corn, oranges, cocoa-nuts, and the other fruit usually found in hot countries; and has plenty of cows, hogs, and poultry. There is a convenient road for ships, and the Portuguese have still the government and property of the island; but most of the inhabitants are negroes brought from the continent of Africa, and their descendants. There are likewise some Portuguese, and a mixed breed called Malottos.

The island of St. Thome, which is somewhat of a round figure, and about a hundred and twenty miles in circumference, is situated just under the equator, thirty leagues to the north-east of Annabon, and between forty

and fifty to the westward of the continent of Africa. This is the most considerable island in the gulph of Guinea; but the heat and moisture of the air render it extremely unhealthful to the Europeans: yet the Portuguese negroes and Malottos who inhabit it are said to live to a good old age.

This island is well supplied with wood and water, and in the middle of it is a high mountain almost covered with a cap of clouds. It produces plenty of Indian corn, rice, and fruits, and the inhabitants make a good deal of sugar; and among other plants is the cinnamon tree.

The chief town in the island is called St. Thome, and sometimes Pavofan. It is the see of a bishop, and contains five or six hundred houses: these are two stories high, and nearly built of wood, and surrounded after the Portuguese fashion, with handsome balconies. Here is also a monastery, which Mr. Smith says has more black friars and nuns than white ones.

Prince's Island, said to be the least of those in the gulph of Guinea, is situated in one degree thirty minutes north latitude, and is very mountainous and woody. It affords plenty of fruit, rice, Indian corn, roots, and herbs; but chiefly abounds in sugar-canes. It has no want of cows, hogs, and goats; but the country is much pestered with several kinds of apes, who will sometimes attack a man, and when there is a number of them together, will tear him to pieces.

The island of Fernando Po is situated in three degrees sixty minutes north latitude, ten leagues to the westward of the continent, and is about thirty miles long, and twenty broad. Its produce and inhabitants are the same as the others.

The Portuguese usually call at some of these last islands for refreshments, in their passage from Brasil to Africa, and in their voyages to and from the East Indies. As the Dutch found them conveniently situated for trade, and supplied with plenty of provisions, they made two attempts to drive the Portuguese from St. Thome; and even made themselves masters of that island: but this conquest was attended with very unhappy effects; for they lost almost all the officers, seamen, and soldiers engaged in those expeditions, by malignant fevers, and were therefore obliged to abandon it. On which the Portuguese again seized it, and ever since have remained in the peaceable possession of those islands; the unhealthfulness of the climate securing them from invasion.

C H A P. XIII.

Of NIGRITIA, including the Countries between GUINEA and ZAARA.

S E C T. I.

Of SIERRA LEONA.

As Name, Situation, and Extent, with a particular Account of the River Scherbro; and of Scherbro and York Islands. A Description of Cape Monte, with the Produce of the adjacent Country.

WE come now to Sierra Leona, a name which, according to some authors, was derived from the Portuguese giving it to several of the mountains on this coast, on account of their abounding with a great number of lions; while others derive the name from the terrible noise made by the beating of the sea against the shore, which they compare to the roaring of a lion. Geographers however are far from being unanimous in giving its precise boundaries. Roberts extends its limits from the Grain Coast on the south-east, to Cape Verga, or Vega on the north-west; but other writers reduce these limits, and confine the country strictly called Sierra Leona between the capes Ledo or Tagrim, and Verga, these two promontories forming the spacious bay into which the river Scherbro discharges its stream.

This river, which by some authors is also called Sefboba, Palmas, and Madre Bomba, separates the country called Sestos, from that named Sierra Leona, and has its source in Superior Ethiopia; whence some authors think it probable, that the Scherbro is a branch either of the river Gambia, or the Senegal. Large ships sail up as far as Bagos, twenty-five miles from the mouth of the river, where the English had formerly a factory, and vessels from sixty to eighty tons burden, as far as Kedham, which is above two hundred miles from the sea; but on passing that place, the channel grows gradually narrow. The navigation of this river, as it is chiefly carried on in the rainy season, is frequently interrupted with tornadoes, on the approach of which the people are obliged to fasten the vessels with cables to the large trees on the banks.

By the mouth of the river is the island called by the English Scherbro, by the French Cerbero, by the Dutch Mast Quaja, and by the Portuguese Forulba, extending south-east, and north-west along the coast, where it forms a large bay between it and the continent. From the west point of this island extend three small ones in a direct line, to which the English have given the name

of

of Plantain Islands, from the quantity of that fruit produced in them,

The island Scherbro produces plenty of rice, maize, yams, potatoes, bananas, citrons, oranges, water-melons, ananas, Indian figs, with a variety of other fruits and roots. Fine pearls are found in oysters on the shore; but fishing for them is dangerous, on account of the multitude of sharks and alligators, with which the mouth of the river is infested. Elephants and wild fowl are also found here in such plenty, as could not be expected in an island of such small dimensions as ten miles in length. The inhabitants are idolaters, and, like many other negroes, practise circumcision.

On a small island to the north-east of Scherbro, called York Island, was a fort erected by the English, and mounted with twenty pieces of large cannon, and at the distance of twenty paces were two large parapets, each defended by five pieces of artillery. These were all built of stone, and the garrison consisted of thirty-five Europeans, and fifty or sixty negroes. Before the building of this fort, the English had a lodge on the continent close to the sea, and fronting the eastern point of Scherbro; but they abandoned both this and York fort in the year 1727, when the factors retired to Jamaica, a small island four miles to the west of York Island; but now they are all deserted, and the English have no factory either on the island or river Scherbro.

Though the Scherbro be the first great river between the Sestos and the river Sierra Leona, there are several intermediate streams and small rivers, some of which are navigable for several miles up, particularly the Junco, the river St. Paul, the Galinas, and the Maguiba, or Nunez.

Having given this general account of the country and its rivers, we shall give a more particular description of it, beginning with Cape Monte. This cape, called by the natives Wash Kingo, is seen several leagues off at sea, and has the appearance of a great mountain encompassed by the ocean; and according to M. D'Anville's charts, is in seven degrees forty minutes north latitude. It is a peninsula, which stretches east-south-east, and west-north-west, affording secure anchorage in two fine bays on the west side. A small river of the same name, that falls into the bay within half a mile of it, supplies the shipping with good water.

A plain several leagues in extent runs along the banks of this river, and is covered with villages, and all kinds of quadrupeds, as cows, sheep, goats, hogs, antelopes, deer, hares, and a great variety of others. Fowls are also found here in the greatest abundance: nor is the earth less fruitful in maize, rice, millet, roots, and fruit of various kinds; among which are oranges, lemons, citrons, pine apples, and most of the rich fruits of Europe, Asia, and America. The palm wine is esteemed excellent, the air moderate, and the water of the springs cooling and refreshing. In short, this country, except in the rainy season, appears a kind of paradise.

SECTION II.

The Manners and Customs of the Inhabitants near Scherbro River; their Dress, Houses, and Trade.

THE inhabitants are represented as mild, generous, sociable, industrious, and disinterested. They are chiefly employed in cultivating rice and other grain, and in making salt, a certain quantity of which is paid as a tribute to the king of Quoja, to whom they are subject. They are little acquainted with war, and in all disputes with their neighbours prefer peaceable negotiations to arms. The men are allowed to keep as many women as they can support, and the females being no less laborious than the males, they find their interest in the multiplicity of their women; nor are the husbands jealous at the freedoms taken by strangers with their wives.

The supreme power under the king and the courts of justice are in the hands of the caboceroes, who deliberate upon all public affairs, and decide by a majority of voices.

Children of both sexes wear no cloaths till they are thirteen or fourteen years of age, when those of people of distinction wear a cotton cloth from the waist downwards, and the common people remain in their primitive nakedness; for none besides the king, his court, and the officers of his household go always clothed. The women of the middle rank however wear girdles of rushes, or palm leaves, prettily interwoven, and hanging down to their knees; these are bordered with a fringe of rushes, or flounced with palm leaves. They likewise wear copper, brass, or iron bracelets round their wrists, and large rings of the same metals upon their legs, to which they hang silver bells. The most common dress among the people of rank of both sexes is the tomy, which is made of woollen cloth manufactured by themselves. This the women tie round the waist, letting it fall to the knee; but the men fix it before, and bringing it between their legs fasten it to their girdle behind.

Both sexes take great pleasure in dressing the hair or wool of their heads, and adorning it with little plates of gold and other ornaments. The women endeavour to attract the regard of the men by making a line of paint, either white, yellow, or red, across their forehead; they have likewise circles of paint round their arms, legs, and waist; for they discover extraordinary beauty in this diversity of colours. The men wear much the same ornaments, differing only in the size of their bracelets and rings, with which their arms, legs, fingers, and toes are loaded. The poorest negro is seldom without some of these, and the number increases in proportion to the wealth and vanity of the wearer.

Their houses are built in the same model as those in Senegal, which we shall describe in treating of that country, and these they keep neat and clean. The royal palaces, and the houses of the great, are an oblong square, with one story floored, and so closely covered with palm leaves as to render them impenetrable by the heaviest rains and the most scorching beams of the sun. Those of the great have on the ground-floor several apartments allotted to different purposes; the first, which may be considered as an audience-chamber, is surrounded with sofas raised about a foot above the floor, and covered with mats of palm leaves, handsomely united, and diversified with a thousand colours. Here the great spend most of their time, stretched on these sofas, with their heads resting in the laps of their favourite women; and when they receive strangers they here eat, drink palm wine, and smoke tobacco; but use another apartment when the family is alone.

They are more civilized in their manner of eating than most other negroes; for they use trenchers of hard wood, and plates of ivory, neatly turned, and kept white with great care. They likewise use wooden spits for roasting, and, to prevent the apartments in which they sit being incommoded by heat, smoke, or the fumes of victuals, they have their kitchens placed at a small distance from their houses.

It has been observed, that the language of the negroes gradually alters as you pass along from east to west. As arts and sciences are entirely unknown to these people, their language consists but of few words, yet is sufficient for all the purposes of life. However, from their poverty of speech probably arises that silence which is observable in all their public meetings and entertainments; the number of their words being, perhaps, insufficient to express all their ideas so as to enliven conversation, and furnish a constant fund of discourse.

The English, Dutch, and other Europeans who trade hither, purchase great quantities of cotton cloth, mats, and ivory, which is not at all inferior to that on the Ivory Coast; but what the natives purchase of the northern negroes, though it is larger than what is found in their own country, has a yellow cast, and is of less value. Here are also purchased the skins of lions, tigers, panthers, and other wild beasts, with which all the mountains abound. This coast also annually affords five or six hundred slaves; but these are only such as they buy or obtain in exchange for their commodities from the king of Mundingo, and the interior parts of Africa; for custom forbids their enslaving any other than criminals, who

who are sold for the king's emolument. The woods also abound in trees, which are of use in dying, and are cut down and brought in logs to the shore, ready to be shipped. This wood our merchants call cam, and prefer it in many respects to Brasil wood.

According to Atkins, the timidity of the natives is almost the only obstruction to an advantageous trade with this coast. They surround the ships in their canoes, which they row with great dexterity; and if they happen to have a cabocero on board, sing all the while out of respect to him. Before they board a ship, they examine her closely, and when they have mounted the deck, betray their fears by an impatience and anxiety visible in every countenance, which makes them hurry over business; and upon the slightest accident leap into the sea. When a cabocero comes on board, he instantly shews the captain a certificate from the last European ship that touched there, in testimony of the kindness with which he was treated.

S E C T. III.

A Description of the great River Sierra Leona; the Climate of the Country on its Banks; an Account of the principal Islands it contains: the Face of the adjacent Country; its Produce; with a particular Account of a poisonous Fruit, and the Animals with which the Country abounds. The Customs and Manners of the Inhabitants.

IT would be equally tedious and unnecessary to give a particular account of every separate kingdom in Sierra Leona, as the natural productions and manners of the people are in most places nearly the same: we shall therefore proceed to the great river of Sierra Leona, which lies to the north-west of Scherbro, and is by some called Mitomba, and by others Tagim, or Tagrin. The mouth of this river is three miles, some say three leagues wide; but on sailing three or four miles up, its breadth is reduced to one mile. The entrance does not exceed two fathoms deep, except in a narrow channel that lies close under the mountains, and varies from six to ten fathoms water. It abounds with fish, but is infested with alligators as far as it is known to the Europeans, and probably to its very source. It is bordered with fine large trees, and has many little islands all covered with wood, and particularly with the palm, whence the natives make great quantities of wine. Villault says, that when he was here in 1666 the English had a factory in one of the most fertile and beautiful of these islands; their house was built of brick and hewn stone, and defended by four pieces of cannon and a small garrison.

The north side of the river being low and flat, the southern country, which is filled with high mountains, is properly called Sierra Leona; but most voyagers give all the coast, from Sestos to Cape Verga, this general appellation.

In the open and plain country the heat of the sun is intolerable before any breeze arises; but as a refreshing gale always springs up about noon, it renders the country very supportable. It must, however, be allowed an unhealthy climate, particularly to the Europeans. The constant thunder and rain, with a close stifling heat that more particularly prevails during four months in the year, produce such a corruption of the air, that all animal food is in a few hours reduced to a state of putrefaction, and people are for several days together confined in their chambers, to avoid as much as possible the pestilential infection of the atmosphere. The tornadoes sometimes produce a most frightful and astonishing scene; the most horrible darkness comes on at mid-day, and all the face of nature seems suddenly changed. However, with whatsoever amazement and terror this may seize strangers, it is seldom attended with any fatal consequences; and so powerful is custom and habit, that it is but little regarded by the natives.

To return to the river: it is filled with islands and small rocks that resemble a number of hay-ricks: the chief islands are Bensé, Tasso, and Togu; in the former of which the English had a factory, and a small fort built of stone, and flanked with parapets, mounted with five

pieces of heavy artillery, with an intermediate curtain and platform mounted with ten cannon. The garrison was generally composed of twenty-five white men, and thirty free negroes, who lived in huts covered by the cannon of the fort; but in 1704 this fortress was taken without resistance by two French men of war, commanded by Guérin. The garrison then amounted to an hundred men, all of whom, except a gunner and six soldiers, abandoned the fort, with their commander at their head, on seeing the ships approach. After plundering the fort, and seizing four thousand elephants teeth, with other merchandize, the French razed it to the ground.

At a small distance from the head of the bay of France, a creek near the entrance of the river, is a basin of fresh water, which falling from the mountains, is collected in this reservoir in so large a quantity, that an hundred tons may be filled by a few hands within the space of an hour. Nothing can exceed the beauty of this delightful spot, surrounded by hills covered with trees that afford a perpetual shade; and, what must appear doubly delightful, in a country parched by the heat of the sun, numberless cascades glide down the mountains in gentle murmurs, or rushing with an impetuous stream with a loud noise, assist in giving an additional air of coolness to the scene. The whole country on each side the river is rich in rice and millet, which is the chief sustenance of the inhabitants. The women grind the rice, and form it into little cakes or balls, which the men sleep in water, and eat without any other preparation. Lemons, oranges, bananas, and citrons, are produced in great plenty and perfection; and farther up the country are also ananas, Indian figs, water-melons, white prunes, wild pears, callava, and different sorts of pulse; and these provisions the natives bring on their shoulders to the shore, for the use of the ships in the road.

But besides these fruits, there are others extremely poisonous. Finch in his voyage mentions a tree that resembles a beach, and which the negroes call agon. It bears an oblong fruit like the pod of a bean, and is distinguished by its size into three kinds, all of which have the most malignant qualities. Within the pod are inclosed four or five square beans, encircled with a hard rind, within which is a yellow kernel, from whence the poison is extracted. These fruit are used by the natives in poisoning their arrows, and nothing can more effectually answer that purpose, as the smallest quantity entering the humours of the body proves fatal.

Besides these spontaneous productions of the earth, there are in great abundance deer, hogs, hares, and fowls, all which the mariners may purchase for a little brandy, of which the natives are extremely fond, preferring it to the best palm wine.

The mountainous parts abound in elephants, lions, tigers, wild boars, different sorts of apes, together with serpents of so monstrous a size, that if any credit is to be given to these writers, each of them is capable of swallowing a man whole. Monkeys are so plentiful, that forming themselves into bodies, they enter the plantations, where they ravage and spoil every thing before them. One kind of these animals, which the natives call barry, is very tall, and of an amazing docility. These are probably the same with the orang-outang. When they are taken young, they are taught to walk erect, and seldom choose any other posture; they grind rice, sleep it in water, carry it in vessels on their heads, and are taught to turn the spit when meat is roasting. Nothing is too difficult for these imitative animals; they will even open oysters, of which they are very fond, with a knife. The negroes admire the flesh of monkeys, which they prefer to that of all other animals, except the elephant. It is very probable that many nations have been collected cannibals upon no other foundation.

The woods furnish a retreat to an infinite number of pigeons, parrots, paroquets, and other birds of the most beautiful kinds; but it is difficult to take them, on account of the thickness and closeness of the trees.

The inhabitants of both sides the river are not so black and flat-nosed as most of the other negroes who border upon

upon them. They adorn their ears with a great number of toys, and usually mark their cheeks and noses with certain figures raised by a red-hot iron. Their arms are loaded with bracelets, and their fingers with iron rings. Both sexes go naked till they are fifteen years of age, at which time they begin to wear round the waist a small piece of cloth, or the leaves of trees formed into aprons. They likewise wear a leathern girdle, to which hangs a long knife, or a poniard; but persons of rank appear abroad in a long flowing robe of striped calico, resembling the Mo with drels.

Authors say, that as they are naturally of a malicious, turbulent, and jealous disposition, they seldom live long without quarrels and dissensions among themselves; and that the Europeans, who are continually exposed to their insults, can contrive no better way of revenge than burning their huts, and ruining their plantations. By this account it appears, that if the natives are naturally malicious, these European intruders are no less so. It is however acknowledged, on the other hand, that these negroes are temperate and sober, from a dislike to gluttony and drunkenness: for though they are great admirers of brandy and other spirituous liquors, they are said never to drink excess, esteeming the wilful loss of reason one of the most shameful vices a man can commit; they have also great quickness of apprehension and delicacy of sentiment, but are at the same time extremely lascivious and effeminate.

Anointing their bodies, especially their arms and legs, with palm oil, is daily practised by the negroes of both sexes, which cannot be omitted without the imputation of slovenliness; and some mix with it civet, which they procure from civet-cats found on the banks of the Scherbro.

Their huts are generally round, and their doors paved with oyster and cockle-shells, two or three crosses are erected in different parts of the house, and the whole surrounded by limes, papas, plaintain-trees, and bee-hives, which they make out of the trunk of a tree, and erect upon high poles.

They have their pallavers, or halls, where the chief persons of the village meet, to adjust differences among the inhabitants, or with the Europeans. On entering this hall they salute each other by bending the elbow, and touching the forehead with the hand. After both parties are heard, and the case fully debated, the equity of their several claims is settled by a vote of the majority of the judges. If a man has been defrauded by his neighbour, he is allowed by custom to seize from the other as much as amounts to his own loss; but he must prove before the judges of that court, that he is no gainer by the exchange.

S E C T. IV.

Of the interior Countries between the River Sestos and the Sierra Leona; and in particular of the Empire of Manow, and the Kingdom of Quoja. Of the Policy and Government of the Quoians; the State of the Dandaghs, and the Ceremonies attending the Arrival of a foreign Ambassador.

IN examining the interior countries between the Sestos and the river Sierra Leona, the first people of note we meet with are the Quabes, who inhabit the southern banks of the river Sestos, and are a free people under the protection of the emperor of Manow. Next are the powerful nation of Folgias, and the great empire of Manow, the limits of both which are entirely unknown. Both these kingdoms are watered by the rivers Arvorada and Junco, which divides Folgias from the kingdom of Carrow. The Folgians are dependent on the emperor of Manow, and the Quoians upon them.

This potent monarch extends his authority over all the neighbouring nations, who pay him an annual tribute of the produce of their country, or of European merchandize, purchased from the maritime negroes; as cowries, bars of iron, and glass toys: and the Folgians, in their turn, expect the same tribute from their vassals. But, notwithstanding this submission to the emperor, each king enjoys an unbounded jurisdiction within his own

territories, and can make laws, and declare peace or war, without the permission of any other.

The next is the powerful kingdom of Lower Quoja, which comprehends all the country from Cape Mafurado to the river Scherbro. Upper Quoja is situated farther to the north-west, and is bounded by the Scherbro and the kingdom of Hondo on the north, that of Silm on the north-west, and the kingdom of Eastern Bolm on the south. As to the kingdom of Galis, Galavey, Hondo, and Carrow, we know nothing more than their names, and that they form a chain behind the maritime provinces from Quoja to Mittenbo. It is remarkable, that the Quoians maintain their authority over the extensive and potent kingdoms of Silm, Bolm, &c. by the same policy with which the emperor of Manow preserves his power over the Folgians, Quoians, and all the country from the river Sestos to the Sierra Leona. Their councils are composed of the oldest, wisest, and most experienced persons in the nation; their government is mild, and the distribution of justice simple and equitable.

Though the Quoians are tributary to the Folgians, yet the prince of the latter people gives the king of Quoja the title of Dandagh, which he himself receives from the emperor of Manow; and the king of Quoja allows it to the monarch of Silm and Bolm, who pay him the same submission that his superior exacts. This title of Dandagh is conferred with some extraordinary ceremonies. Thus, when the king of Quoja is installed by the king of Folgias, he prostrates himself upon the earth, till the other monarch, having sprinkled over his body a handful of dust, asks him what title he chooses to bear; when having made his answer, it is proclaimed in a loud voice by an herald, repeated by the king of Folgias, and echoed by the joyful and numerous assembly of spectators. The new Dandagh being then desired to rise, the king of Folgias invests him with the sword of state, puts a quiver upon his left shoulder, a bow in one hand, and arrows in the other; and the ceremony is concluded by the king of Quoja's doing him homage, by his making him presents of cloth, table-furniture, and kitchen utensils.

The Dandaghs, who are absolute within their dominions, defend their prerogatives against the incroachments of the people, and yet never scruple paying their submission to a superior Dandagh. A great part of the state of one of these princes consists in the number of his women brought from distant countries; and when he appears in public he sits leaning upon a shield, to shew that he is the protector of his people.

When a subject demands an audience of the Dandagh, he first makes presents to the chief women of the seraglio, who carry them to the prince, and solicit him to permit such a one to enter his presence, and prostrate himself before him. If his majesty consents, the presents are accepted, and the visitor introduced; otherwise they are returned, and the petitioner retires, without presuming to approach the palace again till he has made his peace with the king. When an offender has obtained his pardon, and leave to approach the monarch, he advances slowly, with a low inclination of his body; and, on coming before the mat on which the king is seated, he falls upon his knees, and kisses the king's hand, which is extended for that purpose, respectfully pronouncing the word Dandagh; upon which the king answers, I forgive you, and, if he be a person of high rank, orders him to sit on a stool, or mat, placed at a small distance; otherwise he must stand in his majesty's presence.

If a foreign ambassador is coming to court, he stops on the frontiers of the kingdom, and sends one of his train with notice of his approach; upon which a nobleman is immediately dispatched to welcome him, and in the mean time, preparations are made for his reception. When he makes his public entry, he is attended by a multitude of the officers and guards, dressed in the richest manner of the country, each having a bow in his hand, and a quiver filled with arrows on his shoulder. The procession is made amidst the sound of warlike instruments, while thousands of people dancing, keep time to the music. On their arrival at the palace, the ambassador is received between two lines of the Dandagh's body guards, new clothed for the occasion, and passes

passes on to the chamber of audience. If he is sent from the king of Folgin, his attendants are permitted the privilege of dancing between the lines of the life-guard; and when the dance is finished, the whole retinue enter the audience-chamber, and kiss the ground before the king. They then approach the throne, while the ambassador turning his back upon his majesty, bends his bow, falls upon his knee, and by his menacing postures shews his inclination to defend the king against all his enemies. During this ceremony, his retinue dance to some songs composed in honour of the king; and the Quoians return the compliment, by reciting verses in praise of the ambassador and his master.

These mutual eulogies being concluded, the ambassador sends the principal person in his train to prostrate himself before the king, his own character exempting him from that submission. Suddenly the ambassador commands silence, and begins his harangue, which the royal interpreter explains word by word. If the discourse relates to affairs of state, it is referred to the king's council; otherwise an immediate answer is given, and the ambassador is conducted to the apartments provided for him. At night a number of servants flock to his house, to offer him their assistance in rendering his situation commodious; and afterwards the king's women, dressed in their richest habits, attend him with plates of rice, and the most delicate food the country affords. In short, after the king has supped, he sends him a large quantity of palm wine, and presents to his master, which generally consist of large vessels and dishes of copper.

S E C T. V.

The Manners of the interior Negroes in general; their Marriage Ceremonies; and those which attend their naming a Child. Their Laws in relation to Inheritances; their Language, and Funeral Rites.

THE negroes of the interior countries, as well as those on the coast, are said to be so libidinous as to abridge their lives, and even to emasculate themselves before they reach their prime. The women, who are equally addicted to the pleasures of sense, use filtres, potions, and herbs supposed to be possessed of provocative qualities, in dressing provisions for their husbands. This is said to be their greatest vice, and indeed, nothing can be more prejudicial to society. In every other respect, they are said to be temperate, modest, gentle, and sociable, in a far greater degree than the negroes on the coast.

They have an aversion to the shedding of human blood, and seldom make war but in their own defence. They are united by the closest bonds of friendship, and are always ready to assist and relieve each other. If a friend be under misfortunes, they will share their cloaths, their provisions, and all they have with him; and should it be their case to be distressed, they would meet with the same treatment from him. If a person happens to die when his effects are not sufficient to bury him, his friends contribute to his interment, and attend with the same respect as if he had divided an estate among them.

Polygamy, as in all the other negroe nations, is encouraged; but how numerous soever their wives may be, the husband chiefly attaches himself to one. The marriage ceremony is much the same as in other countries, only the bridegroom must make three nuptial presents to his intended bride. The first generally consists either of a piece of coral, or some glass trinkets; the second is usually composed of pieces of cloth for apparel; and the third is a small chest or box, in which she is to deposit her most valuable effects. The value of all these is proportioned to the wealth and affection of the bridegroom; and, in return, the father of the lady makes the husband a present of two suits of cloaths, a quiver filled with arrows, a sword and belt, and three or four baskets of rice. The care of the male children devolves upon the father, and that of the females on the mother. Both here and on the coast, they abstain from the connubial embrace from the instant

a woman is discovered to be pregnant, till after her delivery.

The child has a name given him on the tenth day after its birth, when the father with all his domestics armed with bows and arrows, make a tour round the town, singing a kind of triumphant song, accompanied with instrumental music; and all the people they meet in their way join their voices: afterwards a person takes the infant, and lays him upon a shield that is placed in the midst of the assembly; puts a bow and arrow in the infant's hands, and then pronounces a long discourse to the spectators; after which he addresses himself to the infant, wishing his prosperity; that he may resemble his father, and like him be industrious, faithful, and hospitable; that he may be able to build his own house, and to conduct his own affairs; have no inclination for the wives of his neighbours, but be affectionate to his own; and, in short, that he may be neither a drunkard, a glutton, or a spendthrift. The harangue being concluded, he gives him a name, restores him to the arms of his mother or nurse, and the assembly disperses, except a few select friends, who have an entertainment provided for them, and spend the day in festivity and mirth.

If the child prove a female, it is carried by the mother or nurse to the midst of the town, where the concurrence is greatest, and there laid upon a mat, with a stick in its hand. A female orator pronounces the harangue, with prayers that the child may inherit the accomplishments of the mother, and like her be possessed of every female virtue, as chastity, obedience to her husband, affection for her children, and resolution to aid, follow, and support her lord in all dangers and difficulties.

The eldest son is allowed to inherit all the effects and women of his father, except his giving small portions to the younger sons; but a married man who dies without male issue, passes over his daughters, and leaves his substance to his nephews; and if the whole male line happens to be extinct, the effects then belong to the crown, only the king is to see that care be taken of the daughters.

The chief employment of these negroes consists in cultivating the earth; for they have no fishing, except in a few rivers; nor trade, but in exchanging the productions of their plantations for the fish and other commodities found among the negroes of the coast.

The general language of the inland countries is the Quoian, though several provinces have particular dialects, which almost form a new language. The negroes of rank endeavour to talk with elegance, and are particularly fond of similes, allegories, and parables. Thus the most trivial discourse has something of poetical ornament. Nor are they entirely ignorant of the sciences, especially astronomy, for they distinguish the time of the night by the stars.

In this country the ceremonies of interment in general resemble those related of the other neighbouring nations, but differ in some particulars. The body being washed, they prop it up in an erect posture, adorn the hair, dress it in its best cloaths, put a bow and arrow in its hands; and in the mean while the friends perform a kind of mock skirmish; after which falling upon their knees with their backs to the corpse, they with a menacing air draw their bows, and vow to be revenged on any one who has been accessory to the death of their friend, or shall dare to asperse his character. They then strangle some of their slaves, whom they exhort to attend their friend in the next world with great diligence; but before these unhappy victims are thus offered at the shrines of superstition and ignorance, they feed them with all the delicacies the country affords. At length the corpse is laid upon a plank or bier, and carried upon the shoulders of men to the grave, into which it is thrown, together with the bodies of the sacrificed slaves, their mats, basons, and kitchen utensils. Over all is thrown another mat, and upon this abundance of earth. The relations build round the grave a hut, with an iron rod at the top, to which are suspended the bow and arrows, and other arms of the deceased, by way of escutcheon.

cutcheon. But if the deceased be a female, instead of arms, they hang up all the implements of domestic industry. For several months all kind of provisions and liquors are brought to the tomb to nourish the deceased in the next world; for they suppose it will be some time before he has cleared his new plantations, and formed connections in a strange country.

They usually bury all who belong to the same family in one grave, at a small distance from the place where they have died, and these burying-places are generally chosen in some deserted village. They esteem human blood too precious to be spilt, and therefore strangle the slaves destined for sacrifices. This barbarous custom, however, declines in most provinces; and where it is still retained, the parents usually conceal themselves and children, upon the least appearance of danger to the king's life, when a number of these sacrifices are made.

S E C T. VI.

Of the Religion of the interior Kingdoms of Sierra Leona.

THESE different nations acknowledge one Supreme Being, the Creator of all things, to whom they attribute infinite power, infinite knowledge, and omnipresence; this being they call Canno. They believe that the dead are converted into spirits, whom they call januanins, or protectors, who are employed in guarding their former friends. A negroe who flies from any danger, haltes to the tomb of his patron spirit; and if he escapes, it is attributed to his protection, in return for which he sacrifices a cow, rice, and palm wine, in the presence of the living friends of the januanin, who sing and dance round the tomb. When the Quoians have received any injury, they fly to the groves, the supposed residence of the januanins, and there pouring out their complaints, beseech them to grant their assistance in obtaining revenge, or to mediate with Canno in their behalf. In all difficulties and emergencies they have likewise recourse to them. In short, their veneration for the spirits of the deceased is extreme. Every village has a sacred grove set apart for their worship, to which great quantities of provisions are brought in the proper seasons. Here also persons labouring under any affliction implore the aid of the januanins; but women, children, and slaves, are prohibited entering these sacred retreats; for a trespass of this nature would pass for the most abominable sacrilege, which they suppose would be instantly punished in the most exemplary and tragical manner.

The Quoians have no less faith in magicians and sorcerers than in spirits; for these they imagine suck human blood, and are the inveterate enemies of mankind. They likewise believe, there are other enchanters, whom they stile billis, that have a power over the seasons, and can forward or entirely stop the growth of rice.

The Quoians never venture to pass through a wood without company, for fear of meeting with a billi busied in culling plants and herbs; and generally fortify themselves with a charm against the sava or devil, and all his ministers.

These imaginary invisible agents, especially the januanins, are made the moving springs by which the affairs of government are conducted; for if a woman be accused of adultery, and no other proof but the allegation of her husband appears, she is acquitted upon beseeching a spirit named belli poari, to confound her if she varies from the truth; but if she be afterwards convicted, the law ordains that her husband shall bring her in the night to a public place, where a council sits. Here, after invoking the januanins, her eyes are covered, to prevent her seeing those beings, who are to carry her out of the world; and she is left for a while in the belief, that this will certainly be her fate. When she has suffered the most dreadful apprehensions, and the most painful suspense, the oldest in council begins a solemn discourse on the shamefulfulness of a disorderly life, threatening her with the most cruel punishment if she persist in it. Suddenly a confused murmur, that passes for the voice of

the januanins, is heard, declaring, that though her crime merits the most rigorous chastisement, she will be pardoned on account of its being her first transgression; enjoining certain mortifications, and recommending the most austere chastity. But if she fall a second time under the same censure, and the presumptions are clear, the bellimo or high-priest, with one of his ministers and proper officers, go early to her house, making a prodigious noise with a kind of rattles, and seizing her, bring her to court, obliging her to walk three times round the market-place, attended by the same noise and instruments, all of the society of belli being admitted evidences of what happens. Then, without hearing her defence, or promises of reformation, they conduct her to a wood sacred to the januanins, from which time she is never more heard of, nor are the people ever permitted to mention her name; the negroes being so credulous as to imagine, that she is carried out of the world by the januanins.

They have a festival at the approach of the new moon; which is chiefly observed in the country villages; but strangers are not allowed to be present at these ceremonies. The reason they assign for this practice is more ridiculous than the custom itself; for they say, that the first day of the moon being a bloody day, their rice would change to a red colour, were these ceremonies to be neglected.

There are other superstitious ceremonies equally observed by the negroes of Manow, Folgia, Hondo, Sestos, Silm, and Bolm; in each of which is established a society called belli, which is properly a seminary for the education of youth, of which the king is visitor or superior. Here the young men learn to dance, fight, fish, hunt, and especially to chant a certain hymn called bellidong, or the praises of the bellis, consisting of the repetition of some lewd expressions, joined to the most indecent and lascivious postures.

This school is always seated in a thick wood of palm trees, and includes a compass of nine or ten miles, in which they build huts, and clear plantations, for the support of the scholars. All females are forbid to approach the sacred grove; and, to render this prohibition the more effectual, the girls are taught from their infancy to believe, that if they violate so sacred a law, the bellis will destroy them with the most excruciating tortures. The students are also strictly forbid to pass beyond certain bounds, or to converse with any but the students, during the time they stay there, which is five years; and as these are known by a peculiar mark, no excuse is admitted to extenuate the offence. This mark is extremely visible, it consisting of cicatrices made from the ear to the shoulder by hot irons; a painful operation, to which all must submit before they are duly matriculated, after which they have a new name.

While they reside in this retreat, they go entirely naked. On the day they have finished their studies, they are conducted to a village built for that purpose, where they receive the visits of their relations of both sexes, and have all the conveniencies of bathing and anointing themselves.

After their friends have spent a few days in polishing their manners, their necks are adorned with glass beads and leopards teeth, their legs are encircled by copper rings and bells, and their head covered with a cap of osier. With these marks of wisdom, and a cap adorned with plumes of feathers, they are publicly conducted to the palace, where they are ranged in order, amidst surrounding crowds of spectators, especially women, who flock from all parts to gratify their curiosity. They first uncover their heads, and afterwards repeat, one after another, the hymn and dance taught them at the college for this occasion. The dance being finished, each sagona, or teacher, calls his own pupil, and delivers him over to his parents, letting them know the name he had given him upon entering the college.

A person who has passed through his studies with reputation, is esteemed qualified for all employments, and is intitled to a number of important privileges; but the quolgas, or dunces, who have either not been admitted into the society, or were incapable of instruction, are by an established law excluded from all public offices.

They have also a female institution of the same nature. At a time appointed by the king, a number of small huts are erected, in the midst of a remote wood, for the reception of those young females who chuse to be initiated into the mysteries of the society. When they first meet, the foguilly, an ancient matron of distinction, appointed by the king to preside over the rest, enters upon the office, by giving an entertainment to her scholars, and then exhorts them to comply with the laws of the sisterhood, to live together in perfect harmony, and labours to reconcile them to this short recess of four months from the world. Upon this they shave their heads, throw off the few cloaths they wear, and remain naked during their abode in the seminary. They are no sooner stripped, than they are conducted to a rivulet, where they are washed, anointed, and circumcised, by cutting off part of the clitoris; an operation soon over, and easily healed.

Their studies consist in learning to dance, and sing verses, which are equally indecent, both in the words and postures, with those taught the boys in the male college. No men are allowed to visit them, and even the women who enter their bounds are first stripped naked. When the time of their noviciate is expired, their parents send them pieces of scarlet cloth, copper rings and bracelets, glass necklaces, and other ornaments. Thus equipped, they march to the royal palace, preceded by the matron, the inhabitants of whole provinces assembling to behold them. There the matron sits idle, while the girls frisk it away, dance and sing merrily to the sound of a tabor; after which they are delivered to their several families, with applauses proportioned to their merit, and the proficiency they have made.

S E C T. VII.

A Description of the River Gambia, and of the English and other European Forts upon it; with a concise Account of the Trade carried on with the Negroes on its Banks.

THE great river Gambia was formerly known by the name of Gambro, which is still retained by the French. This river discharges itself into the ocean between Cape Verd and Cape Roxo; or, to speak with more precision, between Cape St. Mary on the south, and Bird, or Broken Island, on the north, which are six leagues distant from each other. The river is divided by a multitude of islands and sand-banks; and its broadest channel does not exceed three leagues. At Joar, fifty leagues up the river, it is a mile broad; a forty-gun ship may sail up thither: and at Baracconda, which is five hundred miles distance from its mouth, it is navigable for ships of a hundred and fifty tons burthen. The season for making this voyage is from December till June, when the river flows in a smooth, equal, and not very rapid stream; but during the rest of the year the passage up it is difficult, if not impassable, on account of the extraordinary swell occasioned by the rains, which fall in these countries with great violence.

Many attempts have been made to penetrate to the source of this river; but all of them have been unsuccessful, the English seldom reaching farther than Baracconda.

From James's island, which is near the mouth of the river, to Baracconda, the soundings are never less than four fathoms and a half in the shallowest parts of the true channel, and are generally from five to eleven. The river is enriched with a multitude of beautiful islands, some covered with wood, and filled with animals. These frequently render it extremely narrow; but balance that inconvenience by adding to its depth, from the water being there confined within narrower limits.

As the chief trade with the natives of Gambia is carried on with the English, we shall begin with describing their settlements upon it. The time when they first began to frequent it cannot be determined; nor is it known who were the first Europeans that established this commerce. However, Labat asserts, that the merchants of Dieppe and Roan were considerable traders on this river before the

Portuguese began their discoveries in Africa: but as the Normans found it less advantageous than their commerce with the coast of Guinea, which brought gold and ivory to France, they at last abandoned it for their establishments on the southern coast of Africa.

Whether there be any truth in the above assertion, we shall not here pretend to determine: it is certain that the Portuguese, eager in the search of discoveries, and of whatever could contribute to the advancement of trade, established factories, not only along the coast, but in the interior kingdoms up the Gambia, as high as the English trade at present; which is proved by the ruins of many forts in different places. The English at length succeeded the Portuguese in the trade of this river, seizing a number of advantageous posts which they had abandoned, and fortified themselves on a small island between Albreda and Jilfray, situated at the distance of six miles from the mouth of the river. Here they built a fort, which was razed to the ground by the French, and afterwards by pirates; a loss which the company could never have recovered without the assistance of parliament.

The next establishment of the English company is on the river Cabata, which falls into the Gambia almost opposite to the south side of James's Island; but here the trade is inconsiderable, the chief purpose of the factory being to furnish James's Fort with provisions. On the north side of the river, opposite to James's Island, stands the English factory of Jilfray, or Gillyfree, which is pleasantly situated, and supplies James's Fort with all kinds of vegetables. Here the king of Barra exacts a duty upon all shipping that pass up the river, to which the English are obliged to submit.

James's Fort, or, as it is usually called, James Fort, is situated in a small island of the same name, in the middle of the Gambia, the whole breadth of the river being here about seven miles. The island is the property of the English; but subject to a small tribute to the king of Barra. It is about three quarters of a mile round; the fort is regular, and defended by four batteries, each mounting seven pieces of cannon, which on every side command the river. Under the walls of the fort, facing the water, are erected two batteries, each mounted with four twenty-four pounders; and between both are planted smaller guns for salutes. The whole artillery of the fort amounts to forty-five pieces of cannon. Within the walls is a number of very commodious apartments for the governor, chief merchants, factors, writers, and military officers, the lower apartments being employed in magazines and storerooms. The soldiers, artificers, servants, and slaves of the fort are lodged in barracks without the walls; but they are built with stone and lime, and are as strong and convenient as the fort itself, the whole being surrounded with palisadoes, by the river, and by canals drawn from it. Underneath the apartments of the servants are magazines, and the slaves are lodged below the soldiers barracks. Centinels are placed at proper posts, and the garrison kept in constant duty and security, a patrol being sent round at certain hours to examine into the situation of the fort, and to make a report to the governor.

The next English factory is at Vintain, or Bintan, upon a river of the same name, which falls into the Gambia about six miles above James's Fort. The chief commerce of this small factory consists in hides, ivory, and wax. Eight miles farther up the river is a factory called Jereja, situated in a kingdom of the same name, which affords little trade besides that of wax, of which there is great plenty. The next is a small factory at Tankeoval, in the kingdom of Caen, on the south side of the Gambia; and something higher up the river is the factory of Joar, situated three miles up the country in the dominions of the king of Barfally. There is not upon the whole river a more flourishing trade than is carried on by this town and factory. Higher up the river are the factories of Samy, that of Yamyakenda, and that of Fatadenda; which last place is situated at least four hundred and eighty miles from the sea, and yet Mr. Moore observes, that the river is as broad as the Thames at Tilbury-fort. Here the Gambia, with its beautiful windings, forms a most agreeable prospect, only equalled by the

the verdure of the trees and the fertility of the adjacent country at Cantor, several provinces of which are surrounded on three sides by these delightful curvatures of the river.

The principal articles of trade on this river are gold, slaves, ivory, and wax; for as to the gum-trade, it is not yet brought to any degree of perfection. The factors some years purchase above two thousand slaves, most of which are prisoners of war, persons stolen from neighbouring countries, or criminals; though some are the children of those who are born slaves, and are bred by the descendants of the Portuguese, who make them an article of trade. Since the slave trade became so profitable to the negroe princes, it has subverted the course of justice; and not only every crime, but every slight misdemeanor, is punished with slavery. Thus murder, adultery, theft, and robbery are confounded with the most trivial faults, and all punished in the same manner. Moore observes, that a negroe shooting an arrow at a tyger who had killed his goat, had the misfortune to slay a man; when, though the king was informed of the circumstances of this fact, he had the inhumanity to sell the offender, with his wife, children, and effects, among the other slaves for whom he had bargained with the English.

Large quantities of ivory are sometimes brought to the factories from Mundingo. The negroes procure it either by hunting elephants, and slaying them with their arrows, swords, darts, or from such of these animals as have died a natural death. The bees-wax, of which prodigious quantities are produced in all the kingdoms along the Gambia, is another article of commerce.

S E C T. VIII.

Of the Kingdom of Mundingo, with an Account of the Manners and Customs of the Natives.

THERE are a great variety of kingdoms, principalities, and petty states between the rivers Sierra Leona and Senegal, of which we scarcely know the names, travellers having related only such trivial circumstances as fell under their own observation, or occurrences merely relating to the trade and navigation of the Gambia; but with respect to the extent of the dominions, and the peculiar customs of the different nations, their religion, policy, and laws, they are almost entirely silent; and we know little except what relates to the Mundingoes, Jolloiffs, Pholeys, or Foulies, and Portuguese. When this country was conquered by these last people, about the year 1420, some of that nation settled in it, who have cohabited with these Mundingoes, till they are now nearly as black as they; but as they still retain a sort of bastard Portuguese language, and as they christen and marry by the help of a priest annually sent thither from St. Jago, one of the Cape de Verd islands, they still esteem themselves Portuguese Christians, as much as if they were actually natives of Portugal; and nothing makes them more angry than to call them negroes, that being a term they use only for slaves.

The various nations that dwell on the banks of the Gambia, and extend to Cape Verga, have the general name of Mundingoes, and are said to resemble each other not only in their complexion, features, and language, but in their manners and policy. This kingdom is of vast extent, both along the coast, and into the interior countries on the banks of the Gambia; but its frontiers cannot be determined with any degree of certainty.

Moore observes, that the natives are generally of a jet-black complexion, and are remarkable for the flatness of their noses and the thickness of their lips. Janequin, however, affirms, that these features are by no means natural to them, but the consequence of the custom of the women's suckling their children over their shoulders; and Moore attributes it to the great care taken to form their features to that cast; for nothing, he observes, is in their opinion so beautiful as large nostrils, flat noses, thick lips, and among the women large, loose, and flabby breasts.

The people are sociable, rational, and humane. Whenever Mr. Moore visited their towns, he met with the most cordial reception, the men running out to welcome his arrival by kissing his hands; though some women, who had never beheld a white man, fled at the sight of him. Some have pressed him to enter their huts, have entertained him in the best manner they were able, and brought out their wives and daughters for him to salute; their astonishment and curiosity being equally raised by his complexion, habit, speech, and manners.

These people are in general brisk and lively, and consume half their time in music, dancing, mirth, and a good-humoured gaiety; yet being fond of company, and at the same time warm and impetuous, they fall into frequent quarrels, and the unhappy discord of the night tarnishes the pleasures of the day. Nothing is more usual, upon any affront or injurious expression, than challenges to single combat; but their heat subsiding almost as soon as kindled, they seldom fight a deliberate battle, for all the blows that are usually given are the effects of sudden passion. But when they really engage, nothing can be more furious than the animosity with which they rush upon each other with whatever weapons come in their way. The fury of tygers, says Jobson, is far inferior to their's, every organ and limb expressing the most riveted hatred; their eyes seem to dart fire; they gnash their teeth, and pour forth the most opprobrious and vilifying expressions; and when they thus fight, the dispute is ended by the death of one of the parties, and sometimes in a bloody war between two nations, each taking part with their countryman.

In points of honour they are extremely jealous, particularly in respect to pride of birth and ancestry. While Mr. Moore was at Butto, on the river Gambia, he saw a dispute of honour arise between Bo-John, a prince of the blood, and a son of the reigning monarch. Each flew to arms, and were fired with such resentment, that the spectators had the utmost difficulty to prevent fatal consequences; and yet the whole contention only proceeded from a comparison of their parentage. Though they were parted, there was no preventing a formal challenge, after which the author found it no hard matter to reconcile them; but at the very time they were vowing a sincere friendship, they also threatened to resume the dispute as soon as they had a proper opportunity, as if they thought menaces necessary to prevent the by-standers entertaining a mean opinion of their courage.

The character of the people who inhabit the interior parts of the country is at present much altered for the better, for they were formerly extremely crafty and knavish even in the most trifling affairs. If a person had sold any thing in the morning, it was allowable for him to retract his bargain, upon offering restitution before sun-set: a custom that gave occasion for much fraud; for if a person had bought only a fowl, or an egg, he could not, without much danger, eat it before the next day, as he might be subject to pay ten times the value, should restitution be demanded, and he unable to produce it. These pernicious practices are, however, in a good measure abolished, commerce with strangers having taught them the necessity of being delicate in points that affect their credit.

The men salute each other by shaking hands; but if a man salutes a woman, he runs his nose close to her, as if to smell her, and falls back twice. It is the highest indignity to offer their left hand in salutations. When a man after an absence of two or three days, returns to his family, his women throw themselves on their knees before him; and their omitting this mark of respect is thought a great crime, and a proof of their little esteem for their lord.

Every thing relating to domestic œconomy is left to the care of the women, while the men cultivate the rice wanted for the family, and spend the rest of their time in indolence. After laying up what is sufficient for their own consumption, the women have a right to dispose of the rest; but are accountable to their husbands for the profits. The same regulations take place with respect to their poultry, of which they breed a great number; for these articles are their principal support, and no inconfi-

derable

derable branch of trade. Many of the Mundingoes take a pride in keeping a crowd of slaves, whom they treat in so kind, gentle, and humane a manner, that it is not easy to distinguish the master from the slave: the women, in particular, wear necklaces, bracelets, and ear-rings of silver, amber, and coral; and Mr. Moore says, that he has seen female slaves wear trinkets to the value of thirty pounds sterling. Most of these slaves are born in the families of their masters, and as natural to them as their own children. At Butto, he adds, is a village of two hundred souls, composed of female slaves, all of them belonging to one nobleman of Mundingoe, who treats them with the tenderness of wives and children. In most other parts of Africa the master has a right to sell all the slaves born in his family; but in Mundingoe this is considered as a crime; so that if any of them are disposed of without their own consent, and against the will of their fellow-slaves, they all abandon their master, and seek a retreat in another kingdom; for though in this case he has no power to punish them, yet they think it dishonourable to enter into the service of another master in the same kingdom.

We might here treat of the marriages and funerals of the Mundingoes; but a description of these and other ceremonies we shall defer to another section, in which we shall give a minute description of the customs of the interior negroes on the banks of the Gambia.

SECT. IX.

Of the Pholeys, or Feulies, with an Account of their Customs and Manners.

SOME authors assert, that the kingdom of Pholey is divided from the kingdom of Jaloff by a lake called, in the language of the Mundingoes Cayor, and stretches from east to west about one hundred and eighty miles; but its limits from south to north are not ascertained, though it extends a great way to the southward.

Mr. Moore, however, gives a very different account, and says, that the Pholeys live in clans, build towns, and are in every kingdom and country on each side of the river; yet are not subject to any of the kings of the country, though they live in their territories; for if they are used ill in one nation, they break up their towns and remove to another. They have chiefs of their own, who rule with such moderation, that every act of government seems rather an act of the people than of one man. This form of government is easily administered, because the people are of a good and quiet disposition, and so well instructed in what is just and right, that a man who does ill is the abomination of all.

The natives of all these countries, not being avaricious of land, desire no more than they can use; and as they do not plough with horses, or other cattle, they can use but very little; and hence the kings willingly allow the Pholeys to live in their dominions, and cultivate the earth.

The Pholeys have in general a tawny complexion, tho' many of them are of as deep a black as the Mundingoes; and it is supposed that their alliances with the Moors have given them the mixed colour between the true olive and the black. They are rather of a low stature, but have a genteel and easy shape, with an air peculiarly delicate and agreeable.

Though the Pholeys are strangers in the country, they are the greatest planters in it. They are extremely industrious and frugal, and raise much more corn and cotton than they consume, which they sell at reasonable rates; and are so remarkable for their hospitality, that the natives esteem it a blessing to have a Pholey town in their neighbourhood; and their behaviour has gained them such reputation, that it is esteemed infamous for any one to treat them in an inhospitable manner. Their humanity extends to all, but they are doubly kind to people of their own race; and if they know of any one of their body being made a slave, they will readily redeem him. As they have plenty of food, they never suffer any of their own people to want; but support the old, the blind, and the lame equally with the others.

These people are seldom angry, and Mr. Moore observes, that he never heard them abuse each other; yet this mildness is far from proceeding from want of courage, they being as brave as any people of Africa, and very expert in the use of their arms, which are javelins, cutlasses, bows and arrows, and, upon occasion, guns. They usually settle near some Mundingoe town, there being scarce any of note up the river that has not a Pholey town near it. Most of them speak Arabic, which is taught in their schools; and they are able to read the Koran in that language, though they have a vulgar tongue called Pholey. They are strict Mahometans, and scarce any of them will drink brandy, or any thing stronger than sugar and water.

They are so skilful in the management of cattle, that the Mundingoes leave theirs to their care. The whole herd belonging to a town feed all day in the savannahs, and after the crop is off, in the rice-grounds. They have a place without each town for their cattle, surrounded by a circular hedge, and within this enclosure they raise a stage about eight feet high, and eight or ten feet wide, covered with a thatched roof; all the sides are open, and they ascend to it by a ladder. Round this stage they fix a number of stakes, and when the cattle are brought up at night, each beast is tied to a separate stake with a strong rope made of the bark of trees. The cows are then milked, and four or five men stay upon the stage all night with their arms to guard them from the lions, tygers, and other wild beasts. Their houses are built in a very regular manner, they being round structures placed in rows at a distance from each other to avoid fire, and each of them has a thatched roof somewhat resembling a high-crowned hat.

The Pholeys are also great hunters, and not only kill lions, tygers, and other wild beasts, but frequently go twenty or thirty in a company to hunt elephants; whose teeth they sell, and whose flesh they smoke-dry and eat, keeping it several months together. As the elephants here generally go in droves of one or two hundred, they do great mischief by pulling up the trees by the roots, and trampling down the corn; to prevent which, when they have any suspicion of their coming, they make fires round their corn to keep them out.

The Pholeys are almost the only people who make butter, and sell cattle at some distance up the river. They are very particular in their dress, and never wear any other cloaths but long robes of white cotton, which they make themselves. They are always very clean, especially the women, who keep their houses exceeding sweet. They are, however, in some particulars very superstitious: for if they know that any person who buys milk of them boils it, they will on no consideration sell that person any more, from their imagining that boiling the milk makes the cows dry.

SECT. X.

Of the Customs and Manners of the Jaloffs; with a concise Account of the Kingdoms of Damel and Barsally.

THE Jaloffs, or Jalloiffs, inhabit the north side of the river Gambia, extending a great way into the interior country, and also to the river Senegal. Their complexion is exceeding black, and more beautiful than that of most of the surrounding nations; nor have they, like the Mundingoes, very flat noses and thick lips. Hence the notions they entertain of beauty are said by most writers to be very different from those of their neighbours, for they admire a small well-proportioned nose, a little mouth, thin lips, with a gentle pouting in the under lip, and lively eyes; for people generally fix the standard of beauty among themselves, and judge by that symmetry of features that is most familiar to them.

The general dress of the Jaloffs is a kind of loose calicoe surplice, that hangs down below the knee, and which they sometimes plait about the waist in a very agreeable manner. They wear a great number of gold trinkets in their hair, ears, noses, and round their necks, arms,

arms, and legs; but the women are particularly fond of these ornaments.

These people are in general of a warlike disposition, and naturally strong and vigorous. Those, at least, who live near the Gambia are good-natured, humane, generous, hospitable, modest, and are remarkable for their honesty. Their estates chiefly consist in droves of camels, dromedaries, cows, goats, millet, and fruit. In the audiences they grant the Europeans, they always appear with a becoming magnificence, and great decorum of behaviour. They are usually seated on a throne, and covered with a long red or blue robe, adorned with tufts of hair from the tail of an elephant, or some other beast; small pieces of ivory or coral, and a crown of osier on their head, adorned with little horns of small deer, antelopes, and other animals. They proceed with great solemnity to the place of audience, which in fine weather is commonly under the shade of a wide spreading tree, round which their guards are ranged, and always have a pipe of tobacco in their mouths. Nothing, says our author, can exceed the dignity with which these princes take out the pipe to interrogate an ambassador concerning his commission; for this is done with a gravity and solemnity of countenance and manner altogether peculiar, and of which no European who has not seen it, can form any idea.

It is said that the damel, or prince of the Jaloffs near Senegal, has two officers under him, of very high rank. The one, called condy, presides over all military affairs, and has the command of the army; the other, called the great jarafo, sits at the head of the civil affairs, and is chief in all courts of justice; whence he takes circuits round the provinces to hear complaints, and redress grievances. Another officer, called the alkair, is treasurer to the crown, and has under him subaltern officers, named alcades, who are the chiefs in the villages where they reside, and a kind of justices of the peace, though, in all important cases, appeals are frequently made to the jarafo when he performs his circuit.

As there are a great number of petty kings included under the general name of Jaloff princes, so there are perpetual wars in some part or other of this large tract of country. When a rupture of some other power is resolved on, the condy assembles the troops, which seldom or never exceed five hundred in number; and thus their greatest battles are only skirmishes, in which very few are left dead in the field. It is said, that in the whole kingdom of Damel there are scarce horses sufficient to mount two hundred men, and yet the strength of their armies chiefly consists in their cavalry. The king of Damel is, however, a potent prince for that part of the world; his army is well supplied with provisions, and hundreds of women daily attend the camp with live cattle for the use of the troops, as well as fruit, roots, and all kinds of vegetables.

The arms of the cavalry are long darts, a kind of javelin bearded like an arrow, and short swords, which they use when they dismount, a part of discipline they are always taught, and frequently practise in battle. The infantry are armed with scymetars, javelins, and a quiver containing ten or twelve poisoned arrows, a wound from which is attended with almost certain death. Their bows are made of a kind of hard reed, that resembles the bamboo. The negroes are such excellent marksmen, that few of them will miss a shilling at fifty paces distance; but they fight in an irregular and tumultuous manner, both sides marching into the midst of the plain pitched upon for the engagement, without the least order or discipline, their instruments of war sounding all the while, and making a most horrible din. On their coming within a proper distance, the infantry make a general discharge of their arrows, after which they engage sword in hand; but having their commercial interest in view, kill as few, and make as many prisoners as possible; for the captives of all ranks and ages are sold for slaves. Though the carnage in the field is frequently inconsiderable, yet their battles have often fatal consequences, as few of those wounded with their poisoned arrows ever recover. Mr. Moore affirms, that the Jaloffs are extremely delicate with respect to mili-

tary honour, preferring death to the smallest reproach on their courage; and this animates them no less than the dread of slavery, to behave with the utmost intrepidity. Should the first shock of battle fail to decide the victory, they frequently renew it for several days, and at length, when the obstinacy of both sides begins to faint under the fatigue of action, they enter upon a treaty, by means of their marbuts, who meet in the field between the two armies; and if they agree about the articles of convention, they swear upon the Koran to be faithful to their engagements.

The king of Barfally, whom Mr. Moore saw in 1732, had a great number of women; but when he went abroad, he was seldom attended by above two, who were dressed in all their finery. The usual residence of this prince was then at Cahone, a town situated near the sea, an hundred miles from Jear, another town belonging to the same king on the river Gambia.

When this king was in want of brandy, or any other of the luxuries of Europe, he sent to desire the governor of James's fort to dispatch a boat with it, and in order to purchase it, plundered the neighbouring towns, and seized a number of his subjects, whom he sold for slaves, and exchanged for European commodities. This was his method of supplying himself when at peace with his neighbours; whence his people were never so happy and secure as when at war, their most cruel enemy being their king, and their greatest danger arising from him who ought to protect them in their liberties, lives, and property.

The kingdom of Barfally is divided into a number of provinces, over which are governors, called bumeys, who pay the king an annual homage and a certain revenue or tribute. These bumeys have absolute power within their jurisdictions, but seldom carry their prerogative so far as to incur the dislike of the people, whose affections are the surest barriers against the tyrannical encroachments of the king. His majesty has, however, an absolute authority over those governors; for if they attempt to throw off their subjection, his standing forces are always sufficient to reduce them to obedience: but this seldom or never happens, it being for the interest of both to live in amity, the one to acknowledge the homage that is due, and the other to require no more. Thus the king enjoys a despotic dominion without having the whole load of government upon his shoulders: while the bumeys enjoy all the privileges of crowned heads, except their being obliged to acknowledge a superior; and the people, when freed from violence, are in the full possession of happiness, by having a kind of mediator between them and the monarch, who considers them as his slaves.

The king maintains so strictly his despotic power, that he has no other counsellor besides his prime minister, or rather his prime slave; for nothing can be more servile than the implicit respect paid by him to the nod of his master. This minister is at the same time general of the king's forces and interpreter of his will, from the latter of which he must never deviate: he is termed the great farbro, or master of the horse, and upon all publick occasions bears the sword of state before the king.

SECT. XI.

A particular Description of the River Senegal, and the Country on its Banks; with an Account of the valuable Drug called Gum Senegal, or Gum Arabic, the Manner in which it is produced, and the Conquest of the Country by the English.

WE now come to the great river Senegal, the source of which is as little known as that of the Gambia. Some geographers maintain, that it is one of the channels by which the Niger discharges its waters into the Atlantic ocean. The Niger rises in the eastern parts of Africa, and after a course of above three hundred miles, nearly due east and west, is said to divide into three branches, the most southern of which is the Sierra Leona, the middle the Gambia; and the most

northerly the Senegal; whence all this tract of country described in this chapter, obtained the name of Nigritia, from the river Niger. This opinion can, however, be no otherwise supported than by conjectures, and cannot possibly be decided till voyagers have carried their discoveries much farther up these rivers; though there is no doubt that one of them is at least that called by the ancients the Niger.

The Senegal is one of the largest rivers of Africa; for from the lake Benin, the farthest part to which the Europeans have penetrated, it is two thousand four hundred miles to the sea. In this course it generally proceeds from the east to the west; but within two leagues of the ocean it takes a sudden turn to the south, and for the remainder of its passage is separated from the sea only by a natural ridge, in some places not above two hundred yards broad. By this curve it prolongs its course for twenty-five leagues farther from north to south, till at length it discharges itself into the ocean, in the sixteenth degree of north latitude.

Both this river, the Gambia, and Sierra Leona, overflow their banks like the Nile, and much about the same time of the year. The Senegal is forty days before it come to its height, and when it has overflowed its banks, its channel is difficult to be found by those who have rowed up it in boats. The French once sent thirty men up this river, who rowed a thousand miles; but suffered such hardships, that only five returned back alive. Their boat once stuck fast, it is said, on the tops of trees, and with great difficulty they disengaged it.

This great river is extremely rapid at its mouth, which is attributed to so large a body of water being confined within so narrow a channel; the mouth of the river being only half a league over, and choaked up by a bar, which renders the passage exceeding difficult and dangerous; especially in the rainy season, when the prodigious swell of the river, and the south-west winds, opposed to its rapid course, raise waves of so prodigious a height at the bar, that their clashing resembles the shock of mountains, and are said to be so furious as to dash in pieces the stoutest ships: yet, according to Labat, the worst season, with respect to commerce, is in September and November, when the winds blowing northerly, exclude all navigation, even of the smallest boats.

This bar is doubly dangerous, not only on account of the violence of the waves, but the shallowness of the water, and the shifting of the bar after floods and heavy rains, by which the channels are lost, and new soundings become necessary to discover them. The Senegal would indeed be quite shut up, were it not for one channel, four hundred yards broad, and two fathoms deep, that has long kept its situation immovable. The most proper time for crossing the bar is from March to September, when the winds are variable, and the bar fixed till the ensuing rainy season.

A person has no sooner crossed the bar, than he finds himself in a smooth and gently gliding river, four fathoms deep.

On advancing a league higher up the country, on the south side, it is covered with a beautiful verdure; lofty trees of different kinds are in perpetual bloom, and filled with a variety of birds; some red, others blue, and others black, of the size of a linnet, and of the brightest colours; and with squirrels and monkeys that divert the passengers, by playing a thousand antic tricks.

The country also abounds with elephants, lions, and other wild beasts; but the former do no hurt, except they are first attacked. In some places the low grounds are covered with thorny trees, that rise to a prodigious height, and bear large bunches of bright yellow flowers, of a fragrant smell. The bark of these trees is of different colours, as black, green, white, and red; the colour of the timber nearly resembles that of the bark; though from its hardness, it seems a species of the ebony; and yet the flower of these different kinds are exactly the same.

The river has a great number of islands covered with trees, fruits, herbage, and birds; but none of these were put to any use by the French company, except the island of Senegal, on which stands Fort Louis, in sixteen degrees five minutes north latitude. This island is situated

in the middle of the river four or five miles from its entrance, and is two thousand three hundred yards in length from north to south; but at the end towards the bar, it is no more than one hundred and eighty yards; at the opposite extremity three hundred and sixty, and two hundred and sixty yards in that part where the fort stands. The island is a dry, sandy, and barren spot of ground destitute of fresh water during one half of the year, it having neither springs nor wells, and the water of the river is too salt for use.

The fort of St. Louis is a quadrangle and has two bastions of considerable strength; but the greatest security of the fort is its natural situation. The cannon of the fort are numerous, and the arsenal well supplied with small arms and stores. Besides this the French had no other fort upon the river, but fort St. Joseph, which stands about four leagues below the cataract at Govina, though they had a few factories in different parts.

The principal commodity of this country is that of gum Senegal, or Arabic; which is a valuable branch of commerce, as it is used in many arts and manufactures, particularly by the painters in water colours, the silk weavers and dyers.

This tree is described by Labat as a species of acacia, small, prickly, full of branches, and covered with leaves moderately long, very narrow, and of a perpetual verdure. Some say it bears a white flower composed of five leaves, which form a kind of cup; but other naturalists represent it as formed of one leaf in the manner of a funnel, and say the flowers are in clusters. The pistil rises from the bottom of the flower, and at length becomes a pod, three or four inches long, filled with small, round, hard, and black grains, which serve to propagate the species. Of this species of gum-tree there are three forests, all of them situated in the desert north of the river, and at nearly equal distances from it. Every year produces two crops, if we may thus term it, of gum; the first and best in December, and the other in March. The first tears or exudations are the largest, the driest, and most pure, with every other advantage required in this drug; and the other more soft, glutinous, and impure. The December crop is gathered after the rains have ceased, and the moisture of the earth has rendered the sap more abundant: but that in March is procured by making incisions in the trees, which have then too little vigour to produce it of themselves. The natives sell the gum by a cubic measure called a quintal, which holds about two hundred weight, and this they exchange for goods of about two shillings value.

The French, when in possession of this river, imported from thence not only this gum, but elephants teeth, hides, bees-wax, gold-dust, cotton, ostrich feathers, ambergris, indigo, and civet.

The first Europeans who settled at Senegal were the Dutch, who fortified themselves there; but were driven from thence by the French in the year 1687. Afterwards, in 1692, this settlement was first taken by the English; but the following year it was retaken by the French, who continued in possession of it till the last war. In 1758, a small squadron fitted out under the command of captain Marsh, having on board a body of marines commanded by major Mason, with a detachment of artillery, ten pieces of cannon, eight mortars, and a considerable quantity of warlike stores and ammunition, were sent against Fort Louis. Captain Walker was appointed engineer, and Mr. Cumming, a quaker of good sense, who had proposed the expedition, failed before to engage the negro princes, with whom he was acquainted, to join the English.

On the twenty-third of April this English squadron saw the French flag flying on Fort Louis, and came to an anchor in Senegal road, after taking a large Dutch ship richly loaded with gum, and soon perceived that several armed French sloops were placed to dispute the passage of the bar. The English immediately prepared for landing; and having discovered the channel, Captain Millar, in the London Buss, passed the bar, and the next morning was followed by the other vessels, sustaining a constant fire from the French sloops. A regular engagement now ensued, which was maintained on both sides, till the buccles and one dogger running aground, instantly bulged,

bulged, and were filled with water. Upon this the troops took to their boats, and, notwithstanding the difficulties with which they were surrounded, reached the shore, where they formed in a body, and were soon joined by their companions in the other vessels, the whole amounting to three hundred and ninety marines, besides the detachment of artillery. They immediately threw up an intrenchment to prevent their being attacked by the natives, who lined the shore at some distance; but this precaution was unnecessary; for the negroes came in great numbers and submitted, and on the following day they were reinforced by three hundred and fifty seamen, who passed the bar in sloops with their ensigns and colours flying.

While they were preparing to attack Fort St. Louis, two French deputies arrived with proposals from the governor for a capitulation, when it was agreed, that all the white people belonging to the French company of Senegal should be safely conducted to France in an English vessel, without being deprived of their private effects: that all their merchandize and uncoined treasure should be delivered up to the victors: that the forts, storehouses, vessels, arms, provisions, and every article belonging to the company in that river, should be instantly put into the hands of the English: that the free natives of Fort Louis should remain in the quiet possession of their effects, and the free exercise of their religion: and that all the negroes, mulattoes, and others, should be at their option, either to remain in the place, or to retire to any other part of the country.

This capitulation was no sooner agreed upon, than the Captains Campbell and Walker were sent up the river with a flag of truce, to see the articles signed and executed. Mean while the negroes on the island took arms, and blocked up the French in Fort Louis, resolving to defend the place, unless they were included in the capitulation, insisting that the French director-general should be permitted to remain with the natives as a security for that article of the capitulation in which they were concerned. The English readily granted this request, and marching to St. Louis, took possession of the castle, where they found ninety-two pieces of cannon, with a considerable quantity of treasure and merchandize. The corporation and burghers of the town of Senegal swore allegiance to his Britannic majesty, and the neighbouring princes, attended by numerous retinues, visited the commander, and concluded treaties with the English. The number of free independent negroes and mulattoes settled at Senegal amounted to three thousand; and the other French factories being included in the capitulation, Great Britain became possessed of a conquest from which great riches may be derived, and which was acquired without the loss of a single man.

S E C T. XII.

Of the Manners and Customs of the People of the interior Countries from the Gambia to the Senegal; containing a minute Description of their Dress, Food, Marriages, Education of Children, and Funerals.

THE most usual dress all over this part of Africa is a kind of shirt and wide drawers of blue and white cotton cloth. The sleeves of this shirt are large, and therefore they tuck them up over their arms when they have any business that requires the free use of their hands, and their drawers hanging in a bag which separates the legs, they straddle as they walk. They have leather sandals on their feet, buttoned at the instep, the toes, and behind at the heel. Some wear a sword slung over the right shoulder, others a long dart, and others a bow and arrows; but all of them have a long knife by their left side. This is to be understood of persons of superior rank; for the poor generally go naked, and at least barefooted.

As to the women, their dress only consists of a piece of cotton tied round the waist, and falling down to the knee, much in the same manner as among the negroes of Guinea. The upper part of their bodies is naked; but, by way of ornament, they mark, stain, and paint it

with various figures and colours, so that at a distance they seem covered with a painted calicoe, or flowered stuff. Some have a loose piece of cotton cloth carelessly thrown over their shoulder: but this is an unusual piece of extravagance. Both sexes take a pride in having a large bunch of keys hanging at their girdles.

These negroes live upon a plain and simple diet, chiefly composed of rice, roots, and fruit, which they naturally eat with great appetite, as many of them make but one meal a-day, and that in the evening; for they carefully keep their cows, sheep, and goats, for milk. The ordinary drink of all the negroes is water, though people in good circumstances use palm-wine diluted with water, and a kind of beer called ballo. They are indeed extremely fond of brandy and other spirits; but as these are purchased from the Europeans, none but persons of superior rank are able to drink them to excess. Nothing can exceed the temperance and simplicity of diet and drink practised by the women, for they seldom or never taste any thing stronger than water, or at most a little wine or ballo, plentifully diluted.

According to some authors, the negroes make two meals a-day, one about noon, and the other in the evening. They sit at table without any of the furniture we esteem necessary, eating with their fingers, and always using the right hand, thinking it indecent to touch their food or lips with the left, which they employ in none but the meanest offices.

Every man has a right to marry the girl he loves, without regard to rank or fortune, or any other circumstance than being of a proper age; yet these contracts are seldom made without the consent of the parents, in whose hands he deposits the jointure intended, or at least a proper security for the payment of it. The preliminaries are no sooner adjusted than the bridegroom, accompanied by a number of young fellows, sets out by moon-light, or at least in the night, and surround the house of the bride, in order to carry her off by force, while she and her female attendants pretend to make all possible resistance, and alarm the whole village with their cries: but this coyness being only looked upon as a necessary part of the ceremony, no opposition is made to the ravisher, and the affair is always terminated by a wedding.

In some places this farce is said to be carried still farther; the lover haunts the house for several weeks before, and conceals himself in woods and groves round the residence of the object of his wishes, covering his face with a veil, to prevent a discovery, and giving the courtship an air of intrigue. This is thought necessary to heighten the joy, which would otherwise be thought flat and insipid.

In the countries near the Gambia, a father frequently betroths his daughter to some neighbouring infant on the day of her birth; an engagement so firm and binding, that the parents can never after break the match; but it is in the power of the man never to come and claim his wife, and yet without his consent she cannot marry another.

The women in general marry very young, and leave off bearing children at the time of life when others begin. The husband must give an entertainment, to which all the neighbours come without invitation; and this ceremony, the neglect of which inevitably incurs the contempt of the whole village, continues three or four days. The bride is carried from her father's house upon the shoulders of young men who are friends to the bridegroom; her face being covered with a veil, which she never lays aside till after consummation, her doing this being a testimony to the whole assembly that the nuptial rites are performed; for it is usual for the married pair to retire, while the company continue dancing, singing, and drinking till they return.

In the countries bordering on the Senegal, these ceremonies, according to Labat, are very different. The young lover applies to his mistress's parents, in order to obtain their influence, but without expecting that any constraint should be laid on her inclinations. If he is so fortunate to gain her affections, he makes some presents to her nearest relations, she is then conducted to his house, and he gives a feast to the village. On her approaching the house, the bridegroom offers her

his hand to conduct her to the best apartment, which she no sooner enters, than, to shew her subordination, he instantly employs her in fetching water, or in some other servile office, while she respectfully retires at the first motion to execute his commands. She sups after him, attends him in quality of a servant during supper, and patiently waits his time to be led to bed. All this is looked upon as a part of the marriage ceremony; but no good-natured husbands assume this authority after the first night.

If the bride knows herself a virgin, she always, from a motive of vanity, and compliment to her husband, spreads a white cotton cloth upon the bed, which, as a proof of her former chastity, and the abilities of the bridegroom, she exposes publicly to the company after consummation, who receive it with profound respect, and carry it in triumph round the village, attended by crowds of people, with variety of music, and great rejoicings.

It is said, that if the proper marks of virginity do not appear, the parents may be obliged to take her back, if the bridegroom insists upon it; but this seldom happens, for the husband chooses rather to take no notice of the affair, than to embroil two families, the inevitable consequence of sending back the bride. Indeed, in many parts of this coast, very little value is set upon virginity, the Africans being greatly divided about the worth of the female jewel, some esteeming it above, and others below all estimation.

Polygamy is permitted here, with the same latitude as in all other negroe countries, the husband being confined to no number, and taking as many women as he is able to support.

In general, the husband has the power of punishing the infidelity of his wife, by selling her to the highest bidder, or driving her out of his house with all her children, without any thing to support them. Yet notwithstanding the severity of these laws, the women look upon an intrigue with a white man as a great honour; and their husbands frequently compliment the factors with the use of their wives, sisters, or daughters.

Among both the Mahometan and Pagan negroes of this country, persons under certain degrees of consanguinity are prohibited by law from marrying. A man, for instance, cannot marry his daughter, his sister, his aunt, or his niece.

The women in general are incredibly fruitful, and in the pains of labour never utter either a groan or a sigh. None but those who are pregnant very young require the assistance of a midwife, and the women never keep their beds above a day or two, if at all; for in general the mother and infant are immediately washed, and the child being wrapped up in a cloth, is fastened to the shoulders of the mother, who goes about her work, as if nothing extraordinary had happened.

A new born child is dipped three or four times a-day over head and ears in cold water, and as soon as he is dry, they rub him over with palm-oil, particularly the neck, the back-bone, the small of the back, the hips, knees, and elbows. When first born they are of an olive colour, and sometimes do not turn black till they are a month or two old.

The women treat their children with extraordinary tenderness, sparing no fatigue or labour till they are able to walk, after which they carefully cherish and assiduously attend them till they are able to provide for themselves. As the boys are bred in a perpetual course of idleness, this becomes habitual. As to the girls, they are bred to labour from their infancy, and to a modest and reserved behaviour in company, especially before their superiors. Here, as well as in some other countries, the woman avoids the caresses of her husband for three years after child-bearing, a custom founded upon their extraordinary affection for their children, who they imagine would contract distempers from the mother's milk being injured by the nuptial embrace.

Upon the death of any person, the whole village is instantly informed of the loss, by the lamentations of the family: the marbut or priest carefully washes the body, and then covers it with the same cloaths the person usually wore. The relations, coming one after another,

ask the deceased the most ridiculous questions, as, Why he was unwilling to live with them? whether he was dissatisfied with the narrowness of his fortune? whether he had too few handsome women? or whether any of his relations had offended him, that he should take this cruel method of punishing them? On the other hand musicians play and sing the praises of the dead, and a ball is given to all the attendants, who perform a particular dance in memory of the deceased. Slaves are sold to purchase brandy, and after the entertainment, the cover is removed from the grave in which the body is to be deposited. Four of the nearest relations hold up a cloth which is spread over the corpse, while the priest whispers some inarticulate sounds in its ear. It is then covered with dust, the tomb-stone laid over it, and upon that a piece of cloth of any colour the relations choose. At the head is placed some plates of provisions, and a jar of water, and near them a pole, on which are suspended the sword, darts, bow and arrows of the deceased. In some countries they encompass the grave with a deep ditch, to prevent the corpse being scratched up by wild beasts; which is frequently the case where this precaution is omitted.

At the death of a king, a certain time is fixed for the public mourning, which consists of a full chorus of howling over the grave, and hundreds of negroes, who, when the king was living, detested him as a tyrant, now seem to tear their hair, to beat their breasts, and pour forth their unfeigned lamentations for his death. All the wealthy subjects from every part of his dominions send presents of sheep, rice, and millet, for the use of the mourners, and an open table is kept round the grave for several days. Some writers say, that their complaints begin with the rising of the sun, and continue till the evening, when all this tragic farce is succeeded by dancing, singing, jollity, and the most extravagant debauchery.

S E C T. XIII.

Of the Languages, Mechanic Arts, Buildings, Furniture, and Activity of the People in the interior Countries between the Gambia and the Senegal.

MOORE says, that the common language spoken on both sides the Gambia is the Mundingan, with which you may bargain and perform every branch of trade, from the mouth of the river to the country of the Jonkos, or merchants, who are so called from the vast number of slaves they annually sell, and are situated at least a voyage of six weeks from James's fort; but a corrupt kind of Portuguese is commonly spoken by the vulgar natives who trade with the Europeans. The other languages are the Jaloossian and Pholian, which are all the languages spoken by the many nations in this division.

The negroes of these countries have made no great progress in arts and manufactures; for they have no mechanics but such as are absolutely necessary, and among these the smiths and cutlers are the principal, as they make all the implements of war, husbandry, and fishing, and in general work in all kinds of metals. The artist next in esteem is called sepatero, and is employed in making the grisgris, or cases for the charms which the marbuts dispose of to the people. This is a very profitable business, as the price of labour is regulated by superstition, and the people would think it the highest impiety to dispute the price of any thing belonging to a grisgris. The third mechanical employment is that of the mason, who is also a plaisterer and a potter; the building consisting of a kind of loam mixed with lime; and these are the people who make all their earthenware.

The women and girls are employed in spinning and weaving cotton cloths; but the artists in this way have made but small progress, being confined entirely to three colours, and giving their pieces of cotton only two yards in length and six inches in breadth, though they have the art of joining them together so neatly as to form a piece of any size, that appears to be of one entire web.

The negro houses and towns bear evident marks of the ignorance of the people; they have nothing like architecture, and scarce any attempts after beauty, order, or convenience: each generation follows the faults of the former, and all proceed in the same beaten track as their ancestors. The negro hut used by the common people is no more than a small conical cabin, with no other light than what enters by the door, which is so low, that they are forced to stoop down in entering it; after which a man of ordinary stature cannot walk round without hitting his head against the walls; and here the fathers, mothers, brothers, sisters, servants, and slaves lie together promiscuously. These huts are formed of a kind of wicker-work plastered over with earth, and are sometimes joined to each other by walls, by which means those of superior rank have distinct and separate apartments for the different parts of their families, and also a hut for the reception of strangers.

Their towns are always built of a circular form, with spiral streets; hence, in a village not half a mile in diameter, it is said that a person is frequently obliged to walk two or three miles to visit an acquaintance, when by a short cross street the distance might be reduced to an hundred paces.

The palace of the daim, or king, of Cayor, is mentioned as an exception to the general rule which the negroes seem to have established in building. This palace is encompassed by a wall, opposite to the first gate of which is a spacious court for exercising the king's horses, with stables all round it. At the farther end is another gate, on each side of which are the apartments of the different officers of the court; and from thence, through a fine vista of fruit-trees, forming a thick shade, you proceed to the royal apartments, on each side of which are the lodgings of the king's women, with proper officers for their servants and slaves. As his majesty has a private passage that leads to each apartment, it is never known with which of his women he spends the night; a method which, it is said, secures his person against all plots, and prevents jealousy and murmuring among the women.

The negroes of great wealth imitate in their buildings the magnificence of the royal palaces, and sometimes surpass them, especially those descended from the Portuguese, who build entirely in the European taste, but without the least notion of the principles of architecture.

According to a late French writer, some nations of the Mundingoes build in a more commodious manner than the rest, the walls being made of a fat binding clay, that seems smooth and hard like porcelain; these structures are thatched with straw, which projects beyond the building to a little wall breast-high, forming a small gallery round the hut, in which they are sheltered from the scorching rays of the sun. Mr. Adamson mentions a village burnt down before his arrival, when the walls that withstood the violence of the flames were partly of a beautiful red, and in a manner vitrified by the intense heat; at a distance the whole seemed covered with a bright enamel, and resembled the finest china.

The furniture of the common people consists of nothing more than a few necessities; as some earthen vessels, calabashes, wooden bowls, dishes, plates, and the like utensils; their mats supply the place of chairs, tables, and beds, except one bed for the master of the family, which consists of a kind of hurdle, laid upon cross pieces of wood, supported by wooden forks a foot above the ground; upon this they throw a mat, which serves them for a mattress, and generally for sheets and covering.

Deficient as these negroes are in the arts, they excel in agility. As they obtain great quantities of palm-wine, by making incisions on the top of the trunk, as already described, it is necessary that they should have a method of ascending these trees; and indeed it is very surprising to see how nimbly they run up them, though they are sometimes sixty, seventy, or even a hundred feet high, and the bark smooth. They have no other help in ascending than a piece of the bark like a long strap of leather, with the ends tied together, to inclose both themselves and the tree; then fixing it under their arms, they set their feet against the trunk of the tree, and their backs against the strap of bark, and thus go up very fast, moving the strap

up higher and higher with their hands: but sometimes they miss their footing, or the bark on which they rest breaks, or comes untied, when falling down, they are in danger of losing their lives.

Their activity and skill are also shewn in their horsemanship; for it is a common practice among the negroes to ride a full gallop standing on the horse's back; to vault into their seat; to raise themselves up again; to throw themselves with one hand on the ground, and again to recover the saddle, without the least fear or danger.

S E C T. XIV.

Of the Religion of the Negroes bordering on the River Senegal; with a particular Account of the Griggris, the Mumbo Jumbo, the Marbuts, or Priests, and the Method of Education.

THE religion of the nations on both sides the river Senegal, and stretching east and south into the interior countries, is that of Mahomet, mixed with pagan superstitions, and entirely consists in the belief of the Unity of the Godhead, and the observance of the fast of Ramadan, the feast of Biram, circumcision, and a few other ceremonies. They believe in the mission of Mahomet, but never invoke or pray to him; and they observe their Friday-sabbath, without interrupting their ordinary work and the regular course of business. The grandees and people of fashion have an apartment in their houses set apart for public worship; but they have neither temples nor mosques, but assemble to perform their devotions in the open air, under the shade of a large tree.

These negro Mahometans content themselves with praying twice on every day in the week, except their Sabbath, when they pray three times. Every village has its marbut, who assembles them to their devotions; and after he has given them absolution from their Koran, they range themselves behind him, in order to imitate his gestures and grimaces, with their faces turned towards the east.

The negro Mahometans have their fast of Ramadan fixed to the month of September, though among the Moors it is a moveable fast; they observe it with the same strictness as the Turks, and neither eat nor drink till after sun-set, and the devotees will not even swallow their spittle: but when night comes, they solace themselves with a joy proportioned to the rigour of the abstinence of the day; and some of the wealthy pass the whole day in sleep, and the night in pleasure.

Circumcision is rigorously observed, and performed on the males at four or five years of age. When the children of the king, or of any man of quality, have arrived at the proper age, all their subjects and dependants bring their children; for the grandeur of the festival consists in the number of persons circumcised. Here one good consequence flows from this practice; for at the circumcision-feast the young people frequently contract alliances that continue for the remainder of their lives.

The people are extremely superstitious: the Mundingoes believe that the eclipses of the moon are occasioned by a large cat putting her paw between the moon and the earth; and upon these occasions they spend their time in dancing and singing in honour of Mahomet.

Whenever they intend to make an expedition, they sacrifice a pullet; and, by observing the entrails, resolve whether it is best to pursue or drop it. They pay a great regard to lucky and unlucky days, and nothing will prevail on them to undertake any important affair on the latter. The custom of making vows, and of wearing large bracelets to remind them of what they have sworn, is extremely frequent. Thus a person vows that he will make a present of such a slave; and, that he may not sell him through forgetfulness, he wears a bracelet on his arm, till it is convenient for him to fulfil his engagement; and their failing in this particular, they imagine, will be followed by some immediate judgment from heaven.

But the most general and remarkable of all their superstitions are their griggris, which, according to Le Maire, are certain Arabic characters, mixed with necromantic figures, drawn by the marbuts on paper; but

Labat

Labat affirms, that they are nothing more than scraps of the Koran written in Arabic. However, they lay such stress on these supposed charms, that the poorest negro never goes to war without his grisgris, as a charm against wounds; and if it prove ineffectual, the marbut lays the blame on the immorality of his conduct. These impostors invent charms against all kinds of danger, and in favour of all their desires; and, by virtue of them, the possessors imagine that they can obtain or avoid whatever they please. They are supposed to defend them from storms, enemies, diseases, pains, and misfortunes; and to preserve health, wealth, honour, and merit. These priests indeed reap great benefit from them, no clergy upon earth being more honoured and revered; and they are sold at so exorbitant a price, that they sometimes exact for them three slaves, and four or five cows. Those intended for the head are made in the form of a cross, reaching from the forehead to the back part of the neck, and from ear to ear; nor are the arms and shoulders neglected. Sometimes they are planted in their bonnets in the form of horns; at other times they are made like lizard's, serpents, or some other animal, cut out of a kind of paste-board. In short, their forms are as various as the purposes for which they are intended.

To these charms they add a bug-bear, which they call a mumbo jumbo, and is intended by the Mundingos to render their wives submissive and obedient. This is a kind of image eight or ten feet high, made of the bark of trees, dressed in a long coat, and crowned with a whisp of straw. Whenever the men have any dispute with the women, this is sent for to determine the contest, which is almost always done in favour of the men. One who is in the secret conceals himself within the image, and walking in it, is the oracle upon these occasions. None is allowed to come armed within his presence, and when the women hear him coming, they are so affrighted, that they run away and hide themselves; but if the person concealed in the mumbo jumbo is disposed to send for them, they are all obliged to come, and at his command either sit down, or sing and dance, as he pleases; and if any refuse to obey his summons, he has them brought by force, and then whips them.

When any man enters into this society, he is obliged to swear in the most solemn manner, never to divulge the secret to a woman, or to any person that is not entered into it; and that the secret may continue inviolable, no boys under sixteen years of age are ever admitted among them. The people also swear by the mumbo jumbo, and this oath is esteemed irrevocable. Indeed there are few towns of any note that have not one of these objects of terror to frighten the poor women into obedience.

We are told, that in the year 1727, the king of Jagra, having a very inquisitive woman to his wife, was so weak as to disclose to her the whole mystery of the mumbo jumbo, for which she had long solicited him; but she was scarcely in possession of this important secret, when, contrary to her most solemn promises, she hastened to reveal it to all the other women. This soon reaching the ears of the chief negro lords, who were before but ill affected to the king's person, and were now shocked at his weakness, and filled with dread, lest if the affair took vent, it should put a period to the subjection of their wives, they assembled to deliberate upon the measures necessary to be taken, and, putting a man into the mumbo jumbo, went to the palace, and with an air of authority, ordered the prince to appear before the idol; when he, not daring to disobey the summons, went, and after being severely censured by the object of female terror, was ordered to produce all his women, who had no sooner made their appearance, than they were instantly assassinated by order of the mumbo jumbo; and thus this discovery was suppressed, before it had proceeded farther than the king's family.

We shall now take notice of the marbuts, who are a numerous ecclesiastical body. Though they are in

most respects a distinct people from the laity, yet on common occasions their habit differs but little from that of the common people: they are said to be formal, affected, stiff, and designing; they have towns, and even whole provinces sequestered from the state for their maintenance, into which they admit no other negroes but their slaves, who are employed in tilling the lands, and cultivating their grain, fruits, roots, and all the other necessaries of life. They marry entirely among themselves, never making any alliances with the laity. Their male children are born priests, and particular care is taken to instruct them in the principles of the Levitical law, on which many of their ceremonies are founded, and to which, next to the Koran, they pay the most profound respect. Polygamy is permitted among them, and in general every thing else that is allowed to the laity.

On the other hand, their conduct in many respects is worthy of praise; they strictly observe those laws of the Koran which relate to abstinence and temperance, carefully avoiding all excess in eating, and never touching wine and spirituous liquors. They carry on a considerable trade among themselves, and are honest and fair in their dealings with each other. They are extremely charitable to all who are of the same profession, and never permit any of their society to be sent into slavery: but if any one of them has offended against the laws, they punish him according to the institutions of their order.

These good qualities, though sometimes blended with the vices of ambition and avarice, are the cement which firmly binds the fabric of this institution, and procures the respect of kings as well as of the vulgar. If persons of the first distinction meet a marbut, they form a circle round him, fall upon their knees, and receive his benediction, a custom which is observed even in the palaces of kings.

The marbuts of Munding spend great part of their time in the instruction of their children; and Jobson informs us, that he had seen seminaries for learning that contained some hundreds of youth, where they are taught to read, to write, to expound the Koran, the principles of the Levitical law, and the nature of the marbut society; but what they instil with their first milk is an inviolable attachment to the interest of the marbuts, a reserved conversation and conduct, with sobriety, temperance, and all the morals necessary to constitute the good order of the fraternity, and to command the respect of the laity.

They teach their children to read and write in a book formed of hard wood. They use a black ink made of the bark of a tree, and a pen resembling a pencil. Their laws are written in a language entirely different from that of the vulgar, and is supposed to be a corrupt Hebrew, or Arabic.

It is said that the great volume of the marbut laws, or institutions relating to the society, is a manuscript, of which they take copies for their private use. Jobson says, that they are far from confining their knowledge to their own schools, and to their own children, but communicate it to whole provinces, and to every youth they meet. According to him, they travel with their books and families from province to province, teaching wisdom and religion wherever they pass, enforcing their doctrine equally by precept and example. All towns are open to them, and the marbuts travel unmolested through whole kingdoms in the heat of the most bloody wars.

Some authors affirm, that in their travelling they live like mendicants upon the public; while others maintain, that they support themselves by trade, and particularly by the sale of grisgris, asking no other alms but pieces of paper, which they convert into food and raiment, by virtue of the mysterious characters they impress upon them. Indeed they carry on the richest commerce of the country, and some of them trade very largely, not only in grisgris, but in gold and slaves. Hence these people oppose by all possible means the endeavours of the Europeans to penetrate to the source of the river Gambia and the Senegal, from the apprehension that this might lessen their trade, and render them less necessary.

S E C T. XV.

*Of the Island of GOREE.**Its situation and extent.*

BEFORE we conclude this chapter, it is proper to take particular notice of Goree, the only European settlement between the rivers Gambia and Senegal, which we shall describe with all possible minuteness.

This island, which is situated in fourteen degrees thirty minutes north latitude, and in seventeen degrees twenty minutes west longitude from London, is called by the natives *Barfaguiche*; but the Dutch, who were the first Europeans that took possession of it, gave it the name of Goree, from an island and town of the same name in Holland. It is only about eight hundred and forty yards in length, and two hundred and forty-eight in breadth; its whole circumference, including a point at the eastern end of the island, being, according to a late mensuration, about two English miles. It stands to the south-west of Cape Verd, within cannon-shot of the shore, and consists of a long narrow piece of land, and a small but steep mountain. Notwithstanding its smallness, its situation renders it agreeable: for on the north part of the island the inhabitants have a view of Cape Verd and the neighbouring promontories. Though it is situated in the torrid zone, the people breathe a temperate air all the year round, owing to its being continually refreshed by alternate breezes from the land and sea. A multitude of surrounding rocks render it almost inaccessible, except at two particular bays. Upon the summit of a rocky hill is St. Michael's Fort, which the late director M. de St. Jean embellished with several new buildings, and added works which, in the opinion of the French, rendered the island impregnable: the land is also defended by other forts and batteries.

The soil was formerly composed of only a red sand, without either grass, trees, water, and scarce any thing besides reeds: but, by the diligence of the above gentleman, several springs of fresh water were discovered in the island; gardens were planted with excellent fruit-trees; pulse and all kinds of vegetables were made to grow in great abundance; and, in short, from a small, barren, and disagreeable island, it was rendered one of the pleasantest and most important settlements in Africa.

The island of Goree was ceded to the Dutch in the year 1617 by the king of Cape Verd, when they immediately built a fort on a rock to the north-west, to which they gave the name of Nassau-Fort; but finding that it could not command the harbour, they erected a fortification, called Orange Fort, nearer the shore. The Dutch kept the island till admiral Holmes taking it in 1663, placed an English garrison in it. Two years after it was retaken by De Ruyter, and the governor and garrison obliged to surrender prisoners of war. The Dutch then augmented the fortifications, and the island enjoyed perfect tranquillity, till in 1677 a French squadron, commanded by the count d'Estrees, attacked the place, and obliged the Dutch governor to surrender at discretion. D'Estrees found that the lower fort mounted forty pieces of heavy cannon, and that the works were kept in excellent repair; but having no instructions to garrison them, he dismantled this, and entirely demolished Nassau Fort. Soon after M. Du Casse arriving at Goree with a forty-gun ship, solemnly took possession of the island, and concluded a treaty with the king and negroes on the same conditions the Dutch had enjoyed the island; and as this measure, which he had voluntarily taken, was approved by the court of France at his return, he was sent back the following year in quality of governor; and soon after this conquest was secured to the French company by the treaty of Nimeguen.

The French instantly repaired and added new works to both the forts, calling the lower fort *Vermandois*, and the higher *St. Michael*. Afterwards several unsuccessful attempts were made by the Dutch to recover a place of such importance to trade, but all of them proved abortive.

The French continued in the possession of this island till the year 1759, when a squadron was fitted out under the command of commodore Keppel, consisting of the *Torbay*, *Fougueux*, *Nassau*, *Prince Edward*, and the *Dunkirk*, several frigates, two bomb-ketches, and some transports, with seven hundred regular troops on board, commanded by colonel Worge. On their arrival before the island, it was resolved to make the attack on the west side, not because it was the weakest, but from its being the weather side; and therefore should their cables be cut by a chain shot, or any other accident, the ships might, without danger, put to sea, and, beating to windward, renew the action; but if they had anchored on the east side, such an accident might have caused the ships to be driven on shore.

On the eleventh of November, at about nine in the morning, the *Prince Edward* and the *Fire Drake* bomb bore down towards the island, and in ten minutes after the action was begun by throwing a shell from a bomb. The enemy instantly returned the fire from the forts and batteries; and at the second shot carried away the *Prince Edward's* ensign-staff, and set fire to an arms-chest close by it, which, blowing up, killed one of the marines. Encouraged by this successful beginning, they levelled their ordnance at the *Prince Edward*, and began a terrible fire; and few in the squadron saw this vessel, in the midst of this shower of bombs and bullets, without sending up their most fervent wishes on the occasion.

The commodore observing that the *Fire Drake* overcharged her mortar, and that all her shells fell beyond the island to the south, sent his boat on board the *Furnace* bomb, with advice, that as they saw the error of the other in over-charging the mortar, they should avoid that extreme, and that as the enemy seemed bent upon sinking the *Prince Edward* and the *Fire Drake*, he desired they would begin their fire, and endeavour as much as possible to draw part of the enemy's attention from their suffering friends; and these orders were instantly obeyed. The fire from all the ships was soon discharged with prodigious fury on the enemy, and that of the *Torbay* alone, in which was the commodore, seemed sufficient to have razed the very foundations of the island. The commodore had brought up with such judgment a breast of the angles of both the west-point battery and St. Francis fort, that the enemy could not bring a gun from thence to bear upon him. Five guns only could have touched him with advantage; two from St. Peter's, and three from a small lunette on the hill before St. Michael's; both which were so warmly attacked by the other ships, that they were soon deserted. Indeed the fire from the *Torbay* was so terrible, so near, and so well aimed, that none but madmen could have stood it. The ship seemed in a continual blaze, and that part of the island was darkened by a cloud of smoke. Several hundred negroes lined the opposite shore, to behold the engagement, and were astonished at seeing ships bear down with the utmost intrepidity against stone walls, and receiving the fire from the batteries with intrepid courage.

The governor was at length prevailed upon to strike his flag; but Mr. Keppel, in the midst of the noise and smoke, was some time before he perceived the silence of the enemy, and at last only suspected they had struck, from the silence of the rest of the squadron. He slackened his fire to look around him, when not a Frenchman was to be seen but those who were flying towards the castle on the hill. Upon this he sent a lieutenant, attended by his secretary, to wait upon the governor; but before they had left the boat they were met by M. St. Jean on the beach; who asked on what terms the honourable Mr. Keppel proposed he should surrender? Surprised at the question, they asked, If his flag was not struck? He answered No, he only meant it as a signal for a parley: and being told that the commodore would hear of no terms but his own, replied that he was sufficiently prepared, and knew how to defend himself; to which the others returned, that the commodore had brought up in a situation where no gun could hurt him, and did not care if they stood out for a month. Hence the engagement was renewed; but M. St. Jean, soon finding it impossible to keep his soldiers to their quarters, surrendered himself

and garrison prisoners at discretion, and the British flag was hoisted on Fort St. Michael.

This island was however restored to the French king by the treaty of peace signed at Paris in 1763; when

the French king, at the same time, ceded and guaranteed to Great Britain the forts and factories on the river Senegal.

C H A P. XIV.

Of the CAPE VERD ISLANDS, with BISSAO, and the small Islands called the BISSAGOES.

SECT. I.

Of the CAPE VERD ISLANDS.

Their Situation and Number, with a concise Description of the principal of those Islands, viz. Bravo, Fuego, St. Jago, Buena Vista, or Bona Vista, Mayo, Sal, St. Nicholas, St. Vincent, St. Antonio, and St. John's.

THE islands of Cape Verd are thus named from the largest of them, being situated opposite to that cape, which projects into the sea between the rivers Gambia and Senegal, though these islands lie a hundred and twenty leagues to the westward of it. They were discovered in the year 1460, by Anthony Noel, a Genoese in the Portuguese service, and are about twenty in number; but some of them, being only barren uninhabited rocks, are not worth notice. They are situated between the thirteenth and nineteenth degrees of north latitude, and the principal of them are ten in number, lying in a semicircle. These, beginning at the south, are Bravo, Fuego, St. Jago, Mayo, Buena Vista, the Isle of Sal, St. Nicholas, St. Vincent, St. Antonio, and St. John's.

The Isle of Bravo is situated in the fourteenth degree of north latitude, and consists of very high land, the mountains rising in the form of pyramids. It is remarkable for its excellent wines, and is inhabited by Portuguese. It abounds in salt-petre, and produces Indian corn, water-melons, gourds, potatoes, horses, asses, and hogs; and the coast supplies the natives with plenty of fish.

The island of Fuego, or Fogo, is situated in latitude fifteen degrees twenty minutes: it is much higher than any of the rest, and appears at sea like one continued mountain. In sailing by it no valleys are to be seen, these only resembling gutters, made by torrents of rain running down the mountain: but when a person is on shore near one of these seeming gutters, he finds that they are deep valleys bordered by lofty mountains.

On the top is a volcano, which may be seen at a great distance at sea. It sometimes casts forth rocks of an amazing size to a vast height, with a noise like that of the loudest thunder, and sometimes torrents of flaming brimstone pour from the peak, like a torrent of water down a steep mountain; after which the inhabitants can gather what quantities they please. It is not unlike common brimstone; but is of a much brighter colour, and on being burnt gives a clearer flame. At other times the volcano casts forth such an amazing quantity of ashes, that the adjacent parts are covered, and many goats smothered.

There are no brooks in the island, and in some places the inhabitants are obliged to go six or seven miles for fresh water: yet, notwithstanding this, it produces great quantities of pumpkins, water-melons, seshoons, and maize; but no bananas and plantains, and hardly any fruit-trees, except wild figs: however, in some of their gardens they have guava trees, oranges, lemons, and limes. They have also some good vineyards, of which a small quantity of wine is made; but it is generally all drank before it has done fermenting.

The island was first inhabited by the Portuguese, to whom the king gave the land. These brought negro slaves with them, and stocked the country with cows, asses, horses, and hogs; the king sending goats, which

run wild on the mountains. Hence the profit of their skins is reserved to the crown; and he who has the management of this revenue is called captain of the mountains, none daring to kill any of them without his licence. It is customary here, and at all the other islands, for every person at his death to give freedom to his blacks. These are now the principal inhabitants, there being an hundred negroes on the island to one of the whites. They make cotton cloths for cloathing, and breed mules, which they sell to other nations.

All the inhabitants are Roman Catholics, but mingle with that religion some Pagan superstitions. Most of the whites live with the governor in the town of St. Philip, which is the capital of the island, and have at the same time country houses on that part of their estates which they keep in their own hands, and manage by their slaves. These supply them with food, and the rents of the plantations let to the blacks are paid them in cotton cloth.

The island of St. Jago, or St. James, is the largest of them all, and took its name from its being discovered on the first of May, the festival of that saint. It is situated in fifteen degrees north latitude, and in six degrees five minutes longitude from Cape Verd. It is of a triangular form, fifty or sixty leagues in circumference, and though rocky and mountainous, the valleys produce Indian corn, oranges, lemons, pine-apples, cocoa-nuts, guavas, custard-apples, bananas, tamarinds, plantains, pumpkins, water and musk-melons, sugar-canes, and grapes; but they are not allowed to make wine; they have also some cedar trees, and plenty of cotton. In short, it is the most fruitful of all these islands.

The animals are horses, asses, mules, cows, deer, goats, hogs, civet cats, and monkeys, and almost all sorts of fowls and birds. Their seas also abound with prodigious plenty of fish. Here our ships bound for the East-Indies usually resort for fresh water and provisions, and are supplied with hogs and poultry in great abundance.

Salmon mentions in a very entertaining manner, the alteration of the air on arriving at this island. "We sailed out of the Thames, says he, on the 30th of January, in an extreme cold winter, the Thames full of ice; and within the space of a month arrived at St. Jago, where we found it so warm, that the men all lay naked upon their chests, not being able to endure any cloaths on; and when we came ashore, we found groves, and gardens of ever-green and ripe fruits, a serene air, and almost every thing that could afford delight to a people just arrived from a frozen region. The sudden change from a cold to a warm country, from winter to summer, from naked trees destitute of leaves and fruits and a land covered with snow and ice, to a place where oranges, and all the fruits of the earth displayed their beauties, and were ready for gathering, was such an agreeable change in little more than the compass of three weeks, that it exceeded any metamorphosis that is to be met with in the most romantic relations. An unusual gaiety seemed to possess all the ship's company, and nothing but mirth and good humour reigned amongst us."

The capital of the island is Ribeira Grande, where the governor, oviadoré, and bishop reside. Here also is a monastery, which is adorned with a large garden, and affords the finest prospect of any building about the city,

city, except the cathedral. Most of the priests among these islands, as also those sent to Guinea, are negroes. The inhabitants, who are about three whites to forty blacks, pay no tax to the crown.

The island has four other towns, which are St. Jago, St. Domingo, St. Domingo Abacen, and Braya, which last is the most noted port.

Buena Vista, or Bona Vista, thus named from its being the first of the Cape de Verd islands discovered by the Portuguese, is situated in the sixteenth degree of north latitude, two hundred miles west of the coast of Africa, and is twenty miles long, and twelve broad, mostly consisting of low land, with some sandy hills, and rocky mountains. It produces great quantities of indigo, and more cotton than all the other Cape de Verd islands; yet there is not one of them where there are fewer cotton cloths to be sold: for the natives will not even gather the cotton before a ship arrives to buy it; nor will the women spin till they want it. They have, in general, the same animals as in the other islands, with plenty of fish and turtle.

The English who frequently land there, to take in a lading of salt, hire men and asses to bring it down to the sea; for which they pay them in biscuits, flour, and old cloaths. This island had also formerly a pretty good trade for horses and asses, which are the best of all that are upon these islands. The people are very fond of silk, with which they work the boloms of their shirts, shifts, caps and women's waistcoats.

The men commonly wear the English dress; for most of them have suits of cloaths bought of the English, and have learned to make cotton cloths to imitate the European fashion. The women have one, two, or three cotton cloths wrapped about them like petticoats, tied on with a girdle about the hips, and sometimes without a girdle. Their shifts are made like a man's shirt, but so short, as scarcely to reach to the girdle; the collar, neck, and waistbands of the young people of some rank, are wrought in figures with silk in various colours in needlework; but the old and the poor have theirs worked with blue cotton thread. Over their shifts they wear a waistcoat, with sleeves to button at the arms, not above four inches deep in the back part, but long enough before to tie with strings under their breasts. Over all they have a cotton cloth in the manner of a mantle; those of the married women are generally blue, and the darker the colour, the richer it is reckoned; but the maidens, and gay young wives and widows, wear blue and white, some spotted, and some figured. They however rather chuse, if they can get them, linnen handkerchiefs wrought on the edges, and sometimes only on the corners, with red, green, and blue silk; the first being the colour they most admire. They wear neither shoes nor stockings, except on holidays; and, indeed, at other times the women have generally only a small cotton cloth wrapped round their waist, and the men a ragged pair of breeches; to which, if there be but a waistband, and a piece hanging to it before to hide what modesty teaches them to conceal, they think it sufficient. The people of Bona Vista are fond of the English, and most of them can speak a little of the English tongue.

Mayo, or May, obtained its name from its being discovered on the first of that month. It is situated in fifteen degrees five minutes north latitude, near three hundred miles from Cape Verd, and is about seventeen miles in circumference. The soil is in general very barren, and water scarce: however, they have plenty of cows, goats, and asses; and also some corn, yams, potatoes and plantains. What trees they have are situated on the sides of the hills, and they have some water-melons and figs. The sea likewise abounds with wild fowl, fish, and turtle. There grows on this island, as well as on most of the others, a kind of vegetable stone, extremely porous, and of a greyish colour, which shoots up in stems, and forms something like the head of a colliflower.

The inhabitants, who amount to about two hundred, are not so well affected to the English as those of Bona Vista; but they have more cows and oxen, which

are the fattest and best on the Cape de Verd islands. They have more cotton than they can use; but are so indolent, that half of it is lost for want of gathering. Their cloaths nearly resemble those worn at Bona Vista; but few of them have their shirts and waistcoats stitched in colours.

The isle of Salis is situated in the seventeenth degree of north latitude, three hundred miles west of the coast of Africa, and is about forty-two miles in circumference. It receives its name from the great quantity of salt naturally produced here from sea water, that from time to time overflows part of the land, which is mostly low, it having only five little hills. This island formerly abounded with cows, goats, and asses; but the want of rain caused it to be deserted. There are abundance of land crabs about the island, and the sea abounds with fish.

St. Nicholas is the longest and most considerable of all the Cape de Verd islands, except St. Jago, it extending about seventy five miles in length. It is situated in seventeen degrees north latitude, and is mostly high land. It is fruitful in maize, and produces the best feshoons in all these islands, and likewise oranges, lemons, plantains, bananas, pompions, musk and water-melons, some sugar canes; and the inhabitants have vineyards, from which they make a tartish sort of wine. They have likewise the dragon-tree, from which flows the drug called gum dragon.

The natives make the best cloths and cotton quilts of all the islands: these are too good for the Guinea trade; but fit for that of Brasil. They make them up into cloaths, as neatly as our common country taylors, and will make buttons to imitate almost any pattern you shew them; they knit cotton stockings, tan cow-hides and goat-skins, and make tolerable good shoes. The women are much more housewifely and ingenious with their needles than those of the other islands; and she who does not appear with a worked cap, like those worn at Bona Vista, is thought very idle.

The town of St. Nicholas is the most compact and populous of any on all the islands, though it is not so large as the city of St. Jago; but the houses, and even the church, are only covered with grass thatch. The inhabitants are the only people of the islands who build boats, with which they fish, and catch turtle. They have a number of horses, and there are few families that have not a stock of hogs and fowls. The people speak the best Portuguese, and are the exactest Roman catholics of any of the islands.

St. Vincent is uninhabited; but on the north-west side of the island is a good bay, called Porto Granda, where ships may wood and water, and also wild goats may be obtained for taking the pains to shoot them. Here are also many asses; it is said there are more turtle and fish caught at this island than in all the rest; and that it abounds with salt-petre.

The island of St. Antonio, or St. Anthony, is situated in seventeen degrees nineteen minutes north latitude, fifteen miles from St. Vincent. It is little inferior in height to Fuego, and considering the amazing loftiness of the mountains, one of which is thought to be as high as Teneriff, and the deepness of the vallies, is supposed to contain as much ground as St. Jago. It has many brooks of fresh water, which render the vallies through which they flow, extremely fertile in maize, and in a variety of trees, as oranges, lemons, limes, bananas, plantains, pompions, guavas, musk and water-melons. The inhabitants have great plenty of wine; but it is the worst and cheapest of any produced in these islands. They have also a large stock of cows, hogs and asses, and the mountains abound with goats. In this island are likewise produced great quantities of gum dragon, and a great deal of indigo is cultivated here, as are likewise large plantations of cotton.

The natives are said to be remarkable for their innocence and humanity. There are supposed to be two thousand five hundred persons in the island, four-fifths of which number are said to be composed of slaves, who, like the free negroes, have wives, houses, and plantations, and cultivate some of the best cotton and indigo, which

are worked up by these slaves, who are governed by a steward placed there by a Portuguese marquis, who is proprietor of the island.

The last of the Cape Verd islands we shall mention is that of St. John's, which is situated in fifteen degrees twenty-five minutes north latitude, and seven degrees two minutes west of Cape Verd, and is very high and rocky. It has more salt-petre than any of these islands: this is found in several caves covering the sides like a hoar frost, and in some hollow rocks, like icicles as thick as a man's thumb. This island abounds with pom-pions, bananas, water-melons, and other fruit, and also with fowls and goats.

The natives, who are a simple, harmless, and friendly people, wear in common only a little slip of cotton fastened to a string before, which passing between the thighs, is tied to the same string behind; but when full dressed they also wear a piece of cotton cloth, which the men hang over their shoulders, and wrap round their waists, while the women put it over their heads, and then wrap it about their bodies; and on both of them it extends to the calf of the leg, or lower. This cloth they spin and weave themselves.

Their fishing utensils are long canes for rods, cotton lines, and bent nails for hooks. As to their hunting, the governor having the sole privilege of killing the wild goats, none dare hunt without his consent. This was a law made by the Portuguese when they peopled these islands from the coast of Africa, in order to prevent the breed being entirely destroyed.

When the governor chooses to make a general hunt, all the inhabitants are assembled, who scarcely exceed two hundred; and the dogs which are between a beagle and a greyhound, are called. At night, or when the governor thinks proper to put an end to the sport, they all meet together, and he parts the goats flesh between them as he pleases, sending what he thinks proper to his own house with all the skins; and after he comes home, he sends pieces to those who are old, or were not out a hunting; and the skins he distributes among them as he thinks their necessities require, reserving the remainder of them for the lord of the soil.

This is one of the principal privileges enjoyed by the governor; who is also the only magistrate, and decides the little differences that sometimes happen among the people. Upon their not submitting to his decision, he confines them till they do, in an open place, walled round like a pound: but, instead of a gate, they generally lay only a stick across the entrance, and those innocent people will stay there without attempting to escape, except when overcome by passion, and then they rush out in a rage; but these are soon caught again, tied hand and foot, and a centinel set to watch them, till they agree with their antagonist, ask the governor's pardon for breaking out of his prison, and have remained there as long as he thinks they have deserved. Nay, if one kills another, which hardly happens in an age, the governor can only confine him till he has pacified the relations of the deceased, by the mediation of his friends, who are bound for the criminals appearance, in case a judge should be ever sent from Portugal to execute justice: but imprisonment is here reckoned such a scandal, that Mr. Roberts says, it is as much dreaded as Tyburn is by the criminals in England.

SECT. II.

Of the Island of BISSAO.

Its Situation and Extent; the Face of the Country; its Produce; and the Dress, Manners, Religion, and Government of the Inhabitants; with the Manner in which they make War.

WE shall now give a description of the island of Bissao, and of a cluster of islands called the Bissagoes. These islands stand close to the continent, a few leagues to the south-east of the river Gambia, in the latitude of eleven degrees north.

Bissao, which is about thirty-five or forty miles in circumference, affords a very agreeable prospect from the

sea, rising on every side by a gentle ascent to an eminence in the center of the island; yet there are a number of hills inferior in height to that in the middle, separated by beautiful and fertile valleys, divided by small rivulets, which at the same time augment the richness and elegance of the scene. There are little groves of palms, and the rest of the ground is cultivated, and produces a harvest equal to the most sanguine wishes of the inhabitants. Wheat and maize spring up to a great height, so as to resemble a field covered with reeds or bamboos. They have likewise another grain that is a species of maize, which they make into cakes. They have also oranges, bananas, mangoes, and every kind of fruit to be found in the warm climates, and perhaps in greater perfection than in any other place. The cattle of Bissao are of an uncommon size, and seem to keep pace with the most extravagant growth of the corn: milk and wine are in the greatest abundance; but the island affords neither swine nor horses, the natives forbidding the importation of the former, and something either in the climate or soil preventing the increase of the latter.

The populousness of Bissao is equal to its fertility, notwithstanding the perpetual state of war in which the natives are engaged with the neighbouring islands, and the kingdoms on the continent: yet, though very numerous, they live in cottages dispersed up and down the country, without the least vestige of a town, except where the French and Portuguese have established themselves. Even the palace of the king only consists of a number of irregular huts, that have a communication with each other. In the Portuguese town are about six hundred persons, all of whom speak Portuguese, and pretend that they are descended from that people, though their complexion is jet-black, and they have a fixed and inveterate dislike to that nation.

The dress of the women consists of a cotton girdle, which falls down before; and bracelets of glass, coral, and copper; but the virgins go entirely naked, and those of high quality have their bodies marked or painted with a variety of hideous pictures of snakes and other reptiles, that give their skins some resemblance to flowered satin. Even the eldest daughter of the king is distinguished from the other ladies only by the elegance of these paintings, and the richness of the bracelets.

The men of all ranks have no other cloathing but a skin fixed to their girdle, and drawn up between their legs. One of the most extraordinary ornaments is a large iron ring, with a flat round surface on the outside instead of a stone, upon which they ring changes with a bit of iron, in such a manner as to converse with the same facility with their catanets, as by means of the most polished language. There is, however, something in this that appears highly improbable, for it is difficult to conceive, how ideas can be conveyed by striking together two pieces of iron; it is nevertheless acknowledged, that besides this artificial language, they have another that is vocal, and used upon all common occasions.

The Bissaoans are all idolators; but their ideas of religion appear so confused, that it is difficult to enter perfectly into their system. Their chief idol is a small image which they call Shina; but we are unacquainted with the sentiments they form of this object of their worship: besides this, it is said, that every man creates a divinity according to his own fancy. Trees are held sacred, and worshipped as the residence of some deity or spirit superior to man.

With respect to their government, it is entirely despotic, the will of the prince being a law to his people; he has nothing to lose, and yet every thing within his dominions may be said to be his, as his power extends over his people and their effects. Authors give the following instance of the policy of one of these princes. Two slaves, who had been sold to an European merchant, made their escape, and were taken by the king's troops. Equity seemed to require their being restored to their masters; but the king gave a different verdict, saying, they had obtained their freedom by having escaped, and by being retaken by his troops were again reduced to slavery; and consequently were the property of the conqueror.

At the death of the king all the women and slaves, for whom he had a peculiar regard, are sacrificed and buried near

near their master, in order to attend him in the next world. It is likewise customary for the nobility to have some of their living friends buried with them. Labat mentions an instance, where a father desired that his three sons, of whom he was very fond, might accompany him into the other world.

The natives are warlike, and fight with extreme fury, though with little discipline. As treaties of peace are unknown among these nations, they have no kind of intercourse except in war, and hence no scheme of politics is carried on among them. The Europeans are far from offering their mediation; for they find it their interest to ferment their quarrels, as war is their harvest, by its augmenting the number of slaves.

When the king of Bissao resolves to carry war into the neighbouring territories, he orders an instrument, called the bonbalon, to be sounded; this is the general signal to arms, in which all in the government's pay assemble at certain head-quarters, that are always fixed; where they find the royal fleet, which usually consists of thirty canoes, each carrying thirty men, with their arms and provisions, under the command of an admiral; for the king seldom puts himself at the head of his fleets and armies. Before the fleet sets sail, a number of sacrifices are offered to the gods, and the flesh of the victims divided between the court, the priests, and the soldiers. In this consultation of the gods the king always receives a favourable answer; for the deities being of wood, it is easy for the priest to direct what they should say: and hence the army always begins a campaign with the fullest assurance of success. They make a descent with all possible privacy, surround the enemy's towns and villages, carry off the inhabitants with every thing of value, and then embark before their troops have time to assemble in order to oppose them. One half of the booty belongs to the king, and the remainder is divided among those who obtained it. The slaves are sold to the Europeans, except where any of them happen to be of quality or fortune; in which case he is restored to his friends, on condition of their sending a certain number of slaves in his room.

The heroes, upon their return, assume an air of great importance, and go round the country, shewing their wounds, and relating the wonders they have done and seen, with a long train of prisoners behind them, whom they oblige to sing the praises of the conquerors; for which they make them presents of pieces of cloth and other things, which they immediately exchange for palm wine.

But when the expedition is attended with less honour and profit than was expected, the prisoners are in danger of being sacrificed, especially if the Bissaoons have lost an officer of distinction. Those who fall upon these occasions receive public honours by dances performed to the music of tabors. The women express their grief in a manner extremely affecting, pulling their hair, and beating their breasts; after which they are served with palm wine, in order to support their spirits. When thus recruited they begin their mourning with redoubled vigour, and shed tears most plentifully, till the corpse is laid in the grave; when their countenances suddenly brighten, and they seem to have lost all ideas of their affliction.

The king's palace is about a league distant from the point of Bissao. He never stirs out without being surrounded by some thousands of his nobility, women, and guards, all of them richly dressed and armed, as far as the skins of beasts and the brightness of their scymetars and lances can make them so.

The Portuguese had formerly a fort in Bissao, which they mounted with eight pieces of cannon in order to awe the natives, and prevent their trading with any other sovereign but themselves: the Bissaoons, however, soon threw off this restraint, and now maintain the full liberty of receiving all strangers into their ports, where they enjoy perfect security under the king's protection; but, before they are suffered to land, his majesty consults the gods, by sacrifices, whether admitting those strangers be for the good of the island, and the interest of himself and people.

SECT. III.

A concise Account of the Bissago Islands; and more particularly of the Island of Bulam.

THE Bissago islands are situated near the mouth of the river Sierra Leona, and consist of the islands of Bulam, La Gallina, Cainabac, Cazegut, Calacha, and some others. The island of Bulam is about ten leagues in length from east to west, and five in breadth from north to south; the whole coast is bordered with woods, beyond which the country is fertile, rich, and beautiful, covered with rice, Indian corn, millet, roots, and fruit: yet the Island is said to be uninhabited, and cultivated only by the natives of the other islands, who come hither in seed-time and harvest, continuing at home the rest of the year.

The ground rises gently from the shore for the space of two leagues, which presents mariners with a most delightful prospect, while it excites their admiration at seeing so beautiful a spot uninhabited. This ascent serves as a base to higher mountains, which rise in the center of the island, and are covered with fine woods, and divided by beautiful valleys, so that nature seems to have been improved by art.

This island produces a tree which might be employed to great advantage in ship-building; it is called michery: it grows to a great height, is easily worked, and at the same time is hard, solid, and proof against worms; all its pores being filled with a bitter oil, which is said to deter them from harbouring in it.

La Gallina was thus named from the great number of hens the Portuguese found there. This and the island of Cainabac are very populous and fruitful, and have plenty of good water. Cazegut, one of the most considerable of these islands, is about six leagues long, and two broad. Its soil is very good, and produces millet, rice, and all kinds of pulse, besides orange and palm trees.

We have no particular account of these islands, none of them being inhabited by the Europeans; we shall therefore only add, that each of the Bissago islands, except Bulam, is governed by a chief, who assumes the authority of a king. All these monarchs are perfectly independent, and frequently at war with each other. They have canoes that carry from twenty-five to forty men, with their provisions and arms, which are sabres, bows and arrows. The negroes of these islands are tall, strong, and healthy, though it is said they live only on fish, nuts, and palm oil; and sell their rice, millet, and other produce of the earth to the Europeans for the ornaments they wear. They are in general idolaters, and are said to be of a savage and cruel disposition, not only to strangers, but to one another; for authors say, that they frequently quarrel about trifles, and if disappointed of their revenge, will drown or stab themselves.

C H A P. XIV.

OF ZAARA, TOMBUTO, and BILEDULGERID.

S E C T. I.

Of ZAARA, ZAHARA, or the DESART.

Its Situation, Extent, Divisions, Produce, and Animals, with a Description of its several Provinces.

WE now come to the countries north of the Senegal, and shall begin with describing the desert of Zaara, or Zahara, a vast inhospitable region, extending from the Atlantic ocean on the west, to the kingdom and deserts of Barca and Nubia on the east, and from the river Senegal on the south, to Biledulgerid on the north; that is, from the eighth degree west, to the twenty-sixth of east longitude, and from the fifteenth degree of east latitude to the tropic of Cancer, comprehending a space of at least fifteen hundred miles in length from east to west, and about five hundred in breadth from north to south.

This immense tract of land is divided by the Arabians into three general divisions. Cahel, Zahata, and Asgar, that is, the sandy, stony, and marshy deserts, according to the nature of the soil; but later geographers divide this country into seven provinces, which are Zanaga, Zuenziga, Targa or Hayr, Lempta or Iguidi, Bardoa, Bornou, and Gaoga.

In a country covered with burning sands, the soil cannot be supposed to be fertile, though that situated on the northern banks of the Senegal being watered, peopled, and cultivated, produces corn, rice, millet, and a variety of fruits, but, except dates, little more perhaps is reaped than is sufficient for the use of the inhabitants.

Besides camels and common cattle, this country is remarkable for a species of domestic animal called adimnaim, of which there is great plenty. This is a kind of sheep, about the size of an ass, with long hanging ears: the females have horns, but not the males, and the wool is short, but soft and fine. This animal is so strong that it can easily carry a man for several miles, and so gentle, that it never refuses a burthen. The miseries to which the inhabitants of this parched, sandy, and barren desert are exposed, are increased by incredible multitudes of lions, tygers, wolves, and other savage animals.

To afford the reader as distinct an account of this great tract of country as possible, we shall describe the different provinces and deserts into which it is divided. Beginning at the south, the province of Zanaga extends from the Senegal on the south, to the province of Suz on the north; it is bounded by the Atlantic ocean on the west, and by the territories of Scram, Sunda, and Zuenziga on the east. It contains the two deserts Azvo and Tagguzza or Taggost. The last of these produces a prodigious quantity of rock salt, which is conveyed hence into all the adjacent countries, and is used in the desert chiefly to moisten the mouth parched with the sultry heat, and to preserve the gums against a scorbutic disorder to which the natives are subject.

Travelling is here extremely fatiguing and dangerous, especially in the summer proves dry; scarce a drop of water being to be seen for thirty leagues together; and when any is found it is so brackish, as to be equally unwholesome and unpalatable. Nor do the cattle fare better, the barren earth not yielding so much as a blade of grass, or any thing for their sustenance, which obliges the passengers to carry not only provisions for themselves, but for their beasts of burthen. Besides the country being flat and sandy, without mountains, woods, rivers, lakes, or any objects to direct their course, it would be impossible to avoid losing their way, were it not for the flight of certain birds, who are observed

to go and return at certain stated periods. They are also guided by the course of the sun by day, and by the stars by night; which last is probably the usual time of travelling here, as well as in the deserts of Arabia.

Yet it is certain, that every part of these deserts is not equally inhospitable, as they are allowed to be inhabited by several different nations, particularly by the Berviches, Ludayers, Duleyns, and Zenequi, some of which are so numerous as to raise fifteen or twenty thousand men; there are also a variety of Arab tribes no less numerous, potent, and warlike, and consequently they find lauds capable of supporting them and their cattle.

The province, or desert, of Zuenziga is still, if possible, more dry and barren than Zanaga; and we are told, that of large caravans that pass through this country, seldom half the number, either of men or beasts, ever return; most of them dying of thirst, hunger, fatigue, or under the whirlwinds of sand with which they are overwhelmed: but this is doubtless greatly exaggerated.

The inhabitants of this district breed many beautiful horses, and are such expert horsemen and warriors, that they are become formidable to the princes of Barbary, who study to keep on good terms with them; nor are they less dreaded by the negroes, whom they seize on all occasions, and sell to the people of Fez and Morocco; and, in return, when the negroes get any of them in their power, they cut them in pieces.

The province of Targa is said to be less barren, dry, and sultry than either of the former, it having a variety of good wells of fresh water dug deep in the ground, and the sand produces grass and several vegetables fit for food; the climate is healthful, and great quantities of manna are gathered here, which they sell to the neighbouring kingdoms.

To the east of Targa is the province of Lempta, which travellers find no less dangerous than any of the former, on account of the excessive heat of the sun reflected from the sand, the scarcity of water, the whirlwinds of sand, and the barbarity of the people, who endeavour to rob and plunder all that come in their way. Through this inhospitable region caravans pass from Constantina, and other towns of Algiers and Tunis, to Nigritia, though equally in danger of perishing by thirst, hunger and the sword; but their attachment to commerce, and the advantages they reap from it, make them encounter these hazards with the utmost intrepidity.

Bardoa stretches from the sixteenth to the twenty-second degree of east longitude. De Lisle says, the inhabitants, who are named Bardoaits, have towns, but live in tents on the plunder of merchants and passengers. But near the mountains, which form the northern barriers between this province and Tripoly, stands the town of Kala, where are kept some considerable fairs, to which merchants resort from every part of Zahara, and the nations bordering upon the Mediterranean sea, with the wealth of their several countries. The soil is in general dry, barren, and produces no commodities that merits a particular description.

The province or kingdom of Bornou extends from the twelfth to the twenty-second degree of east longitude, and from the seventeenth to the twenty-first degree of north latitude. The northern part resembles in barrenness the other provinces of Zahara; but all the rest, which is the greater part, is well watered by springs and rivers, that fall with a dreadful noise from the mountains, and render the country fertile in corn, grass, and fruits. Both the eastern and western frontiers are inhabited by people of a roving disposition, who live in tents, and are said to enjoy every thing in common, no such thing as property being known among them. The eastern and western frontiers

frontiers are divided into mountains and valleys, covered with flocks of cattle, fields of rice and millet, and many of the mountains with timber, fruit-trees, and cotton.

In hot weather the natives, who are chiefly shepherds and husbandmen, go naked, except wearing a short apron before, which they put on out of regard to modesty; but during the winter they are warmly clothed with the softest sheep-skins, of which they also form their bed-cloaths; and indeed this is scarce a sufficient defence against the inclemency of the weather at certain seasons of the year, when a cold piercing wind blows from the northern mountains, that chills the blood in proportion as the pores have been opened by the late scorching heats.

Towards the south there are towns and regular formed societies, where the people are tractable, polite, and hospitable; and great part of them artificers and merchants, of various nations, and of all complexions.

It is said that the government is in general monarchical; and that the king has all his household-furniture, and even his stirrups and spurs, with the bit and ornaments of his bridles of solid gold; whence it may be inferred, that either a great traffic in that valuable metal is carried on here with the distant countries, or that Bornou, or some of the neighbouring kingdoms, produces gold. The capital of this kingdom is a considerable city of the same name; besides which there are said to be the towns of Amozon, Sagra, and Semegonda, all of them to the northward of the metropolis, and to the eastward those of Sama and Nebrina. However, very little is known of any of these towns, and some writers question their existence.

We now come to the last and most eastern province of the desert of Zahara, called by the natives Gaoga, which on the east is contiguous to Nubia, and on the north to Egypt. This province is computed to be a hundred and eighty leagues in length from north to south, and about a hundred and sixty from east to west where broadest, extending from the nineteenth to the twenty-ninth degree of east longitude, and from the twelfth to the twenty-second of north latitude.

The only city in the whole kingdom is Gaoga, which stands on the north side of a lake of the same name, in fifteen degrees forty minutes north latitude, and twenty-five degrees thirty minutes east longitude, which is all we know of either, as no traveller gives any particular account of them.

The kingdom of Gaoga is mostly mountainous, and the natives rude and illiterate: they dwell in poor slight hovels, of materials so combustible, that they are frequently set on fire: and feed large herds both of small and great cattle, which are their principal wealth as well as sustenance.

S E C T. II.

The Complexion and Manners of the Inhabitants of Zahara, different from those of the People on the other Side the Senegal. Their Dress, Villages, Camps, Furniture, Manner of eating, Freedom from Diseases, Marriages, and Funerals.

HAVING described the various provinces of this barren and sultry desert, we shall now give some account of the general customs and manners of the inhabitants.

It is remarkable that though the river Senegal only divides this desert from Nigritia, and tho' the pastoral lives of the inhabitants exposes them to the vertical rays of the sun, under a climate as hot at least as that of Nigritia, their complexion is very different, they being for the most part no more than tawny, while the others are of a jet-black; and few or none of them on this side that river approach either in complexion or features to the negroes, who seem to be a people entirely distinct from those: nor do the inhabitants of Zahara differ less from those of the southern countries in their manners, customs, and religious rites, than in their external appearance. The former are all professors of the Mahometan religion, a few only excepted, who are worshippers of fire. Hence

the various tribes of Arabs, Barabars, &c. found in this country are probably descended from those Saracens and Arabians, who breaking out of Asia in the seventh century, over-ran the greatest part of northern Africa, and were here stopped by the river Senegal. Hence we may account for that inbred and inveterate hatred that still reigns between them and the native Africans on the other side the river.

The women never appear without a long veil that covers their face and arms; nor can the Europeans ever see them uncovered, except by accident. Both the men and women are of a middling stature, and, in general, well proportioned, with a beautiful symmetry of features. Their complexion is tawny, but delicate; and, as the women are less exposed to the sun, they are probably more fair and beautiful. Labat assures us, that they are remarkable for their prudence, oeconomy, and strict fidelity to their nuptial engagements. They not only live alone, but a man turns away his head when he chanceth to meet a woman, even his own wife, except at the time appointed for marriage freedoms. One who is too poor to have separate tents for the women, transacts all business and receives visits at the door in the open air, his nearest friends not being permitted to converse with his wives in the tent. This is a privilege, says a modern author, reserved for their horses, or rather mares, which are preferred on account of their beauty, for the advantages of breeding, their tameness, and docility. They lie down in their tents promiscuously with the women and children, their little iles being the play-fellows of infants.

The dress both of the Moors and the Arabs of this country chiefly consists of a robe or caftan of serge, some woollen stuffs, or blue and white cotton, and sometimes, but very seldom, of silk. They are clothed in a large shirt tied round the neck; this is so wide as to fold two or three times about the body, and is bound round the waist by a sash, in which is stuck a long knife like a bayonet, and sometimes two. According to Mr. Adamson, the dress of both the men and women consists in a large shirt, generally of black linen, and a cloth with which the women cover their head and shoulders; the men sometimes rolling it about their heads, in imitation of a turban, and sometimes round their middle. Some of the women wear their hair tied up in a knot, and others let it hang down; but the men are in general very negligent of it. They wear sandals, or rather socks, of Morocco leather, which rise to the small of the leg, and their heads are covered with a red bonnet, or cap, bordered with white cotton. They frequently wear above their other cloaths a long loose robe of white or striped cotton, or a woollen stuff, which they call haik, and is extremely becoming. This robe has a long pointed hood that falls down behind, to the extremity of which hangs a tassel by a long string. However, the poor are clothed after the manner of the negroes, and wear only a piece of cloth hanging down from the waist.

The women wear a long cotton shift, with long and wide sleeves, large drawers, and a piece of calicoe, or linen, that covers them from head to foot, and flows in an easy manner behind. They are all adorned with ear-rings and pendants, which are valuable in proportion to their station and quality: their fingers are also covered with rings, their arms with bracelets, and their legs with chains of brass or copper.

When a considerable number of tents or cabbins are placed together, and form a kind of town or village, they call it adouar. These villages are usually of a circular form, the tents standing very thick, and in the center is an empty space in which they keep their cattle. They have centinels on every side of this encampment to guard against surprizes from robbers, and from wild beasts. On the least appearance of danger, the alarm is given by the centinels, and soon spread over the camp, by the barking of dogs, and the noise of different animals; upon which every man able to bear arms stands on his defence, each before his own tent. As these people never encumber themselves with much household furniture, these villages are easily transported from place to place. Indeed all the domestic implements belonging to a family are contained in a leathern bag, or sack, which is easily transported, tent and all, on the back of a camel to any distance.

Their

Their usual drink is milk or whey, and their only bread cakes made of millet; indeed wheat and barley grow to great perfection in several parts of the country near the Senegal; but they are continually moving from one place to another, and their dislike to a fixed residence destroys all taste for agriculture. If they were to sow their corn, it might be reaped by other nations, for no inducements can engage them to continue a whole season in one place; for however useless and unnecessary their excursions might be, they would consider such an instance of inactivity as highly culpable.

When they happen to have a stock of wheat or barley, they lay it up in deep pits hewn out of the rock; these they contrive with abundance of art, in order to cause a constant draught of fresh air though the whole cavern, which is narrow at the entrance, and gradually enlarges itself in proportion to its length, which is sometimes above thirty feet. It is certain, that the grain will keep sound for many years in these subterraneous store-houses, the mouths of which, after the corn is sufficiently dry, are closed up with wood and sand.

In some parts of the country the people have portable mills, with which they grind their corn as they want it, and these they always carry with them wherever they go; but authors do not describe their form. Their manner of eating resembles that of the Asiatics. At their meals they sit cross-legged round a covering of Morocco leather, or a mat of palm leaves, spread upon the ground, upon which their dishes or plates of copper or ivory are laid; and they never drink till they rise in order to wash, a ceremony that cannot be omitted without the greatest indecency. They never allow themselves more than two meals a day, one in the morning and the other at night, and the women are never allowed to eat with the men. Their repasts are short and silent, not a syllable being uttered till they have washed and returned to their pipe and coffee, and then conversation begins.

From this temperance in their meals arises that strong health and freedom from diseases that renders them strangers to medicine, which was so much cultivated by their predecessors. The only distempers to which they are subject are dysenteries and pleurisies, both which they are said to cure by the internal and external application of simples; but as for the gravel, stone, gout, and a number of other acute and chronical diseases, they are absolute strangers to them. The inhabitants are said to live to a great age, without knowing what sickness is, they seldom dying before the course of life is consumed by years, and the vital heat extinguished by the rigidity of the solids, and diminution of the circulating fluids. With them a man at sixty is said to be in the prime of life, and to marry and beget children with all the vigour of an European at thirty. It has been found by experience, that the less they are connected with foreigners, and the more strictly they adhere to their primitive manners, the fewer are their maladies and diseases; and that while they maintain their original simplicity and frugality, no people upon earth are blessed with such an uninterrupted flow of health and spirits.

The mothers have a passionate fondness for their children, and take the utmost care to prevent their being injured by any accident. They are so weak as to imagine, that they can be greatly hurt by an evil eye, which they suppose capable of bringing diseases and death upon them; but this opinion is not peculiar to the Moors and Arabs, since it prevails among the vulgar in Spain and Portugal, and even among the papists of Ireland. The boys are circumcised at fourteen years of age, and are at liberty to marry as soon as they can purchase a wife; for the fathers here make an estate by having a great number of daughters; for those who address them make presents to the parents of camels, horses, and horned cattle. They form a judgment of the affection of the husband from his liberality, and the young lady is never delivered to him till by his presents he has made her parents sensible of his merits. If upon her being brought home he is disappointed in his expectations of her beauty and chastity, he may send her back; but in this case he forfeits the presents he had made.

A man has no sooner breathed his last, than one of his women, or some relation, puts her head in at the door of

the tent, and bursts into a terrible cry; upon which all the women within the village set up a lamentable shriek and dismal screams, which alarm the whole camp or village. All the people then assemble round the tent of the deceased, some deploring his own loss in mournful strains, and others singing the praises of the deceased in melancholy accents suited to the occasion. From their lively and natural representation of grief, from their assumed melancholy, feigned sighs and tears, they seem to be all the friends and kindred of the deceased; yet all this is mere form, and is bestowed on every man without the least regard to his merit. The body is afterwards washed, dressed, and placed on a rising ground, to be viewed by every one till the grave is dug; after which it is interred with the head elevated a little, the face turned to the east, and the grave covered with large stones.

SECT. III.

Of the Learning, Poetry, and Music of the Natives of the Deserts of Zabara; their Method of making War; and their Skill in Horsemanship. They sometimes ride upon the Back of an Ostrich; and are fond of making long Journeys.

WITH respect to the learning of the Moors and Arabs of the deserts, it is so extremely limited, that few of them are able to read Arabic or any other language; yet some of them have a tolerable notion of astronomy, and talk with the precision of an European scholar upon the stars, their number, situation, and division into constellations. The clear and serene sky in which they live has greatly assisted their observations, an advantage they have improved by a warm imagination and a happy memory: their system of astronomy is, however, so replete with fable and absurdity, that it is in general difficult to comprehend their meaning: yet, with all their ignorance, they seem formed by nature for liberal sentiments, and with a taste for the polite arts, as their essays in poetry and music, which are far from being contemptible, seem to indicate. Those who are acquainted with the genius of the oriental tongues, from which theirs is derived, have been highly delighted with their songs sung in recitative, accompanied by a kind of guitar, in which they take the greatest pleasure.

From the softness and effeminacy of their musick it might be imagined, that these people cannot be very warlike; but if we may judge from some of their maxims, they are far from being pusillanimous. "Can any thing," say they, be more dastardly, than to kill a man before "you approach him near enough to be distinguished." Hence they never attack an enemy till they come within the length of their lances, and then retiring to a proper distance, throw them or shoot their arrows with surprising dexterity. They fight chiefly on horseback with short stirrups, and by raising themselves high in the saddle, strike with greater force. They never draw up their cavalry in long lines and extended wings, but in small detached squadrons, by which means they are less liable to be broke or thrown into confusion; and when such an accident happens, are more easily rallied. The agility of their horses, and their own skill in riding, give them great advantages by attacking in all quarters, wheeling off, and returning to the charge with amazing dexterity.

It may be proper here to observe, that they sometimes mount the ostrich. Mr. Adamson says, that some of those he had seen among the burning sands on the north side of the Senegal, are incredibly large, swift, and strong. Two boys were mounted upon the back of one of these gigantic fowls not full grown, with which weight it ran several miles with a velocity exceeding belief, and the swiftness of the fleetest courser. To try the strength of an exceeding large ostrich, Mr. Adamson had two stout men mounted upon his back, when their weight appeared by no means disproportioned to his ability, as it was far from retarding its progress. At first the bird went a pretty high trot; but when he was heated he extended his wings, as it were to catch the wind, to which his swiftness seemed indeed equal. "Every body," says he, "must have seen a partridge run, and consequently must know

“ know there is no man whatever able to keep up with it; and it is easy to imagine, that if its steps were longer its speed would be greatly augmented. The ostrich moves like the partridge, but with the advantages of a long step, and great assistance from its wings; and I am satisfied, those I am speaking of would have distanced the fleetest race-horses in England.” Whence, say the authors of the Modern Part of the Universal History, we may judge of their utility, could they be tamed and broke in the same manner as a horse.

These people are in general fond of long journies and excursions into remote countries on affairs of trade and commerce, in which respect they are so indefatigable, that no hazard is too great where profit is the motive. These expeditions being undertaken in large caravans, in which their goods and necessities are carried on camels, they are able to make head against any opposition they may meet with on the road, and seldom return without rich loadings of gold, ivory, gum, ostrich-feathers, camel's-hair, slaves, and other commodities, which they sell to the Europeans, or to the merchants of Fez and Morocco. It has been already intimated, that as no road or path can be preserved in these sandy deserts, they are directed in their course by the flight of certain birds. These the devout and zealous Mahometans consider as guides sent by their prophet to direct them in their journey; and, it is said, that without their direction they never presume to undertake an expedition of any considerable length.

S E C T. IV.

Of the Kingdom of Tombuto.

Its Situation; a Description of its Capital; the Wealth and State of the King; and a concise Account of the City of Cabra.

BEFORE we take leave of this country, it may be proper to take some notice of the kingdom of Tombuto, which is situated to the south-east on both sides the Niger; and, though little known, is said to be of great extent. It took its name from Tombuto its capital, which stands in the latitude of fourteen degrees thirty-two minutes, and in the longitude of two degrees twenty five minutes east from London. This kingdom borders on the province of Zuenziga, already described.

In this town, and the surrounding country, the houses are built of a bell form, and only composed of hurdles plaistered over with loam: but it has a handsome mosque built with stone and lime. The royal palace is likewise built with the same durable materials, after a design drawn and executed by an excellent artist of Granada, who was driven hither when the Moors were expelled from Spain. Besides these there are some other tolerable structures.

The city of Tombuto has many weavers of cotton; and mechanics are more encouraged than in any other part of Africa. Hither European cloths are brought from Barbary, and the coast of Guinea. Of these markets and public fairs are held, to which the women resort with their faces veiled. Some of the native inhabitants and strangers who reside in the city are so rich, that the king thinks it not beneath the dignity of his rank to enter into an alliance with them. Leo Africanus mentions two princesses in his time, who were married to wealthy merchants, one a native of the place, and the other a foreigner.

This kingdom is well watered by natural springs, canals drawn from the Niger, and wells, that render it fertile in all kinds of grain, grass, cattle, milk, butter, and all the necessities of life, except salt, which they procure by land carriage from Tagaza, which is about five hundred miles distant, and is so highly valued, that a camel-load is said to sell for eighty ducats.

The king of Tombuto has in his possession a prodigious quantity of gold plate, and the whole court is said to eat out of gold vessels; silver, or any other metal, being seldom used. When he travels he rides upon the back of a camel, richly caparisoned; all the furniture

shining with burnished gold, while one of his great officers leads his horse after him. He likewise rides upon a camel in war; but all his soldiers are mounted upon horses. His general retinue and guards consist of three thousand horsemen well armed with poisoned arrows and darts, besides a number of foot, who have shields and swords. He often levies in person the tribute he receives from those princes who do him homage, and frequent skirmishes pass between the guards and the troops of those vassals, who unwillingly give this testimony of their servitude. As no good horses are bred in the country, the cavalry are usually mounted upon Arabian horses and barbs, which the king purchases at a great expence. The court and merchants, however, ride upon little horses bred in the country, which are hardy, and in every respect, except in beauty, equal to the former. When the king is informed of a merchant's arrival in town with a drove of horses, he instantly orders a number of the finest of them to be brought him; for which he pays a high price, scrupling no expence to have his troops handsomely mounted.

The most profound homage and respect is paid by those who address him; for all who approach the throne must prostrate themselves on the ground, take up the dust, and sprinkle it over their head and shoulders: a ceremony that is particularly observed by all who never had this honour before, and also by foreign ambassadors.

This monarch is such an enemy to the Jews, that he has strictly prohibited their entering the city, and laid a heavy penalty on all the merchants who trade with them. His taste for literature is said to appear from the great number of doctors, judges, and priests, whom he maintains at a great expence in the capital, furnishing them with all the conveniencies of study. Manuscripts from Barbary are brought hither, and sold as the most valuable merchandize; and, we are told, that some traders have amassed immense wealth by confining themselves to this literary traffic, which the monarch encourages with the spirit, taste, and generosity of a prince. Learning has, however, made but little progress, except about the court, it having produced no visible alteration in the manners of the people. These are mild and gentle in their disposition, frugal in their œconomy, industrious in the discharge of their several employments, and chearful in the hours of relaxation, which they devote to singing, dancing, and festivity.

The Tombuton gentry place the highest mark of pomp and pageantry in keeping a great number of slaves, but their carelessness frequently produces the most dreadful calamities: thus the whole town is often in flames, occasioned by their means; for the houses, being built of combustible materials, catch fire upon the most trivial accident. Without the suburbs the Tombutons have neither gardens nor orchards.

The currency used in commerce consists of small bits of gold, and certain shells, which they use in purchasing things of little value, four hundred of these being only worth a ducat.

About twelve miles from the city of Tombuto, to the south, stands Cabra, a large town built in the same manner as the former, but without walls. Here is a judge appointed by the king to decide all disputes; but the people have the liberty of appealing from his decision to the throne. The inhabitants of Cabra are said to be subject to several diseases, which are supposed to be owing to the heterogeneous qualities of their food, which is usually composed of flesh, fish, milk, butter, oil, and wine.

S E C T. V.

Of BILEDULGERID.

Its Situation, Extent, and Produce; with an Account of the Persons, Dress, Manners, and Customs of the Inhabitants; and a Description of the City of Teusera.

BILEDULGERID is almost of a square form, and extends above eighty leagues every way, or from
 5 Y twenty-

twenty-eight degrees thirty minutes to thirty-two degrees fifty minutes north latitude, and from five degrees thirty minutes to eleven degrees fifty minutes east longitude; and is bounded on the east by a ridge of lofty mountains which divide it from the kingdom of Tripoly and part of Gudamis, on the west by the countries of Zeb and Mezeb, and on the south by the province of Verghela: this is all that can with propriety be comprehended within the just limits of Biledulgerid, though it is usual to include under that name all the countries here mentioned as its frontiers.

The whole country of Biledulgerid is mountainous, sandy, and barren, producing little besides dates, which grow here in such plenty, that the face of half the country is covered with trees bearing that fruit. The climate is hot and unhealthy, the people lean, swarthy, with shrivelled complexions, and their eyes inflamed, owing to the reflexion of the sun-beams from the white hard soil; and the showers of dust and sand driven by the high winds that blow here at certain seasons with such violence, as sometimes to bury men and cattle under heaps of it.

To their eating dates is attributed an inveterate scurvy in the gums of the inhabitants, which frequently makes all their teeth drop out, and sometimes spreads over their whole bodies, by which means they are rendered unhappy and extremely loathsome. In other respects the natives are sound, vigorous, and healthy; and many of them live without sickness to a good old age, though they discover a furrowed countenance, shrivelled skin, and hoary locks very early in life, and before infirmity, decrepitude, or any decay of their faculties begin to appear. The plague, which makes such havock in Barbary, is in a manner unknown at Biledulgerid; though the countries are contiguous, and there is a constant intercourse between the inhabitants at all seasons. This is also the case with the small-pox, which in other hot countries is no less contagious and fatal than the plague itself.

The natives are represented as a savage, treacherous, and thievish people, consisting of a mixture of old Africans and Arabs. The former live with greater regularity in villages, composed of a number of small huts, and the latter in tents, ranging from place to place in quest of food and plunder. There is not a town in the whole country besides Teusera and Tonsera worthy of notice: nor is it less destitute of rivers, there being in all this large territory scarce a single stream worth mentioning, or that is not dried up during half the year.

The Arabs, who value themselves on their being superior in birth and talents to the primitive inhabitants, are perfectly free and independant, and frequently enter into the service of the neighbouring princes who are at war. They are fond of hunting, particularly the ostrich, of which they make great advantage, for they eat the flesh, exchange their feathers for corn, pulse, and other things they want, use the talons as pendants for their ears and other ornaments; their fat is esteemed a medicine of singular virtue, and they convert their skins into pouches and knapacks; so that no part of the animal is left unemployed in some useful purpose. The Arabs likewise live

upon the flesh of camels and goats, and drink either the broth in which it is boiled, or camels milk, for they seldom taste water, that which is good being generally more scarce than milk itself.

They have some horses which they use in the chace, where people of rank are attended by negro slaves; and those of inferior fortune by their women, who are no less obsequious than the slaves themselves, looking after the horses, and performing the most servile and laborious offices.

Though learning is here at a very low ebb, they have schools to which all the boys of distinction are sent in order to be instructed in that kind of knowledge which is most in repute, and are raised from thence to the dignities of judges or priests, in proportion to their genius and the proficiency they have made in their studies. Some addict themselves to poetry, for which many of the natives of this country shew a very early genius; and it is not uncommon to see a person merit the highest distinctions by means of this talent, which, considering the rude ignorance of the people in general, they sometimes carry to an amazing pitch of sweetness and sublimity. Their invention is surprisingly fertile, and they particularly excel in fables and parables. A few of them pursue the mechanic arts: but the people in general despise them as mean and servile, and where any of them engage in the employments of husbandry, they leave all the labour to their wives and slaves.

The city of Teusera, which de Lisle has placed within the limits of Biledulgerid, stands on the confines of Tunis, in thirty-two degrees twenty-eight minutes north latitude, and in ten degrees twenty-six minutes east longitude from London. Of this city Marmol has given us the following account: that it was built by the Romans, and fortified with high walls, the ruins of which are still to be seen. The Mahometans on their entering this country plundered and destroyed the city on account of the resistance made by the inhabitants, and thus all its noble structures were demolished, the present buildings consisting only of low and mean huts. Here they have fairs at certain seasons, to which the merchants of the surrounding countries resort. Through the center of the town runs a river, by which the Arabs and Africans are separated, each possessing a certain quarter, the one to the south, and the other to the north, enjoying different privileges, though all are equally the inhabitants of the same city. They are even continually at war with each other, and make incursions across the river with all the rancour and animosity of declared enemies; but both frequently unite to repel all endeavours to bring them under a foreign government.

It might now be expected that we should come to Morocco; but as that kingdom is only a part of a very extensive region, distinguished by the name of Barbary, and resembles the other countries in that great division in its climate, and in the religion and manners of the inhabitants, it will be proper to place them all in one view; and therefore before we take leave of the western coast of Africa, we shall describe the Canary Islands and the Madeiras, which lie opposite to it.

C H A P. XVI.

Of the CANARY and MADEIRA ISLANDS.

S E C T. I.

Of the Situation and Extent of the Canary Islands in general; with a Description of Lancerota and Fuertaventura.

THE Canaries, antiently called the Fortunate Islands, lie in the Atlantic Ocean opposite to the coast of Africa, between the twenty-seventh degree thirty minutes, and the twenty-ninth degree thirty minutes north latitude, and between the twelfth and seventeenth degree fifty minutes west longitude from London. Mr. Glas observes, that on sailing four hundred and fifty miles to the south-west from the mouth of the Straights of Gibraltar, along by the coast of Fez and Morocco on the Atlantic Ocean, we arrive at the south-west extremity of Mount Atlas; then leaving the land, and sailing into the ocean, directly west, one hundred and sixty miles, we come to the island of Lancerota, the first of the Canary Islands in that course; the rest of these islands lie all to the west and south of Lancerota. The Canaries are seven in number; these are Lancerota, Fuertaventura, Canaria, Tenerife, Gomera, Hierro, or Feiro, and Palma: these lie from east to west in the order in which they are here placed; and the last is about sixty-five leagues distant from the first.

The first of these islands, named Lancerota, is very high, and may be discovered at a great distance. On approaching it appears black, rocky, and barren. It is about fifteen miles long and ten broad, and the center of the island is in latitude twenty-nine degrees eight minutes north.

The principal port is on the south-east side of the island, it is called Porto de Naos, and any vessel that does not draw above eighteen feet may enter at high water, and lie secure from all winds and weather; yet in sailing along the coasts the ships appear as if at anchor in an open road; for the harbour is formed by a ridge of rocks, which at a small distance cannot be perceived, as most of them lie under water: these breaking off the swell of the sea, the inside is as smooth as a mill-pond. As this is the only convenient place among the Canary Islands for cleaning and repairing large vessels, it is much frequented for that purpose by the ships that trade to these islands. At the west end of the harbour is a square castle built of stone, and mounted with some cannon, but is of no great strength, as ships of war may approach it within musket-shot. There is no town or village at this port, though there are some magazines in which corn is deposited for exportation.

At the north end of Lancerota is a spacious harbour called El Rio, which is a channel dividing the island of Lancerota from the uninhabited island of Graciosa, and through this channel ships of any burthen may pass. That part of Lancerota which faces this harbour, is an exceeding high and steep cliff, from the bottom of which the shore is about two musket-shot distance. The ground here is low, and in it is a salt-work, which is a square piece of land levelled and divided by shallow trenches about two inches deep; into these they let the sea-water, which, by the heat of the sun, and the nature of the soil, is soon turned into salt.

There is no other way of access into Lancerota from the shore of this harbour, than by climbing up a narrow, steep, and intricate path, that leads to the top of the cliff; and it is scarce possible for a stranger to ascend it without a guide; for should he chance to wander from the path, it would be difficult to regain it, and he would be in great danger of falling to the bottom.

There are only two towns in the island: one called Cayas, or Rubicon, is situated about two leagues to the north-west of Porto De Naos, and may be termed the capital of the island, since it was formerly a bishop's see;

but it contains only about two hundred houses, an old castle mounted with some guns, a church, and a convent of friars; but most of the dwelling-houses have a mean appearance.

About two leagues within land, to the southward of the narrow path of the cliff at El Rio, is the town of Haria, the next in size to Cayas. It contains about three hundred inhabitants; but all the buildings, except the church and three or four private houses, are very mean structures.

The island of Graciosa lies on the north side of Lancerota, and is barren, uninhabited, and destitute of water; though it is about three miles in length, and two in breadth; besides this, there are several other rocky, barren, and uninhabited islands.

We shall now give a description of Fuertaventura, and then give an account of the produce and inhabitants of both these islands.

The north end of Fuertaventura lies about seven miles south-and-by-west from the south-west point of Lancerota, and in the channel between them is the little uninhabited island of Lobos, or Seals, which is about a league in circumference.

Fuertaventura is about eighty miles in length, and in general about fifteen in breadth; but in the middle it is narrow and low, being almost cut in two by the sea. That part of the island on the south side of the isthmus is mountainous, sandy, barren, and almost uninhabited; but though the northern part is also mountainous, yet within land it is fertile and well peopled.

This island has several bays and harbours; and there are three small towns, one of which, called Oliva, is situated somewhat less than two leagues within land from the road of Lobos, in the midst of a plain that abounds with corn-fields. Here is a church, and about fifty good houses. The next to this is La Villa, the chief town in the island, which is situated in the center of that part which lies north of the isthmus, and has a church, a convent of Franciscan friars, and near an hundred houses. There is also a town called Tunche, which contains about one hundred houses; but they are very mean when compared with those of La Villa and Oliva. Besides these there are many small villages scattered up and down in the northern and inland part of the island, which stand so thick, that we no sooner lose sight of one than we come in view of another.

It is remarkable, that when there is a great westerly swell the sea breaks on the rocks, at the north-west end of Lobos with such violence, as to strike the beholder with terror. "I may without exaggeration affirm, says Mr. Glas, that I have seen breakers there near sixty feet high: were one of these to strike the strongest ship, she would be staved to pieces in a moment. When I saw those mighty breakers, our ship had just passed through the channel between Fuertaventura and Lobos: we had a fine brisk trade-wind at north-north east, and though we had no less than ten fathoms water, when we came into the westerly swell, ye we trembled for fear the waves would have broken, and thought ourselves happy when we got out of soundings. We heard the noise of these breakers like distant thunder, after we were passed them six or seven leagues."

S E C T. II.

The Climate, Soil, Vegetables, and Animals of Lancerota and Fuertaventura; with an Account of a Volcano in the former of these Islands.

BOTH these islands have the advantage of a wholesome climate, which perhaps is owing to the dry-

ness

ness of the soil, and the strong northerly winds that almost continually blow; whence the inhabitants in general live to a great age. From the middle or end of April, to the beginning or middle of October, the wind blows violently, and almost without intermission from the north and north-east. From the middle of October, to the end of April, it most commonly blows in the same direction; but sometimes intermits, and gives place to other winds. The south-west wind always brings rain, and therefore is most welcome. Other winds, particularly the north-west, bring showers; but these are partial, and of short duration; but the rain which comes from the south-west frequently lasts two or three days. When these rains begin to fall, the natives sow their grain, and about fourteen or twenty days after the latter rains, that is towards the end of April, it is ready for reaping. The north, and north-north-east winds blow so hard and constantly, as to prevent the growth of all sorts of trees, especially in Lancerota, which is most exposed to their violence: yet we find there a few shrubs called tubaybas, which never grow to a great height any where; but here spread along the ground, except when sheltered from the wind by rocks and walls. In the gardens are fig trees, and some low trees or shrubs which seldom shoot up higher than the garden walls.

Fuertaventura, being less exposed to the wind than Lancerota, is not quite so bare of trees and shrubs, and produces the palm, the wild olive, and a sort of wild pine; the cotton and euphorbium shrubs, fig-trees, and the shrub which bears the prickly pear.

Though these islands are so destitute of trees, they abound in excellent herbage, and several kinds of odoriferous flowers. The great plenty and variety of these induced the inhabitants to bring bees from the other islands in order to propagate here; but they were disappointed; for none of those insects would remain with them, they not being able to bear the violent winds.

Corn of various kinds grow in both these islands, as wheat, barley, and maize, which are produced in such abundance, as not only to serve the inhabitants, but also those of Tenerife and Palma, who depend greatly on these islands for their sustenance. No vines were produced at Lancerota till within thirty years past, when a volcano breaking out, covered many fields with ashes, which have so improved the soil, that vines are now planted and yield grapes; but the wine made from them is thin, poor, and so sharp as to resemble vinegar, yet is very wholesome. Fuertaventura produces a greater quantity of wine, of a quality something superior to that of Lancerota.

Upon the rocks on the sea coast grows a great quantity of orchilla-weed, an ingredient used in dying. It grows out of the pores of the rocks, to about three inches, and sometimes eight or ten inches. It is of a round form, and of the thickness of common sewing twine; it is of a grey colour, inclining to white, and on the stalk are white spots. Many stalks proceed from one root, at a distance from which they divide into branches. This weed dyes a beautiful purple, and is also much used for brightening and enlivening other colours. The best sort is that of the darkest colour, and of a form exactly round: the more it abounds with white spots or scabs, the more valuable it is. This weed also grows in the Madeira and Cape de Verd Islands, and on the coast of Barbary; but the best sort and the greatest quantity is found in the Canary islands. There is some reason to believe, that the orchilla was the Getulian purple of the ancients; and in support of this opinion, it is observed, that the coast of Africa adjacent to the Canary Islands was called by the ancients Getulia, and abounds with orchilla.

In Lancerota are few springs or wells. The inhabitants use for themselves and cattle rain water, which they preserve in pits and cisterns. This is also practised at Fuertaventura, though they have more springs and wells; but the water is generally brackish. At El Rio, to the northward of the salt works mentioned in the last section, is a well of medicinal water, esteemed a sovereign cure for the itch. It is also good for common drinking, and will keep sweet at sea.

The cattle of these islands are camels, horses, asses, bullocks, sheep, goats, and hogs, all of which, except the sheep and goats, were brought from Barbary and Spain, since the conquest of these islands by the Spaniards. The horses are of the Barbary breed, and are much esteemed in Canaria and Tenerife, for their spirit and swiftness; but the natives of these two islands we are now describing have little or no use for them, on account of their having no great distance to travel, and therefore little care is taken to increase the breed; whence their number is at present very small. The natives use for travelling asses of a larger size than those of the other islands, which serve well enough for their short journeys, and are maintained with little or no expence.

In the spring their cattle, being fat and good, appear plump, sleek, and glisten as if rubbed with oil; but in the beginning of autumn, when all the grass is either withered or eaten up, they have a very different appearance, and are unfit for food.

The people here generally plow with a camel, or a couple of asses, for the soil is light, and they do not plow deep.

The want of wood or bushes occasions a scarcity of birds and wild fowl; yet there are some canary birds, and a bird called tubayba, about the size of a starling, speckled black and white. Here are likewise partridges and ravens, with plenty of dunghill fowls; but neither turkeys, geese, nor ducks: the want of the two last species may probably be owing to the scarcity of water in these islands.

Here are no other venomous animals but the black spider, the bite of which the natives say occasions a swelling, attended with a burning pain. Their cure for it is to eat a small quantity of human excrement.

The sea coast of Lancerota and Fuertaventura afford the inhabitants great plenty of fish of various kinds, particularly a kind of cod, much better tasted than that of Newfoundland, or of the north sea. Another fish of a still more excellent taste is caught here, called mero: it is as long as a cod; but much thicker, and has long straps or whiskers hanging at his mouth. There are many other sorts of fish for which we have no name; one of them however ought not to be omitted: this is the picudo or sea pike, the bite of which is as poisonous as that of a viper; yet when this fish is killed and dressed, it is good and innocent food. On the rocks by the sea-shore are many shell fish, and particularly limpets.

In Lancerota and Fuertaventura are many hills that were formerly volcanoes, the tops of which are of a small circumference, and are hollow for a little way downwards; the edges of the tops being usually narrow and sharp, and on the outside is generally seen a great deal of black dust and burnt stone like pumice-stone, only darker and more ponderous. No eruptions have been known to happen for several ages, except that already mentioned at Lancerota, which about thirty years ago broke out on the south-west part of the island, throwing out such an immense quantity of ashes and huge stones, and with so dreadful a noise, that many of the natives leaving their houses, fled to Fuertaventura; but some time after, finding that those who had ventured to stay had received no hurt, they took courage and returned. This volcano was near the sea, in a place remote from any habitation. At a small distance from the volcano a pillar of smoke issued from the sea, and afterwards a small pyramidal rock arose, and still continues. This rock was joined to the island by the matter thrown out of the volcano. The noise of this eruption was so loud, that it was heard at Tenerife, which stands at the distance of forty leagues; which was probably occasioned by the winds generally blowing from Lancerota towards that island.

SECT. III.

Of the Manners and Customs of the ancient Inhabitants of Lancerota and Fuertaventura.

THE ancient inhabitants of these two islands were of a larger size and better made than those of the others, and so they are to this day. The habit of the natives of Lancerota

cerota was made of goat-skins sewed together, reaching down to the knees, and was formed like a cloak with a hood. The seams of this habit were neatly sewed with slender thongs of leather, which were as fine as common thread. Those thongs they prepared with sharp flints or stones, instead of knives or scissars. They wore bonnets made of goat-skins, with three large feathers stuck in the front. The women wore the same, with a fillet of leather tied red with the bark of some shrubs. They had long hair, and wore their beards plaited. The king of the island wore a diadem like a bishop's mitre, made of goats-leather, and adorned with sea-shells. Their shoes were also of goat-skin, with the hairy side outwards.

When they were sick, which seldom happened, they cured themselves with the herbs that grew in the country; and when they had acute pains they scarified the part affected with sharp stones, or burned it with fire, and then anointed it with goats butter. When any one died, they laid him in a cave, stretching out the body, and laying goats-skins under and above it.

Their food was barley-meal roasted, which they called *goffio*, and goats flesh boiled and roasted; also milk and butter. They ate their victuals out of vessels made of clay, hardened by the heat of the sun.

Their method of lighting a fire was by taking a stick of dry, hard, thorny wood, which they caused to turn rapidly round on the point, within a soft, dry, spongy thistle, and so set it on fire: and this method has been used to this day. When they sowed their land with barley, which was their only grain, they turned it up with goats horns, they threshed their barley with sticks, winnowed it with their hands, and ground it in a hand-mill made of two stones.

These two islands, as well as the others, were divided into portions, each governed by its own lord, or captain, and separated from the rest by a wall of loose stones, that crossed the island from sea to sea. The inhabitants of these quarters had a great esteem for their respective chiefs.

The people of both islands were of a humane, social, and cheerful disposition, extremely fond of singing and dancing. Their music was vocal, accompanied with a noise made by clapping their hands, and beating with their feet. They were remarkably nimble, and took great delight in leaping and jumping, which were their principal diversions: two men took a staff, which they held by the ends, and lifted as high above their heads as they could reach, keeping it parallel with the ground; and he who could leap over it, was esteemed very dexterous. Some of them had such agility, that they could, at three leaps, bound over three poles placed in that manner behind each other.

They frequently quarrelled, and then fought with sticks a yard and a half long. It was a custom among them, that if a man entered the door of his enemy's house, and wounded or killed him, he was not punished; but if he came upon him unawares, by leaping over the wall, and killed him, the captain, or chief, by whom the cause was tried, ordered him to be slain. Their manner of executing criminals was as follows: they carried them to the sea-shore, and placing their heads on a flat stone, took another of a round form, and with it dashed out their brains; after which their children were held infamous.

They were excellent swimmers, and used to kill the fish on their coasts with sticks. Their houses were built of stone, without cement, yet were strong; and the entry was made so narrow, that only one person could pass through at a time. They had also houses for worship and devotion; these were round, and composed of two walls, one within the other, with a space between; and, like their dwelling-houses, were built of loose stones, with a narrow entry. They worshipped only one God, and in these temples offered to him milk and butter. To him they also made offerings on the mountains, pouring out goats milk from earthen vessels, at the same time adoring him by lifting up their hands towards heaven.

The inhabitants of Fuertaventura wore jackets made of sheep-skins, with short sleeves that reached no farther than their elbows. They had short breeches that left the

knees bare, and short stockings that reached but just above the calf of the leg. They wore the same sort of shoes as the natives of Lancerota, and had high caps on their heads made of goat-skins. They dressed the hair of their heads and beards like the natives of Lancerota.

S E C T. IV.

Of the present Inhabitants of Lancerota and Fuertaventura; their Persons, Dress, Buildings, Food, Manners, Customs, Government, and Trade.

THE natives of these islands, though they pass for Spaniards, are sprung from a mixture of the ancient inhabitants, the Normans, and other Europeans, by whom they were subdued, and from some Moorish captives whom the Spaniards brought to these islands from the coast of Barbary.

They are generally tall, robust, strong, and of a very dark complexion; but the natives of the other Canary Islands account them rude and unpolished in their manners.

They dress coarsely, and after the Spanish modern fashion; for the short cloak and golilla, formerly used by the Spaniards, are here unknown. They neither speak nor understand any other language but the Castilian, which they pronounce most barbarously.

Their houses are built of stone and lime; those of the gentry are covered with pantiles; but the meaner sort are thatched with straw. Few even of the better kind have either ceilings or lofts, but are built in the form of large barns, and divided into apartments by boarded partitions that rise no higher than the walls; so that all the rooms are open above, and have no other covering than the roof. They generally pave the floors with flag-stones.

The usual food of the peasants is what is called *goffio*, which is the flour of wheat, or barley, well heated by the fire: this they make into dough with water, and then eat it; a simple diet, that requires neither knives, forks, nor spoons. This they sometimes make up with their hands in balls or lumps, which they dip in honey or molasses; and during the winter, when grass is in perfection, and they have plenty of excellent milk, they put the *goffio* into it, using sea-shells instead of spoons. They also prepare *goffio* by putting it into boiling milk, and stirring it about till it is sufficiently boiled and thickened. On particular occasions, as at festivals and weddings, the poor eat flesh and fish: but bread is rarely used by any but the gentry, and there are some people in these islands who do not even know the taste of it. They seldom drink wine, or any thing but water.

The peasants are employed in plowing the ground, sowing corn, reaping, and other parts of husbandry. Few of the men in Lancerota and Fuertaventura are artificers; for almost all their cloaths are made by the women, and their household-furniture is brought from the other islands.

The gentry are so averse to leaving their country, and have so little curiosity, that few of them visit Spain, or even Canaria, except when obliged to attend their lawsuits in that island. A gentleman possessing a few acres of land, a camel, a couple of asses, and a dozen sheep, would choose rather to live all his days on *goffio*, than venture to the Spanish West Indies, in order to mend his fortune by trade, which, in his opinion, would disgrace him and his family for ever: yet he will, without shame, oppress the poor peasants, and deceive strangers, in order to support his imaginary rank, which, among the poor gentry, wholly consists in not working, and riding a little way on an ass, attended by a ragged servant, instead of walking on foot.

There are but few monks, and no nuns in these islands; they are, however, in no want of priests, for there are several parish-churches, and an inferior court of inquisition in each of these islands, in order to prevent heresy: so that the religion of the church of Rome is alone professed among them.

Though all the Canary islands are subject to Spain, yet the natives of the two of which we are now treating, with those

those of Gomera and Hierro, do not hold their lands of the crown, but of the family of Don Diego de Herrera, who conquered the island of Canaria.

The chief part of the power originally possessed by the proprietors of these islands has been, however, taken from them, and annexed to the crown, probably on account of their making an ill use of such an extensive authority. The government is now vested in an alcalde major and a fargento major, also called governador de las armas. The first is the head of the civil, and the other of the military government. There is an appeal from the decision of the alcalde major to the royal audience in the island of Canaria; and the fargento major receives his orders from the governor-general of the Canary Islands, who usually resides in Tenerife. No standing forces are kept here; but there is a militia properly regulated and divided into companies, to each of which is a captain, lieutenant, and ensign. The fargento major is colonel, and takes care that their arms are kept in order, and that the companies may be raised at a short warning.

Though these islands are but little esteemed by the Spanish government, they are really of great value; for were they once subdued by any other nation, Palma and Tenerife would fall of course, on account of their depending on Lancerota and Fuertaventura for their corn. Besides, the forts in Lancerota would afford convenient retreats, where the cruising ships of an enemy might careen, and be supplied with provisions.

The exports from hence are entirely confined to the other islands, and consist of wheat, barley, maize, cattle, fowls, cheese, orchilla-weed, goats-skins, and salt-fish; but the two last are only exported from Lancerota. The wheat is small-grained, but hard, clean, and so good, that it always sells at Tenerife at a higher price, by one fifth, than either English or other European wheat. About ten years ago a number of camels were exported from Fuertaventura to Jamaica, and other parts of the English West Indies; but this trade was soon prohibited, for fear of losing the breed, or at least raising the price of those animals.

The asses brought by the Spaniards to Fuertaventura increased so fast, that they ran wild among the mountains, and were so prejudicial to the natives by eating their corn and other grain, that in the year 1591 they assembled all the inhabitants and dogs in the island, in order to destroy them; and accordingly killed no less than fifteen hundred. Since that time there have been no more in the island than is sufficient to supply the inhabitants.

They have impolitically prohibited the exportation of corn to any place except the other islands; whence in a year of great plenty it becomes of so little value, as scarcely to pay the expence of cutting it down. Hence they are very indifferent about raising more than what they can consume themselves, or sell in the other islands; so that in a bad year the people starve for want, especially the inhabitants of Tenerife, unless they are so happy as to be supplied from Europe.

Almost all the imports are from the other islands, especially from Tenerife, which is the center of trade for all the Canary Islands. These consist in English woollen goods and German linens, both of the coarsest kinds, wine, brandy, oil, fruit, planks and other timber, barks and fishing-boats, household furniture, tobacco, snuff, bees-wax, soap, candles, and a considerable quantity of cash, which they receive in the balance of trade, part of which is paid to the proprietors of the lands, and the rest sent to Gran Canaria, to support the expence of their law-suits; the natives of all the Canary Islands being generally extremely litigious.

S E C T. V.

Of GRAN CANARIA.

Its Situation and Extent; with a particular Account of the Calms on the South-east Side of these, and some of the other Mountains; with a concise Description of the Ports, and of the City of Palmas, the Capital of the Island.

THE two islands we have just described are almost deserts, if compared with the fertile and pleasant

island of Canaria, which, on account of the delightful temperature of the air, and the plenty of good water, trees, herbs, and delicious fruits found upon it, justly merits the name of the Fortunate Island.

The north-east point of Canaria lies at the distance of eighteen leagues from the south-west end of Fuertaventura, and in clear weather either of those islands may be seen from the other. Canaria is about forty-two miles in length, twenty-seven in breadth, and a hundred and five in circumference, reckoning the length from the north-east point southward to the point Arganeguín, and the breadth from the port of Agaete, on the west side of the island, to that of Gando on the east.

The inland part, towards the center of the island, is filled with lofty mountains, which rise so far above the clouds, as to stop the current of the north-east wind that generally blows here; so that when this wind blows hard on the north side of the mountains, it is either quite calm on the other, or a gentle breeze blows from the south-west. The calms and eddy winds caused by the height of the mountains above the atmosphere, extend twenty or twenty-five leagues beyond them to the south-west. There are also calms beyond some of the rest of the islands; for those of Tenerife extend fifteen leagues into the ocean, the calms of Palma thirty, and those of Gomera ten. Upon first coming to the calms the waves appear foaming and boiling like a pot, breaking in all directions; and when a vessel enters the verge of them, she is shaken and beaten by the waves on all sides in such a manner, that one would imagine it impossible to withstand them. This confusion, however, does not last long; for after a ship is once fairly entered into the calms, she will either find a dead calm, and smooth water, or a pleasant and constant breeze at south or south-west, according as the wind blows without; for this eddy wind, as it may be called, constantly blows in an opposite direction to it.

At the north-east end of Canaria is a peninsula, about two leagues in circumference, connected with the main land by an isthmus about two miles in length, and a quarter of a mile in breadth at the narrowest part. On each side of the isthmus is a bay, which on the north side is exposed to the swell of the sea. That on the other side is called by some Porto de Luz, and by others Porto de Isletes, from some steep rocks or islands at the entrance of the bay, towards the north-east. This is a good road for ships of any burthen, with all winds, except the south-east; but that wind is not common, and rarely blows so hard as to endanger ships.

The landing-place is at the bottom of the bay, where stands a hermitage, or chapel, dedicated to St. Catharine, and a castle of no strength mounted with a few guns. At three miles distance is the city of Palmas, the capital of the island, between which and the above castle are two other forts, mounted with guns; but they have no garisons, except a few invalids. At the other end of the city is another castle, called St. Pedro; but neither of them are capable of standing against a regular attack.

Though the city of Palmas is of no strength, it is pretty large, and contains several fine buildings, particularly the cathedral of St. Anne, with many churches, convents of friars of all orders, and nunneries. The private houses are in general good, and built with stone. The city is divided into two parts, which have a communication by a bridge thrown over a small stream of water, and the number of inhabitants is supposed to amount to six thousand.

There is also the port of Gando, situated on the south-east part of the island, and the port of Gaete, or Agaete, on the north-west part of the island, which has a castle for its defence. The whole coast, except these ports, is generally inaccessible to boats and vessels, on account of the breaking of the sea upon it. This indeed is the case of the shores of all the Canary Islands, particularly at the full and change of the moon, except those of Lancerota and Fuertaventura. There are no inland cities or large towns in Canaria, though there are many villages, the chief of which are Galdar and Telde.

S E C T. VI.

Of the Climate, Trees, Fruits, Plants, and Animals of Canaria; with a particular Description of the Face of the Country.

WE shall now treat of the temperature of the air, which is no where more delightful than in this island; for the heat in summer seldom exceeds what is generally felt in England in the months of July and August, and the coldest part of the winter is not sharper than with us about the end of May in a backward season. The same winds blow here at the same periods as at Lancerota and Fuertaventura; but the northerly wind is less furious, and, compared with that, is only a gentle breeze that cools a person, so as to render it agreeably temperate; and thereby is almost continually serene and free from storms and thunder. The only disagreeable weather is when the south-east winds blow from the desert of Zahara, which we have lately described; but this seldom happens. These winds being very hot, dry, and stifling, are of great prejudice to the fruits of the earth, by their pernicious quality, and by their bringing clouds of locusts, that wherever they alight devour every green thing. The weather is indeed very different in the mountains, where the air is not only cold in winter, but their summits are uninhabitable, from the great quantities of snow that fall upon them in that season. Besides, the air is so exceeding wholesome, that the natives are said to enjoy health and longevity beyond any people upon earth.

Canaria is well watered, and abounds with wood of various kinds; for almost every thing planted here thrives. The pine, palm, wild olive, laurel, poplar, dragon-tree, lena nueña, or lignum rhodium, the aloe shrub, Indian fig, or prickly pear, and the tubayba, a shrub whose branches have no leaves except at the extremities, grow spontaneously, and without cultivation. The euphorbium shrub grows here in great plenty, and to an extraordinary size. All the large trees natural to the island, except the palm, grow on the mountains near the clouds, which descending upon them near the evening, furnish them with moisture.

Among the fruits are the orange, lemon, citron, lime, pomegranate, walnut, chesnut, apple, pear, peach, apricot, cherry, plum, mulberry, fig, banana, date, and, in short, all the American and European fruits, except the anana. They have wheat, barley, and maize; but peas and beans are scarce and dear. They have potatoes, yams, the best onions in the world, and many kinds of roots; nor are cabbages and fallads wanting.

Though there is more level and arable land in Canaria than in any of the islands to the westward of it, yet it bears no proportion to the stony, rocky, and barren ground. The most fertile part of this island is the mountain of Doramas, situated about two leagues from the city of Palmas, and shaded by groves of fragrant trees of different kinds, whose lofty boughs are so interwoven as to exclude the rays of the sun. The rills that water these shady groves, the whispering of the breezes among the trees, and the singing of the Canary birds, form a most delightful concert; and a person in one of these enchanting solitudes cannot help calling to mind the fine things written by the ancients of the Fortunate Islands.

The upper part of the island is, on the contrary, entirely barren and desolate; for it projects far above the clouds, and therefore receives neither dew nor rain; but is exposed to a dry, parching wind, in a direct opposition to the trade-wind below, which generally blows from the west. In the night this westerly wind blows hard, but lulls in the day. The amazing quantity of calcined stones, ashes, and lava, that cover the greatest part of all the Canary Islands, greatly disfigure them. The volcanoes from whence these proceeded may be discerned in all quarters of this and the other islands, as also the channels made by the fiery streams that flowed from them; but it does not appear that any volcano has burnt in Canaria since that island was conquered by the Spaniards.

Though the wine of Canaria is good, it has not such a body as that of Tenerife, and is therefore less fit for exportation, yet many pipes of it are annually sent to the Spanish West Indies. Olives have been planted in this island; but no oil is made of the fruit, which does not come to such perfection as in Spain, Barbary, and other countries. Formerly much sugar was made here; but the great demand for the wines and brandies of this island in the Spanish West Indies stopped the culture of the sugarcane, and the natives find it more for their advantage to receive the produce of their wines at the Havana in sugar, than to raise it in their own country. Canaria also abounds in honey, which is good, though of a black colour.

The animals of this island are camels, horses, asses, a few mules, bullocks, sheep, goats, hogs, rabbits, dunghill fowls, turkeys, geese, ducks, partridges, crows, and Canary birds, with some others.

Lizards abound in this and all the other islands; but there do not appear to be any snakes, scorpions, or other venomous creatures, except the spider of Lancerota, and a very innocent kind of snake peculiar to the island of Gomera.

S E C T. VII.

Of the ancient Inhabitants of Canaria, their Persons, Drefs, Manners, and Customs. Their Nobility, Combats, Buildings, Furniture, and Employment. The Butchers ignominious. The Education of their Children; their Government, and the Manner in which it was changed to a Monarchy; with a concise Account of their Funerals.

ON the first arrival of the Europeans at Gran Canaria, that island was supposed to contain no less than fourteen thousand fighting men; but a pestilence breaking out some time after, swept away two thirds of the inhabitants. These were of a dark complexion like the natives of Lancerota and Fuertaventura, of a good stature, and well proportioned, active, warlike, cheerful, good-natured, and faithful to their promises; for they considered a lye as one of the greatest crimes. They were very fond of hazardous enterprizes, such as climbing to the top of steep precipices, and there fixing poles of so great a weight, that one of them was a sufficient burthen for a man of common strength to carry on level ground.

The Canarians were dressed in a tight coat, with a hood to it, like that of a Capuchin friar; it reached to the knees, and was fastened to the waist by a leathern girdle. This garment was made of a kind of rush, which they beat till it became soft like flax, and then they spun and wove it. Over this they had a goat-skin cloak, with the hairy side inward in winter, and outward in summer. They had likewise caps made of the skins of the heads of goats, taken off almost entire, which they formed in such a manner, that a goat's beard hung under each ear, and these they sometimes tied under the chin. Some had bonnets of skins, adorned with feathers. These garments were all neatly sewed and painted, and were in every respect much more curious than those of the natives of the other islands. Their shoes, like those of Lancerota and Fuertaventura, were made of raw hides.

The Canarians had an order of nobility distinguished from the vulgar by the cut of their hair and beards; but a man could not be intitled to this honour merely from his being the offspring of noble or rich parents; but was to be declared noble by the faycag, a person whose business was to decide differences among the natives, and regulate the ceremonies of their religion; in short, he was a priest, and acted also as judge in civil affairs. The manner by which nobility was conferred was very singular: at a particular time of life the son of a nobleman let his hair grow long, and when he had obtained sufficient strength to endure the fatigues of war, went to the faycag, and said, "I am the son of such a nobleman, and desire also to be ennobled." Upon this the faycag went to the town or village where the young man

was brought up, and there assembled all the nobles, and other persons of the place, whom he caused to swear solemnly by their god Acoran, to declare the truth. He then asked them, If they had ever seen the youth so far demean himself as to dress victuals, or to go into the folds to look after the sheep or goats, and whether he was ever seen to milk or kill them? If he was ever known to steal cattle, or forcibly take them in time of peace from their owners? Whether he was discourteous, of a slanderous disposition, or guilty of any indecent behaviour, especially to women? If they all answered these questions in the negative, the faycag cut the youth's hair in a round form, so short as not to hang below his ears, and giving him a staff, declared him noble. But if any of the standers-by could charge him with any of the offences mentioned by the faycag, and bring sufficient proof of them, instead of being declared noble, the faycag shaved his head, and sent him away in disgrace, by which means he was rendered incapable of nobility, and obliged to remain a plebeian during the rest of his life.

In their wars they esteemed it base and mean to molest or injure the women and children of the enemy, whom they considered as weak and helpless, and therefore improper objects of their resentment; nor did they offer the least damage to the temples of the enemy.

The offensive weapons used by the Canarians were clubs and sharp pointed poles hardened by fire; but after the Europeans began to invade their island, they formed shields, in imitation of theirs, and swords of pitch-pine, the edges of which were hardened by fire, and sharpened in such a manner, that it is said they cut like steel; but their chief strength lay in their wooden spears, and their throwing stones with great force and dexterity.

Public places were appointed for fighting, in which a kind of stages were raised for the combatants, that they might be more easily seen by the spectators. On a challenge being given and accepted, the parties went to the council of the island, which consisted of twelve members, for a licence to fight, which was easily obtained, and then they went to the faycag, to have this licence confirmed. Afterwards they assembled all their relations and friends, that they might be spectators of their bravery and skill, and with them repaired to the public place, or theatre, where the combatants mounting upon two stones flat at the top, and placed at the opposite sides, threw stones at each other, which, though good marksmen, they generally avoided, merely by their agility in writhing their bodies, without moving their feet. When each had thrown three stones at his antagonist, they armed themselves with a cudgel in their right hand, and a sharp flint in their left; then drawing near, they beat and cut each other till they were tired, and then retired with their friends to take some refreshment; but soon returning, fought till the twelve members of the council called out, Gama, Gama, or Enough, Enough, when they instantly desisted, and ever after remained good friends. If during the combat one of the parties happened to break his cudgel, the other instantly desisted from striking, and the dispute was ended in an amicable manner, though neither of the parties was declared victor.

These combats were usually fought on public festivals, rejoicings, or the like occasions; and if either of the combatants was deeply wounded, they beat a rush till it became like tow, and dipping it in melted goats butter, applied it to the wound as hot as the patient could bear it; and the older the butter was, the sooner, they say, it effected a cure.

They had also public houses or rooms, in which they assembled to dance and sing. The Canarian dance is still in use in these islands; it has a quick and short step, and is called Canario. Their songs were either dirges, or amorous sonnets set to grave and plaintive tunes.

The houses in Canaria were built of stone without cement, and yet were so neat and regular, that they made a handsome appearance. The walls were very low, and the floors sunk beneath the level of the ground on which they stood, being so contrived for the advantage of warmth in the winter season. At the top they laid wooden beams, or rafters close to each other, and covered them with

earth. Their beds and bedding were the skins of goats dressed in their hair. Their other furniture consisted of baskets and mats of palm-leaves and rushes very neatly made; for they had people among them whose sole employment was building houses and making of mats.

The women were generally employed in painting and dying; and in the proper season they carefully gathered the flowers and shrubs from which they extracted their several colours. The thread they used in sewing was made of the nerves and tendons of the loins of sheep, goats, or swine, with which they were supplied by the butchers. These they first anointed with butter, and then prepared by fire in such a manner, that they could split them into fine threads at their pleasure. Their needles were of bone, and their fish-hooks of horn. The vessels they used in cookery were made of clay, hardened in the sun.

None of the Canarians would follow the trade of a butcher, except the very dregs of the people; for their employment was thought so ignominious, that they would not allow one of that profession to enter any of their houses, or to touch any thing belonging to them. It was even unlawful for the butchers to keep company with any that were not of their profession; and when they wanted any thing of another person, they were obliged to carry a staff, and standing at a considerable distance, point at what they wanted; but, to compensate for this abject state, the natives were obliged to supply the butchers with every thing they wanted. It was unlawful for any Canarian, except the butchers, to kill cattle; and when any person wanted his beast to be slain, he was forced to lead it to the public shambles, but was not permitted to enter himself; and this prohibition was extended even to the women and children.

The wealth of the inhabitants chiefly consisted in their sheep, goats, and hogs. Their common food was barley-meal roasted, which they ate with milk or goats flesh; and when they made a feast, they dressed the latter with hog's lard or butter. They ground their barley with a hand-mill. When they went to plough their lands, about twenty people assembled together, each had a wooden instrument resembling a hoe, with a spur at the end of it, on which they fixed a goat's horn: with this they broke the ground, and if the rain did not fall in its proper season, they moistened the earth with water, which they brought by canals from the rivulets. The corn was gathered in by the women, who reaped only the ears; these they threshed with sticks, or beat out the corn with their feet, and winnowed it with their hands.

The poor lived by the sea-coast, chiefly on fish, which they usually caught in the night, by making a great light with torches of pitch-pine. In the day-time, whenever they perceived a shoal of sardinas, a small fish that has some resemblance to a pilchard, a multitude of men, women, and children, went at a small distance into the sea, and swimming beyond the shoal, chased the fish towards the shore, and with a net, made of a tough kind of rush, inclosed and drew them to land, where they equally divided their prize: but in doing this every woman who had a young child received a share for each; or if she happened to be pregnant, she received an additional share for the child in her womb.

The Canarians had never more than one wife. When the parents were disposed to marry their daughter, they fed her thirty days with large quantities of milk and goffio, in order to fatten her; for they thought that lean women were less capable of conceiving children than those who were fat.

They were very careful in the education of their children, and never failed to chastise them when they did amiss. It was usual to propose two of the youth as examples to the rest, the one of virtue, the other of vice; and when a child did any thing that was praise-worthy, he was commended, and told that such behaviour was amiable, and resembled that of the good boy. On the other hand, when a child displeased its parents, they observed that such an action resembled those of the person set up as a bad example. By this means they raised a spirit of emulation for excelling in virtuous actions.

Among

Among the Canarians were religious women, called *magadas*, a number of whom lived together in one house, or convent, of which there were many in Canaria; and these were held so sacred, that criminals, who fled to any of them, were protected from the officers of justice. The *magadas* were distinguished from other women by their long white garments, which swept the ground as they walked. They maintained that *Acoran*, their god, dwelt on high, and governed every thing on earth; and when they addressed him, lifted up their joined hands towards heaven.

There are two rocks in the island, to which the inhabitants, in times of public calamity, went in procession, accompanied by the religious women, carrying in their hands palm-branches, and vessels filled with milk and butter, which they poured on the rocks, dancing round them, and singing mournful songs: from thence they went to the sea shore, and all at once, with one accord, struck the water with their rods, all shouting together as loud as possible.

The Canarians were remarkable for their good government, and strict administration of justice. At the time of the conquest of the island it was governed by two princes, each of whom had his separate district; but before they were ruled by captains, or heads of tribes, who presided over small circles. The people of each tribe was confined to their own district, and not allowed to graze their flocks on the ground belonging to another tribe. Such crimes as deserved death were punished in the manner already related, by dashing out their brains with a stone; but for those of a less criminal nature they used the law of retaliation, and took an eye for an eye, or a tooth for a tooth.

As the manner in which Canaria changed its government from the heads of tribes to its being under the jurisdiction of two princes, appears singular and entertaining, we shall give it our readers from the account given of that revolution by Mr. Glas. In the division of *Gal-dar*, the most fertile part of the island, lived a virgin lady of great merit, named *Antidamana*, who was so highly esteemed by the natives for her prudence and judgment, that they frequently applied to her to determine their differences, and never appealed from her decisions; for she hardly ever suffered the party against whom she had given the cause to depart, till she had first convinced him of the justice of her sentence; which she seldom failed to do by the force of her eloquence, and the high character she bore for equity. After some years the nobles, vexed at observing the deference paid to this woman while she acted as a judge, or arbitrator, which they thought more properly belonged to them, persuaded the people no longer to regard her sentences, or to refer their causes to her decision. This lady now perceiving herself disregarded and despised, was stung to the quick; for she had in a manner spent the prime of her life in the service of the public, who had now most ungratefully deserted her; but, instead of venting her resentment in vain complaints, she went to one *Gumidase*, a captain of one of the districts, who was esteemed the most brave and prudent of all the nobles of Canaria, and had great influence over the people. To him she related all her grievances, and proposed a match between them, to which *Gumidase* readily consented, and accordingly they were soon after married. *Gumidase* now, under various pretences, made war upon the other captains, and proved victorious over them all; so that at length he became king of the whole island. He had by his wife *Antidamana* a son, named *Artemis*, who succeeded him in the government of the kingdom, and at his death left two sons, who shared the island between them, and were both upon the throne when it was conquered by the Spaniards.

But to return: when any of the nobles died they brought out the corpse, and placing it in the sun, took out the entrails, and buried them in the earth; then drying the body, they swathed it round with bandages of goats-skins, and fixed it upright in a cave, cloathed with the same garments which the deceased wore when alive; but if no proper cave was at hand, the body was carried to one of the stony places now called *Mal Paices*, where levelling the ground, and fixing the loose stones, they made a sort of artificial cave of large stones placed so as

not to touch the body, and then taking another large stone two yards in length, wrought into a round form, with this closed the entrance, and afterwards filled up the outside between the top of the round stone and the outward part of the other large ones with small stones in a very neat manner. Some of their dead bodies were put into chests, and afterwards deposited in stone sepulchres.

People of the lower class were interred in the *Mal Paices* in holes covered with stones, and all the bodies, except those placed upright in the caves, were laid with their heads towards the north.

S E C T. VIII.

Of the Island and Pike of TENERIFE.

Its Situation and Appearance at Sea. A Description of the Port and Town of Santa Cruz; of the Chapel of Our Lady of Candelaria; of the Haven and Town of Garrachica, and of a dreadful Earthquake there. Of the Towns of Port Orstava, La Villa De Orstava, and St. Christbal de la Laguna. The Face of the Country, and the Number of its Inhabitants.

THIS island was named *Tenerife*, or the White Mountain, by the natives of *Palma*; in their language *Thener* signifying a mountain, and *Ife* white, the summit or pike of *Tenerife* being always covered with snow. This name has been continued ever since by the Spaniards and other European nations; but the natives called it *Chineeche*, and the present inhabitants *Vincheni*.

The north-east point of *Tenerife*, called *Point Nago*, or *Anaga*, bears north-west about sixteen leagues distant from the north-west part of *Canaria*; but from that part of *Canaria* to the nearest part of *Tenerife*, the distance does not exceed twelve leagues. This island is nearly triangular, the three sides being almost equal, and each about twelve leagues long. In the center is the famous pike of *Tenerife*, called by the ancient inhabitants *Teyde*, and this name it still retains among the present inhabitants.

The accurate Mr. Glas observes, that in coming in with this island, in clear weather, the pike may be easily discerned at a hundred and twenty miles distance; and in sailing from it, at the distance of a hundred and fifty miles, it then resembles a thin blue vapour, or smoke, very little darker than the sky; and at a farther distance, the shade disappearing, is not distinguishable from the azure of the firmament. Before we lose sight of this towering mountain, it seems a considerable height above the horizon, though from its distance, and the spherical figure of the earth, the rest of the island, notwithstanding its being exceeding high, is sunk beneath the horizon.

Near *Punto de Nago* are high perpendicular rocks, and five or six leagues distant from them, on the south-east side of the island, is the harbour of *Santa Cruz*, the most frequented port in the *Canary Islands*. The best road for ships is between the middle of the town and a fort, or castle, about a mile to the northward. Ships may here lie secure in all winds, though the bay is exposed to those which blow from the north-east, east, and south-east; yet these winds do not blow so hard as to cause any considerable damage above once in the space of four or five years. However, some years ago most of the shipping in the road were driven on shore by one of these gales. Some English ships were then in the harbour; but the crews prudently cutting away their masts, rode out the storm. On that occasion some Spanish seamen publicly declared, that in the height of the tempest they saw the devil very busy in assisting the heretics.

In the midst of the town is a mole, built at a vast expence, for the convenience of landing. It runs up to the northward, and the outermost part turns towards the shore. However, in mild weather, goods are landed at a creek among the rocks, near the Custom-house, at the distance of a stone's cast to the southward of the mole.

On proceeding from the mole into the town, you come to a square fort on the left hand, named *St. Philip's*; this is the principal one in the bay. To the northward of it are some forts and batteries mounted with guns, the most

considerable of which is named Passo Alto. Near it is a steep rocky valley, which begins at the sea-shore, and runs a great way within land. There are several batteries at the south end of the town, and beyond them, close to the shore, is a fort called St. Juan. All these forts are mounted with cannon, and joined to each other by a thick stone-wall, which begins near the above rocky valley, and continues, with little interruption, to Fort St. Juan. This wall is within only breast-high, but it is higher on the outside facing the sea; and from thence to the southward the shore is generally inaccessible, from its being naturally fenced with rocks.

The town of Santa Cruz is large, and contains several churches, three convents of friars, an hospital, and the best constructed private buildings of any to be found in the Canary Islands. It is indeed the capital of them all; for though the episcopal see and courts of judicature are in the city of Palmas, in Canaria, the governor-general of the islands always resides in Santa Cruz, where a great concourse of foreigners continually resort, on account of its being the center of the trade between the Canary Islands with Europe and America. The number of inhabitants are supposed to amount to about five or six thousand. The water drank by them is conveyed into the town in open wooden troughs from a spring beyond the above-mentioned valley, and in many houses are pits of water which serve for other purposes.

About twelve miles to the southward of Santa Cruz, close to the sea, is a cave, with a church, or chapel, called Our Lady of Candelaria, in which is a little image of the virgin Mary, about three feet high, holding a green candle in one hand, and in the other an infant Jesus, who has a gilt bird in each hand. This chapel received its name of Candelaria from its being pretended, that on the eve of the Purification of the Holy Virgin a great number of lights are constantly seen going in procession round the cave in which the image is placed; and they assert, that in the morning drops of wax are scattered about the sea-shore. This image is held in the highest veneration, on account of the many miracles it is said to have performed, and her chapel is adorned with so many ornaments, that it is the richest place in all the seven islands. At a certain season of the year most of the inhabitants of the island go thither in pilgrimage; when troops of young girls march singing in an agreeable manner the praises of the Virgin, and the miraculous deeds of the image.

On the north-west side of the island is the bay of Adexe, or, as it is pronounced, Adehe, where large ships may anchor. On the north-west side is a haven called Garrachica, once the best port in the island; but it was destroyed in 1704, which the natives call the year of the earthquakes, and filled up by the rivers of burning lava that flowed into it from a volcano; so that houses are now built where ships formerly lay at anchor; yet vessels come there in summer.

The above earthquake began on the twenty-fourth of December; and, in the space of three hours, twenty-nine shocks were felt. After this they became so violent as to rock all the houses, and oblige the inhabitants to abandon them. The consternation became universal, and the people, with the bishop at their head, made processions and publick prayers in the open fields. On the thirty-first a great light was observed on Manja, towards the White Mountains, where the earth opening, two volcanoes were formed, that threw up such heaps of stones, as to raise two considerable mountains; and the combustible matter continually thrown up kindled in the neighbourhood above fifty fires. Things remained in this situation till the fifth of January, and then the sun was totally obscured with clouds of smoke and flame, which continually increasing, augmented the consternation and terror of the inhabitants. Before night the whole country, for nine miles round, was in flames by the flowing of the liquid fire, with the rapidity of a torrent, into all quarters from another volcano, which had opened by at least thirty different vents within the compass of half a mile. The horror of this scene was greatly increased by the violence of the shocks, which never once remitted, but by their force entirely overthrew several houses, and shook others to their very foundations; while the wretched inhabitants

were again driven defenceless and dismayed into the open fields, where they every moment expected to be swallowed up by some new gulph. The noise of the volcano was heard at sea at twenty leagues distance, where the sea shook with such violence as alarmed the mariners, who at first thought the ship had struck upon a rock. Mean while a torrent of sulphur and melted ores of different kinds rushed from this last volcano towards Guimar, where the houses and publick buildings were thrown down by the violence of the accompanying shocks. On the second of February another volcano broke out even in the town of Guimar, which swallowed up a large church. Thus, from the twenty-fourth of December to the twenty-third of February, the people were constantly alarmed by continual shocks of earthquakes, and the terrible volcanoes that burst forth in different parts of the island.

Garrachica is still a pretty large town, and contains several churches and convents of both sexes. It has a small trade for brandy and wine, which are usually sent from thence in barks, or large open boats, to Santa Cruz, or Port Orotava. Strong and durable vessels are also built there, some of which are of three hundred tons burthen, and upwards.

Six miles to the eastward of Garrachica is the town of Port Orotava, which is a good harbour in the summer season; but in the winter ships are often obliged to slip their cables and put to sea, for fear of being surprized by a north-west wind, which throws in a heavy sea upon this coast. This is a place of considerable trade, it having flourished greatly since the destruction of the harbour of Garrachica. It contains two churches, two convents of friars, two of nuns, and some good private buildings. At each end of the town is a black sandy bay; along the northernmost is a low stone-wall, built to prevent the landing of an enemy: at the other bay is a small castle, or fort, for the same purpose, and at the landing-place between them is a battery of a few cannon; but the best defence of this port is the surf that continually breaks upon the shore.

La Villa de Orotava, which is about three miles within land from Port Orotava, is a large place, and contains several churches, convents of friars and nuns, with a number of stately stone buildings belonging to private persons. A rivulet, which runs through the midst of the town, supplies the inhabitants with water, and refreshes their gardens and orchards.

About four miles within land from Santa Cruz is the city of St. Christobal de la Laguna, that is, St. Christopher of the Lake. The road to it from Santa Cruz is a pretty steep ascent, till within a small distance of the town, which is seated in the corner of a plain, about four miles in length, and a mile in breadth. This city is the capital of the island, and contains two parish-churches, three convents of friars, two of nuns, and three hospitals; two of which are for the venereal disease, and the other for foundlings. The jesuits have also a house here, and, besides these publick structures, there are many handsome private buildings. The water drank by the inhabitants is conveyed in troughs to the city from the mountains situated to the southward of the plain. In this city there is not the least show of business, it being chiefly inhabited by the gentry of the island, particularly the officers of justice, such as the corregidor, and his tiniente, or lieutenant, the regidores, or cavildo, with the judge of the Indies, who presides in the India-house, where all affairs relating to the West-India commerce are conducted. Here is likewise an office of inquisition, with its proper officers, subject to the tribunal of the Holy office at Gran Canaria: yet the city appears to a stranger as if desolate and uninhabited; for hardly any body can be seen in the streets, and grass grows in the most frequented of them.

Behind the city is a laguna, or lake, about half a mile in circumference, from which the city takes its name. It is dry in summer, but in winter is full of stagnant water. As this city is situated on a plain, elevated a considerable height above the sea, it is extremely cold in winter, and exposed to the winds in all seasons.

From the western extremity of this plain the road descends to La Montanza de Centejo, a large village in the mid-way between Santa Cruz and Port Orotava, chiefly inhabited by peasants:

All these places are populous, and situated at no great distance from the sea, from whence most of them may be seen; and indeed there are no habitations at a greater distance from it than three leagues. The whole island continues rising on all sides from the sea till it terminates in the pike, which, as hath been already observed, is in the center. The north side is the most fertile, and ascends more gradually than the others, particularly a space along the shore about three leagues broad, bounded on the sides by high mountains, or rather cliffs; but upwards from the sea it rises like a hanging garden all the way, without any considerable interruption of hills or vallies, till you come within a league of the clouds.

In the western border of this space is situated a large town, called Realejo, and on the eastern La Rambla. Between them stand the towns of Orotava and Port Orotava, with a number of detached inhabitants scattered about from the sea-shore upwards to the clouds, in or beyond which there are no houses; yet the clouds are not higher than the middle distance between the sea and the summit of the pike. All the fertile ground within a league of the sea is covered with vines; that of the next league produces corn; and the third some corn, woods of chestnut-trees, and many other trees of different kinds. Above these woods are the clouds, which, in fine weather, generally descend gradually towards the evening, and rest upon these woods till the morning, when they re-ascend about a league, and there remain till the succeeding evening.

Besides the towns already mentioned, there are several others, and many small villages. Indeed the island is so populous, that when the last account was taken, it contained no less than ninety-six thousand persons, and is supposed to have as many inhabitants as all the rest of the seven islands together.

S E C T. IX.

A Journey up the Pike of Tenerife; with a concise Account of the Weather and Produce of the Island.

OUR readers will not be displeased at seeing here a journey up the pike of Tenerife, undertaken by Mr. Glas, from whose History of the Canary Islands we have taken this and many other curious and interesting particulars, which, we hope, will serve to recommend his work to the notice of the public.

In the beginning of the month of September, 1761, at about four in the afternoon, our author set out on horseback, in company with the master of a ship, to visit the pike. They had with them a servant, a muleteer, and a guide; and, after ascending about six miles, arrived towards sun-set at the most distant habitation from the sea, which is in a hollow: here finding an aqueduct of open troughs that convey water down from the head of the hollow, their servants watered the cattle, and filled some small barrels to serve them in their expedition. The gentlemen here alighted, and walking into the hollow, found it very pleasant, it abounding with many trees that sent forth an odoriferous smell; and near the houses are some fields of maize, or Indian corn.

On their mounting again they travelled for some time up a steep road, and reached the woods and clouds just as it grew dark. They could not miss their way, the road being bounded on both sides with trees or bushes, which were chiefly laurel, savine, and brushwood. Having travelled about a mile, they came to the upper edge of the wood, above the clouds, where alighting, they made a fire and supped; soon after which they laid down to sleep under the bushes.

About half an hour after ten, the moon shining bright, they mounted again, travelling slowly two hours through an exceeding bad road, resembling the ruins of stone buildings scattered over the fields. After they had got out of this road they came upon small light pumice-stone, like shingle; upon which they rode at a pretty good pace for near an hour. The air now began to be very sharp, cold, and piercing, and the wind blew strong from the south-westward. Their guide advised them to alight here, as the place was convenient, and rest till four or

five in the morning. To this they agreed, and entered a cave, the mouth of which was built up to about a man's height to exclude the cold. Near this place was some dry withered retamas, the only shrub or vegetable near the cave, and with these they made a great fire to warm themselves, and then fell asleep; but were soon awaked by an itching occasioned by the cold thin air, want of rest, and sleeping in their cloaths. They here passed away their time as well as they could; but while they crept so near the fire, that one side was almost scorched, the other was benumbed with cold.

At about five in the morning they mounted again, and travelled slowly about a mile; for the road was rather too steep for travelling quick on horseback, and their beasts were now fatigued. At last they came among some great loose rocks, where was a kind of cottage built of loose stones, called the English Pitching-place, probably from some of the English resting here on their way to visit the pike; for none take that journey but foreigners, and some poor people who earn their bread by gathering brimstone. Here they again alighted, the remainder of their way being too steep for riding, and left one of the servants to look after the horses, while they proceeded on their journey. They walked hard to get themselves a heat; but were soon fatigued by the steepness of the road, which was loose and sandy. On their reaching the top of this hill, they came to a prodigious number of large and loose rocks, or stones, whose surfaces were flat, and each of them on a medium about ten feet every way. This road was less steep than the other; but they were obliged to travel a considerable way round, to leap over the rocks, which were not close to each other. Among these is a cavern, in which is a well or natural reservoir, into which they descended by a ladder placed there by the poor people for that purpose. This cavern is very spacious, it being almost ten yards wide, and twenty in height; but all the bottom, except just at the foot of the ladder, is covered with water, which is about two fathoms deep, and was then frozen towards the inner edges of the cave; but when they attempted to drink of it, its excessive coldness prevented them. After travelling about a quarter or half a mile upon the great stones, they reached the bottom of the real pike, or sugar-loaf, which is exceeding steep, and the difficulty of ascending increased and rendered more fatiguing by the ground being loose and giving way under their feet; for though this eminence is not above half a mile in height, they were obliged to stop and take breath near thirty times; and when they at last reached the top, being quite spent with fatigue, they lay about a quarter of an hour to rest themselves and recover their breath.

When they left the English Pitching-place in the morning, the sun was just emerging from the clouds, which were spread under them at a great distance below, and appeared like the ocean. Above the clouds, at a vast distance to the north, they perceived something black, which they imagined to be the top of the island of Madeira, and taking the bearings of it by a pocket compass, found it to be exactly in the direction of that island from Tenerife; but before they reached the tops of the pike it disappeared. They saw from hence the top of the islands of Gran Canaria, Hiero, Palma, and Gomera, which seemed to be quite near; but could neither perceive Lancerota nor Fuertaventura, they being not high enough to pierce the clouds.

Having rested for some time, they began to observe the top of the pike, which is about an hundred and forty yards in length, and an hundred and ten in breadth. It is hollow, and shaped like a bell with the mouth upwards. From the edges of this bell or cauldron, as it is called by the natives, it is about forty yards to the bottom, and in many parts of this hollow, they observed smoke and steams of sulphur issuing forth in puffs; and in particular places the heat of the ground was so great, as to penetrate through the soles of their shoes to their feet. On observing some spots of earth, or soft clay, they tried the heat with their fingers; but could not thrust them in farther than half an inch; for the deeper they went, the hotter it was. They then took their guide's staff, and thrust it about three inches deep into a hole or porous place, where the smoke seem-

ed thickest; and having held it there about a minute, drew it out, and found it burnt to charcoal. They gathered here many pieces of most curious and beautiful brimstone of all colours, particularly an azure blue, violet, green, yellow, and scarlet.

From hence the clouds beneath them, which were at a great distance, made a very extraordinary appearance: they seemed like the ocean, only the surface was not quite so blue and smooth, but had the resemblance of white wool; and where this cloudy ocean, as it may be called, touched the mountain, it seemed to foam like billows breaking on the shore. When they ascended through the clouds, it was dark; but when they afterwards mounted again, between ten and eleven o'clock, and the moon shone bright, the clouds were then below them, and about a mile distant. They then mistook them for the ocean, and wondered at their seeing them so near; nor did they discover their mistake till the sun arose. When they passed through the clouds, in descending from the pike, they appeared as a thick fog or mist, resembling those frequently seen in England; all the trees of the wood and their cloaths were wet with them.

On the top of the pike the air was thin, cold, and piercing, like the south-easterly winds felt in the great desert of Africa. In ascending the sugar-loaf, which is very steep, their hearts panted and beat violently, and, as hath been already observed, they were obliged to rest above thirty times to take breath; and this was probably as much owing to the thinness of the air causing a difficulty of respiration, as to the uncommon fatigue they suffered in climbing the hill. Their guide, who was a thin, active old man, was far from being affected in the same manner; but climbed up with ease like a goat; for he was one of the poor men who earn their living by gathering brimstone in the cauldron and other volcanoes, the pike itself being no other, though it has not burned for some years; for the sugar-loaf is entirely composed of earth mixed with ashes and calcined stones, thrown out of the bowels of the earth, and the great square stones before described, were probably thrown, in some eruption, out of the cauldron, or hollow of the pike, when it was a volcano.

Having surveyed every thing worthy of notice, they descended to the place where they had left their horses, which took them up only half an hour, though they were about two hours and a half in ascending. It was then about ten in the morning, and the sun shone so exceeding hot, as to oblige them to take shelter in the cottage, and being extremely fatigued, they laid down in order to sleep; but were prevented by the cold, which was so intense in the shade, that they were obliged to kindle a fire to keep themselves warm.

After they had taken some repose, they mounted their horses about noon, and descending by the same way they went up, came to some pines situated about two miles above the clouds. Between these pines and the pike, no herb, shrub, tree, or grass can grow, except the before-mentioned retamas. At about five in the evening they arrived at Orotava, not having alighted by the way to stop, only sometimes to walk, where the road was too steep for riding.

The whole distance they rode in the five hours spent in coming down from the English Pitching-place to Orotava, they computed to be about fifteen English miles, travelling at the rate of three miles an hour. Mr. Glas supposes, that the perpendicular height of the English Pitching-place to be about four English miles, and adding to that a mile of perpendicular height from thence to the pike, observes, that the whole will be about five English miles, and that he is very certain he cannot be mistaken in this calculation above a mile either way. But we beg leave to observe, that Mr. Glas is here probably mistaken, owing perhaps to his not using any instruments proper for ascertaining the exact altitude of this mountain, which, according to this calculation, is much higher than either the Alps, or the highest part of the Andes.

The weather in Tenerife is the same as in Gran Canaria; but the sea-breeze generally sets in at about ten o'clock in the morning on the east and north-east sides

of the island, and blows till about five or six in the evening, when it falls calm till midnight. The land-wind then begins, and continues till seven or eight in the morning, when it is followed by a calm, which lasts till the sea-breeze returns.

In the bay of Santa Cruz, and on all the east side of the island, the sea-breeze commonly blows at east, and the land-wind at west. On the north side, the sea-breeze blows at north-east by east, or north-east, and the land-wind directly opposite to it; but at Point Nago, where the land stretches towards the north-east far into the sea, there is no land-wind.

It is remarkable, that at the brow of the hill above Santa Cruz, and at the city of Laguna, a fresh gale blows from the north-west all the time of the sea-breeze, which is occasioned by the mountains almost encompassing the plain. These being so exceeding high on the south side of it, as to beat back the sea-breeze, and throw it against the mountains that bound the north side of the plain, where finding no passage, it veers to the south-east, and there meeting with no resistance, forces its way with great vehemence through the plain; till coming to the brow of the above-mentioned hill, part of the current of air pours down it towards Santa Cruz, advancing within a mile and half of the sea, where it is checked by the true sea-breeze.

Yet there is no regular sea or land-breeze on the south-west coast, which is sheltered from the trade or north-easterly wind by the immense height of the pike, which towers above the region of the wind: hence on that side of the island, either an eddy wind at south-west, or a calm prevails.

The produce of this island is nearly the same as that of Canaria, only there are more vineyards and less corn land. The wines are strong, good, and very fit for exportation, especially into hot climates, by which they are greatly improved. Formerly a great quantity of Canary sack was made here; but of late years they do not make above fifty pipes in a season; for they now usually gather the grapes when green, and make a dry hard wine of them, which, when about two or three years old, can hardly be distinguished from Madeira; but after four years of age it becomes so sweet and mellow, as to resemble the wine of Malaga in Spain. This, like all the other Canary islands, abounds with orchilla weed.

S E C T. X.

Of the ancient Inhabitants of Tenerife, their Dresses, Customs, and Manners.

THE ancient natives of Tenerife were generally of a middle stature; but those who dwelt on the north side of the island were not only much fairer, but had hair of a lighter colour than those in the south. Both sexes frequently anointed their bodies with sheep's fat. The men wore cloaks of goats skins dressed, and rendered soft with butter: those of the women were longer, and reached down to their feet, and underneath they had petticoats of the same skins. Their language was entirely different from that used in the other islands, and was very guttural. They had no iron, nor any other metal; and instead of instruments made of these, used a black hard stone sharpened and made fit for killing sheep and cutting timber. Of these also they made lancets, and when they were troubled with acute pains, drew blood with them from the part affected.

Among them were artificers, who dressed the skins of goats, and made garments; carpenters, who wrought in wood; and potters, who made earthen-vessels: all of whom were paid for their labour in flesh, barley, or roots.

The inhabitants of Tenerife were very neat and cleanly; they washed their hands and faces whenever they arose from sleep, when they sat down to eat, and after they had eaten. Their food was the flesh of sheep and goats roasted, or boiled, which they ate alone; and not, like the Europeans with bread or roots. They also fed upon barley-meal, roasted and dressed with milk and butter.

After

After eating they refrained from drink for about half an hour, from the opinion that drinking cold water immediately after eating warm victuals, spoiled their teeth. They had no other cattle but sheep and goats; nor grain but wheat and barley, beans and pease.

The men prepared the ground for seed, by breaking it up with a kind of wooden hoes; and the women sowed the seed. When they were in great distress for want of grain, or the like, they assembled with their children and flocks in certain places set apart for that purpose, where they sat on the ground in a circle, weeping and making a mournful noise, their flocks at the same time bleating for want of food; for on these occasions both the men and beasts were debarred all kind of sustenance.

They married without any regard to kindred, except that of a mother or sister; but no man had more than one wife. They had a custom, that in the house, or cave, where the husband and wife slept, no other person was allowed to sleep; yet they did not lie together, but in separate beds, which were made of herbs or grass covered with goat skins, neatly dressed and sewed together, with coverings of the same skins. They could put away their wives when they pleased; but the children of those women who were divorced were esteemed illegitimate, and could not inherit their fathers effects. When their children were born they were washed all over with water by virgins, who were set apart for that office, and never allowed to marry. They had a custom among them, that when a man accidentally met a woman alone, or in a solitary place, he was not to look at or to speak to her, unless she spoke first, but to turn out of the way; and if he made use of any indecent expression, or behaved in an unbecoming manner, he was severely punished.

It was customary, when one person went to the house of another, instead of entering in, to sit on a stone at the door, and either to whistle or sing till somebody came out and desired him to walk in. Whoever neglected this ceremony, and entered another person's house without being invited, was liable to punishment; this being esteemed a very extraordinary affront.

It is said, they had a surprizing facility in counting the number of their sheep and goats, when issuing tumultuously out of a fold, without even pointing to them with their fingers, or moving their lips.

The natives acknowledged a God, whom they called by the names Achguarergenán, Achoran, and Achaman, which signify the Sustainer of the heavens and the earth. They also gave him the titles of the Great, the Sublime, and the Sustainer of all: but they did not worship idols, nor had any images of the Deity. They believed that God created them of earth and water, and made as many women as men, giving them cattle, and every thing necessary for their subsistence; but that afterwards, they appearing to him too few, he created more; but to these last gave nothing; and when they prayed to him for flocks of sheep, and herds of goats, he bid them go and serve the others, who, in return, would give them food. From these, they said, were descended their servants.

The king was obliged to marry a person who was his equal; but if such a one could not be found, he took his own sister to wife, for he was not permitted to debase his family by a mixture of plebeian blood. In the summer season the king resided in the mountains; but in winter near the sea-shore. When he travelled, or went to change his place of residence, the elders of his tribe assembled, and carried before him a staff and a lance, with a kind of flag upon it, to give notice of the king's approach, that all who were travelling upon the same road might pay him the customary homage, by prostrating themselves before him on the ground, wiping the dust from his feet with the corners of their garments, and kissing them.

A few years before the conquest of Tenerife was a prince, called Betzenuria, who governed the whole island, and had nine sons, who, upon his death, divided the government equally between them; by which means the island became separated into nine kingdoms, eight of which paid homage to Tinobat, the elder brother, who was the most powerful, from his possessing the richest and most fertile part of the island, which is the tract

that extends between Orotava and the brow of the hill above the port of Santa Cruz, in which he could raise seven thousand fighting men.

The natives had frequent disputes among themselves about their flocks and pastures, which often ended in war. Their offensive weapons were darts made of pitch-pine sharpened and hardened in the fire, like those used in Gran Canaria: they had also a weapon like a spear, very sharp, and were so dexterous at throwing these, that they scarce ever missed their mark. At the approach of an enemy they alarmed the country, by making a smoke, or by whistling, which they repeated from one to another. This last method is still in use, and may be heard at an almost incredible distance.

In their wars they were attended by their women, who brought provisions, carried off the dead, and interred them in caves.

They held their courts of judicature on a large plain, in the midst of which they placed a high square stone, and on each side several others of inferior size and height. On the day appointed for holding the court the king, who was always present, was seated on the high stone, and the principal elders of the district on the smaller ones, according to their seniority; and in this manner they heard and decided causes. When any one was sentenced to suffer corporal punishment, he was laid flat on the ground, and the king delivering the scepter or staff, which he always carried with him, into the hand of some person present, ordered him to give the offender a number of blows proportioned to his crime, and then take him from his presence. In case of murder the king took away the criminal's cattle and effects, gave them to the relations of the deceased, and banished the murderer from that district; but, at the same time, took him under his own protection, that he might be safe from the attempts of the friends and relations of the deceased. They never punished any person with death; for it was a maxim with them, that it belonged to God alone to take away that life he gave.

When any person died, they carried the body to a cave, and stretching it on a flat stone, opened it and took out the bowels, then twice a day washed the porous parts, that is, the neck, the arm-pits, behind the ears, the groin, and between the fingers, with cold water: after washing it sufficiently, they anointed those parts with sheep's butter, and sprinkled them with a powder made of the dust of decayed pine-trees, and a kind of brush-wood, called by the Spaniards *bressos*, and with the powder of pumice-stone. They then dried the body, by extracting from it all its moisture, after which the relations of the deceased came and swaddled it in dressed sheep or goats skins, and girding all tight with long leather thongs, they put it in the cave which had been set apart by the deceased for his burying-place. The king could only be buried in the cave of his ancestors, in which the bodies were so disposed as to be known again. Particular persons were set apart for the office of embalming; and there were men to embalm the bodies of the men, and women to perform that office for those of their own sex. During the process, the bodies were watched by the embalmers with the greatest care to prevent their being devoured by the ravens; the husband, or wife, of the deceased bringing them provisions, and waiting on them during the time of their watching. It is said that not many years ago, two of these embalmed bodies were taken out of a cave; they were entire, and as light as cork; but quite fresh, and without any disagreeable smell. Their teeth and garments were also fresh and sound.

SECT. XI.

Of the Island of GOMERA.

Its Situation; a Description of the principal Port and Town; - the Produce of the Island; and the Persons, Dress, and Manners of the original Inhabitants.

THE middle of this island lies six leagues to the south-west of Point Teno, in Tenerife. The principal town is seated close to the sea-shore, in the bottom

of a bay, where ships lie land-locked from all winds, except the south-east. On the north side of this bay is a cove, where ships of any burden may haul close to the shore, which is a high perpendicular cliff, and there with safety heave down, clean, and repair. From this cove is a path-way along the face of the cliff to the town; but it is so narrow that two persons cannot walk a-breast. Near the end of this path-way is a gate, which is always shut when it grows dark. About a stone's cast from the beach the principal street of the town begins, and from thence runs straight within land.

This town is called La Villa de Palmas, or the town of Palms, from the number of palm-trees growing there. There are here a church and convent of friars, with about a hundred and fifty private houses, most of which are small and mean. It is, however, well supplied with good water, which the inhabitants draw from wells in every part of the town. During the winter season a large rivulet, which then flows from the mountains, discharges its waters into the fort; and on the south side of its mouth stands an old round tower: also on the top of the perpendicular cliff on the north side is a chapel and a battery of a few pieces of cannon, for the defence of the fort.

Gomera, though small, is a plentiful island, many rivulets flowing from the craggy mountains refresh and give fertility to the narrow valleys, and indeed water may be found in every part of the island, by digging to the depth of about five or six feet.

The produce of Gomera is much the same with that of Tenerife and Canaria. The inhabitants have generally just corn enough for their own use, and seldom import or export any. In this particular it resembles Canaria; for it has almost every necessary within itself, and therefore has little need of any thing from abroad; for cattle, fowls, corn, wine, roots, fruit, and honey are here in great plenty; and if there was sufficient encouragement for the exertion of their industry, the natives could easily manufacture a sufficient quantity of wool and raw silk to clothe themselves: here is also stone, lime, timber, and all the other materials for building, except iron.

The wine of this island is in general weak, poor, and sharp; it is therefore unfit for exportation; yet some of it, when two years old, exceeds the very best wine made in Madeira, both in taste and flavour, though it is as clear as water and as weak as small beer.

Here are the animals common in the rest of the islands, and also plenty of deer, originally brought from Barbary. There are likewise more mules bred in Gomera than in any of the other Canary Islands, and some snakes; but it does not appear that any of them do the least harm.

The original natives of the island of Gomera were of a lively disposition; they were of the middle stature, extremely active and dexterous in attacking and defending, and excellent slingers of stones and darts, to which they were trained from their infancy, it being the common amusement of the young people to cast small stones and darts at each other; to avoid which they seldom moved their feet, but only waved their bodies to and fro; and so expert were they at this sport, that they used to catch in their hands the stone and darts as they flew in the air.

The Gomerans used to dress themselves in a sort of cloak made of goat-skins, which reached to the calf of the leg; but the women were clothed with a petticoat, and a head-dress that hung down to their shoulders, both of which were made of goat-skin dyed and curiously painted. The blue dye they extracted from an herb which they called *pastil*, and the red from the root of a tree which they called *taginalte*: all between the head-dress and petticoat were left bare. When the men had any quarrel which was to be decided by a combat, they laid aside their cloaks, tied a sort of bandage round their waist, and bound their foreheads with a kind of painted turban. The Gomerans wore shoes made of hogs-skins.

In their combats they used the same weapons as the natives of the other islands, which were sticks or poles of hard wood, with the ends sharpened. They have had amongst them several men distinguished by their bravery, whose fame they still celebrate in their songs.

SECT. XII.

Of the Island of PALMA.

Its Situation and Extent. A Description of a high Mountain, called La Caldera, or the Cauldron. Its Springs and Rivers. Its Volcanoes, Climate, Produce, Ports, and Towns.

THE island of Palma is situated seventeen leagues to the west-north-west of Teno, the west end of Tenerife, in twenty-eight degrees thirty minutes north latitude, and is only twenty-four miles in length from north to south, and the extreme breadth about eighteen miles.

The summit of Palma is, according to Mr. Glas, higher than that of Tenerife; for he reckoned the pike or sugar-loaf only as a hill placed on the top of the island: and he observes, that when any one who has never seen land of an uncommon height, approaches in clear weather within twelve leagues of the islands of Tenerife and Palma, and comes all at once to behold them, his surprize will be very great, resembling that which strikes a person who has never seen the ocean, till he has all at once a full view of it from the top of an adjacent mountain.

Within land, on the north-east part of the island, is a high and spacious mountain, steep on all sides. This is called La Caldera, or the Cauldron, from a hollow like that on the pike of Tenerife. The summit is about two leagues in circumference, and on the inside the Cauldron descends gradually from thence to the bottom, which is a space of about thirty acres. On the declivity of the inside springs several rivulets, which joining together at the bottom, issue in one stream through a passage to the outside of the mountain from which this brook descends; and having run some distance from thence, turns two sugar-mills. The water of this stream is unwholesome, on account of its being mixed with some water of a pernicious quality in the Cauldron; all the inside of which abounds with herbage, and is covered with palms, pitch-pine, laurel, lignum-rhodium, and retamas; which last have in this island a yellow bark, and grow to the size of large trees; but in the others they are only shrubs. The people here take great care not to let the he-goats feed on the leaves of the retama, on account of their breeding a stone in the bladder, which kills them.

There are two rivulets which spring on the outside of the Cauldron; one of these runs northward to the village of St. Andreas, and turns two sugar-mills, and the other runs to the town of Santa Cruz, which lies to the eastward. These are the only rivulets or streams of any consequence in the island: on which account the natives build tanks, or square reservoirs with plants of pitch pine, which they make tight with caulking. These they fill with the torrents of rain-water that in the winter season rush down from the mountains, and preserve it for themselves and cattle: but the sheep, goats, and hogs, in places at a distance from the rivulets, feed almost all the year round on the roots of fern and asphodil, and therefore have little or no need of water, there being moisture enough in those roots to supply the want of that element.

The south quarter of the island is most destitute of water, yet there is a medicinal well of hot water so close to the sea-shore, that the tide flows into it at full sea. And at Uguer is a cave, that has a long narrow entrance, so straight that people pass through it backwards, with the face to the mouth of the cave; but after they have got through this passage, they enter a spacious grotto, where water distils from between the large flakes of slate-stones that hang from the roof; the least blow given to these resound through the cave with a noise like thunder.

There is a mountain in the district of Tifuya, which appears to have been removed by an earthquake from its original situation. The natives have a tradition that the spot on which it now stands was a plain, and the most fertile spot in the whole island, till it was destroyed by the burning lava, and the fall of the mountain.

Indeed, the effects of volcanoes are to be seen in almost every part of the island; for the channels where the

the burning matter, melted ores, and calcined stones and ashes ran, are easily distinguished.

On the thirteenth of November 1677, a little after sun-set, the earth shook for thirteen leagues, with a dreadful noise that lasted five days, during which the earth opened in several places; but the greatest opening was at Mount aux Chevres, a mile and a half from the sea, from whence proceeded a great fire which cast up stones and pieces of rock; and in less than a quarter of an hour were twenty-eight gaps about the foot of the mountain, which cast forth flames and abundance of burning stones. There was another eruption in 1750, when one of these rivers of fire ran down from the mountains towards the town of Santa Cruz, and discharged itself into the sea about a mile to the northward of the town: but we do not know that any considerable volcano or earthquake has happened since, though they have sometimes some slight shocks.

On viewing Palma at the distance of three leagues off at sea, the mountains seem full of gutters or beds formed by torrents of rain water; but these only appear little from their height and distance; for on approaching near, we find them large vallies, abounding with wood.

The black shining sand used to throw upon writing to prevent its blotting, is found in many places on the shore of this and the other islands. It appears to have been thrown out of volcanoes, and is certainly the most perfect iron; for the load-stone, on being held near it, will draw up every grain.

The air, weather, and winds are nearly the same here as at Tenerife and Canaria, only the westerly winds and rain are more frequent in Palma, on account of its lying more to the westward and northward, and consequently being not so far within the verge of the north-east trade-winds as those islands, whence it is more exposed to variable winds, particularly the south-west, which most prevails in the latitudes adjacent to those of the north-east trade-winds.

With respect to the climate both here, and in Tenerife, Canaria, and Gomera, a person will find great difference according as he lives in the mountains, or near the sea-shore. In the months of July, August, and September, the heat seems almost intolerable near the shore, while there is a calm; but, at the same time, the air is quite fresh and pleasant on the mountains. In the middle of winter the houses far up the mountains, near the clouds, are extremely cold, and the natives keep fires burning in their habitations all day long; but this is far from being the case near the sea; for there they use fires only in their kitchens. For eight months in the year the summits of all the Canary islands, except Lancerota and Fuerteventura, are generally covered with snow.

Formerly the summit of Palma abounded with trees; but a great drought, which prevailed in 1545, destroyed them all, and though others began to spring up some time after, they were destroyed by the rabbits and other animals, which finding no pasture below, went up there, and devoured all the young trees and herbs; so that the upper part of the island is at present quite bare and desolate. The rabbits were first brought to Palma by Don Pedro Fernandes de Lago, the second lieutenant-general of Tenerife, and have since increased in a surprising manner. Before the trees and shrubs were destroyed on the summit of the island, a great deal of manna fell there, which the natives gathered and sent to Spain.

The produce of this island is nearly the same with that of Canaria; but a great quantity of sugar is made in Palma, particularly on the west side of the island. On the east side are produced good wines, which have a different taste and flavour from those of Tenerife: the dry wine is small bodied, and of a yellow colour. The malvasia, or sack, is not so luscious or so strong as that of Tenerife; but on its being about three years old, it obtains the rich flavour of a ripe pine-apple. These wines are however very difficult to preserve, especially when exported to cold climates, where they frequently turn sour.

All the kinds of fruit that grow in Tenerife and Canaria are found here in greater abundance, so that the natives cannot consume them; but as they have great

plenty of sugar, they make vast quantities of sweet-meats and conferves, which they export to the rest of the islands, and also to some parts of the Indies.

The bees produce a great deal of good honey, especially in the hives that are at a great distance from vines, and the mocanes, a fruit that resembles an elder-berry; both these having a bad effect on its colour. In Palma is also much gum-dragon, and the natives extract great quantities of pitch from the pitch-pine. In time of scarcity they make good bread of the roots of fern, which is said to be not inferior to that made of wheat flour; but the fern of Palma is not esteemed so good as that of Gomera.

Though the woods that formerly grew on the summit of Palma are all destroyed, yet there are many trees in the region of the clouds, and beneath it; so that at about two leagues distance, the island appears like one entire wood. Fine trees grow here to such a size, as to be fit for masts of the larger ships; but they are exceeding heavy, and from the ruggedness of the roads, the expence of bringing them to the shore would be very great.

The chief port in Palma is that of Santa Cruz, on the south-east side of the island. The road is within a musket shot of the shore, where vessels generally ride in fifteen or twenty fathoms water, and are exposed to easterly winds; yet with good anchors and cables they may ride with great safety, in all the winds that blow in this part of the world; for the ground is clean and good, and the great height of the island, with the perpendicular rocks that face the road, repel the wind that blows upon it; though ever so strong. Santa Cruz is a large town, containing two parish churches, several convents of friars and nuns, with many neat and private buildings, though they are neither so good, nor so large as those of the city of Palmas in Canaria, or of the towns of Tenerife. Near the mole is a castle or battery mounted with some pieces of ordnance for the defence of the ships in the bay, and to prevent the landing of an enemy. In the midst of the town, near the great church, is a fountain filled by a rivulet, which supplies the inhabitants with plenty of good water.

The next port, named Tassacorta, lies on the south-west of this; but being exposed to westerly winds, is little frequented by any other vessels than boats. It has a village of the same name. There are no other towns of any note in the island; but many villages, one of the chief of which is St. Andres.

S E C T. XIII.

Of the Island of HIERRO or FERRO.

The French formerly reckoned the Longitude from thence. The Situation and Extent of that Island, with a particular Account of a Tree that is continually dropping Water.

THE island of Ferro, called by the Spaniards Hierro, and by the French l'Isle de Fer, is the most westerly island of the Canaries. Here the French navigators formerly placed the first meridian for reckoning the longitude, as the Dutch did theirs from the Pike of Tenerife: most geographers however at present reckon the first meridian from the capital of their own country; it conveying a more distinct idea to an Englishman to say, that such a place is so many degrees east or west from London, than to reckon the longitude from a distant island; and hence the English geographers now usually reckon the longitude of places from London, and the French from Paris.

The island of Hierro, or Ferro, is about five leagues in breadth and fifteen in circumference. It is situated in twenty-seven degrees forty-eight minutes north latitude, and in seventeen degrees twenty-six minutes west longitude from London. On all sides it rises steep and craggy from the sea for above a league, so as to render the ascent extremely difficult and fatiguing; but after travelling this league, the rest of the island will be found to be tolerably level and fruitful, it abounding in many kinds of trees and shrubs, and producing better grafs, herbs,

herbs, and flowers than any of the other islands, whence bees thrive and multiply here in a very extraordinary manner, and also make excellent honey.

There are only three springs in the whole island. On account of the scarcity of water, it is said that the sheep, goats, and swine of this island, do not drink in the summer; but digging up the roots of fern, they chew them to quench their thirst. The great cattle are watered at the above fountains, and at a place where water distils from the leaves of a tree. Of this tree many authors have made mention, some of whom represent it as miraculous; while others deny its very existence; but the author of the History of the Discovery and Conquest of the Canary islands gives a particular account of it.

In the cliff or steep rocky ascent by which the whole island is surrounded, is a narrow gutter which commences at the sea, and is continued to the summit of the cliff, where it joins, or coincides, with a valley terminated by the steep front of a rock, on the top of which grows a tree called in the language of the ancient inhabitants *garfe*, or *sacred*, which for many years has been preserved entire, sound, and fresh. Its leaves constantly distil so great a quantity of water, that it is sufficient to furnish drink to every living creature in Hierro, nature having provided this remedy for the drought of the island.

It is distinct from other trees, and stands by itself: its trunk is about twelve spans in circumference; its height from the ground to the top of the highest branch is forty spans, and the circumference of all the branches together is one hundred and twenty feet. The branches are thick and extended, and the lowest begin about the height of an ell from the ground. Its fruit resembles an acorn, but tastes like the kernel of a pine-apple, only it is softer and more aromatic; and the leaves resemble those of the laurel, but are larger, wider, and more curved. These come forth in a perpetual succession, whence the tree always remains green. Near it grows a thorn which fastens on many of its branches, with which it is interwoven, and at a small distance are some beach trees, *bresos*, and thorns.

On the north side of the trunk are two large tanks or cisterns of rough stone, or rather one cistern divided; each half being twenty feet square, and sixteen spans deep. One of these contains water for the drinking of the inhabitants, and the other that which they use for their cattle, washing, and the like purposes.

Every morning a cloud or mist rises from the sea, which the south and easterly winds force against the above-mentioned steep cliff; when the cloud having no vent, but by the gutter, gradually ascends it, and advances slowly from thence to the extremity of the valley, and then rests upon the wide spreading branches of the tree, from whence it distils in drops during the remainder of the day, in the same manner as water drips from the leaves of trees after a heavy shower.

This distillation is not peculiar to the tree, for the *bresos* which grow near it also drop water; but their leaves being only few and narrow, the quantity is so trifling, that though the natives save some of it, yet they make but little account of any but what distils from the tree; which, together with the water of some springs, is sufficient to serve the natives and their flocks.

This tree yields most water in those years when the easterly winds have most prevailed; for by them alone the clouds or mists are drawn hither from the sea. A person lives near the spot on which the tree grows, who is appointed by the council to take care of it and its water, and is allowed a certain salary, with a house to live in. He daily distributes to each family of the district seven vessels filled with water, besides what he gives to the principal persons of the island.

Whether the tree which yields water at present be the same here described, Mr. Glas says he is unable to determine, but justly observes, that it is probable there have been a succession of them. He himself did not see this tree, for this is the only island of all the Canaries which he did not visit; but he observes, that he has sailed with the natives of Hierro, who, when questioned about the

existence of this tree, answered in the affirmative; and takes notice, that trees yielding water are not peculiar to this island, since travellers mention one of the same kind in the island of St. Thomas, in the gulph of Guinea.

There is said to be no considerable town, and only one parish church in the whole island of Ferro.

S E C T. XIV.

Of the original Natives of the Island of Hierro, or Ferro; their Dress, Manners, and Customs.

THE natives of Ferro, before that island was rendered subject to Spain, were of a middle stature, and cloathed with the skins of beasts. The men wore a cloak made of three sheep-skins sewed together with the woolly side outwards in summer, and next their bodies in winter.

The women also wore the same kind of cloak, besides which they had a petticoat, which reached down to the middle of their legs. They sewed these skins with thongs cut as fine as thread, and for needles used small bones sharpened. They wore nothing on their heads, and their long hair was made up into a number of small plaits. They had shoes made of the raw skins of sheep or goats, and some of them were made of those of hogs.

They had a grave turn of mind, for all their songs were on serious subjects, and set to slow plaintive tunes, to which they danced in a ring, joining hands, and sometimes jumping up in pairs, so regularly, that they seemed to be united; a manner of dancing still practised in Ferro.

They lived in circular enclosures formed by a stone-wall without cement, each having one narrow entrance. On the inside they placed poles or spars against the wall, one end resting on the top, and the other extending a considerable distance to the ground; and these they covered with fern, or branches of trees. Each of these inclosures contained about twenty families. A bundle of fern, with goat-skins spread over it, served them for a bed, and for bed-cloaths and coverings they used dressed goats-skins to keep them from the cold.

When a child was born, before they offered it the breast, they gave it fern roots roasted, bruised, and mixed with butter; and at present they give them flour and barley meal roasted, and mixed with bruised cheese.

The usual food of the natives was the flesh of sheep, goats, and hogs; and as they had no kind of grain, their bread was made of fern roots, which, with milk and butter, was the principal part of their diet.

They all lived under one king, and having never any occasion to go to war, had no warlike weapons: they indeed used to carry long staves; but these were only to assist them in travelling; for the country being so rocky, as to make it necessary frequently to leap from one stone to another, this they performed by means of these staves.

Each man had only one wife, and they had no restrictions with respect to their marriages, except a man's not being allowed to marry his mother or sister; for every man might take the woman he liked best, and whose consent he could obtain, without the least regard to rank or nobility. Indeed all, except the king, were in this respect upon an equality: the only distinction among them consisted in the number of their flocks. It was usual for the man, when he chose a wife, to make a present of cattle to her father, according to his ability, in return for the favour of letting him have his daughter. Even the king received no particular tribute from his subjects; but every one made him a present of cattle, according to his wealth and pleasure; for they were not obliged to give him any thing.

When they made a feast they killed one or two fat lambs, according to the number of their guests: these they placed in a vessel on the ground, sitting round it in a circle, and never rising till they had eaten the whole. These feasts are still continued among their descendants.

When a person fell sick, they rubbed his body all over with butter and sheeps marrow, covering him well up,

to keep him warm; but when a man happened to be wounded, they burned the part affected, and afterwards anointed it with butter. They buried their dead in caves; and if the deceased was a man of wealth, they interred him in his cloaths, and put a board at his feet, with the pole with which he used to travel at his side, and then closed the mouth of the cave with stones, to prevent his being devoured by the ravens.

They punished no other crimes but those of murder and theft; the murderer was put to death in the same manner as he had killed the deceased; and the thief, for the first offence, was punished with the loss of one of his eyes, and for the second of the other. This was done that he might not see to steal any more. A particular person was on these occasions set apart to perform the office of executioner.

They paid their adorations to two deities, one of whom was male, and the other female. The male was named Eraoranzan, and was worshipped by the men; the other was called Moneyba, and was worshipped by the women. They had no images or visible representations of these deities; nor did they ever sacrifice to them, but only prayed to them in their necessities, as when they wanted rain to bring up the grass for the subsistence of their cattle. The natives pretended, that when their gods were disposed to do them good, they came to the island and took their stations on two great rock, which are in a place to which they gave the name of Ventayca, and which is now called Los Antillos de los Antiguos, where they received the petitions of the people, and afterwards returned to heaven.

S E C T. XV.

Of the present Natives of Canaria, Tenerife, Palma, Gomera, and Ferro; their Persons, Dress, Food, Buildings, Manners, and Customs.

WE have already given a description of these islands, and of the manners of their antient inhabitants, with whom the Spaniards and other Europeans have been so long intermixed, that they are become one people. The descendants of this mixed nation are at present denominated Spaniards, whose language is that of the Castilian, which the gentry speak in perfection; but the peasants in the remote parts of the islands in an almost unintelligible manner; so that strangers can scarcely understand them.

The present natives are slender, and of the middle size; they are pretty well shaped, and have good features; but they are more swarthy than the inhabitants of the southern parts of Spain: they have, however, fine, large, sparkling eyes, which give great vivacity to the countenance; but the old people make a very shocking appearance.

The men of rank, instead of their own hair, wear white perukes, which form a very odd contrast to their dusky complexions; but they neither put on these, their upper coats, or swords, but when they walk in procession, pay formal visits, or go to church on high festivals: at all other times they wear a linen night-cap, bordered or ruffled with lace or cambric, and above it a broad brimmed slouched hat; and, instead of a coat, a long wide camblet cloak, of a raisin colour, or black. They generally walk with their hat under their arm, and never wear an upper coat without a sword.

The dress of the peasants is after the modern fashion of the Spaniards, which is not unlike the habit of the common people in England, only here the natives, when dressed, wear long cloaks instead of upper coats; but the peasants of Canaria, instead of the cloak, use an upper garment fastened about the middle by a girdle, or sash. This garment is white, long, and narrow: it has a neck like an English riding-coat, and is made of the wool of their own sheep. All the people of low rank in these islands wear their own black hair, which is generally bushy: they let it grow to a great length, and tuck the hair of the right side of the head behind the right ear.

The women of inferior rank wear on their heads a coarse linen gauze, which falls down upon their shoulders; and, as they pin it together under their chin, the

lower part answers the purpose of an handkerchief, by covering the neck and breast. When they go abroad, they likewise wear a broad brimmed slouched hat to shade their faces from the sun; and on their shoulders a mantle of flannel, baize, or saye. Instead of stays they wear a short close jacket laced before, and have many petticoats, which make them appear very bulky: but the poor who live in towns wear veils, when they walk the streets, made of black saye, in the form of two petticoats; and when they go abroad take the upper, and putting it over the head, wrap it so close about the face, that no part of it is seen, except one eye. Thus they have the privilege of beholding all they meet, without being known; for all their veils are of the same stuff and colour, only those of the ladies are of silk.

Some of the most fashionable ladies in the city of Palmas, in Canaria, and in Santa Cruz, in the island of Tenerife, go abroad in their chariots dressed after the French and English mode; but none walk in the streets without veils; yet they wear them so open, that any one may see the whole face, the neck, and even a part of the breast. The young ladies wear no caps, but have their fine long black hair plaited, tucked up behind, and fastened on the crown of the head by a gold comb. Instead of stays, they wear short jackets, like the common people, only they are made of finer stuff: they have also mantles of scarlet cloth, or fine white flannel, laced with gold or silver; but the most expensive part of their dress is their ear-rings, necklaces, and bracelets.

Scarcely any are to be seen, even among people of the first rank of either sex, who walk with an easy and graceful air: this is entirely owing to their going abroad, either covered with long cloaks, or almost constantly veiled: the men's motion being hid by their cloaks, and the women, not being known, do not care how they walk; and when the men lay their cloaks aside, and dress in upper coats, with their swords, canes, and perukes, and their hats under their arm, they make the most stiff, ridiculous, and awkward appearance imaginable.

Here the inferior people are remarkably lousy, without being even ashamed of it; for the poor sit at their doors picking the lice out of one another's heads. The itch too is common among people of all ranks, and they do not even take any pains to cure it. The same may be said of the venereal disease, though this is not quite so general as the other.

Gentlemen rise here by break of day, and usually go to church soon after to hear mass; at eight or nine in the morning they breakfast on chocolate. The ladies seldom go to mass before ten in the forenoon; but the women-servants commonly attend it about sun-rising. At the elevation of the host, which is generally a little before noon, the bells toll, when all the men, who happen to be within hearing, pull off their hats, and say, "I adore and praise thee, body and blood of our Lord Jesus Christ, shed on the tree of the cross to wash away the sins of the world."

At noon all the natives go home to dinner, and the street-doors are shut till three o'clock. The first dish set upon the table in gentlemen's houses consists of soup made of beef, mutton, pork, bacon, potatoes, turneps, carrots, onions, and saffron, stewed together, with thin slices of bread put into the dish. The second course consists of roasted meat, fowls, &c. The third is the olio, or ingredients of which the soup was made. After which comes the desert, consisting of fruit and sweet-meats. The company drink freely of wine, or wine and water, while at dinner; but have no wine after the cloth is removed. On drinking to each other, they say, "Your health, Sir;" or, "Madam, your health:" and the other answers by saying, "May you live a thousand years;" and sometimes, "Much good may it do you."

Dinner being over, a large shallow silver dish, filled with water, is set upon the table; when the whole company, all at once, wash in it; and then a servant, who stands at the lower end of the table, cries, "Blessed and praised be the most holy sacrament of the altar, and the clear and pure conception of the most holy virgin, conceived in grace from the first instant of her natural existence. Ladies, and gentlemen, much good may it do you." Then making a low bow to the com-

pany, he retires. They then rise, and each goes to his apartment, to take a nap for about an hour. This, which is termed the *siesta*, is very beneficial in a warm climate; for after a person awakes from it, he finds himself greatly refreshed, and fit to engage in business with spirit.

People of rank seldom make an entertainment without having a friar for one of their guests, who is usually confessor to some of the family, and frequently behaves with great ill manners; yet neither the master of the house, nor any of the company, choose to take much notice of it. Our author was once invited to dine with a gentleman, where a Franciscan friar was one of the guests; but they had scarce begun to eat, when the friar asked him if he was a Christian? He answered, that he hoped so. He was then desired to repeat the Apostle's Creed; but answering, that he knew nothing about it, the friar stared full in his face, and cried, "O thou black ass!" Offended at this rudeness, he asked, What he meant by treating him in that manner? when the friar only answered by repeating the abuse; the master of the house endeavoured, in vain, to persuade him to give over. But as our author did not at that time understand Spanish so well as to express himself fluently, he rose, and telling the gentleman, that he saw he was unable to protect him from insults at his own table, instantly left the house.

In the morning and evening visits they treat with chocolate and sweet-meats; but in the summer evenings with snow-water. People sup between eight and nine, and soon after retire to rest.

The usual food of the common people is *goffio*, fruit, and wine, with salt-fish brought from the coast of Barbary. Some think their being subject to the itch, is owing to their eating so much of this last food. In the summer season fresh fish is pretty plentiful; but at other times more scarce and dear.

The houses of people of rank are two stories high, and are handsome square buildings, built of stone and mortar, with an open court in the middle like our public inns in England, and like them have balconies running round, which are on a level with the floor of the second story. The street-door is placed in the middle of the front of the house, and within that door is a second, the space between them being the breadth of the rooms of the house. The court-yard, which is on the inside, is large or small according to the size of the building, and is usually paved with flags, pebbles, or other stones. In the centre of the court is a square or circular stone-wall about four feet high, filled with earth, in which are commonly planted orange, banana, or other trees.

All the lower story of each quarter of the house consists of store-rooms, or cellars. The stairs leading to the second story usually begin at the right or left hand corner of the entrance of the court, and consist of two flights of steps, which lead into the gallery, from which one may enter any room on the second story. The principal apartments are generally in that quarter of the house facing the street, which contains a hall with an apartment at each end. These rooms are the whole breadth of the quarter, and the hall is twice the length of any of the apartments at its extremities. The windows of these rooms are formed of wooden lattices, curiously wrought, and are all in the outside wall, none of them looking inwards to the court.

In the middle of the front of some great houses is a balcony on the outside above the gate, equal with the floor of the second story; and some have a gallery which runs from one end of the front to the other, but this is unusual on the outside of the house.

The apartments are all white-washed, and those at the extremities of the great halls, with some of the rest, are lined with fine mats about five feet high, and the floor is sometimes covered with the same. The sides of the windows of all the rooms are lined with boards to prevent people's cloaths being whitened; for they commonly sit in the window, there being benches on each side of it for that purpose; and when the master of the house intends to show a stranger respect, he always conducts him to the window.

The walls of the great hall, and those of some of the other apartments, are hung with paintings, representing

the virgin, the twelve apostles, saints, and martyrs, usually drawn as large as life, and distinguished by some circumstance of their history. Thus St. Peter is usually represented looking at a cock and weeping, and a great bunch of keys always hangs at his girdle. One of their favorite paintings is Anthony preaching to the fishes.

They seldom use curtains to their beds, for these they consider as receptacles for fleas and bugs, which abound here extremely. They chiefly use mattresses spread on the floor upon fine mats: besides the sheets, there is a blanket and above that a silk quilt. The sheets, pillows, and quilt, are frequently fringed or pinked, like the shrouds used for the dead in Europe.

In a particular apartment is a place raised a step higher than the floor, covered with mats or carpets; and there the women generally sit together upon cushions, both to receive visits from their own sex, and perform their domestic offices.

Though the houses of the peasants and lower sort of people are only one story high, they are built of stone and lime, and the roofs either thatched or tiled. These are generally neat, clean, and commodious. Indeed there is but little dirt or dust in these islands to make them uncleanly; for the ground is mostly rocky, and, from the almost continual fine weather, it is seldom wet.

The natives have a grave deportment, and at the same time great quickness and sensibility; the women, in particular are remarkable for the sprightliness and vivacity of their conversation, which is said greatly to exceed that of the English, French, or other northern nations. The great families in these islands would be highly offended should any one tell them; they are descended from the Moors, or even from the ancient inhabitants of these islands; yet it would not perhaps be difficult to prove, that most of their customs have been handed down to them from those people. The gentry boast much of their birth, and indeed they are descended from the best families in Spain.

The people hold in the greatest contempt the employment of a butcher, taylor, miller, or porter. It is not indeed very surprising, that they should not have any great esteem for the profession of a butcher, or that the employment of a taylor should be considered as somewhat too effeminate for a man; but it is difficult to imagine why millers and porters should be despised, especially the former; but it must be considered, that the millers here are generally esteemed great thieves; and as the master of every family sends his own corn to be ground, unless it be narrowly watched, the miller will take too much toll. It is said that when any criminal is to suffer death, and the executioner happens to be out of the way, the officers of justice have the power of seizing the first butcher, miller, or porter they can find, and of obliging him to discharge that office.

We cannot here forbear mentioning a circumstance given us by Mr. Glas, who once touching at the island of Gomera to procure fresh water, hired some poor ragged fishermen to fill the water casks, and bring them on board; but some time after, going to the watering place to see what progress they had made, he found the casks full, and all ready for rolling down to the beach, with the fishermen standing by, and talking together, as if they had nothing farther to do. He reprimanded them for their laziness in not dispatching the business in which he had employed them; when one of them, with a disdainful air, replied, "What do you take us to be, Sir? Do you imagine we are porters? No, Sir, we are seamen." Notwithstanding all his intreaties and promises of reward, he was unable to prevail on any of them to roll the casks to the water-side; but was at last obliged to hire porters.

Though the gentry of these islands are usually poor, yet they are extremely polite and well bred, the very peasants and labouring people have a considerable share of good manners, with little of that surly rusticity which is too common among the lower class of people in England; yet they do not seem to be abashed in the presence of their superiors. A beggar asks charity of a gentleman, by saying, "For the love of God, Sir, please to give me

“ me half a rial ;” and if the other gives him nothing, he returns, “ May your worship excuse me for the love of God.”

The servants and lower people are much addicted to pilfering, for which they are seldom punished any other way than by being turned off, beaten, or imprisoned for a short time. Robberies are seldom or never committed ; but murder is more common than in England ; and they have no notion of duels, for they cannot comprehend that a man's having the courage to fight can atone for the injury he has done his antagonist, or that it ought to give him a right to do him a greater. When the murderer has killed a man he flies to a church for refuge, till he can find an opportunity to make his escape to another island ; and if he had been greatly provoked or injured by the deceased, and did not kill him in cold blood, every body will be ready to assist him to escape, except the near relations of the person murdered ; yet quarrels are far from being frequent here, which may be owing to the want of taverns and other public houses, to their temperance in drinking, their polite behaviour, and the little intercourse between them.

The lower people never fight in public ; but if one person puts another in a violent passion, the injured party, if able, takes his revenge in the best manner he can, without regard to what is called fair-play, till he thinks he has got sufficient satisfaction.

The people are in general extremely temperate ; and was a gentleman seen publicly drunk, it would be a lasting stain on his reputation. The evidence of a man who can be proved a drunkard, will not be taken in a court of justice ; hence those who are fond of wine shut themselves up in their bed-chambers, where, when they have drank their fill, they get into bed and sleep it off.

In these islands persons of all ranks are extremely amorous ; but their notions of love are somewhat romantic ; which is perhaps the want of innocent freedom between the sexes. They do not, however seem to be inclined to jealousy, any more than the English or French ; and in every country, custom has established between the sexes certain bounds of decency and decorum, beyond which no person will go without a bad intention. It is usual for young people here to fall in love at sight ; and if the parties agree to marry, but find their parents averse to their union, they acquaint the curate of the parish with the affair, who goes to the house where the girl lives, and endeavours to persuade them to agree to her marriage ; but if they cannot be induced to give their consent, he takes her away before their faces, without their being able to hinder him, and either places her in a nunnery, or with some of her relations, till he marries them.

It is said not to be uncommon for a lady to send a man an offer of her person in an honourable way, when, if he does not think proper to accept the offer, he keeps it secret till death : should he do otherwise, he would be looked upon by all people in the most despicable light. Young men are not allowed to court young girls without any intention to marry them ; for if a woman can prove that a man has, in any instance, endeavoured to engage her affections, she can oblige him to marry her. This, like many other good laws, is abused ; for loose women take advantage of it, and frequently lay snares to entrap the simple and unwary ; and sometimes worthless young men form designs upon the fortunes of ladies, without having the least regard for their persons : however, there are not many mercenary lovers in this part of the world, their notions being in general too refined and romantic to admit the idea of that passion being made subservient to their ambition or interest ; and yet there are more unhappy marriages here than in the countries where innocent freedoms being allowed between the sexes, lovers are not so blinded by their passions as not to perceive their mistresses are frail and imperfect.

When a man loses his wife by death, some of his relations come to his house, and reside with him some time in order to divert his grief, and do not leave him till another relation comes to relieve the first ; the second is relieved by a third ; and thus they succeed each other till the term of a year is expired.

Every one of the Canary Islands, and every town and

village in them, has a particular saint for its patron, whose day is celebrated as a festival, by a sermon preached in honour of the saint, and a service suited to the occasion. On these days the street near the church is strewed with flowers and leaves, a multitude of wax candles are lighted, and a considerable quantity of gun-powder used in fireworks.

On the eve of these festivals is generally held a kind of fair, to which the people of the adjacent country resort, and spend the greatest part of the night in mirth, and dancing to the sound of the guittar, accompanied with the voices not only of those who play on that instrument, but by those of the dancers.

The dances practised here are sarabands and folias, which are slow dances ; those which are quick are the canario, first used by the antient Canarians ; the fandango, which is chiefly practised by the vulgar ; and the zapeteo, which nearly resembles our hornpipe. Some of these dances may be termed dramatic, as the men sing verses to their partners, who answer them in the same manner. The natives of these islands have generally excellent voices, and few of them are unable to play on the guittar.

At the feast of the tutelar saints of Tenerife, Canaria, and Palma, plays are acted in the streets for the entertainment of the populace ; but the performers not being professed actors, and only some of the inhabitants of the place, who seem to have a natural turn for acting, they cannot be supposed to rise to any great degree of perfection.

All the eminent families have also a particular saint, or patron, to whose honour they keep a festival at a great expence ; and, on these occasions, the gentry vie with each other in the splendour of their entertainments. The gentry frequently take the air on horseback ; but when the ladies are obliged to travel, they ride on asses, and instead of a saddle they use a kind of chair, in which they sit very commodiously. The principal roads are paved with pebble-stones, like those used in the streets of London. There are a few chariots in the city of Palmas in Canaria, the town of Santa Cruz, and the city of Laguna, in Tenerife : these are all drawn by mules ; but they are kept rather for shew than use ; for the roads, being steep and rocky, are not proper for wheel-carriages.

The diversions in use among the lower class of people besides dancing, singing, and playing on the guittar, are throwing a ball through a ring placed at a great distance, cards, wrestling, and quoits. The peasants, particularly of Gomera, when they travel, have the art of leaping from rock to rock, which is thus performed : the long staff or pole used on these occasions has an iron spike at the end of it ; and when a man wants to descend from one rock to another, he aims the point of the pole at the place where he intends to alight, and then throws himself towards it, pitching the end of the pole so as to bring it to a perpendicular, and then slides down it to the rock on which it stands.

Children are taught in the convents reading, writing, latin, arithmetic, logic, and other branches of philosophy. The scholars read the classics ; but Greek is never taught here, and is entirely unknown even to the students in divinity : they are particularly fond of civil law and logic, which last is most esteemed.

The natives of these islands have a genius for poetry, and compose verses of different measures, which they set to music. Some of their songs and other poetical pieces, would be greatly esteemed in any country where a taste for poetry prevails. Few of those books which are called prophane, only to distinguish them from those of a religious kind, are read here, since they cannot be imported into the island without being first examined by the inquisition, a court with which nobody cares to have any concern. However, the History of the Wars in Granada is in every body's hands, and is read by people of all ranks ; they have also some plays, most of which are very good ones. But the books most read by the laity are the Lives of the Saints and Martyrs, which may be considered as a kind of religious romances stuffed with legends, and the most improbable stories. Thomas a Kempis, and the Devout Pilgrim, are in every library, and much admired.

S E C T. XVI.

*Of the Civil Government of Canaria, Tenerife, and Palma;
of the Ecclesiastical Government of all the Islands in general;
and the Diseases to which the Natives are subject.*

WE have already described the government of Lancerota and Fuertaventura, and that of Gomera and Ferro nearly resembles them; we shall now, therefore, proceed to the government of Canaria, Tenerife, and Palma, which are called the King's Islands.

The natives on their submitting to the crown of Spain were so far from being deprived of their liberty, that they were put on an equality with their conquerors, in which the Spaniards shewed the utmost wisdom and policy; but how they came soon after to act in a quite contrary manner in America, is hard to determine. After the conquest of the Canary islands, the Spaniards incorporated with the natives in such a manner as to become one people with them, and in consequence of this political union, the king of Spain is able to raise in these islands more soldiers and seamen than in any other part of his dominions of three times their extent.

The lowest officer of justice, except the alguazils, is the alcalde, who is a justice of peace; and there is one of them in every town or village of note. These magistrates are appointed by the royal audience of the city of Palmas, in Canaria; they hold their places only for a certain time, and, in cases of property, can take cognizance of no disputes where the value of what is contended for exceeds seventeen rials, or seven shillings sterling. Over these magistrates is the alcalde mayor, who is appointed in the same manner as the other, and cannot decide any case relating to property that exceeds the sum of two hundred dollars. From the decision of those magistrates, appeals lie to the tiniente and corregidor: the first of whom is a lawyer, and nominated by the royal audience; but the latter, who is appointed by the king, is not obliged to be a lawyer, yet must have a secretary, clerk, or assistant bred to the law.

The corregidor generally holds his place five years, and sometimes longer. Few of the natives enjoy this honourable office, which is commonly filled by native Spaniards. The proceedings in the corregidor's court, and in that of the tiniente, are the same; these courts seeming to have been originally intended as a check upon each other.

Appeals are made from the corregidor and tiniente to the royal audience of Gran Canaria; a tribunal composed of three oidores, or judges, a regent, and fiscal, who are usually natives of Spain, and are always appointed by the king. The governor-general is president of this court though he resides in Tenerife. In criminal causes there is no appeal from their determination; but, in matters relating to property, appeals are carried to the council or audience of Seville in Spain.

The standing forces in the Canary Islands amount only to about an hundred and fifty men; but there is a militia, of which the governor-general of the island is always commander in chief, and the officers, as colonels, captains, and subalterns, are appointed by the king. There are also governors of forts and castles, some of which are appointed by the king, and others by the twelve regidores of the islands, called the cavildo; some of the forts belonging to the king, and the rest are under the direction of the regidores.

The regidores also take care of the repairs of the highways, prevent nuisances, and the plague from being brought into the island by shipping; for no man is allowed to land in these islands from any ship till the master produces a bill of health from the last port he left, or till the crew have been properly examined.

The king's revenue arises from the following articles: a third of the tithes, which scarcely amounts to a tenth part of them, the clergy appropriating almost the whole to themselves. This third part was given by the pope to the king of Spain, in consideration of his maintaining a perpetual war against the infidels.

The second branch in their revenue consists in the monopoly of tobacco and snuff, which the kings officers sell on his account, no other persons being allowed to deal in those articles.

Another branch of the revenue arises from the orchilla-weed, all of which in the islands of Tenerife, Canaria, and Palma, belong to the king, and is part of his revenue; but the orchilla of the other islands belongs to their respective proprietors.

The fourth branch consists of the acknowledgment annually paid by the nobility to the king for their titles, which amounts to a mere trifle.

The fifth branch is a duty of seven per cent. on imports and exports: and the sixth duty on the Canary West India commerce. All these branches, the sixth excepted, are said not to bring into the king's treasury above fifty thousand pounds per annum, clear of the expences of government and all charges.

With respect to the ecclesiastical government of the Canary Islands in general, it must be observed, that the bishop is suffragan to the Archbishop of Seville, in Spain, and has a revenue of six thousand pounds sterling per annum. He resides in the city of Palma, in Canaria, where he is treated with as much respect and homage as a sovereign prince.

The superior of the various orders of Friars and nuns reside in the city of St. Christobal de la Laguna, and are only accountable to the generals of their respective orders at Rome.

In each of the islands is a house belonging to the inquisition, with its proper officers, in order to prevent all appearances of heresy or disrespect to the clergy. They have power to apprehend and confine suspected persons, without giving any reason for it to the civil magistrate; and, after examining them, they are either discharged, or sent to the tribunal at Canaria.

When any foreign ships arrive at the islands, the first time the master comes a-shore, he is conducted to an officer of the inquisition, who examines him whether he has any books or pictures in his ship against the doctrine or ceremonies of the church of Rome? and he is obliged to sign a paper, by which he engages, if he has any, not to land or expose them to view; and that, while he remains in the country, he will neither speak against the Romish religion, nor ridicule its rites and ceremonies. As all the natives are zealous members of the Romish church, this tribunal has seldom an opportunity of exercising its extensive authority.

As the gentry are generally poor, and unable to give fortunes to their younger sons and daughters, many of the former are educated for the church, and not a few young ladies shut themselves in convents for life, because they cannot find husbands suitable to their rank, and are unwilling to depend upon their elder brothers, or other relations, for subsistence: others take the same step from their having met with disappointments in love; and a few flattered by the nuns and clergy into a high conceit of their own sanctity, from religious motives, take the veil.

The priests are here far from being satisfied with their tithes, or the friars with the revenues of their convents, and have therefore found means to load the inhabitants with many impositions which, though not established by law, it would be dangerous for them to presume to refuse paying. Thus every fishing bark from the coast of Barbary is obliged to deliver a certain quantity of fish to each convent; and when the Mendicant friars go begging from house to house, they are liberally supplied; and, was any to refuse giving them alms, they would be marked out as objects of their vengeance, and be exposed to the inquisition. In short, all ranks of men, who have any great point in view, take care, in the first place, to secure in their interest the leading men of the clergy; and, when this is accomplished, it is easy to surmount every other obstacle.

The Catholics of these islands seem to think, that all excellence is confined to those of their religion; and when they see any of a different persuasion behave with common decency, they appear greatly surprised, imagining that those they call heretics differ but little from brutes.

All

All strangers, who are not of the Romish religion, are strongly importuned on their arrival to become profelytes; and indeed it is not possible for a person to live in any of the Canary Islands, except Tenerife, who is not a member of the church of Rome; and even in Tenerife no professed Jew, Mahometan, or Pagan can be a member of society; nor indeed can any protestants, except they are eminent merchants. The clergy are unwilling to meddle with them, and probably have orders from Rome not to disturb them, lest it should embroil them with the English or Dutch. Indeed formerly it was no uncommon thing for the inquisition to seize on the Dutch and English consuls.

All the foreigners in these islands make very just complaints of the want of good physicians and surgeons. The diseases most predominant here, besides the itch and venereal disorders, which have been mentioned in another place, are the spotted fever, the flatos, a windy disorder affecting the head, stomach, and bowels, and the palsey. The ague is scarce known in any of the islands, except Gomera. A few of the natives are affected with the leprosy, and, as it is thought, incurable, there is an hospital at Canaria for the reception of the unhappy sufferers by that loathsome disease. A man of fortune is no sooner found to be a leper, than all his effects are seized for the use of the hospital, without leaving any part for the support of his family; while the poor, who are infected with that distemper, are left to subsist as well as they can, or to perish in the streets. The sole judges of the leprosy are the directors of the hospital, and from their determination there is no appeal.

S E C T. XVII.

Of the Manufactures and Commerce of Canaria, Tenerife, Palma, Gomera, and Ferro; with a particular Account of their Fishery on the Coast of Barbary; and of the Coin, Weights, and Measures used in the Canaries.

THE manufactures of these islands are taffeties, knit silk hose, silk garters, and quilts for beds. In Canaria and Tenerife coarse linens and gauze are made of the flax imported from Holland. In Canaria is also made white blankets, and coarse cloths, from the wool of their own sheep. The rest of the islands also make a coarse kind of cloth, which is worn by the peasants; but on festivals, weddings, &c. the labouring people usually wear English coarse cloth. The exportation of raw silk is now prohibited, in order to encourage their silk manufactures. In the large towns men are employed in weaving, and as tailors; but in the villages those trades are only exercised by the women.

The Commerce of the Canary Islands may be divided into, that to Europe, and to the English colonies in America; that to the Spanish West-Indies; that carried on between the islands themselves, and the fishery on the coast of Barbary.

Ferro and Gomera are so poor as to be visited by no ships from Europe or America; nor are the natives of those islands allowed any share of the Spanish West-India commerce, they being not entirely under the jurisdiction of the crown of Spain, but subject to the count of Gomera, who is their lord and proprietor.

The trade to Europe and the British American colonies is centred in Tenerife. A few ships indeed go to Canaria and Palma; but these are not to be compared to the numbers that arrive at Tenerife. This trade is carried on almost entirely in foreign bottoms, especially in English, the natives being afraid of sailing in those seas where they are in danger of being taken by the corsairs of Algiers, Sallee, and other ports of Barbary. The greatest part of this trade is in the hands of the Irish Roman catholic merchants settled in Tenerife, Canaria, and Palma, and the descendants of the Irish who formerly settled there and married Spanish wives; and there are no protestants who reside there, except the English and Dutch consuls, and two or three merchants who live at Tenerife.

They import from Great Britain to these islands chiefly woollen goods of various kinds, hats, hardware, red

herrings, pilchards, and wheat, when it is scarce in the islands, with many other articles. The imports from Ireland chiefly consist of beef, pork, pickled herrings, butter, and candles. Linens of all sorts are imported from Hamburgh and Holland, to a very great amount; as also gunpowder, cordage, coarse-flax, and other goods. A considerable quantity of bar iron is annually imported from Biscay.

The imports from Majorca, Italy, Barcelona, Cadiz, and Seville, chiefly consist of velvets, silks, oil, salt, and cordage made of bass or spartum, with many little articles for the consumption of the Canary Islands and the Spanish West-Indies. This trade is almost entirely carried on in French and Maltese tartans. The Maltese vessels, before they sail to these islands, make the tour of all the European harbours to the westward of Malta, trading from one port to another. From the Mediterranean they go to Cadiz, and from thence to the Canaries, where, besides the commodities of Italy, France, and Spain, they sell the cotton manufactures of their own island; all cottons imported into the Canary Islands, except those from Malta, paying such an exorbitant duty as almost amounts to a prohibition. This privilege is enjoyed by the Maltese, on account of their maintaining a perpetual war against the Turks and Moors.

They import from the British colonies, in America, beef, pork, hams, baccalao or dried cod, rice, bees-wax, deal boards, pipe staves, and, when the crops in the islands fail, wheat, flour, and maize.

In return, these islands export to Great Britain and Ireland wine, orchilla-weed, Campeachy logwood, and a considerable quantity of Mexican dollars. To Holland and Hamburgh the same goods; but a greater quantity of dollars, and little or no orchilla-weed. To Marseilles, Malta, Italy, and Spain, the commodities they receive from the Spanish West-Indies, particularly sugar, hides, Campeachy logwood, some orchilla-weed, and dollars; and to the British colonies, in America, a great quantity of wines, and nothing else.

All these goods, whether imported into the Canaries, or exported from thence, pay a duty of seven per cent. on the rated value.

The commerce of the Canary Islands with the Spanish settlements in the West-Indies is under particular regulations, and no foreigners are permitted to have any share in it; nor are any ships suffered to sail to the Spanish ports of that part of America from any of the islands, except Tenerife, Canaria, and Palma; and the trade there is confined to the ports of the Havannah, Campeachy, and La Guaira on the coast of Caraccas, St. Domingo, Porto Rico, and Maracaiva: the three first are called the greater ports, and the others the lesser, because the trade of the latter is very trifling, when compared with that of the former.

In the city of St. Christobal de la Laguna is a judge, a secretary, and other officers, who manage every thing relating to this trade; and, before a ship takes in her lading for any of these ports, she must obtain a licence from the judge of the India trade, which is generally granted, if it be her turn; for here all ships are registered, and must take their turns, though interest and money often prevail against justice.

The trade of the Canaries to the Spanish West-Indies is confined to their produce; as wines, brandy, almonds, raisins, figs, &c. of which they can annually send one thousand tons; and are only allowed besides what is termed a general for each ship, which consists of all the kinds of goods thought necessary for the use of the vessel, crew, and passengers, during the voyage; and is more or less extensive in proportion to the size of the ship. But tho' they are thus restricted by the rules, this trade is extended much farther; and, it is said, they export at least two thousand tons of the produce of the islands, and also immense quantities of European commodities.

The cargoes brought from the West-Indies consist of the commodities of the ports from whence they come, and are chiefly logwood, hides, cacao-nuts, sugar, and Mexican dollars; all which they are obliged to land at Santa Cruz, in Tenerife; but cochineal and indigo are prohibited from being landed there. The silver they bring is limited to fifty Mexican dollars per ton, accord-

ing to the registered tonnage; yet some of these ships are said to bring home to Tenerife one hundred thousand dollars.

The ships employed in this trade are commonly about two hundred and fifty, or three hundred tons burthen. Some of them are built in the islands, and others at the Havannah, or Old Spain. No foreign bottoms can be employed in this trade; for which reason the freight from the Canaries to the West Indies is extremely high; for the Canary shipping carry so many uselefs hands, particularly chaplains; lie so long in the road of Santa Cruz, waiting their turns; and are at such a vast expence of anchors and cables, that the owners cannot afford to take less freight for a pipe of wine, from the Canaries to La Guaira, than ten pounds sterling; and yet the run from Tenerife to that port being all the way before the wind, is usually performed in less than thirty days: yet our author observes, that were the natives allowed to employ English ships in this trade, they would soon find a sufficient number ready to carry their wine at the rate of twenty shillings for each pipe.

With respect to the trade carried on from one island to another, it is as follows:

The natives of Canaria export to Tenerife some raw and wrought silk, coarse woollen blankets, provisions of all sorts, particularly cattle and fowls, orchilla-weed, square flags for pavements, some salt, and filtering-stone vessels for purifying water. In return for these commodities, they chiefly receive cash, and the other produce of the Spanish West-Indies.

Palma exports to Tenerife boards, pitch, raw silk, orchilla-weed, sugar, almonds, and sweet-meats; and receives in return European and West India goods.

The natives of Gomera export to Tenerife cattle, brandy, orchilla-weed, a great deal of raw silk and some wrought, and in return receive European and West-India goods.

The inhabitants of Ferro export to Tenerife small cattle, brandy, and orchilla-weed.

Lancerota and Fuertaventura export a great quantity of corn to Tenerife, besides cattle, fowls, and orchilla-weed; and, in return, generally receive European goods and cash, with some wine. The natives of the same islands send corn to Palma, for which they receive sugar, wine, cash, boards, and other timber. The natives of Lancerota also export salt and some dried fish to Tenerife and Palma.

All the vessels employed in this trade are built in the islands, and are from twenty to fifty tons burthen; they are about twenty-five in number, and each of them navigated by ten hands, on account of the great labour required in loading and unloading their cargoes.

We now come to the fishery carried on by the natives of the Canary Islands on the coast of Barbary. It employs about thirty vessels, from fifteen to fifty tons burthen, the smallest carrying fifty men, and the largest thirty. The owners having fitted out a vessel for this voyage, put on board a quantity of salt sufficient to cure the fish, with bread enough to serve the crew till their return. Each man has his own fishing tackle, which consists of a few lines, hooks, one or two stout fishing-rods, a little brass wire, and a knife for cutting open the fish. If any of the crew carry wine, brandy, fleshmeat, or any other stores, it must be at his own expence; for the owners furnish only bread.

This fishery is bounded on the north by the southern extremity of Mount Atlas, in the latitude of twenty-nine degrees, and on the south by Cape Blanco, in the latitude of twenty degrees thirty minutes; an extent of about six hundred miles; in all which tract there is neither town nor village, and but few settled habitations. The wandering Arabs who frequent this part of the world live in tents, and have neither barks, boats, nor canoes; and the king of Morocco's cruizers never venture so far to the southward.

The fishermen no sooner arrive on the coast, than they endeavour to catch bait, which is done as we do trouts with a fly, only the rod is three times as thick as ours, and does not taper so much towards the point. The line is formed of six brass wires twisted together; the

hook is about five inches in length, and is not bearded; the shaft is loaded so as to lie horizontally on the surface of the water, and the hook is covered with a fish's skin, except where it bends to the point. The fishermen getting within a quarter or half a mile of the shore, carry so much sail as to cause the bark to run about four miles an hour, when two or three men throw their lines over the stern, and let the hooks drag along the surface of the water. The fish taking the hooks for small fish, snap at them; and they are no sooner hooked, than the fishermen swing them into the barks with their rods.

These fish, which the Canarians call *tassarte*, have no scales, and are shaped like a mackarel, but are as large as a salmon; and they are so voracious, as to swallow all the hook, notwithstanding its being so large; and was it bearded, it would be impossible to extract it, without cutting open the fish. Our author observes, that he has seen three men in the stern of a bark catch a hundred and fifty *tassarte* in half an hour, and a bark will sometimes complete her lading with these fish only. Another sort of fish which they call *anhoua* is taken in the same manner: this is rather bigger than a large mackarel, and also serves for a bait; as does also another fish called *cavallos*, which is shaped like a mackarel, but is somewhat more flat and broad; it is about a span long, and is caught with an angle-rod and line, with a very small hook, baited with almost any thing that comes to hand.

When a bark has obtained a sufficient stock of bait, she leaves her boat with five or six men to catch more, and runs out to sea till she gets into a great depth of water; there she anchors, and all the crew heave their lines and hooks over-board, baited with the above fish, in order to catch bream and cod. The lines are loaded so as to cause the hooks to sink near the bottom of the sea, where these fish swim; and when a bark meets with fine weather, and is well provided with bait, she will be able to compleat her cargo in four days.

These people make but one meal in the whole day, which is in the evening, after they have cleaned and salted the fish they have taken; they then dress their supper in the following manner. In every bark the crew has a long flat stone for a hearth, upon which they light a fire, and hang a large kettle over it, in which they boil some fish: they then take a platter, with some broken biscuit, onions shred small, to which they add pepper and vinegar, and then pour in the broth of the fish, which is said to be delicious. Having eaten of this excellent soup, they finish their meal with roasted fish; for they throw that of which the soup was made into the sea. Soon after this repast they lie down to sleep in the most commodious part of the vessel, for they have no bedding, and about five or six in the morning rise, leave the boat near the shore, weigh anchor, and stand out to sea as before, never tasting food before the same time the next evening.

Though the bulk of their cargoes consists of large bream, yet they catch many other sorts. The *tassarte* just mentioned is a delicious fish, which tastes like a large and a fat mackarel; but, when dried, is not to be distinguished from salmon. The cod caught here is better than that of Newfoundland: the *anhoua* is extremely good; the *corbino* is a large fish that weighs about thirty pounds. There are also a number of flat fish, with many other sorts.

These fish are thus cured; they cut them open, and having thoroughly cleaned and washed them, chop off their heads and fins, and pile them up to drain off the water; after which they are salted, and stowed in bulk in the hold.

"It is strange, says Mr. Glas, to think that the Spaniards should want to share the Newfoundland fishery with the English, when they have one much better at their own doors. I say better, for the weather here, and every thing else, concurs to make it the best fishery in the universe. What can be a stronger proof of this, than the Moors on the continent drying and curing all their fish without salt, or any other process than exposing them to the sun-beams? for the pure wholesome air of that climate, and the strong northerly wind which almost constantly prevails on this coast, totally

"totally prevents putrefaction, provided the fish are split open, well washed, and exposed to the sun until they are perfectly dry."

The Canarian barks make eight or nine voyages in a year; for having unloaded their cargoes, they leave the fish with their agents to sell them at their leisure, while they go in search of more. They are commonly sold at three half-pence for a pound of thirty-two ounces, which is the weight used here for flesh and fish.

Instead of encouraging this useful and profitable branch of trade, the magistrates take every method to hurt it, by fixing the price of the fish, clogging the trade with unreasonable duties, and forbidding the fishermen to have any intercourse with the Moors on the coast, where they sometimes go to fish, which is a great hardship, as they are frequently obliged, when they meet with bad weather, to go ashore for fuel and water. They, however, privately correspond, to their mutual advantage: for the Canarians give the inhabitants of the desert old ropes, which the latter untwist and spin into yarn or twine, for making fishing-nets: they also give them bread, potatoes, onions, and many kinds of fruit; in return for which the Moors allow them to take wood and water on their coast, whenever they are in want of these necessary articles, and make them presents of ostrich eggs and feathers.

The current coin in the Canaries is the Mexican dollar, and the half, quarter, eighth, and sixteenth parts of a dollar. There is also the provincial rial of plate, which is a small silver piece worth five-pence sterling. The quart, a copper coin of the value of a half-penny, ten of which makes a rial of plate. The provincial silver coin is never exported, on account of its passing in the islands for more than its intrinsic value. Accounts are kept in imaginary money, that is, current dollars of ten rials of vellon each. The rial of vellon is equal in value to eight of the above quarts, and the current dollar is exactly three shillings and four-pence; and, therefore, six of them make one pound sterling. Three sixteenths of the Mexican dollar pass for two rials of plate. Little or no gold coin is to be found in these islands.

The pound and smaller weights are nearly the same with ours. The quintal, which is their hundred weight, weighs only a hundred and four pounds. The arroba is twenty-five pounds.

The measures used in the Canaries are the fanega, or hanega, the almud, the liquid arroba, the quartillo, and the var. The fanega is a measure for corn, cacao, salt, and the like, and contains nearly the quantity of two English bushels. Twelve almuds make a fanega. The liquid arroba contains little more than three gallons, and the quartillo is nearly the same as our quart. The var is a measure for cloth, &c. and is somewhat less than the English yard.

We have now concluded our account of these islands, in which we have borrowed much from Mr. Glass, whose History of the Canary Islands must be esteemed both the best and most entertaining that has been written on this subject; and it is a pleasure to us that, in the course of this work, we have an opportunity of doing justice to the merit of authors who have deserved well of their country, and of mankind.

S E C T. XVIII.

A concise Description of the Islands called the Salvages; their Situation and Produce.

IT will not be improper before we describe the Madeiras, to give a concise account of the islands or rocks named the Salvages, which lie between the Canary Islands, just described, and Madeira, and are situated twenty-seven leagues north from Point Nago, in Tenerife, in thirty degrees twenty minutes north latitude, and in sixteen degrees twenty-five minutes west longitude from London.

The principal island, which is high and rocky, is about three miles in circumference. Three or four leagues to the south-west of this island is another not unlike the largest Needle rock at the west end of the Isle of Wight. Between these islands are a considerable number of rocks and sands, some above and others under water, which

render it dangerous for those unacquainted with these islands to approach them, except on the east side of the great island, which produces nothing but orchilla weed. Here are great plenty of cormorants, or sea fowls that nearly resemble them. Some barks and boats belonging to the Canary Islands frequent the salvages in the summer season, in search of wrecks and those sea-fowls; for they catch the young in their nests, kill and salt them, and then carry them to Tenerife for sale.

The Salvages, though uninhabited, belong to the Portuguese, who consider them as dependant on the island of Madera, and, notwithstanding they scarcely ever visit them, will not allow the Spaniards to gather orchilla weed there. A few years ago some fishermen went in a bark from Tenerife to these islands, in quest of wrecks; but finding none, went ashore, and gathered about half a ton of orchilla-weed. But this was no sooner known at Madera, than the Portuguese complained of it to the governor-general of the Canary Islands, and would not be satisfied till the master of the bark was thrown into prison, where he remained a long time.

S E C T. XIX.

Of the MADERA or MADEIRA Islands.

The Situation, Extent, and Produce of Madeira; with a Description of Funchiale, its Capital; and a concise Account of the little Island of Porto Santo.

THE Madeiras are two islands, situated to the north of the Salvages, and were thus named from the principal of them, which was called by the Portuguese Madeira, signifying a wood or forest, from its being overgrown with trees.

The island of Madera was discovered, according to Mr. Ovington, by an English gentleman in 1344, and was taken by the Portuguese in 1431, when they found it uninhabited; and making a fire to warm themselves, it communicated itself to the trees, which continued burning for several years; but the ashes rendered the soil extremely fertile.

This island is situated under the thirty-second degree twenty-seven minutes north latitude, and extends, according to Lord Anson's Journal, from the eighteenth degree thirty minutes to the nineteenth degree thirty minutes west longitude from London, it being about sixty miles in length, twenty in breadth, and an hundred and forty-four in circumference. It is composed of one continued hill of a considerable height, extending from east to west: the declivity of which, on the south side, is cultivated, and interspersed with vineyards; and, in the midst of this slope, the merchants have fixed their country-seats, which help to form a very agreeable prospect.

The air of Madera is more moderate than in the Canary Islands, and the soil more fertile in corn, wine, sugar, and fruits; for as it has five or six rivers, it is better watered than any of those islands. It has also the same cattle, birds, plants, and trees. Here is a perpetual spring, which produces blossoms and fruit throughout the whole year.

It produces plenty of citrons, bananas, peaches, apricots, plums, cherries, figs, and walnuts; with oranges of all sorts, and lemons of a prodigious size. Fruit-trees from Europe thrive here in perfection; and the natives are said to make the best sweatmeats of any in the world, and particularly greatly excel in preserving citrons and oranges, and in making marmalade and perfumed pastes, which greatly exceed those of Genoa. The sugar made here is very fine, and has the smell of violets; this, indeed is said to be the first place in the West where this manufacture was set on foot, and from thence was carried to America: But afterwards the sugar plantations at Brazil prospering extremely, the greatest part of the sugar canes in this island were pulled up, and vineyards planted in their stead, that produce excellent wines, which, the author of Lord Anson's voyage observes, seems to be designed by Providence for the refreshment of the inhabitants of the torrid zone.

Of these wines there are several sorts; one is of the colour of champaign, but is not much valued: another sort is a white wine, much stronger than the former. A third sort is excellent, and resembles malmsey, it being of the same nature with that which grows in Tenerife: and another resembles Alicant wine, but is much inferior to it in taste, and is never drank alone, but mixed with the other sorts, to which it gives a colour, and strength to keep. It is observable of the Madeira wines, that they are greatly improved by the heat of the sun, when exposed to it in the barrel, after the bung is taken out. In the whole island they annually make about twenty-eight thousand pipes, eight thousand of which are drank there, and the rest exported, the greatest part being sent to the West-Indies, especially to Barbadoes.

Among the timber trees are tall and strait cedars, and nasso-wood, the boards of which are of a bright rose colour. There are also the mastic and gum-dragon tree. Atkins mentions a curiosity which he found in the gardens of this island, called the everlasting flower; for when plucked, it never fades. It grows like sage, and the flower resembles that of camomile. This author says, he plucked several, which a year after appeared as fresh as when first gathered.

There is but one considerable town in the whole island: it is named Fenchiale, and is seated in the south part of the island at the bottom of a large bay. Towards the sea it is fortified by a high wall, with a battery of cannon, besides a castle on the Loo, which is a rock standing in the water, at a small distance from the shore. Fenchiale is the only place of trade, and indeed the only place where it is possible for a boat to land. And even here the beach is covered with large stones, and a violent surf continually beats upon it.

The churches here are well built, beautiful structures, enriched with gilding, fine pictures and plate, and people are said to meet in them upon business that has little relation to devotion. The town is very populous, but the majority of the inhabitants are not natural-born Portuguese; for there a great number of English and French Roman Catholics settled there, who live after the Portuguese manner; some English Protestants, and a prodigious number of negroes and mulattoes, both freemen and slaves. The streets are straight, and drawn by a line; the houses are pretty well built, and the windows have a lattice-work instead of sashes.

The women, who have no domestic chapels, never go to church but on Sundays and holidays; when, if there be several daughters, they walk two and two before the mother, each having a large thin veil over her face; but their breast and shoulders are quite bare. By their side walks a venerable old man, with a string of beads in his hand, and armed with a sword and dagger.

The city is the see of a bishop, who has the whole island under his spiritual jurisdiction, and is suffragan to the archbishop of Lisbon. Here also resides the governor of the island.

There are two other towns, one called Manchico, which has a church named Santa Cruz, or the Holy Cross, and a convent of Bernardine friars: the other town is named Moncerito. In short, the island lately contained thirty-six parishes, a college, and monastery of jesuits, five other monasteries, eighty-two hermitages, and five hospitals. There are several fine seats and castles about the country.

Porto Santo which is generally termed one of the Madeira islands, lies to the north-east of Madeira, in the thirty-second degree thirty minutes north latitude, and in the sixteenth degree five minutes west longitude from London, and is only about fifteen miles in circumference. It was discovered in the year 1412, by two Portuguese gentlemen, sent by prince Henry, son to John I, king of Portugal, to double Cape Bajador, in order to make farther discoveries; but being surpris'd by a violent storm, were driven out to sea, and, when they gave themselves over for lost, had the happiness to find this island, which proving a safe asylum to them, they called it Porto Santo, or the Holy Port. This island produces wheat and other corn just sufficient for the support of the inhabitants: here also are plenty of oxen, wild hogs, and a vast number of rabbits. There are trees which produce the gum called dragons-blood, and likewise a little honey and wax, which are extremely good. It has properly no harbour, but there is good mooring in the road, which affords a convenient retreat to ships going to Africa, or coming from the Indies; so that merchantmen often stop there, which affords considerable profit to the inhabitants, who are descended from the Portuguese, the island being subject to Portugal.

CH A P. XVII.

OF BARBARY, including MOROCCO, FEZ, ALGIERS, TUNIS, and TRIPOLY

S E C T. I.

Of BARBARY in general.

Its Situation, Extent, Climate, and Seasons.

WE now proceed to the northern countries of Africa, usually comprehended under the general name of Barbary, and, from its limits, situation, and commerce with Europe, better known than most parts of that extensive continent we have already described. This country was by turns possessed by the Carthaginians, Romans, Greeks, Saracens, Vandals, Arabs, Moors, and Turks; besides the various attempts made by the Spaniards, Portuguese, and the European nations who have formed settlements in some parts of this coast, which stretches from east to west near two thousand miles in length, and in some places seven hundred and fifty in breadth. It was known to the ancients by the name of Mauritania, Numidia, Africa Proper, and Lybia; and is the best country in all Africa, except Egypt and the country about the Cape of Good Hope.

Barbary begins on the west at Mount Atlas, extending north-eastward along the coast of the Atlantic Ocean to Cape Spartel, and then bending eastward, forms the south

coast of the Straights of Gibraltar, and afterwards the south coast of the Mediterranean as far as the city of Alexandria, which is the western boundary to Egypt, where that country joins to Barbary. Both coasts, whether that washed by the Atlantic Ocean, or by the Mediterranean, are extremely fertile in corn and pastures; the former being watered by many large and small rivers, which flow from Mount Atlas, and discharge themselves into the ocean; while the other extends along the declivity of a vast range of mountains, some of them of a considerable height, and spread in depth above forty leagues into the inland country: all of them watered by a multitude of rivers, which, after a long course, and various windings, through a vast variety of pleasant and fertile vallies, discharge themselves into the Mediterranean.

The climate of this extensive country is, during a great part of the year, neither extremely hot, nor very cold. There are, however, great quantities of snow in winter, and both Atlas and some other of the mountains have their tops covered with it all the year round.

Winter begins here about the middle of October, when the weather is frequently very sharp. The rains usually begin about the end of the month, and last till the end of January, and sometimes longer; but how severe

severe soever the weather may be in the morning, the afternoons are commonly warm enough to dispense with a fire. In February the air becomes milder, and the weather usually changes three or four times in a day.

During the spring, which begins about the end of February, the weather is for the most part serene; except from the latter end of April to that of May, when kind refreshing showers begin to fall in great plenty, which, warmed by the moderate rays of the sun, bring the produce of the earth to a gradual maturity; so that by the latter end of May, ripe figs and cherries are gathered in Tunis, Algiers, and some parts of Morocco. By the middle of July their apples, pears, and plumbs, are in full maturity; and grapes, with all the latter fruits, are gathered by the latter end of September. These are more or less plentiful, according to the quantity of rain that has fallen from the twenty-fifth of April to the twenty-fifth of May; on which account this rain is stiled *naïsan*, or water sent from heaven; and the people save a quantity of it in vessels for use.

Their summer begins on the twenty-eighth of May, and lasts till the twenty-sixth of August; during which the heat is so excessive as to be dangerous, especially if they have great rains in June and July, when the atmosphere becomes so hot as to cause malignant fevers, and other diseases of the pestilential kind, which carry off a prodigious number of people for want of proper caution in preventing, or sufficient skill in curing of them. This is chiefly owing to a religious prejudice deeply rooted in the mind of every Mahometan, who imagines that all such sublunary disasters are pre-ordered by an unerring and unalterable decree of the Divine Providence; so that every precaution used either to prevent or avoid, and every remedy used against them, are not only thought fruitless, but impious. This notion has, however, been in some measure exploded among the more sensible part of the inhabitants of the coast, by their frequent commerce with the Christians; but the rest still esteem it the greatest impiety to go a step out of their way to avoid the plague, or to use any remedy against it.

Autumn begins on the twenty-seventh of August, when a sensible diminution of the heat begins to be felt. Winter begins on the seventeenth of November, and ends on the sixteenth of February, when the people begin to plough and sow their low lands; but that work is performed on the high lands and mountainous parts a month sooner. They suppose the year to have forty days of excessive hot weather, and as many of excessive cold: the former begins about the twelfth of June, and the latter about the twelfth of December. At the two equinoxes they regulate all affairs relating to agriculture and navigation, and have many persons among them who are very expert in directing and establishing settled rules for both, though they can neither write nor read.

The natives of Barbary mention three winds which are dangerous and detrimental to them: these are the east, south-east, and south; and all of them are most prejudicial in the months of May and June, in which they seldom fail of blasting a great deal of fruit, and burning up the grain, to which the fogs and mists that usually reign at those times greatly contribute. During the latter end of autumn, the whole winter, and the beginning of spring, they are much exposed to violent rains, snow, hail, thunder, and lightning. Those who inhabit the high lands, especially along the ridge of mountains of the great Atlas, reckon but two seasons in the year, winter and summer, the former of which lasts from October to April, during which such quantities of snow fall in the night, that they are frequently obliged in the morning to remove it with shovels from the doors. During their summer, which lasts from April to September, the vallies are excessive pleasant; but the higher grounds more temperate and agreeable, and the tops of the mountains are not warm enough to melt away the winter snow.

SECTION II.

Of the Vegetables, Beasts, Reptiles, Birds, and flying Insects Of Barbary in general.

BARBARY produces several kinds of grain, besides all that are found Europe, except oats, particu-

larly rice, a white sort of millet, and several sorts of pulse unknown in England. The Moors and Arabs still follow the primitive customs observed in the East of treading out their corn, after which it is only winnowed by throwing it into the wind with shovels.

Dr. Shaw observes, that in Barbary all kinds of provisions are extremely cheap; and that you may purchase a large piece of bread, a bundle of turnips, or a small basket of fruit, for the six hundredth and ninety-sixth part of a dollar, of three shillings and six-pence sterling. Fowls are frequently bought for three half-pence a piece, a sheep for three shillings and six-pence, and a cow and calf for a guinea. One year with another the people can purchase a bushel of the best wheat for fifteen or eighteen pence. The inhabitants of these countries, as well as the Eastern nations in general, are great eaters of bread, and three persons in four live entirely upon it, or upon such food as is made of wheat and barley-flour.

All the fruits in Europe, besides those found in Egypt, are produced here, except the hazel-nut, the filbert, the gooseberry, and currant-tree. Their gardens are, however, laid out without the least method and design, and are a confused intermixture of trees with beds of turnips, cabbages, beans, and sometimes wheat and barley dispersed among them. Parterres and fine walks would be considered as the loss of so much soil and labour, and new improvements regarded as so many deviations from the practice of their ancestors, which they think they ought to follow with the utmost reverence.

The beasts of burthen in this extensive country are, camels, a few dromedaries, horses, which are said to have lately much degenerated, asses, mules, and a creature called the *kumrah*, which, Dr. Shaw says, is a little serviceable beast of burthen, begot between an ass and a cow; it is single hoofed like the ass, but in every other respect different from it; the skin being sleeker, and the tail and head, though without horns, resembling that of a cow.

The cows of this country are small, slender, and afford but little milk. Whence Abdy Bashah, dey of Algiers, and all his ministers, were greatly surprised, when told by admiral Cavendish, that he had an Hampshire cow on board the *Canterbury*, then in the road of Algiers, that every day gave a gallon of milk, which is as much as half a dozen of the best Barbary cows yield in the same time; besides these cattle always lose their calves and their milk together.

The daries are supplied by the sheep and goats, the cheese being chiefly made of their milk. Instead of rennet, they, during the summer, make use of the flowers of the great-headed thistle, or wild artichoke, to turn the milk. The curds are put into small baskets of rushes or palmetta leaves, and afterwards bound and pressed. These cheeses are generally of the shape and size of a penny-loaf. Their butter has neither the substance nor the rich taste of ours, and is only made by putting their cream into goat's-skin, which being suspended from one side of the tent to the other, and pressed to and fro, soon occasions the separation of the butter from the whey.

The sheep are of two kinds: one of them, common all over the Levant, is distinguished by its having a large broad tail, and is of the same species as that we have already described in treating of Syria. Those of the other species are almost as tall as our fallow-deer, and, excepting the head, are not much different from them in shape; but their flesh is dry, and their fleeces as coarse and hairy as those of the goats. It is observable, that a gelding among the horses, an ox among the horned cattle, or a weather among the sheep, is seldom or never known in this country; for those males that are more than sufficient for the preservation of the species, have, when they are about three months old, their testicles only squeezed, the Mahometans thinking it an act of great cruelty to castrate any but their own species.

Of those cattle that are not naturally tame are a kind of wild cows, which are remarkable for having a rounder turn of body, a flatter face, with horns bending more towards each other than the tame cattle. They are nearly of the size and colour of the red deer. The young calves of this species quickly grow tame, and herd with other cattle.

The Ierwee, the most timorous species of the goat kind, is so fearful, that when pursued it will precipitate itself down rocks and precipices. It is of the size of a heifer, but the body is more rounded, and it has a tuft of shaggy hair on the neck and knees: it is of the colour of red deer; but the horns, which are above a foot long, are wrinkled and turned back like those of the goat. There are also several species of the antelope and deer-kind.

Among the ravenous beasts are the lion and the panther, and in some parts of Barbary the tyger. Some authors pretend, that the women may without danger be familiar with the lion, and that upon taking up a stick he will immediately fly from the flocks they are attending. This may perhaps be the case when the lion is satiated with food; for then they lose their fierceness so far that, the Arabs say, a woman may seize their prey, and rescue it out of their jaws. But it much oftener happens, that, for want of other food, they devour women as well as men. They are indeed most afraid of fire, and yet, notwithstanding the precautions taken by the Arabs in this respect, and the barking of their dogs all night, those ravenous beasts frequently outbrave these terrors, and leaping into the midst of the circle enclosed by their tents, bring out a sheep or a goat alive. If these ravages are repeated, the Arabs, observing where they enter, dig a pit, and covering it over slightly with cedars, or small branches of trees, frequently catch them, and feed on their flesh, which is much esteemed, it having the taste of veal.

The dubbah is, next to the lion and panther, the fiercest of the wild beasts of Barbary. It is of the size of a wolf; but has a flatter body, and naturally limps upon its hinder right leg; notwithstanding which, it is tolerably swift. Its neck is so stiff, that in looking behind, or snatching obliquely at any object, it is obliged to move its whole body. It is of a dun or reddish buff colour, with some transverse streaks of a dark brown. It has a mane near a span long, and its feet, which are well armed with claws, serve to dig up the roots of plants, and sometimes the graves of the dead.

An animal which Dr. Shaw calls the faadh has spots like the leopard, but the skin is coarser and of a deeper colour, and the animal is not naturally so fierce. The Arabs imagine it is begot by a lion and a leopardess.

There are also two other animals marked like the leopard, but their spots are generally of a darker colour, and the fur softer and somewhat longer. One of the cat kind is about a third less than a full grown leopard, and may be taken for a species of the lynx. The other has a small pointed head, with the feet, teeth, and some other parts resembling those of the weasel. The body is only about a foot long, and is round and slender, with a regular succession of black and white ringlets upon the tail.

Both the jackall, and an animal called the black-eared cat, are supposed to find out prey for the lion, and are thence called the lion's provider, though it may be much questioned whether any such friendly intercourse subsists between animals so different in their natures. Indeed in the night time these, with other beasts, prowl about in search of prey, and have often been seen in the morning devouring such carcases as the lion is supposed to have fed upon the night before. This, and the promiscuous noise made by the jackall and the lion, are said to be the only circumstances in favour of this opinion. The lion is supposed to feed chiefly on the wild boar, who sometimes defends himself with such courage, that the carcases of both have been found dead, lying together, covered with blood, and dreadfully mangled.

Barbary also produces bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, and moles; with camels, and several kinds of lizards.

The most remarkable of the serpent kind is the thalbanne, some of which are said to be three or four yards long, and the people make purses of their skins. The zurrike is about fifteen inches long, slender, and remarkable for darting along with great swiftness; but the most malignant of this tribe is the lessah, which appears to be the burning dispa of the antients, and seldom exceeds a foot in length.

Among the birds are the rhaad, which is of two species, the smaller is of the size of an ordinary pullet, but the larger is almost as big as a capon, and differs from the lesser in having a black head with a tuft of dark blue feathers immediately below it. The belly of both are white, the back and wings are of a buff colour, spotted with brown; but the tail is lighter, and marked all along with black transverse streaks.

The kitawiah frequents the most barren, as the rhaad does the most fertile parts of these countries. In its shape and size it resembles a dove, and has short feathered feet; but the body is of a livid colour, spotted with black; the belly is blackish, and upon the throat is a crescent of a beautiful yellow. The tip of each feather of the tail has a white spot, and the middle one is long and pointed. The flesh of both this bird and the rhaad has an agreeable taste, and is easy of digestion.

The shagary is of the size and shape of the jay, but has a smaller bill, and shorter legs. The body is brownish, the head, neck, and belly, of a light green, and on the wings and tail are rings of a deep blue.

The houbaara is as large as a capon, and of a light dun colour, marked all over with streaks of brown. The wings are black, with a white spot in the middle, and the feathers of the neck are remarkable for their length, and for being erected when it is attacked or provoked; the bill is flat like the starlings, and near an inch and a half long. There are also partridges, quails, and several other wild birds. Among the birds of prey are eagles, and several kinds of hawks. With respect to the smaller birds, the green thrush is not inferior to the American birds in the richness of its plumage: the head, neck, and back, are of a light green, the breast white and spotted, the wings of a lark colour, the rump of a beautiful yellow, and the extremities of the wings and tail are also tipped with yellow. This bird only appears in the summer months.

Among the small birds with thick bills is the capsa sparrow, which is of the size of a common house-sparrow; it is of a lark colour, but the breast, which is somewhat lighter, shines like that of a pigeon. This bird is remarkable for the sweetness of his note, which infinitely exceeds that of the Canary bird or nightingale, but is of so delicate a nature as immediately to languish and pine away on its being removed into a different climate. Here are also several kinds of water fowl, besides those known in England.

The flying insects are very numerous; among these is a curious species of the butterfly, which is near four inches from the tip of one wing to that of the other, and beautifully streaked with murrey and yellow, except the edges of the lower wings, which being indented, and ending in a narrow strip or lappet, an inch in length, are elegantly bordered with yellow, and near the tail is a spot of carnation.

SECT. III.

Of the Natives of Barbary in general.

THIS country is chiefly inhabited by three different sorts of people: the Moors, who are the original inhabitants; the Arabs, who had over-run this country; and the descendants of the Turks, who made themselves masters of some of the best provinces, and rendered the kingdoms of Algiers, Tunis, and Tripoly, tributary to them; besides a variety of foreign nations, as Christians, Jews, and others; and an innumerable multitude of renegadoes, who, to free themselves from slavery, or from avaricious views, have renounced their faith.

The greatest part of the Moors are involved in ignorance, superstition, and lewdness, many of them of the most unnatural kind; and are said to be treacherous, fraudulent, and deceitful. Indeed it must be confessed, the cruel oppressions they suffer under their tyrannical governments have greatly contributed to their degeneracy; and one can hardly imagine a more abject and miserable condition than theirs seems to be, when it is considered that they are crushed on the one hand by a heavy load of taxes

taxes, and treated with the utmost cruelty by their governors, and on the other exposed to the inroads of the Arabs, who strip them of the small pittance they are able to lay up; whence they dare not provide more than is barely sufficient to serve them the year round, lest their plenty should induce those freebooters to visit them the oftener, or their Moorish landlords to raise their rents. Hence if, from an unexpected good crop, they obtain more corn than they want, they take the utmost pains to conceal it, by burying it under ground, or stowing it in caverns: whence they are in no less danger of being bastinadoed, and even tortured by both, to oblige them to discover it. Thus to avoid the cruel oppressions of the one, and the insults and ravages of the other, they are contented to purchase their ease and safety by the most pinching penury.

Can we imagine a situation more adapted to depress the human mind, or render mankind completely miserable? But it is far from producing this effect; from their unparalleled patience, under these various branches of what others would esteem the greatest wretchedness, they enjoy a tolerable share of happiness; for peace and contentment reign in every family; and what appears very astonishing, is, that their oppression and misery has not yet driven them to coin or adopt into their language any phrases or expressions of impatience, discontent, or repining at their unhappy condition, much less of curses and imprecations against the authors of their distress; and though nothing is more common from the mouths of renegadoes and profligate Christian slaves, they seldom fail to rebuke them with marks of abhorrence.

On seeing a circle of them sitting at the doors of their poor cots, with naked bodies and empty bellies, some either smoking or telling merry tales, others singing or dancing, and when weary lying supinely on the ground, one would conclude them to be a happy, though a lazy people. From this disposition to be pleased with the rank in which they are placed, arises another virtue; they seldom quarrel or fight among themselves, and when they do, use no other weapons than their fists, and the battle lasts no longer than the heat of passion.

The people we have here described are chiefly the Moors that live at large in the country, who, like some of the Arabs, are employed in agriculture and the breeding of cattle; but those who live in the sea-port towns along the coast follow a variety of trades and manufactures, and even carry on some commerce by sea and land: but though these are less poor, they are equally oppressed with taxes, and, if possible, more cruelly treated by their lordly masters; for the least mark of disrespect to the meanest soldier, or the vilest officer, is sufficient to procure them, if poor, the chastisement of the bastinado; or a heavy fine if they have any thing to pay.

Of the Arabs we have already given a particular account in treating of Arabia, and shall be obliged to take notice of some particularities relating to those of the countries we shall soon describe.

As to the Turks, these are by far the fewest in number; they are also the worst, and, except in their surprising power, the most contemptible of the three; these being a wretched crew of indigent, ragged, loose, theivish, and idle fellows, insisted in and about Constantinople, and sent into Barbary once in three years to recruit the soldiery. These wretches being furnished with a gun, a sword, and other arms, are incorporated into some regiment, and instantly obtain a vote and share in the government; and from thence are raised from one post to another, till they obtain those of admiral, vizier, and even bey; in all which they treat with insupportable insolence and tyranny their Moorish vassals, the wealthiest of whom tremble at the sight of a Turkish common soldier.

S E C T. IV.

Of the Kingdom of Morocco, including that of Fez.

Its Situation, Extent, Division, Climate, Rivers, and the Fertility of the Country.

THE kingdoms of Fez and Morocco, which now compose one empire, were once a part of the an-

tient Mauritania, and are situated on the most western borders of Barbary, they being bounded on that side by the Atlantic Ocean; on the east by the river Mulvya, which separates them from Algiers; on the north by the Straights of Gibraltar and the Mediterranean sea; and on the south by the river Sus, which divides Morocco from the province of Darha, and by part of the kingdom of Taflet; the whole empire extending from twenty-eight to thirty-six degrees of north latitude, and from the fourth to the eleventh degree of west longitude from London. Its greatest length, in a direct line from north to south, is above five hundred miles, but in breadth it does not much exceed two hundred and sixty.

Each of these kingdoms still retains its antient name, though both the empire and emperors are chiefly called by that of Morocco, which is the most considerable.

This empire, or kingdom, is thrown into three grand divisions, Fez, Morocco Proper, and Sus; besides the kingdom of Taflet and the large province of Gefula, both which are subject to the emperor.

The climate is almost every where hot, and much more so to the south, yet it is generally healthier than that of Algiers or Tunis, it being plentifully diversified, and the air rendered more moderate by its mountains and plains, and cooled by sea-breezes from the Atlantic Ocean. The great Mount Atlas, which surrounds it on the south like a crescent, has, as hath been already observed, its summits covered with snow, and even in the vallies it sometimes freezes in the night during the winter season; but the snow that falls there is commonly melted away by the next day's sun. Their rainy season generally begins about October; but if it continues too long in the summer, it seldom fails of producing pestilential fevers. The north-west winds, which begin to blow about March, sometimes prove so sharp and violent, as to injure the fruits and other produce of the earth. In other respects the inhabitants enjoy a clear and serene sky, and a wholesome air.

The country in general is well watered with springs and very considerable rivers, the largest of which have their sources on Mount Atlas, and, after winding some hundreds of miles, discharge themselves either into the Atlantic Ocean, or into the Mediterranean. The principal of these rivers are, first, the Mulvya, Marmol, or Mullooyah, which divides the kingdom of Fez from Algiers. It springs from the foot of Mount Atlas, in the province of Chaus, runs through that desert, and between those of Garret and Angued, then winding round the mountain of the Benizeti falls into the Mediterranean. The Taga springs from the same mount, and discharges itself into the Mediterranean nearer to the Straights of Gibraltar. These two are the only rivers of note which fall into that sea, and the last is only remarkable for a city of its name built on its banks.

Those that fall into the Atlantic Ocean are the Cebu, or Sebou, which runs from Mount Atlas, and its course passes between two steep rocks of a prodigious height, falling into the sea near Mamor. The mountaineers convey themselves from the top of one of the rocks to the other over the dreadful chasm through which this river passes, in a very singular and hazardous manner. They fast themselves in a strong basket, big enough to hold about ten persons, and which runs by a pulley along a stout cable, fastened at both ends to two beams fixed in the rocks, and this is drawn by the people on the opposite side, so that if the basket, or any of the tackle, happen to break, as it has sometimes done, they fall into the river from the height of above fifteen hundred fathoms. This river abounds with most excellent fish, which the emperor farms out for about twenty thousand ducats a year.

The next in rank is the Ommirabih, generally called the Marbea, which has its spring head from Mount Magrau, one of the heads of Atlas, near the confines of Fez; whence it runs through several plains and narrow vallies, and then discharges itself into the ocean, forming a capacious bay on the east side of Azamor: it also abounds in fish.

The Tensift is a deep and large river, which springs from the heights of Atlas near the town of Animmey, and running through Morocco, enters the ocean near the

the port of Saffi. It receives a considerable number of other rivers in its course, and is for the most part very deep, though in many places it is fordable during the summer season, and has in the neighbourhood of the city of Morocco, an handsome stone bridge of fifteen arches, built by the great Almanzor, esteemed one of the noblest structures in all Africa.

The last river of note is the Sus, which gives its name to the province through which it passes: in its course from the Atlas to the Atlantic Ocean, and is its southern boundary. This river is very large, and is by the inhabitants cut into a multitude of canals, which render the province the most fruitful of any in this empire. Each side of its banks is variegated with rich corn and pasture-land, gardens, and orchards: it also turns a great number of sugar-mills; so that the inhabitants are numerous, and some of them wealthy.

There are besides these six principal rivers a prodigious number that fall into them, some of which are also cut into a variety of channels, and greatly enrich the lands on both sides; but have little else remarkable.

The lands in general are so good, that were they cultivated with more industry, they might be made to yield most of the products of other parts of the world, and in as great plenty: but this cannot be expected in a country which groans under the most despotic tyranny. It is commonly computed that the land of Morocco is capable of producing an hundred times more than is consumed by the inhabitants, and will yield two or three crops in a year; yet it almost every where lies waste, and without a proprietor, except about three or four leagues round their cities and great towns. The northern parts produce most corn, oil, wine, fruits, wax, honey, silk, and the finest wool; and the southern; dates, sugar, cotton, indigo, variety of gums, and ginger.

S E C T. V.

A Description of the City of Morocco.

THE city of Morocco, from its agreeable situation, and the number and variety of its noble edifices, was once esteemed not only the capital of the empire, but the richest and most considerable town in all Africa. It is conveniently situated between two rivers, the Nephthi and the Agmed, and upon that of the Tensift; and stands on a spacious plain about fifty miles in length, sixty miles north of Mount Atlas, and an hundred and seventy to the east of the Atlantic Ocean. Morocco is encompassed with high stone walls, the cement of which is so hard as to strike fire; and though the city has been frequently besieged and plundered, there is not the least sign of a breach to be seen in them. These walls are flanked with strong and lofty towers, with bastions and other works, and also encompassed with a broad and deep ditch. They have twenty-four gates, which retain some signs of their former strength and beauty; but the houses, which once amounted to an hundred thousand, are dwindled to less than one third of that number; the ground on which they stood in some places lying waste, and in others being turned into gardens, orchards, and corn-fields. Though many noble structures are fallen to ruins, there still remain in that part which is inhabited many stately buildings, particularly the royal palace, three magnificent mosques, and a few baths and hospitals.

The Al Cassava, within which is the imperial palace, is a very large fortress on the south side of the city, capable of containing within its walls above five thousand houses. These walls are high, strong, flanked with lofty towers, and surrounded with a good ditch; they have two gates, one to the south, facing the adjacent country, and the other on the north, next the city; both of them guarded by a company of soldiers, to prevent the Christian slaves going out without their keepers. This last gate faces a straight and handsome street, at the end of which stands in the centre of a spacious court, a magnificent mosque, erected by Abdalmumem, king of the Almohedes; but being too low for its bulk was raised fifty cubits higher by his grandson Almanzor, who also

built its great tower, or steeple, which is only to be equalled in height and beauty by those of Rabat, in the kingdom of Tremesen; and of Seville, in Spain; which were the works of the same architect. This noble structure was also embellished with carvings of jasper, marble, and other costly stones; which, together with the noble gates of the cathedral of Seville, covered with relieve in brass, that conqueror caused to be brought from Spain to enrich this new fabric. On the top of the above-mentioned tower were fixed on an iron spike four large balls of copper, plated so thick with gold, that they were thought to be made of that rich metal. These were of different sizes, the largest capable of containing eight sacks, the second four, the third two, and the uppermost one sack of wheat; but Muley Ishmael took them down, and had them put in his treasury.

Under the floor of this extensive mosque is a deep vault, of the same length and breadth with the building, in which is deposited an immense quantity of corn belonging to the king; but it was originally designed for a capacious cistern to receive the rain-water that fell upon the leads, and was conveyed into it by leaden pipes. The battlements of the tower are of an amazing height, and from thence arises a spire of about seventy feet, on the top of which were fixed the above-mentioned balls.

But to return to the place: before the removal of the court to Mequinez, the royal apartments, and those for the king's wives and concubines, the state-chambers, and the halls of audience, were extremely magnificent; and we are told, that the pillars, ceilings, and mouldings were all richly gilt.

The gardens, though far from being regularly designed, had something uncommonly grand and noble, they being adorned with terraces, fountains, spacious fish ponds, and rich pavilions, shaded from the heat of the sun by delightful groves of fragrant trees: but in the midst of this splendour were the remains of other noble buildings, which, before the removal of the court, were suffered to run to decay; and of four hundred aqueducts, some were broke down, and others shamefully neglected.

In the first court of the royal palace, the apartments, though erected in the Moreisco stile, appeared with surprising grandeur, adorned with basins and fountains of the finest marble, and the most curious workmanship, shaded with citron, orange and lemon trees. The next court was embellished with galleries and colonades of white marble, so exquisitely wrought, that some of the nicest judges in architecture among the Europeans, have beheld them with the greatest admiration, even in their decaying state. In this court stood also a great number of marble vases and basins full of water, in which the Moors made frequent ablutions before prayer. The stables for camels, dromedaries, horses, and mules, were extremely splendid. Near them were two granaries, each of which was capable of containing thirty thousand loads of corn: these were two stories high, the lower for wheat, and the upper for oats and barley, which were conveyed on mules, by an easy ascent, to the top of the building, and thence thrown by trap-doors into their proper chambers; whence they were distributed with the same ease, by proper conduits, into the stables and mangers.

The gardens at the farther end of the castle towards the country, and the park almost contiguous to them, shewed some eminent tokens of their former elegance. When Moquet was there, these gardens had a prodigious variety of fruit and other trees, shrubs, and flowers; and were adorned with a noble square, railed in with a marble balustrade: in the centre stood a column, on which was placed a lion, both of the same stone. This lion threw from his mouth a fine stream of water into a large basin within the rails, on the four corners of which were four leopards of white marble beautifully spotted with round spots of green natural to the stone. In the park were to be seen a variety of wild beasts, as elephants, lions, tigers, leopards, &c. which were kept in buildings prepared for their reception.

At a small distance from the palace stands the quarter of the Jews, inclosed within its own walls, which have but one gate, and that is guarded by the Moors. We learn from Moquet, that when he was there, four thousand of those people lived within that precinct. The foreign

foreign agents, and even ambassadors, also choose to reside there, rather than in any other part of the city; but the Christian merchants commonly live near the Custom-house, which is about three miles from the palace. The Jews have always been burthened with very heavy taxes, notwithstanding which many of them are very rich; but it is their constant policy in all these despotic governments to make the meanest appearance in their dress and houses, to avoid their being still more oppressed; even the natural subjects of the kingdom are obliged to do the same to prevent their becoming a prey to the avarice of the monarch, or his ministers. Hence the houses of all the middling and common people in every part of the city, that is still inhabited, make a miserable appearance. Indeed those of the alcades, nobles, military officers, and courtiers, are strong, well built, and lofty, encompassed with walls, and flat on the top, where they usually spend the evening in fresco, after the African manner.

The river Tenist, which runs through the city, has a handsome bridge over it, and turns a variety of mills on its banks. From this river water is conveyed into all the houses and gardens.

S E C T. VII.

Of the most considerable Cities in the Kingdom of Fez; particularly of the City of Fez, its antient Capital, Mequinez, the present Capital of the whole Empire, Sallee, Majagan, Tangier, Ceuta, and Tetuan.

THE city of Fez was formerly esteemed the next in dignity, it being the capital of the once powerful kingdom of the same name, and is divided into the Old and New City. The first is most worthy of notice, it being near nine miles in compass, and one of the most populous cities in all Africa. Old Fez is situated on the declivity of two mountains, the valley lying between them, and is surrounded by a strong wall of square stone, flanked with towers. The houses are square, terraced on the top, without any windows fronting the street. Those of the wealthy inhabitants, and also the colleges, mosques, baths, and hospitals, have spacious courts adorned within with galleries, fountains, basins of fine marble, and fish-ponds, and are shaded with lemon and orange trees, which are loaded with fruit throughout the year. These structures are plentifully supplied with water from the river Fez, which here divides itself into six branches, and turns about four hundred mills.

The city has seven gates, but no suburbs: the streets are narrow, but mostly straight, and are shut up at night with gates placed at the end of them; so that no people can go out after that time, except upon extraordinary occasions.

The mosques are said to amount to five hundred, fifty of which are of the first rank; among these one exceeds all the rest, and, including the college and cloister belonging to it, is near a mile and a half in compass. It has thirty stately gates: its roof is a hundred and fifty cubits in length, and eighty in breadth, divided into seventeen great domes, besides a considerable number of inferior ones, and the whole supported by fifteen hundred pillars of white marble; every dome is adorned with lamps of a large size, and curiously wrought. There are said to be four hundred cisterns in the cloister, to which the people repair to make their usual ablutions before prayer. Within the buildings of this mosque is a spacious college, in which divinity, philosophy, and other sciences, are taught by their most learned men, the chief of whom is chosen president over the rest, and raised to the dignity of grand mufti. In this college is also one of the largest libraries in all Africa.

The inhabitants of this city are said to amount to three hundred thousand, besides the merchants and other foreigners. The principal magistrate, who is stiled provost of the merchants, has several inferior magistrates under him, and usually resides in one of the most populous streets, that he may be near at hand to punish all delinquents. This magistrate is chosen from among the citizens. There is also a governor appointed by the king,

who has a cady, or judge, under him, to try criminal causes. When a person is condemned to suffer death, if he be a plebeian, he is led through the chief streets of the city to the place of execution, with his hands tied behind him, and is obliged to proclaim as he goes his crime and punishment; and when he comes to the gallows, he is hung up by the feet, and has his throat cut; but if he be a person of high rank, his throat is cut beforehand, and the hangman, marching before the body, proclaims his crime. A man guilty of murder is conducted to the nearest relation of the deceased, who may either condemn him to suffer what death he pleases, or compound with him for a sum of money. But if he denies the crime, he is either bastinadoed or scourged in so cruel a manner, that he commonly dies under the executioner's hands.

As Fez is the common emporium of all Barbary, to which all commodities are brought and exchanged, the streets swarm with merchants and tradesmen. The goods imported chiefly consist of spices, vermilion, cochineal, brags, iron, steel, wire, arms, ammunition, drugs, watches, small looking-glasses, quicksilver, opium, tartar, aloes, allum, English woollen and linen cloths, muslins, calicoes, fustians, silks of all sorts, brocades, damasks, velvets, red woollen caps, toys of all sorts, earthen-ware, combs, and paper.

The exports consist in hides, and all sorts of leather, particularly the Morocco, which is the manufacture of the country, wool, furs, skins, cotton and flax, cloth of the same materials, horses, ostrich feathers, potashes, almonds, dates, raisins, figs, olives, honey, silk of their own manufacture, gold dust and ducats, of both which the Jews have the sole brokerage.

Mequinez, the present capital of the empire, is situated in the kingdom of Fez, on the river Sebu, or Sabro, in a spacious and delightful plain, sixty-six leagues to the westward of Fez, and three to the east of Sallee. This city is surrounded with high walls, at the foot of which are pleasant gardens. It has many mosques, colleges, baths, and other public buildings; and it has a continual market, to which the Arabs resort from all parts to sell their honey, wax, butter, dates, and other commodities.

The palace is about four miles in circumference, and is almost square. It stands on even ground, and has no hill near it. The buildings are of rich mortar, without either brick or stone, except for pillars and arches; and the mortar so well wrought, that the walls resemble one entire piece of terrace: they are formed in wooden cases, within which the mortar is rammed down by the Christian slaves, much in the same manner as the pavours among us drive down the stones; they all raise together heavy pieces of wood, and keep time in their strokes. These wooden cases are built higher as the wall rises; and when they are finished, and dry enough to stand firmly without them, are removed. The whole building is exceeding massy, and the outer wall, which surrounds the whole, is twenty-five feet thick.

Mr. Windus, a gentleman in the retinue of Charles Stewart, Esq; ambassador to the emperor of Morocco in the year 1720, attended his excellency to see the palace, when they were first shewn some large rooms full of men and boys making saddles, stocks for guns, scabbards for scymetars, and other things. From thence they passed through several large neat buildings, and at length entered the most inward and beautiful part of the palace, which has a garden in the middle, planted round with cypress and other trees. All the columns of this building, which form a colonade of vast length, are of marble, and said to be antient Roman pillars brought thither from Sallee; the arches and doors of the apartments are finely adorned.

From thence they were conducted to another neat regular building, with piazzas all round. The area was checquer-work, and in the middle was a row of marble basins at certain distances, with little channels cut in stone, conveying water from one to the other; and here is a magazine and treasury. They afterwards visited the inside of an apartment, where one of the queens formerly lived. They also saw the baths, and some beautiful cobahs, belonging to that apartment. These cobahs

are

are lofty and magnificent rooms, each covered with a dome painted with a sky blue, adorned with stars, and a golden sun in the middle of curious workmanship.

From thence they were led through several other buildings, consisting for the most part of oblong squares, with piazzas, under which the doors enter into the lodgings, which are generally ground rooms. The doors of each building are all of one size and form, finely inlaid, and some of them gilt. In one of these squares was a fountain, with channels of marble, that formed a neat labyrinth.

The quarter of the Jews is in the heart of the city; and, in order for their security, they are allowed the privilege of shutting up their gates at night. They are, however, abused and insulted by the Moors as they go along the streets, who sometimes call them cuckolds and dogs, and even pelt them with dirt. The noblemen sometimes lash them severely with their whips, if they dare to come in their way as they ride along; and, as a still greater mark of contempt, they are not suffered to go out of their quarter with either shoes or boots, but must be bare-footed and bare-legged. All this they endure with singular patience, it being death for them to lift up their hand against a Moor.

Close to Mequinez, on the north-west side, and only divided from it by a road, stands a large negro town, that takes as much ground as the city; but the houses are neither so high, nor so well built.

Sallee is situated on the banks of the river Buragra, which divides it into two parts; the northern, called by us Sallee, and by the natives Sela, is encompassed by a strong wall about six fathoms high, and a yard in thickness, on the top of which are battlements flanked with towers of a considerable height and strength. The southern part, which is on the opposite side of the river, is called Rabat, or Ravat, and is of much greater extent; the high walls with which it is surrounded enclosing a great number of gardens, orchards, and corn-fields so extensive, that wheat may be sown in them sufficient to serve fifteen thousand men. On the south-east-quarter stands a lofty tower, from which ships may be seen at a great distance; but it is now much lower than it was at first. This is owing to a clap of thunder which struck off a part of the top, and caused a wide rent on the south side, which runs from the top to the bottom. This tower is fifty feet square, and is built of stone, joined by a strong cement. It still serves for a land-mark in the day-time, and for a light-house in the night; and under it are the two docks which belong to the town, the one for building of ships, and the other for them to winter in.

The harbour is large, but shallow, and seldom rises above twelve feet at high water; so that the corsairs which belong to this city are obliged to put into the island of Fedal, which lies at a small distance from it. This harbour is esteemed one of the best in the country; and yet, on account of a bar that lies across it, ships of the smallest draught are forced to unload and take out their guns before they can get into it. It is now defended by two castles, the old and the new; one stands at the mouth of the river, where the walls are built on rocks, and are so high as to shelter the governor's house from cannon-shot. Its fortifications are very irregular, and within the walls, which are mostly of square stone, is a fort just before the principal gate, that commands the whole town. Next to the sea-side, facing the bar, is a bastion mounted with five pieces of cannon, to secure the vessels that lie at anchor in the road.

The new castle is seated on the west side, and is a square building flanked with towers and battlements like the walls of the city. A communication is preserved between one castle and the other by means of a high wall built upon arches, under which the people pass and repass to and from the island. The king sends thither a governor, who has a council chosen from among the citizens. All merchandize imported or exported pay a tenth part of their value to the government; but the chief wealth of the place arises from the plunder taken by the Sallee rovers, or pirates, which make prizes of all Christian ships that come in their way, except there be a treaty to the contrary.

Mazagan is situated about ten leagues to the south-west of Sallee, and is a strong well-built town in the hands of the Portuguese, who keep a good garrison in it to prevent the Moors retaking it from them. It is surrounded with a strong wall, so thick that six horsemen may ride abreast upon it all round the city, and is well furnished with cannon. The greatest inconvenience is the pirates often intercepting the provisions sent to the garrison, which obliges them, in return, to make incursions against the neighbouring Arabs to obtain subsistence.

Tangier is situated about two miles within the Straights of Gibraltar. This town was antiently called Tingis, and was the capital of Mauritania Tingitana. It is situated in thirty-five degrees forty minutes north latitude, in a fine bay, and is said by the African fabulists to have excelled all the cities upon earth in size and magnificence, and to have been surrounded by walls of brais. It had, however, many handsome edifices and palaces; but being taken by the Portuguese about the year 1471, or 1473, became more considerable for its strength than its beauty. The Portuguese at length finding the expence of keeping it greatly exceeded the advantages they reaped from it, readily gave it to the English, as a part of the dowry of the princess Catharine of Portugal, upon her marriage with king Charles II. who, at an immense expence, rendered it one of the strongest places on all that coast; and built a deep mole, which ran three hundred fathoms into the sea. But finding it too chargeable to keep, and the parliament refusing to vote him the sums he demanded for its maintenance, he caused all the fortifications to be blown up in 1684, since which time the Moors have endeavoured to repeople it, but have not yet been able to render it more than a mean fishing town.

Ceuta is as considerable for its advantageous situation at the entrance of the Mediterranean, as for the beauty of its public buildings, and the strength of its walls and bulwarks, by which, and a good garrison, it held out an obstinate blockade against an army of Moors. It is situated on a rising ground at the foot of the mountain of Apes, which projects into the Straights, and forms the nearest point to the Spanish coast. It is still a considerable place and a bishop's see, and has both a good palace and a noble cathedral.

Twenty-one miles to the south of Ceuta is the city of Tetuan, which stands upon the rising of a rocky hill on the Straights mouth; but is neither large nor strong, it being only surrounded by a wall made of mud and mortar, framed in wooden cases, and dried in the sun. It does not contain above eight hundred houses; but the inhabitants, by piracy, and a good trade for raisins, honey, wax, and leather, are generally in pretty good circumstances, though they dare not let it be known, lest the government should fleece and oppress them.

The shops, which are very small, have no doors; but the master, having opened the shutters, jumps in, and sits cross-legged upon a place raised about the height of a counter. The goods are disposed round about him in drawers, which he can for the most part reach, without moving out of his place, his customers standing in the street while they are served.

The chief strength of the city consists in a garrison of about five hundred men, and four hundred horse. The port is defended by a square castle, flanked with towers of the same materials with the town walls, and in time of danger can entertain a garrison of five hundred men. This harbour affords a safe shelter to the corsairs, who resort thither in great numbers to take in provisions; on which account the Spaniards attempted to choak up the mouth of the river, by sinking vessels loaded with stones; but the Moors found means to open it again.

In the heart of the city is a large dungeon, in which they lock up the Christian slaves at night. These are very numerous, and used with as much severity as in any part of Barbary. The inhabitants are chiefly the descendants of the Moors and Jews, who were driven from Spain, the latter of whom carry on a considerable commerce.

The houses are kept so continually white-washed on the outside, as well as within, that the eyes of the beholders

holders are dazzled by the reflection of the sun. The batha's palace is both a curious and magnificent structure; as is likewise his villa, about two miles out of town. The mosques, and other public structures, make a noble appearance, though built in the Moreisco taste.

The Jews of this city are computed to amount to about five thousand, and are allowed to make wine and brandy. They have seven synagogues, and yet are said to have no more than a hundred and seventy houses.

The city is surrounded with a fine country covered with gardens, orchards, and villas; and on an adjacent eminence is a spacious burying-ground, adorned with such a variety of cupolas, pyramids, and other monuments, that at a distance it resembles a fine city in miniature. If to this be added its prospect towards the sea, and of the adjacent hills and plains, and the courteousness and affability of the people, which exceeds that even in the most celebrated capital of this empire, we shall not scruple to acknowledge this to be one of the most agreeable cities in all Barbary.

S E C T. VIII.

Of the Province of Suz; with a concise Account of the Cities of Messa, Teflut, Tagast, Tarudant, and Tedsfi.

AS we have now taken a view of the principal cities of Morocco and Fez, we shall say something of Suz, or Sus. The province of Suz is intersected by several ridges of Mount Atlas, from which many springs flow, and render the country fruitful in corn, rice, sugar, dates, vines, and indigo. The river Suz, like the Nile in Egypt, overflows all the low lands, and, by having canals cut from it, enriches all the country through which it passes. This, and the inferior rivers, turn a great number of sugar and corn-mills; and the indigo, which grows wild in all the low grounds, is of a very bright colour, and is prepared and exported in great quantities. The inhabitants, who are chiefly Berebers, are distinguished by their industry; and many of them who live in towns become wealthy, and are much more polite than the natives of Fez and Morocco: but the cities of this province are neither considerable for their strength, size, nor beauty.

The city of Messa is seated on the river Suz, where it discharges itself into the sea, and is divided into three distinct quarters about a mile distant from each other, and each quarter enclosed by its own walls. The inhabitants cultivate the adjacent lands, which are fertilized by the overflowing of the Suz; but when it fails to rise above its banks, the natives are obliged to live chiefly on dates, which are here much coarser than in other parts of Africa. As the river forms no harbour, the natives have little or no foreign commerce; and the shore being flat and shallow, whales are sometimes cast upon it.

About three or four miles from Messa, on the same river, stands Teflut, or Teceut, which, like the former, is divided into three parts; but is much larger and more populous. In the center is erected a stately mosque, through which runs a branch of the river. Teflut is supposed to contain four thousand families, most of which are industrious and in good circumstances; for the sugar manufactory flourishes here, and the finest Morocco leather is dressed in this place, and exported from thence in great quantities.

Tagoast, or Tagost, the largest city in the province, is built in a spacious and fertile plain, and was surrounded with walls, which are now decayed. It is said to contain eight thousand families, four hundred of which are Jews; and though the rest are Mahometans, they nevertheless preserve a kind of religious veneration for St. Austin, who, they say, was born there. It enjoys two markets in a week, to which the Arabs and Moors resort with their commodities, and the negroes to buy cloth.

Tarudant is situated near the Atlantic Ocean, in latitude thirty degrees, and, though a small place, is in a flourishing condition, and carries on a considerable commerce with the Berebers, who resort to its markets. Its buildings are handsome, and the adjacent plains fertile. It was once the residence of its own princes, who adorned

it with handsome edifices, as it is now that of the governors of the province.

Tedsfi is a considerable town, which chiefly subsists by the cultivation of sugar, and contains about five hundred inhabitants. Its market on Mondays is resorted to by merchants from many distant parts of Barbary, and even from Nigritia. Its trade consists in cattle, leather, linen and woollen cloths, sugar, wax, honey, butter, and iron tools. The Jews are here rich and numerous, and the people of the town are much commended for their courteous behaviour to strangers.

S E C T. IX.

A concise Description of Taflet and Gfula.

WE shall now give a concise account of Taflet, which was once a kingdom of itself, though now subject to Morocco. This kingdom has its name from its capital, and is a long tract of dry and barren ground, which runs almost east and west, it being bounded on the north by Fez and Tremesen; on the south by Zahara, or the Desart; on the east by the country of the Berebers; and on the west by Morocco and Suz. Its extent, including the provinces of Itaate, Darha, Sakrah, and Tuete, is very considerable, and variously computed; but the country is, for the most part, so hot and sandy, that it produces little corn and fruit. The only place where they can raise barley is along the banks of the river, and even there it grows in small quantities; so that none but persons of distinction are able to purchase it, while the common people live chiefly upon dates and the flesh of camels, both which are here in great plenty: yet indigo grows without art or culture, and yields a more vivid and lasting blue than that produced in our American plantations. They have abundance of ostriches of a prodigious size, the flesh of which they eat. The chief commerce of the natives of Taflet, besides the indigo above-mentioned, consists in their dates, and in a sort of leather made of the hides of a creature called the dantos. They also make a sort of striped silk of various colours, much used by the Moors and negroes; also fine cassocks and caps for the men, veils for the women, curious carpets, and the like.

The king, or emperor of Morocco, among his other titles, takes that of lord of Taflet and Darha, and frequently permits the prince, whom he sends thither governor, to take that of king of Taflet.

The city of Taflet, which is the capital of this kingdom, is seated on the river of the same name, and has a strong castle, supposed to have been built by the Berebers, who have here the name of Fitelis, and are industrious, and rich in camels, horses, and other cattle. This city is resorted to by merchants, not only from several parts of Barbary, but even from Europe. The people are affable and civil to strangers, but the Arabs are much addicted to superstition.

Adjoining to this kingdom is Gfula, which is also subject to Morocco, and is bounded by Taflet on the east, by Darha on the south, by Suz on the west, and by Morocco on the north; but its extent and boundaries are too uncertain to be determined with any degree of exactness.

Though the country is mostly dry and barren, it has many mines of copper and iron, which are worked by the natives, who also fabricate those metals into all the utensils used in Barbary; and these they exchange for horses, linen and woollen cloths, spices, and the other commodities they want, either by carrying them into other parts of Barbary, or by the frequent fairs they hold in their plains, or in their large towns, some of which contain a thousand houses, or more. They have one fair in particular, kept in a large plain, that lasts two months, to which strangers resort from most parts of Barbary and Nigritia; and, it is said, that though these strangers amount to at least ten thousand persons, besides their servants and cattle, they are all maintained at the public expence, there being persons appointed to dress their provisions, and to furnish them with all other necessaries, which is done without tumult or disturbance. Two cap-

tains,

tains, with a sufficient body of soldiers, prevent all disorders; and if a thief be taken, he is immediately put to death, and his flesh thrown to the dogs.

They have a remarkable custom, which is, that let them be at war with whomsoever they will, they observe a truce three days in the week with all strangers, for the encouragement of trade; and this is likewise done during the two months of the above fair.

This country produces very little wheat, but plenty of barley, dates, good pasture, and variety of cattle. The inhabitants are said to be so numerous, as to be able to bring sixty thousand men into the field. Their dress is only a short striped woollen or linen jacket, with half sleeves, over which they throw a long coat or gown of coarse woollen cloth, under which hangs either a dagger, or a short two-edged sword. Their other weapons, when at war, are the scimitar, spear, and short gun.

A part of this country was once conquered by the Portuguese; but the natives soon recovered their liberty, which they enjoyed till they were subdued by the emperor of Morocco.

SECT. X.

Of the different Inhabitants of Morocco. Their Persons, Dress, Entertainments, Manners, and Customs.

THE inhabitants of this empire are composed of a mixture of different nations, particularly of the Moors, who are chiefly the descendants of those who were driven out of Spain; and, though poor and oppressed, are very numerous, especially on the sea-coast; but they have no trading vessels, nor carry on any immediate commerce with foreign nations. These are said to be covetous, superstitious, great cheats, jealous, vindictive, and treacherous.

The Berbers, or, as they stile themselves, the antient natives, are people who still follow their own customs, use their antient language, and live in huts on the mountains, for the sake of enjoying their liberty, they having never yet been entirely subdued.

The Arabs are here very numerous, and range from place to place with their herds, cultivate the plains, and sow corn on the most fertile spots. These are equally fond of liberty; and, though they pay a kind of tribute, live under cheyks of their own race and choosing. Some of their tribes live rather upon plunder than industry, and cannot easily be suppressed, as they generally live in some of the most inaccessible parts of the mountains, from which they make their excursions into the low lands, and attack the caravans who come in their way.

The Jews were also for the most part obliged to fly out of Spain and Portugal; and, though they have a very bad character, are suffered to be the chief traders, factors, minters, and bankers in the empire; and it is said, that, by their frauds and impositions, they make themselves ample amends for the heavy taxes with which they are loaded.

The renegadoes, though less numerous than in Algiers and Tunis, yet make a distinct class of people; but are almost as much detested by the rest of the inhabitants as by the Christians. These guard the gates of the royal palaces and fortified places; and some of them are distributed among the governors of the provinces, who are to employ them as occasion offers.

The slaves make another considerable class; they are here also very numerous, and are much more inhumanly treated than in Algiers and Tunis. These all belong to the king, who causes them to be employed in the hardest labour, and the vilest offices, almost without intermission. The poor pittance allowed them daily consists of a pound cake of coarse barley-bread, dipped in a little oil, which they are sometimes forced to put in their mouths with one hand, while the other is employed in some painful drudgery. Their dress consists of a long coarse woollen coat, with a hood, which serves them for cap, shirt, coat, and breeches. In this wretched situation they are harnessed in carts with mules and asses, and more unmercifully lashed for the least inadvertency or intermission of their labour, though perhaps solely owing to their strength

being quite exhausted by hunger, thirst, and fatigue. Their lodging at night is a subterraneous dungeon, about ten yards in diameter, into which they descend by a rope-ladder, which is afterwards drawn up, and the mouth of the prison covered with an iron grate. In short, these cruel wretches take a singular pleasure in tormenting these unhappy people: they, however, except those that are married from hard labour, a favour which is indulged the women, on account of their breeding and nursing a new brood of slaves; but these are neither better fed, clothed, or lodged than the rest.

The language of this country is the Arabesk, or modern Arabic, which is spoken not only in all the cities, towns, villages, and tents of this empire, but is understood throughout all Barbary, and indeed throughout the Turkish dominions.

The dress of the people of Morocco is not ungraceful. The men wear short shirts, with very broad sleeves that sometimes hang down; but are more frequently tucked up to keep them cool. They have linen breeches tied about their waist next their skin. Over their shirt they wear a cloth-vest, or waistcoat, very short, made to fit close to the body, and fastened with small buttons and loops set close together, which is often embroidered with gold or silver thread. Round the waist they tie a scarf of silk or stuff, in which they stick large knives, with the handles either of some valuable metal or ivory inlaid, and the sheaths are tipped with silver. Their outer garment is either the alhague, or the albornooce; the former is a piece of fine white woollen stuff, five or six yards in length, and about one and a half broad, which they wrap round them above and below their arms, a dress which resembles the drapery of antique figures: the albornooce is either made of cloth or woollen stuff napped, and has some resemblance to a short cloak; but is joined a little way before, from the neck downwards, having two or three rows of short stripes worked in the stuff, and fringed at the ends: the bottom and sides are edged with a deep fringe, and at the neck behind there hangs a peaked cowl, with a tassel at the end. With this cowl they can cover their heads to keep off the weather. On their heads, which they always keep shaved, they wear a little red cap, which they make into a turban by rolling muslin about it; but when they go into the country they wear a handsome cane hat, to keep off the sun. The alcaides have a broad leather belt, embroidered with gold, in which they hang their scimitars. They all go bare-legged, but wear slippers of red or yellow leather, without heels.

The Moors in general dress after this manner, without any other difference than in the richness and fineness of the stuffs, only the upper garment worn by the poor is a coarse, thick, woollen cloth, with holes at the top to put their arms through, instead of sleeves: this reaches to their knees, and hangs loose about their bodies.

Whenever the women go abroad, they dress nearly like the men, their upper garment being the alhague just mentioned, with which they cover their heads, bringing it down over their foreheads close to their eyes, and underneath tie a piece of white cloth to hide the lower part of the face. The alhague covers all but their legs, which, when they are at home, or visit from the tops of their houses, are generally naked; only some ladies of superior rank have their drawers so long that they reach to their feet, and hang in great loose folds about their legs. They wear the same kind of slippers as the men. Within doors they have only a single binder about their foreheads, and their hair hangs behind in two large plaits at full length. They also wear at home a vest open from the bosom to the waist, to shew their embroidered smocks, and fasten large pieces of muslin to the sleeves of their vest, which hang down very low, in the manner of ruffles. They wear a short petticoat over their drawers, have large earrings in their ears, with bracelets on their arms and legs.

The women are remarkable for their fine eyes, and some of them have very beautiful skins, which Mr. Windus, one of the English ambassador's retinue, in the year 1720, says they had sometimes an opportunity of observing; and though a man might live a year in one of their towns without seeing the face of a Moorish woman in the streets, yet when these English gentlemen met them in the fields, or saw them on the house-tops, if none of the

Moors

Moors were in sight, they would unveil, and laugh till the appearance of one obliged them to conceal their faces again.

The above author observes, that the men are of a swarthy complexion, intermixed with a race of well-looking men, somewhat fairer than the rest. They are generally lusty, strong-limbed, active, laborious, and enduring with surprising resolution the heats of summer and the cold rains of winter. Thus a messenger will go from Tetuan to Mequinez, which is a hundred and fifty miles, for a Barbary ducat, of the value of three shillings and six-pence; and when caught in a storm of rain, will only look out for a bush or high stone, and sitting down on his hams, with his back towards it, remain in that posture the whole night; or, if the weather be fair, will wrap himself up in his cloaths, and pass the night sleeping on the grais. 'Tis said that the most famous footmen will go a hundred and eighty miles in three days. They swim the rivers, even in the depth of winter, if not deterred by the rapidity of the current; and when they take a journey of seven or eight days, carry only a little meal and a few raisins or figs in a small goat's skin. They have no posts for carrying letters in this country; the usual way of sending them being by footmen, who are almost as expeditious as horses: nor have they any kind of wheel-carriage; for they remove their light goods from place to place on horses, but make use of camels when they carry to a considerable distance, great quantities of corn, hides, or the like.

Their visits are generally short, and last no longer than the business which occasions them requires; the visitor being only treated with coffee, or sherbet, and a pipe of tobacco, except on particular occasions. The women have their peculiar apartments, where they receive their female visitors; and from which even their husbands are excluded.

When a Moor is disposed to give an entertainment to his neighbours, his women go to the top of the house, where they continue till the guests are gone. Their entertainments generally consist of cuscusu, which is thus made: they put fine flour into a large flat pan, and moistening it with water, roll it up into small balls. These they put into a kind of cullender, that serves for the cover of a pot, in which meat and fowls are stewing; whence it receives the heat and steam. As soon as it is enough, it is put into a dish, and strong broth being poured over it, they put in the meat and fowls, and serve it up. Their dishes are either pewter or earthen-ware, wide at the top and narrow at the bottom, somewhat like a high crowned hat turned with the crown downwards.

They sit cross-legged on the floor, placing their dishes on a large piece of Morocco leather, that serves both for table and table-cloth. While they eat a servant stands by with a great bowl of water in one hand, and a narrow long piece of blue linen in the other, to wipe their right hand, with which they pull the victuals to pieces, it being generally stewed to rags. They never use the left hand in eating, because that is always used on necessary and less cleanly occasions.

They eat without speaking, and after their meals drink water or sherbet, their religion forbidding them the use of wine and all other intoxicating liquors; yet most of them will get drunk with strong drink of any kind, if they can get it. They are so very fond of butter-milk, which is their chief desert, that when they would speak of the extraordinary sweetness of any thing, they compare it with that. A large black pitcher of it is usually brought in with a wooden ladle, which is presented to the most considerable person, and from him it passes several times round the company.

They bury their butter in the ground to make it keep, and do not dislike it when it is three or four years old.

They also wrap up the cauls, fuet, and fat of cows, sheep, and goats, in great rolls, which in winter are sold to the poor instead of butter. Their bread is, however, extremely cheap and good.

When they are in their houses they are always sitting or lying on mats; and if they ever go out on foot, it is never farther than to make a visit, unless their business requires it; but they daily spend five or six hours before their doors, sitting on their hams, for they think it ex-

tremely ridiculous for any one to walk up and down a room: "Why, say they, should a man remove from one end of the room to the other, without apparent cause? Cannot he as well stay where he is, as go to the other end, merely to come back again?"

It is here reckoned so shameful a thing for a man to make water in a standing posture, that those who are found guilty of it are excluded from being evidence in any trial. Whether this be in order to prevent any drop of their urine falling upon their cloaths, which they esteem a legal defilement, is not easily determined; they are, however, very careful to squat down, like the females, whenever they make this evacuation.

The women in labour have also a strange superstitious custom of sending to a school for five little boys, four of whom are directed to hold the four corners of a cloth, in each of which an egg is tied, and running with it through the streets, sing prayers alternately; upon which the Moors come out of their houses with hotties or pitchers of water, which they pour into the middle of the cloth; and by this means they expect to have an easy and quick delivery.

S E C T. XI.

Of the Government of Morocco, the despotic Power of the Emperor, his Titles, Laws, Revenue, Navy, Land-Forces, Manner of making War, and the Punishments inflicted on Criminals.

THERE is not, perhaps, upon earth a more despotic government than that of Morocco: for their religion, laws, antient customs, and inbred prejudices, all conspire to render the monarch absolute, and to confirm the subjects in the most absolute slavery. The king, or emperor, who has the title of sharif, is not only allowed to have an uncontrollable property and power over the lives and fortunes of his subjects, but even over their consciences too, he being the only person who, as the successor of Mahomet, sets up for being the principal interpreter of the Koran, and appoints all the judges under him. Whenever therefore any of his laws are enacted and proclaimed, as they are commonly done by his governors in all places of his dominions, that none may plead ignorance, they are every where received with an implicit and religious submission. His subjects are even bred up with a notion, that those that die in the execution of his commands are immediately admitted into Paradise; and those that have the honour to die by his hand, to a still greater degree of happiness there. Whence it is not surprising that we find on the one side such cruelty, oppression, and tyranny; and on the other such passive submission and abject slavery.

When the honourable Charles Stuart, ambassador from England, appeared before the emperor of Morocco, he was mounted on a black horse, which the negroes fanned, and beat off the flies with cloths, while an umbrella was kept constantly twirling over the emperor's head, to produce a little wind; the man that carried it taking care to move as the horse did, that the sun might not shine upon him. His dress differed little from that of his bashas; but the hilt of his scimitar was of gold, set with large emeralds; his saddle was covered with scarlet cloth, embroidered with gold, with one pistol in a cloth case on the left side. His bashas prostrated themselves before him, kissed the ground, and rising, went up to him and kissed his feet: which they all do very often when he talks to them, and then retire backwards into their places.

The emperor treated the ambassador with great civility; he was named Muley Abdallah, and was eighty-seven years of age, about fifty of which he had spent on the throne: but though his behaviour to the English was full of civility, our author observes, he might justly be termed a monster in the human form, and one of the most bloody tyrants that ever plagued mankind; for his life was one continued scene of exactions, murders, and the most horrid acts of cruelty, daily exercised on his slaves and his wretched subjects: yet this monster was esteemed a saint; he was continually prostrating himself on the earth,

earth, to offer up his petitions to heaven, and perpetually exercising wanton acts of inhumanity. By his four wives, and the many thousand women he had had in his seraglio, during his long reign, he is said to have had seven hundred sons able to mount a horse; but the number of his daughters is unknown.

On the ambassador's going to visit one of the emperor's sons, the prince received him sitting on a silk carpet, wrought with gold in large flowers. He had two black boys fanning him, one of them dressed in a vest of black and white flowered velvet, the other's was of yellow velvet speckled with black. The prince's garment was of rich cloth of gold. The English had chairs brought them, and sat down for some time, the ambassador talking to the prince by one of the captives, who rested himself on his hands and knees at the threshold of the door; and, when he spoke to the prince, prostrated himself almost close to the ground.

The tyranny of the emperors of Morocco is chiefly exercised on the Moors and slaves; for the Arabs, who pay an involuntary tribute, are not to be treated with such rigour. The zeal and attachment of the negroes who enjoy the principal power at court, entitle them to better treatment. During the last reign they gained a great ascendancy from Muley Ishmael's mother being a negro. These are better foldiers than the Moors; and the tyrant who raises them to the highest post of trust and authority, commits his person, treasure, and concubines to their care; and encourages them, by his own example, to tyrannize over and oppress the natives.

The emperor has here established a branch of despotism, which renders him extremely powerful and formidable; that is, his being the sole heir to all his subjects, in virtue of which he seizes on all their effects, and makes only such provision for their families as he thinks proper; frequently leaving them entirely destitute of support. To preserve, however, some specious shadow of justice, he allows the mufti a kind of superiority in spirituals, and the meanest subject the power of summoning him before the mufti's tribunal; but the danger of such an attempt, which would probably be no less than death, is alone sufficient to deter any man from it.

The titles assumed by the emperors of Morocco are those of most gracious, mighty, and noble emperor of Africa, king of Fez and Morocco, Taflet, Suz, Dahra, and all the Algarbe and its territories in Africa; grand sharif, or xarif, (that is successor, or vicegerent) of the great prophet Mahomet.

The judges are either spiritual or temporal, or rather ecclesiastical and military: the mufti and cadis are judges in all religious and civil affairs; and the bashas, governors, alcaides, and other military officers, of those affairs that relate to the state and the army. These are all the most obsequious slaves to their prince, and the most rapacious tyrants to his subjects; for from them they can obtain neither justice nor favour, without a bribe. Indeed it cannot be otherwise in an arbitrary government, where the highest posts are bought of the prince at a most extravagant rate, and only enjoyed by paying an exorbitant tribute to him; and bribing the courtiers about the monarch's person to prevent their being supplanted by slanderers, or higher bidders.

Another very considerable branch of the revenue arises from the piratical trade, which brings the greater sums into the emperor's treasury, as he is at no expence, either in fitting out vessels, or maintaining the men, and yet has a tenth both of all the cargo and of all the captives: besides which he obtains all the rest by paying fifty crowns per head; by which means he engrosses all the slaves, whose ransom he fixes at a very high rate; and, while they stay, has all the profit of their labour, without allowing them any other maintenance than a little bread and oil; nor any other assistance, when sick, than what medicines they receive gratis from a Spanish convent, which he tolerates, and which is forced to pay him an annual present for that toleration, besides furnishing the court with medicines, and the slaves who are unable to work with lodging and diet.

Another branch of his revenue consists in the tenth part of all cattle, corn, fruit, honey, wax, hides, and other produce, which is exacted of the Arabs and Be-

rebers, as well as of the natives, and are farmed by his bashas, governors, and alcaides.

The Jews and Christians also pay a capitation; the former of six crowns per head on all males from fifteen years and upwards, besides arbitrary imposts and fines. That on the Christians for the liberty of trading in his dominions rises and falls according to their number, and the commerce they carry on; and when once settled there, they cannot leave the country without forfeiting all their debts and effects to the crown.

The duties on imports and exports is another branch of his income; but as the trade of Morocco is not very considerable, the amount of it cannot be great. Indeed consul Hatfield has computed the whole annual revenue to amount to no more than five hundred quintals of silver, each quintal, or hundred weight, worth somewhat above three hundred and thirty pounds sterling; so that the whole, according to him, amounts to no more than one hundred sixty-five thousand pounds, a very small revenue for so large an empire; but the prince has little occasion for money, since he has almost every thing without it; besides, the necessaries and luxuries of life are exceeding cheap.

The navy of Morocco is in the utmost degree inconsiderable; in Mr. Braithwait's time, it consisted only of two ships of twenty guns each, the largest not above two hundred tons burthen; a French brigantine they had lately taken, and a few row vessels; yet with these well manned, they made a great number of prizes. It is a singular happiness to the Christian traders, that in this whole empire there is not one good harbour, that of Sallee, which is the best, being almost dry at low water, and has besides a very inconvenient bar, which prevents ships of any burthen from entering; for had they better ports, they might be induced to make a greater figure at sea. They also want timber for building of ships, and tackle for rigging them, with which, as well as with powder and shot, they are furnished by England and Holland. So little formidable are they at sea, that about forty years ago a small English frigate of twenty guns, with an active commander, by raking some of their ships, and running others ashore, struck such terror among them, that the name of captain Delgarno, like that of some other warriors of distinguished bravery, was used by the women of Sallee and Mamora to still their peevish children.

The land forces, among which are the greatest part of the renegadoes, are dispersed in distant parts, to garrison the castles and forts on the frontiers. The pay of these foot soldiers is no more than about three shillings and four-pence a month, with a small allowance of flour; and they appear half naked, and half starved. The Moors are neither much better paid, nor equipped; but the choicest troops, both of horse and foot, are the negroes, who being brought hither from the other side of the river Senegal when young, are trained up for the army, and commonly make the best foldiers. These are computed to amount, including both horse and foot, to about forty thousand, and the Moors are pretty near as many. These last forces are, however, neither raised, paid, nor armed at the emperor's expence; but upon any expedition are sent to him by the alcaides, every one of which is obliged to furnish his particular quota, according to the extent of his government; every town and village being obliged to maintain a number proportionable to its bigness, to be ready to march ready armed upon the first notice.

Their martial skill and discipline is amazingly rude and imperfect, except in their dexterity in riding and horsemanship. When they engage an enemy, they place the horse on the two wings, and the foot in the center, in the form of a crescent, and where the ground will allow it, the infantry are never more than two ranks deep; but these have neither discipline nor order, and are in such dread of the cavalry of the enemy, that five hundred foot will be put to flight by fifty horsemen. They at best make but a poor figure in the field; for the only mark of courage they shew, is their beginning the attack with a loud shout, which is followed by a short ejaculatory prayer for victory. The cavalry nearest to the emperor chiefly consists of negroes armed with guns, pistols,

pistols, and scymiters, and that farthest from him only with musquets and lances. The infantry are variously armed, some with guns, others with bows, slings, broad swords, short pikes, and clubs. With these weapons they engage the enemy with a kind of enthusiastic fury, rather than like a well disciplined army; but if they meet with a brave opposition, or an unexpected repulse, are easily routed; and when this is the case, are with great difficulty rallied again; especially if the enemy be of the same religion as themselves.

The Arabs and Berbers are seldom called in as auxiliaries; because being under a forced subjection, they cannot be safely trusted. They are, however, required to furnish the emperor's troops with corn, barley, cattle, butter, oil, honey, &c. wherever they encamp. The Arabs, who are very numerous, and at the same time brave and fond of liberty, would soon shake off the yoke, were they not kept under by the want of good arms.

The punishments inflicted on criminals are the same as those we shall find described in other parts of Barbary, except such as flow from the arbitrary sentence of their monarchs, as sawing asunder, either length or cross-wise; burning by slow fires, and other instances of cruelty, that fill the mind with horror at the bare repetition; especially as they are frequently inflicted on the innocent, and are the effects of jealousy, revenge, detraction, and frequently of drunkenness or disappointment. The renegades on attempting to return to Christianity, are stripped quite naked, and anointed all over with tallow, and having a chain fastened about their loins, are dragged from prison to the place of execution, and there burned.

S E C T. XII.

Of the Religion, Superstitions and Ignorance of the people of Morocco.

THE established religion both among the Moors and Arabs is the Mahometan, of the sect of Melech. The Moors are in particular extremely superstitious, and express a more than common abhorrence against all Christians, to whom they usually give the name of dogs. They on particular days are said to place a variety of provisions on the tombs of their deceased relations; and bury with them gold, silver, jewels, and other treasures, to enable them to live the more at their ease in the other world. But these are rather Pagan than Mahometan superstitions. They are also said to dig their graves narrow at the top, and broad at the bottom, in order to give the deceased more room, and greater facility in gathering up their bones at the resurrection; on which account they never inter two persons in one grave. They pay a great veneration to these sepulchres, embellishing them with tomb-stones, cupolas and other ornaments, forbidding all Christians to approach them. Every Friday, which is their sabbath, these sepulchres are crowded with men and women in a blue dress; but mostly by the latter, they being allowed to repair thither to pay their tribute of tears and prayers for the dead; and by priests, who have generally cells in the neighbourhood of the burying places, which are out of town, and for a little money join their devotions with a seeming zeal and fervency.

In their mosques they behave with great decency, and seeming devotion; and if a man be convicted of having absented himself from them during eight days, he is for the first fault rendered incapable of being a witness in any court of judicature, is fined for the second, and burnt as a heretic for the third: but as for the women, they are never permitted to enter them, they being obliged to pray at home, or at the sepulchres just mentioned.

They allow salvation for all of what nation or religion soever that die before they are fifteen years of age; but to none beyond it, except to the Mahometans of their own sect. They, like the other Mahometans, reckon idiots and madmen among their saints of the first class, and build chapels to them after their death, which

are visited with great devotion, and are esteemed sanctuaries for all crimes, except treason. As the Koran forbids all games of chance, that prohibition is so strictly observed in Morocco, that the people of all ranks content themselves with playing at chess, draughts, and the like games, and express the utmost abhorrence for cards, dice, &c. and if any person has lost his money at any game and complains of it to the cady, he will order it to be immediately restored to him, and the winner to be bastinadoed or fined. Indeed they usually play only for a treat of coffee, or some other trifle.

They suffer neither Christians nor Jews to enter into their mosques, or to have any carnal conversation with their women; and if any of them are found guilty of either, they must turn Mahometans, or be burned or impaled alive. They are strict observers of their ramadan or lent; and the very corsairs, though the basest villains under the sun, will keep this long fast on ship-board, and if a renegado is found to neglect it, he is punished with one or two hundred blows on the soles of his feet.

It must, however, be acknowledged, that they pay the utmost regard to the name of God, and express great abhorrence of the impious custom so much in vogue among many who call themselves Christians, of swearing upon the most trivial occasions, which the greatest resentment cannot provoke them to, much less to use blasphemous and indecent expressions, in speaking of the Supreme Being. Nor are they ever guilty of duelling or murder; they never kill but in war; for their religion allows of no pardon for murder, and it is with the utmost reluctance that they ever engage in battle with those of their own religion.

They are no less commendable for their observance of some of the social duties. Their respect and obedience to their parents, superiors, and even a younger brother to an elder, is very remarkable; for before them, they neither dare to sit or speak without being bid. They are extremely jealous of the honour of their wives, and impatient of the least blemish, or suspicion that is cast upon it. They are moderate in their eating, and with respect to drinking wine and other intoxicating liquors, it is forbidden by their law; and though this prohibition is perhaps the least observed, many even of their great men indulging themselves with drinking them privately. However, those persons, of whatever rank, who abstain from them, and regale themselves only with coffee, sherbet, and such sober liquors, are the most esteemed.

The priests and doctors of the law are the only persons of any learning, though a few of the people can read, write, and cast accounts; even these are much neglected by their princes and nobles, many of whom, like the late emperor Muley Ishmael, can neither write nor read. The people are, however, fond of the pretended science of astrology, and place great confidence in charms. There are, however, some regular schools in all their cities and great towns, for teaching children to read, write, and cast accounts; but all the books they are taught consist only of some short catechisms, and the Koran. When a boy has once gone through the last, he is handsomely dressed, set upon a horse, and led in triumph through the town by the rest of the school boys.

S E C T. XIII.

Of the Trade and Coins of Morocco.

THE commerce carried on here is almost entirely confined to the Jews and Christians; the Moors neither understand it, nor have any trading vessels of their own; whence the whole navigation is carried on by European ships, chiefly those belonging to the English and French; but this trade is not a fourth part so extensive as it might be.

The principal goods exported are elephants teeth, ostrich feathers, copper, tin, wool, hides, honey, wax, dates, raisins, olives, almonds, gum-arabic, sandrac, and fine mats.

The

The usual imports are arms, bullets, gun-powder, hard ware, iron in bars, lead, linen and woollen cloths, all which formerly paid a duty of ten per cent. but now only eight; besides which the ships trading to Morocco pay a barrel of gunpowder for entrance, with twelve more for loading and anchorage, and twelve to the captain of the port. Yet vessels sailing to and from Gibraltar, pay but half that duty, this being an indulgence granted by the late Muley Ishmaël, who had a particular regard for the English, more than for any other Europeans. The English and French consule is eight dollars, and every French and Spanish ship pays three more to the hospital or convent of Spanish friars, founded there for the benefit of Christian slaves. But what is extremely detrimental to their commerce, is their dishonesty; for they are said to cheat all the strangers they can, both in their weights and measures, particularly in their silver coin, which besides its wear, is generally clipped by the Jews; so that if a man does not carry a pair of scales in his pocket, he is sure to be cheated.

They also carry on a considerable trade by land by their caravans, which set out twice a year from Fez to Mecca and Medina, and carry variety of their woollen manufactures, some of which are very fine and beautiful; besides Morocco leather, cochineal, indigo, and ostrich feathers: in return for which they bring silks, muslins, and a variety of drugs. They likewise send large caravans into Nigritia, consisting of many thousand camels, which the length of the way and the difficulty of the passage, through deserts void of provisions and water, render absolutely necessary, every other camel being loaded with water and provisions: the others carry silk and woollen goods, oil, salt, beads, &c. which they exchange with the natives for negro slaves, ostrich feathers, ivory, and gold dust.

The coin of Morocco is of three sorts, the lowest, called a *suice*, is a small piece of copper a little less than a farthing; twenty of these make a blankit, which is a small silver coin worth about two-pence English. This last is most in use, and for want of being milled is so liable to be clipped by the Jews, that if care be not taken to weigh them, one is sure to be a loser; for though both the Jews and Moors will use their utmost endeavours to put them off, yet if they be light they will refuse to take them, except by weight, in order to be melted again; for the Jews being both clippers and coiners, get considerably by both. They also exchange good money for Lad; for which, besides the payment of the difference, they extort an extravagant premium. This renders trading very troublesome, because if one of these pieces be but cracked it will be refused; and yet large payments are generally made in that coin, gold being very scarce.

The only gold coin current in this country is the ducat, which is not unlike that of Hungary, and is worth about nine shillings sterling; and three of them make a moidore. Merchants accounts are kept by ounces, each of which contains four blankits, and four of these last make a ducat accompt, or, as they stile it, a metical. But in payments to the government they require no less than seventeen and a half for a gold ducat. These last ounces and ducats, or meticals, are imaginary. With respect to the three real species above-mentioned, the Mahometan religion not permitting them to bear the effigy of the prince, or of any other person, they are only stamped with some Arabic characters.

With respect to gold or silver foreign coin, it is only valued according to its weight, and as if it was to be melted. The Jews here make a considerable profit, not only in the exchange of it, but in lessening and even debasing it, which renders it dangerous to take any from them without the touch-stone and the scales.

S E C T. XIV.

Of the Kingdom of ALGIERS.

Its Situation, Extent, Provinces, Soil, and Climate.

WE now come to the kingdom of Algiers, which is bounded on the north by the Mediterranean sea;

on the east by the river Zaine, the ancient Tusca, which separates it from Tunis; on the south by the Zahara, or the Defart; and on the west by the village of Twunt, and the mountains of Trara, which separate it from Morocco; extending in length, according to Dr. Shaw, from sixteen minutes west longitude from London to the river Zaine in nine degrees sixteen minutes east, or four hundred and sixty miles. To the west it is generally about sixty miles broad, but the eastern part is no where less than a hundred miles in breadth.

This country is at present divided into three provinces, that of Tremesen, or Tlemsen, to the west; the province of Titterie, which lies to the south; and Constantia, which lies to the east. Each of these provinces is governed by a bey, or viceroy, appointed and removed at pleasure by the dey of Algiers.

The remarkable chain of mountains, sometimes placed between this country and the Zahara, and at others reckoned within the dominions of Algiers, is thought to be a continuation of Mount Atlas; though these mountains are far from being so high as they have been represented by the ancients; for the above excellent author observes, that those parts which he has seen are nearly equal to some of the most lofty mountains in our island; and he questions whether they are any where so high as the Alps or the Appenines. "If you form, says he, the idea of a number of hills of the perpendicular height of four, five, or six hundred yards, with an easy ascent, adorned with groves of fruit and forest-trees, rising successively one behind another, with here and there a rocky precipice, and place upon its side or summit a village, encompassed with a mud-wall, you will have a just and lively idea of one of these mountains, and will have no occasion to heighten the picture with the imaginary nocturnal flames, the melodious sounds, or the lascivious revels of the fictitious beings attributed to them by the ancients."

Twunt and the mountains of Trara form the western confines of the province of Tremesen, as the river Maffran, at near two hundred miles distance, bounds it to the east. This province is almost equally distributed into mountains and valleys. Twunt, the frontier village of the Algerines, is situated about four leagues to the southwest of Cape Hone, and is defended by a small fort. This Cape is the largest and one of the most conspicuous promontories to the eastward of the river Malva.

The climate of Algiers is for the most part so moderate, that the country enjoys a constant verdure, the leaves of the trees being neither parched by the heat of summer nor nipt by the cold of winter. They begin to bud in February; in April the fruit is in its full size, and most of it is ripe in May. The grapes are fit to gather in June; and their figs, olives, and nuts in August: but this is not every where the case, for the soil differs greatly, some parts being excessively hot, dry, and barren; and on that account lie uncultivated, the inhabitants in general being very negligent about agriculture: other parts, especially the mountainous places of Tenez, Bugia, and Algiers Proper, are fertile in corn and other grain, and variety of fruits; others afford plenty of excellent pasturage, especially the northern coast of Tremesen; while the southern side, and other parts at a distance from the sea-coast, being wild and barren, harbour a great variety of wild beasts, as lions, tygers, buffaloes, wild boars, stags, porcupines, ostriches, and wild fowl; on which account they have few towns, and those but thinly peopled, when compared with the cities near the sea; yet being advantageously situated for an inland trade, carry on a considerable commerce with Biledulgerid, and other countries to the south.

S E C T. XV.

A Description of the principal Places in the Western Government of Algiers; particularly the Cities of Tremesen, Oran, Arzew, Mostagan, and Tenez.

WE shall begin in the western government of Algiers with the description of Tremesen, or, according to the pronounciation of the Moors and Arabs, Tlemsen, which is situated on the southern part of the province of the

the same name, in thirty-four degrees forty minutes north latitude, and in three degrees ten minutes west longitude, about thirty miles from the sea, and ninety south-west of the city of Oran. It is seated on a rising ground below a range of rocky precipices, upon the first ridge of which is a long narrow piece of level ground, watered by many springs, which, uniting their streams, fall in a variety of cascades, on their descent towards the city; the westernmost of these rivulets turning a variety of mills.

Tremesen is surrounded by a strong wall, forty cubits high, flanked with towers, and made of mortar composed of lime, sand, and small pebbles, which being well tempered and wrought in a frame, in the same manner as those described at Mequinez, have acquired a solidity and strength not inferior to that of stone. The gates of the city, which are five in number, have draw-bridges before them, with other fortifications; and it is also defended by a spacious castle, built in the modern way with courts, halls, and convenient barracks for the janizaries. In the city is a large reservoir of water, conducted thither by a subterraneous channel, and from thence the usual demands of the city are supplied; for which purpose the water is conducted from thence to the castle, the mosques, and other places.

In the west part of the city is a square basin, of Moorish workmanship, two hundred yards long, and about half as broad; in which, according to a tradition of the inhabitants, the kings of Tremesen took the diversion of sailing; while, at the same time, their subjects were taught the art of navigation: but it appears more probable, that this basin was designed as a reservoir in case of a siege, and to preserve at all other times a quantity of water sufficient to refresh and fertilize the fine gardens and plantations below the city.

Tremesen, while it was the capital of the kingdom, was divided into several wards, or partitions, by strong walls, in order, perhaps, the better to put a stop to any intestine commotion, or to prolong a siege. There were two of these divisions in the time of Edressi, each of which might be considered as a distinct city, these being of an oblong square figure, inclosed by a wall of the same structure with that of the city. In the year 1562 Tremesen contained no less than twenty-five thousand well built houses, with large streets, and a multitude of fine public buildings; particularly five large colleges, besides baths, hospitals, &c. But, about the year 1670, Hassan, dey of Algiers, laid the greatest part of the city in ruins, as a punishment for the disaffection of its inhabitants; so that now scarcely a sixth part remains of this famous metropolis, which was about four miles in circumference. Out of a hundred and fifty mosques there remain no more than eight, each of which has a tower of the Doric order, adorned with marble columns; and of a hundred and sixty public baths, only four are now remaining. The Jews had ten synagogues, but all of them are gone to decay; and among the ruins are several shafts of pillars and other fragments of Roman antiquities.

The first town on the coast worthy of notice, on proceeding from the dominions of Morocco, is the city of Oran, the residence of a bey. This was formerly a place of great resort, and contained six thousand houses, chiefly inhabited by clothiers and weavers; and thither came the Venetian, Genoese, and Catalonian merchants, for the sake of trade. It is situated in the thirty-seventh degree forty minutes north latitude, and had several noble mosques, besides caravanseras, hospitals, baths, and other public buildings; but it is now much reduced from its ancient extent and grandeur, and is no more than about a mile in compass.

It is situated on the sea-coast upon the declivity, and near the foot, of a high mountain, on the summit of which are two castles. Within half a furlong of this mountain is another castle, in a situation somewhat higher than the two former, with a large valley between them; whence their respective ridges are so remarkably disunited, that they not only form a most convenient land-mark, but render all the approaches from the latter to the former impracticable. To the south and south-east two other castles are erected upon the same level with the lower part of the town, but separated from it by a deep winding valley, which serves as a natural trench to the south

side of the city. In the upper part of this valley is a spring of excellent water, which, forming a rivulet, adapts its course to the several windings of the valley, and, passing under the walls, plentifully supplies the city with water. At every opening of this valley appears a prospect perfectly romantic, consisting of the intermingled view of precipices, plantations of orange-trees, and rills of water trickling down from the rocks, and forming cool and delightful retreats. Near this fine spring is another castle, which is also an important defence to the city. Three of these castles are regular polygons; but the highest upon the ridge, and the easternmost of those before the town, are built like our old English castles, with battlements and loop-holes.

Oran has only two gates, and both of these open into the valley. The nearest to the port is named the Gate of the sea, and has over it a large square tower, which upon occasion might be converted into a fort. Adjoining to the upper gate is an oblong battery; and a citadel, raised on the highest part of the city towards the north-west, has all its angles mounted with cannon, while the lower and opposite corner is defended by a regular bastion.

This city was taken by the Spaniards in the year 1505, after which they built several beautiful churches and other edifices in the Roman stile; and also imitated the Romans in carving upon the friezes, and other convenient places, inscriptions in their own language in large characters: but after this city had continued in the possession of the Spaniards above two hundred years, it was retaken by the Algerines in the year 1708.

At the distance of three miles from Oran is Arzew, the ancient Arsenaria, behind which the country extends in rich champain grounds; but on the other side is a view of the sea from precipices that are a natural safe-guard to the place. The water now used by the inhabitants is drawn from wells below these precipices; but being beneath the surface of the sea, it is brackish. In order to procure the advantage of fresh water, the ancient city was erected on cisterns cut in the rock, which received that which fell in rains; but though these reservoirs still subsist, they are applied to a very different use, and serve the inhabitants as caves to dwell in. Some ruins of the ancient city are still to be seen; capitals, shafts, and bases of columns being scattered about. Dr. Shaw observes, that a well wrought Corinthian capital of Parian marble, when he was there, supported a smith's anvil; and that he accidentally discovered a beautiful Mosaic pavement through the rents of a ragged carpet spread over it; and that there is here also a sepulchral chamber, fifteen feet square, built plain, without niches or any other ornaments, though there are several Latin inscriptions in Roman capitals on the walls.

At the distance of five miles to the southward of Arzew is a large space of ground filled with pits, from which the neighbouring people are supplied with salt. These salt-pits take up an area of about six miles in compass, surrounded with mountains. This space is in winter a lake, but in summer the water is exhaled by the heat of the sun, and the salt left behind chrySTALLIZED. This commodity, from the facility of digging it, and the shortness of carriage to the adjacent port, would, under any other government, be an invaluable branch of trade, the pits being inexhaustible.

About sixty miles to the east of Oran is Mostagan, or Mostagannin, which is built in the form of a theatre, with a full prospect of the sea; and on every other side is surrounded with hills, which hang over it. In one of the vacant spaces, about the middle of the town, are the remains of an old Moorish castle, which from its form, appears to have been built before the invention of firearms. The north-west corner of the city, which overlooks the park, is encompassed with a wall of hewn-stone, and has another castle built in a more regular manner, and defended by a Turkish garrison. But these being over-looked by the adjacent hills, the chief security of the place lies in the citadel, which, being erected upon one of the just mentioned eminences, commands both the city and the adjacent country. The town is well supplied with water, and its haven is safe and commodious. Behind it runs Mount Magaraba, which is so called from the Magarabas, its inhabitants, who are de-

scended from the Berebers. This mount extends about thirty miles from east to west along the coast of the Mediterranean. These Magarabas live in tents, feed a great quantity of flocks, and annually pay ten thousand crowns to the dey of Algiers.

About fifty miles to the east of Mostagan, is the city of Tenez, situated at the foot of a hill, and about a league from the sea, where it has a convenient port. This city with its territory were once subject to the kings of Tremisen; but the inhabitants taking advantage of the intestine broils by which that kingdom was divided, chose a king of their own: yet they enjoyed their independence but a short time; for their little state became soon after a prey to the Algerines, who have kept a strong garrison in it ever since. The governor resides in the castle, which was once the royal palace. The adjacent territory is very fertile in corn, fruits, and pasturage, and produces honey and wax.

Still farther to the eastward is the city of Sherfhel, the inhabitants of which are famous for making earthen vessels, steel and such hard-ware as is wanted by the neighbouring Arabs. It only consists of low tiled houses, and is a mile in circumference, though it was once the seat of one of the petty kings of the country. It is situated amidst the ruins of a city that was once little inferior in extent to Carthage. These ruins are a proof of its former magnificence; for they abound with fine capitals, the shafts of columns, capacious cisterns, and beautiful Mosaic pavements. The water of the river Hachem, as it is now called, was conveyed thither through a large and noble aqueduct, little inferior to that of Carthage, in the loftiness and strength of its arches, several fragments of which are to be found among the neighbouring mountains and vallies, and are incontestible proofs of the grandeur and beauty of the workmanship. Two conduits were also brought from the mountains to the south and south-west; these still subsist, and as they furnish Sherfhel with excellent water, while that of the wells are brackish, they may be considered as two legacies of inestimable value, left to the inhabitants of this town by the ancients.

The situation of this place was nobly adapted to answer the purposes of strength and beauty. It was secured from the incroachment of the sea by a wall near forty feet high, supported by buttresses, and winding near two miles along the several creeks of the sea-shore. The city was on a level for two furlongs within this wall, and afterwards gradually rose for the space of a mile, to a considerable height, extending over a variety of small hills and vallies.

This ancient city appears, by many circumstances, to have been the Julia Casaria of the Romans, which was the see of a bishop. The inhabitants have a tradition, that the city was destroyed by an earthquake, and that the port, which was once large and commodious, was reduced to its present wretched state, by the arsenal, and the other adjacent buildings being thrown into it by the concussions. The Cothon, which had a communication with the western part of the port, affords a proof of the truth of this tradition; for when the sea is low and calm, there are discovered all over the area, massy pillars, and pieces of great walls, that can scarcely be conceived to come there by any other means than by some violent shocks of an earthquake. Indeed, no place could be better contrived for the safety of their vessels than this Cothon, which was fifty yards square, and in every part of it secure from the wind, the swell and the current of the sea, which are troublesome enough in the port.

The country round the city is extremely fertile, and well watered by several brooks. On the banks of one of them is an old ruined town, under a high rocky precipice, and at some distance near these springs, the Algerines have a fortress, in which is a garrison of Moors and Arabs.

S E C T. XVI.

Of the Southern Province named Tittere, with a particular Description of the city of Algiers.

TITTERE, the southern province of Algiers, is much inferior to the western in extent, it being

scarce sixty miles either in breadth or length. The sea coast to the breadth of five or six leagues chiefly abounds in rich champain ground, behind which is a range of rugged mountains, that run almost in a direct line through a great part of the province, and beyond them are extensive plains. In this province is situated Algiers, the capital of the kingdom, in the thirty-sixth degree thirty minutes north latitude, which has for several ages braved the resentment of the greatest powers in Christendom; though it is not much above a mile and a half in circumference; but little as it is, it is said to contain a hundred thousand Mahometans, fifteen thousand Jews, and two thousand Christian slaves.

It is washed on the north, and north-east side by the Mediterranean, over which it has a full prospect, it being built on the declivity of a hill, upon which the houses rise so gradually above each other, that there is scarce one in the city that has not a view of the sea, and from thence it affords a beautiful prospect, from the advantage of that declivity, and the whiteness of the terrasses. The walls of the upper part of the city are thirty feet in height, and forty at the lower end towards the sea. They are twelve feet thick, and flanked with square towers, but all of them so decayed as to be of little defence, except where they are strengthened by additional fortifications. The ditch with which they are surrounded was twenty feet wide, and seven deep; but it is now almost filled up with mud.

The city has six gates kept open, each of them guarded by some out-works, and there have been others which are now walled up. The citadel, which is built upon the highest part of the city at the western angle, is of an octagonal figure, and each of the sides in view has port-holes or embrasures.

The whole city is over-looked by a ridge of hills on the western side, which run almost on a level with the uppermost gate, and upon it are erected two strong forts; one of which is called, from its five acute angles, the Star-castle, and commands the Sandy-bay, and the mouth of the river Elved. The other, called the Emperor's castle, stands at half a mile distance from the upper gate, and has the command both of the Star-fort, and of the whole ridge, as well as of the Sandy-bay, and the mouth of the river Rebat, on the south side of the city.

The city is much better fortified on the sea-side. The mole was the work of Cheredin, the son of Barbarossa. Before his time the port lay open, and rather resembled a road than a harbour; but he no sooner became master of the place, than he employed all the Christian slaves in building the mole, which they completed in three years time. It extends from one of the extremities of the small island that faces the town, in the form of a large semi-circle, to the mole gate; and from the other extremity of the island towards the walls of the town, leaving a handsome opening into the haven, where the largest vessels may ride in safety, from the violence of the waves. This is defended at one angle by an old round castle built by the Spaniards, when they were masters of the place, and now called the Fanal Castle, or Light House Fort. It is seated on the solid rock, and a fire is carefully kept in it for the security of the ships: it has three batteries of fine cannon.

At the south end of the island is another fort, consisting of three batteries to defend the entrance of the harbour, which according to Dr. Shaw is of an oblong figure, one hundred and thirty fathoms in length, about eighty in breadth, and fifteen in depth. The above batteries that guard its entrance, are said to be bomb-proof. They have each of them their lower embrasures mounted with thirty-six pounders. However, as none of the fortifications are assisted with either mines or outworks, and as the soldiers who are to guard and defend them, cannot be kept to any regular course of duty and attendance, a few resolute battalions, protected by a small squadron of ships, it is said, might soon make themselves masters of the strongest of them. The embrasures of the castle and batteries have all brass guns in good order. The battery of the Mole-gate, at the east angle of the city, is mounted with long pieces of ordnance, one of which, our author thinks, hath seven cylinders, each

each of them three inches in diameter. Half a furlong to the west-south-west of the harbour is the battery of Fisher's Gate, or the Gate of the Sea, which consists of a double row of cannon, and commands the entrance into the port, and the road before it.

There is but one handsome street in the city, which reaches from the west to the east end, and is in some parts wider than in others; but in all much broader than any of the rest. It has on the widest part the houses of the chief merchants, handsome shops, and a market for corn and provisions. All the other streets are so narrow, that two persons can hardly walk a-breast, and the middle being much lower than the sides, added to the usual nastiness of these streets or lanes, renders it very disagreeable to walk through them, especially as camels, hories, mules, and asses, are continually passing and repassing, to which one must give way at the first warning, by squeezing up close to the houses. It is still more dangerous to meet with a Turkish soldier in these streets; for the wealthiest Christian must take care to give him the way, and stand close till he has passed by, or be in danger of feeling some shocking effect of his brutal resentment. The narrowness of these streets is commonly thought to be designed as a shelter from the heat; it may also be occasioned by the frequency of the earthquakes, in order to prevent their falling, since the fronts of most of them are supported by pieces of timber, extending a-cross the streets from one to the other.

The houses are computed to amount to about fifteen thousand, and are built of brick or stone, round a square court. They are obliged to white-wash them, both on the inside and without, once a year; but commonly do it against the approach of their grand festivals. The most magnificent of all is the dey's palace, which stands in the heart of the city. This is a spacious and stately edifice; the front, which faces the inner court, being surrounded with two noble galleries, one over the other, supported with marble pillars, and has two spacious halls, in one of which the dewan or divan meets every Sunday, Monday, and Tuesday. The barracks for the Turkish soldiers are very handsome structures, kept clean, at the charge of the government, by the slaves that attend them. Every barrack contains six hundred Turkish soldiers, each of whom has an apartment allotted him, and all the courts of these barracks have fountains to wash in, before they go to prayers.

The married men, who are mostly renegadoes, are, however, excluded the benefit of these barracks, and obliged to provide themselves lodgings at their own expence, in some other parts of the town; as are likewise the single men who will not conform to the regulations observed in these public buildings. In either case they are obliged to hire private houses, or to take up their quarters in one of the four albergas or fondakas of the town.

These are large structures belonging to private persons, consisting of several courts, in which are warehouses and a variety of apartments to let, and are much frequented by the Levantine merchants; for neither Algiers, nor any other town in the kingdom, has either inns, taverns, or public places for the accommodation of strangers, like the caravanseras in Turkey. The few Christians who resort thither either lodge with some persons to whom they are recommended, or with the consul of their nation, who is always ready to accommodate them with an apartment in his own house, or at his table, if they are persons of distinction. As to the Greeks, and other mean travellers, there are plenty of cooks-shops and public taverns kept by the slaves of the deylik, for their accommodation. The Jews also keep such houses and apartments to let, for the use of those of their nation.

Their mosques are so numerous, that they are said to amount to about a hundred and seven; some of these are handsome structures; and as they are chiefly situated near the sea-side, they make a very fine shew, and greatly add to the beautiful prospect of the city. The baths are also very numerous, the Turks resorting to them not only before the time of their five daily prayers, but whenever their affairs will permit. Some are large and handsome, finely paved with marble, and elegantly furnished; others are small and mean, suited to the lower rank; but they

are all built much after the same manner. The women have also their particular baths, attended by persons of their own sex, into which no man is allowed to enter upon any pretence whatever.

Besides these public baths they have six other buildings, called basios, which are little better than stinking prisons, wherein they lock up the slaves at night. In each of these the poor wretches have a chapel for the free exercise of their religion; and every slave is allowed three small loaves, and a little matras and rug for his bed. To these basios they must all repair at a stated hour in the evening, and the next morning they are again let out to go to their respective labours.

There are also some handsome edifices without the walls of the city, which add to the beauty of the prospect on viewing it from the sea; as the hall where the officers of the marine hold their assemblies, at the foot of the mole; and a great number of tombs belonging to men of eminence, some of which are very neat, and most of them are adorned with chapels and oratories, which are resorted to by men and women every Friday.

Algiers had formerly neither wells nor fountains, their only water being the rain which they save in cisterns. However, in the last century, a Moor, driven thither from Spain, discovered a way of conveying as much of it, by the help of two aqueducts, as supply a hundred fountains at proper distances from each other. This water, which is allowed to be excellent, is brought thither by a long course of pipes and conduits, from a great variety of rivulets that have their sources on the adjacent mountains. These pipes likewise supply the country seats, and the adjoining orchards and gardens.

The territory about Algiers is very fertile, and the hills and vallies beautified with groves, gardens, and country-seats, to which the rich retire during the summer season. These villas are small white houses, shaded with a variety of fruit-trees and other verdure, and watered by a multitude of fountains, which afford singular pleasure and benefit in these hot countries, as by this means every thing is kept constantly green. The people are too negligent to prune their trees; they even suffer their vines to run up to the top of the most lofty of them, and extend themselves from one tree to another, by which means they indeed form natural and delightful bowers; but would yield much better fruit were they frequently pruned. The same may be said of their citron, orange, and other fruit-trees, which, though they are very numerous, never come to that perfection as those cultivated by strangers, particularly by the European consuls, at whose villas the trees produce much more excellent fruit than those which belong to the natives.

S E C T. XVII.

Of Constantina, the eastern Province of Algiers; with a Description of the Cities of Bugia, Bona, Hippo, Constantina, the Inhabited Baths, and the Mountains of Aurels.

THE eastern province of Algiers, distinguished by the name of Constantina, is nearly equal in extent to the other two, for it is two hundred and thirty miles long, and about a hundred broad. The sea-coast is rocky almost through its whole extent.

The first town worthy of notice on the west is that of Bugia. The port is larger than either that of Oran or Arzew, though it is formed like theirs by a narrow neck of land running out with the sea, a great part of which was once faced with a wall of hewn-stone, and there was likewise an aqueduct for bringing fresh water to the fort; but at present both the wall, the aqueduct, and the basions into which the water flowed, are destroyed.

The town of Bugia is built upon the ruins of the ancient city, at the foot of a high mountain. Besides the castle which commands the city, there are two others at the bottom of the mountain for the security of the port, and upon the walls of one of them are still remaining the marks of a cannon ball fired against it by admiral Spragg, in his famous expedition against this place.

This

This town is defended by a garrison, notwithstanding which the neighbouring Arabs lay it in a manner under perpetual blockade. However, the inhabitants carry on a considerable trade in plough-shares, mattocks, and other utensils, which they forge out of the iron ore dug out of the neighbouring mountains; great quantities of wax and oil are also brought there every market-day by the Arabs, and shipped off for Europe and the Levant. Yet these last raise strange disturbances in the town every market-day: every thing indeed is transacted with the utmost tranquility while the market continues; but it is no sooner over than the whole place is in an uproar, and the day is seldom concluded without some flagrant instance of rapine and barbarity.

At a considerable distance to the east stands the city of Bona, on the south-east side of a hill, on the top of which the Algerines have a castle and garrison. Besides the capacious road which lies before it to the east, this city had formerly a small convenient port under its very walls to the southward; but by the constant discharge of ballast into the one, and the neglect of cleansing the other, both are daily rendered less safe and commodious; yet a considerable quantity of hides, wool, corn, and wax, are annually exported from thence.

A mile farther to the south are the ruins of the antient Hippo, called Hippo Regius, from its being one of the royal cities of the Numidian kings; it having the advantage of great strength, and of being commodiously situated both for commerce and for hunting. It enjoys a healthful air, and affords so fine a prospect, that at one view the eye takes in the spacious harbour, a number of mountains covered with trees, and plains finely watered. The ruins of the city take up about a mile and a half in compass, and chiefly consist of large broken walls and cisterns. St. Augustine was bishop of this city, and the Moors shew a part of the ruins which they say belonged to his convent.

At a small distance to the east of Cape Rofa is a bastion on a small creek, and the ruins of a fort which once belonged to a French factory; but the unhealthiness of the place, from the neighbouring ponds and marshes, obliged them to remove to La Celle, another creek three leagues farther to the east, where they have a magnificent house and garden, a company of soldiers, a considerable quantity of arms, and some pieces of ordnance. They command the trade of the whole country, and besides a coral fishery, which they carry on here, wherein they employ three hundred men, they monopolize the trade of hides, wool, corn, and wax at Bona and other places. For these privileges they annually pay the dey of Algiers, the magistrates of Bona, and the chiefs of the neighbouring Arabs, thirty thousand dollars, or about five thousand guineas.

Among the mountains of Beni Abbes, in this province, is a narrow winding defile, which, for near half a mile, extends between precipices that rise to a great height on each side. At every winding a rock, which originally went across it, and separated one valley from another, is cut in the form of a door-case, six or seven feet wide; and these are named by the Turks, The Gates of Iron. Few persons can pass them without horror, and a handful of men might defend the pass against a numerous army.

At the distance of six miles to the south-south-east is another dangerous pass, named the Acaba, or the Ascent; this being the reverse of the former, the road extending along a narrow ridge, with precipices and deep valleys on each side. Here the least deviation from the beaten-path exposes the traveller to the danger of being dashed to pieces by falling to the bottom; yet the common road from the city of Algiers to the eastward lies through the above pass and over this ridge.

Constantina, or Cirta, as it was antiently called, is situated forty-eight miles from the sea, and was both one of the principal, as well as one of the strongest cities of Numidia. The greatest part of it has been built on a rock that may be termed a peninsular promontory, inaccessible on all sides, except towards the south-west. This is computed to be above a mile in circuit, ending to the northward in a perpendicular precipice, at least a

hundred fathoms deep. On that side is a beautiful landscape of a great variety of mountains, vales, and rivers, extending to a great distance. To the eastward the view is bounded by a range of rocks much higher than the city; but towards the south-east the country is more open, and the prospect is terminated by distinct mountains. On that side the eminence is separated from the neighbouring plains by a deep narrow valley, perpendicular on both sides, where the river Rummel conveys its stream, over which was formerly a bridge of admirable workmanship. To the south-west is a neck of land about half a furlong broad, near which stood the principal gate of the city: this is entirely covered with broken walls, cisterns, and other ruins, that are continued quite down to the river, and are from thence extended along a narrow piece of plain ground that runs parallel with the valley already mentioned. This was the situation of the antient Cirta; but the present city is entirely confined to the eminence which Dr. Shaw has termed the peninsular promontory.

Among the ruins scattered over this place, there are still remaining, near the center of the city, a set of cisterns, which receive the water conveyed thither by an aqueduct: these are about twenty in number, forming an area fifty yards square. This aqueduct, though in a more ruinous condition than the cisterns, demonstrates the public spirit of the inhabitants of Cirta, in erecting a structure that required such an immense quantity of materials.

Near the brink of the precipice to the north are the remains of a magnificent edifice, in which the Turkish garrison is now lodged. Four bases, each seven feet in diameter, with their pedestals, are yet standing, and seem to have belonged to a portico; these are a black stone little inferior to marble. The side-posts of the principal gates of the city are of a beautiful reddish marble, and are neatly moulded and pannelled. An altar of white marble also forms part of a neighbouring wall. The gate towards the south-east resembles the other, though it is much smaller, and leads to the bridge built over this part of the valley. This bridge was a fine piece of workmanship. The gallery and the piers of the arches were adorned with cornices and festoons, oxes-heads and garlands, and the keys of the arches are embellished with caducei and other ornaments. Between the two principal arches is the figure of a woman treading upon two elephants, with a large scollop-shell for her canopy. This is well executed in a bold relief. The elephants, which stand with their faces turned towards each other, twist their trunks together; and the woman, who is dressed in her hair, with a close-bodied garment like an English riding-habit, raises up her petticoats with her right hand, looking scornfully at the city. This group, in any other situation, might be supposed to belong to some fountain; these being sometimes ornamented with such wanton designs.

The river Rummel begins to turn to the northward just below the bridge, and continues that course through a subterranean passage in the rocks, which seems to have been an extraordinary provision of nature for the reception of this river, that must otherwise have formed a prodigious lake, and have laid a great part of the neighbouring country under water, before it found a passage to the sea. This river falls from its subterranean cavity in a large cataract, a quarter of a mile to the eastward of a place called Seedy Meemon.

Amidst the ruins to the south-west of the bridge is a great part of a triumphal arch, named The Castle of the Giant. All the mouldings and friezes are embellished with the figures of battle-axes, flowers, and other ornaments. On each side of the grand arch, which is between two smaller ones, are pilasters of the Corinthian order, pannelled like the side-posts of the city-gates, in a taste that seems peculiar to this city.

At the distance of some leagues to the east of Constantina are the Enchanted Baths, situated on a low ground surrounded with mountains. There are here several springs of an intense heat, and at a small distance are others extremely cold. The hot springs have a strong sulphureous steam; and Dr. Shaw observes, that their heat is so great

as to boil a large piece of mutton very tender in a quarter of an hour, and that the rocky ground over which the water runs is, for the space of an hundred feet, in a manner calcined by it. The same author adds, that these rocks being originally soft and uniform, the water, by making every way equal impressions, leaves them in the shape of cones and hemispheres; which being six feet high, and nearly of the same diameter, the Arabs believe to be the tents of their predecessors metamorphosed into stone. But where these rocks, besides their usual chalky substance, also contain some layers of a harder matter not so easily dissolved, there appears a confusion of traces and channels, forming figures, which the Arabs distinguish into camels, horses, and sheep; with men, women, and children, whom they suppose to have undergone the same fate with their habitations.

There are here also other natural curiosities; for the chalky stone dissolving into a fine impalpable powder, and being carried along with the stream, sometimes clings to the twigs, straws, and other bodies in its way; and immediately hardening and shooting into a bright fibrous substance, like the asbestos, forms itself at the same time into a variety of glittering figures and beautiful crystallizations.

To the southward of Constantina are the mountains of Aurefs. These are a knot of eminences running into one another, with several little plains and vallies between them. Both the higher and lower parts are in general extremely fertile, and esteemed the garden of Algiers. They are about a hundred and thirty miles in compass, and over them are spread a number of ruins, the most remarkable of which are those of Lerba, or Tezzoute, the Lambese of the antients. These ruins are near three leagues in compass; and, among others, consist of the magnificent remains of several of the gates of that city: these, according to a tradition of the Arabs, were forty in number; and the city could send forty thousand men out of each. There are still to be seen the frontispiece of a beautiful temple of the Ionic order, dedicated to Æsculapius; part of an amphitheatre; a small, but elegant mausoleum, erected in the form of a dome, supported by Corinthian columns. These, and other structures of the like kind, are a sufficient proof of the ancient splendor of this city.

It is very remarkable, that the natives of the mountains of Aurefs have a very different complexion and mien from their neighbours; for they are so far from being swarthy, that they are fair and ruddy; and their hair, which among the Arabs of the other mountains is dark, is with them of a deep yellow.

S E C T. XVIII.

Of the different Inhabitants of Algiers; with their Persons, Dress, Manners, and Customs.

THE Algerines who inhabit the sea-coast are a mixture of various nations; but are for the most part Moors, driven thither from Catalonia, Arragon, and other parts of Spain. Here are also many Turks besides those in the army, whom poverty sends hither from the Levant to seek their fortunes. The Jews also swarm along the coast; and there are a great number of Christian prisoners taken at sea, and brought hither to be sold for slaves. There are also other Christians who are free, and trade unmolested with the rest of the inhabitants.

The Berebers are some of the most ancient people of these parts, and are supposed to be descended from the Sabeans, who came hither from Arabia Felix, under the conduct of one of their princes. These are dispersed all over Barbary, and divided into a multitude of tribes, under their respective chiefs, most of whom inhabit the mountainous countries; some live in tents, or portable huts, and range from place to place, while others are scattered in villages; yet they have for the most part kept themselves from being intermixed with other nations. These are esteemed the richest, go better clothed, and carry on a much larger traffic in cattle, hides, iron, wax, and other commodities.

The most numerous of the inhabitants are the Moors and Arabs. The Moors, who are thus called from Mauritania, their ancient country, are of two sorts, those who inhabit the cities and towns, and carry on some commerce, either by land or sea, bearing offices in relation to the concerns of their own nation, under the commission of the dey, beys, or agas of the places where they live; some follow trades and manufactures; others are farmers, gardeners, and graziers; and having houses and lands of their own, may be stiled the citizens of Algiers. Many of these grow so rich, as to purchase estates and shares in the ships that cruise abroad.

The other sort of Moors are of the wandering kind, without lands or patrimony, and are in all respects very poor. These are divided into a prodigious number of tribes, distinguished either by the names of their chiefs, or the places of their abode, or by both. Each forms a kind of itinerant village, or adowar, as they term it, and every family lives in a particular tent or portable hut. Each of these adowars has a cheyk, or chief, who, in conjunction with his assistance, govern the whole community with great equity and tenderness. They live solely on the produce of such lands as they farm from the other Moors, and pay their rent in kind, whether in corn, fruit, herbs, honey, and wax, selling the remainder to the inhabitants of the neighbouring towns. They are skilful in the choice of the most advantageous soil for every season, and take great care to avoid the neighbourhood of the Turkish troops. Each adowar pays the dey a tax in proportion to the number of its families, their chief being answerable to him; and the whole community for each individual.

As these wandering Moors are scattered over all this part of Africa, it will be proper here to take some notice of their manners, religion, and customs. Their dress consists in a haik, or coarse piece of cloth four or five ells long, which they wrap about their shoulders; this hangs down to their ankles, and to this they add a cap of the same cloth. The dress of the cheyk is a shirt and a cloak all of one piece, which comes down to the calf of the leg. On the upper part of the cloak is a hood of a finer sort of cloth. Both the boys and girls go quite naked, till they are about seven or eight years of age, when they tie a rag or two about them. Their mothers carry them while they suck, and have often two in a bag tied behind their backs when they go to fetch wood or water; but these children are generally so strong, that they begin to walk when six months old.

The Moorish women dress in only a piece of woollen stuff, which covers their bodies from the shoulders down to the knees. They wear their hair braided, and adorn it with bugles, coral, glass, fishes teeth, and other baubles; and on their legs and arms wear bracelets of horn or ivory. Their cheeks, foreheads, arms, fingers-ends, and legs, are embellished with black spots from their very infancy, which is done by pricking those places with a needle, and then rubbing them with a black powder. Their complexion is in general very swarthy, but their constitution robust and lively; they marry while very young, the boys at fourteen or fifteen, and the daughters at nine or ten years of age; and as they are generally very fruitful, it is not uncommon to see them suckling their children at ten or eleven.

When a youth has obtained the parent's consent to have his daughter, he brings the number of cattle agreed upon to her father's hut, where she, without any reluctance, receives him for her spouse; when some of the by-standers asking what his bride cost him, he answers, "A virtuous and industrious woman cannot be bought too dear." After the mutual congratulations, the young women of the adowar are invited to the marriage-feast, and the bride being set upon the bridegroom's horse, is carried to his tent, amidst the acclamations of the people; and being arrived at the entrance, is offered a mixture of milk and honey; and while she drinks, the rest of the company sing an epithalamium, concluding with their good wishes to the new-married couple. The bride then alighting, her companions put a stick into her hand, which she thrusts as far as she is able into the ground, saying, As the stick cannot be removed without force, so neither

will she quit her husband, except he forces her from him. Before she is admitted into the tent, he places his flock before her, which she must lead to some neighbouring pasture; by which she is informed, that he expects her to labour, and to take care of his flocks and family.

Upon her return, she and her retinue are admitted. The feast begins and ends with singing and dancing, which are continued till the evening, when the bride being presented to her husband, the company take their leave. She is afterwards to wear a veil over her face during a whole month, and not to stir out of the tent till that term is expired, from which time she enters into that branch of the family œconomy that is allotted to the rest of the married women.

These wandering Moors are generally strong, warlike, and skilful horsemen; they value themselves on not being confined to towns like the other Moors, whom they regard as slaves always at the mercy of the Turks: so that if they receive any insult or ill usage from the Turkish aga, they instantly return it in a hostile manner, till the town Moors, who are unable to subsist without being supplied with provisions from them, have mediated a peace between them. To keep up this martial spirit, the chief persons of every adowar meet in a circle round their cheyk, every evening, to discuss public affairs; after which they perform their usual exercises on horseback, in which they are so dextrous, that they can take up any thing from the ground with their lance in full speed. Their usual weapons are a broad cutlass, which hangs just below the left elbow, and a short lance, which they always carry in their hand.

These wandering Moors are generally so addicted to robbery, that it is dangerous travelling at a distance from the towns without a guard, or at least a marabut, that is, one of their priests, or monks; for as they consider themselves as the original proprietors of the country, and not only as dispossessed by the rest of the inhabitants, but reduced by them to the lowest state of poverty, they make no scruple to plunder all they meet, by way of reprisal.

The other considerable nation scattered through all the provinces, not only of the Algerine dominions, but through the other parts of Barbary, is that of the Arabs, which is a mixture of many tribes descended from the Mahometan Arabians, who once over-run this part of Africa, from which being driven by the Turks, they fled to the mountainous parts to save themselves, their cattle, and effects, where they have ever since enjoyed their liberty; and, by their labour and industry, have improved these barren and desert lands into pleasant and fertile territories. They are divided into a multitude of little governments, under their respective chiefs, and value themselves highly on their having preserved their blood untainted by a mixture with other nations, expressing the utmost contempt for those who, preferring their ancient habitations in cities and towns, submitted to a foreign yoke, whom they therefore in derision call citizens and courtiers; and, from their having intermarried with strangers, are esteemed by them no better than Moors. Indeed the Algerines, who make no distinction between these two sorts of Arabs, any more than they do between the wandering and city Moors, call them all four by the common name of Moors, an inaccuracy in which they have been imitated by several European writers, who, confounding the various nations, seem to make no distinction between the Turks, Moors, and Arabians of this part of Barbary.

When the Turks first subdued this country, they were so little acquainted with the mountainous and desert parts of it, that they gave the Arabs an opportunity of seizing upon the passes that led to the kingdoms of Fez and Tunis; but afterwards raising fortifications on the most advantageous posts, they in a short time obliged them either to retire, or submit; which was the more easily accomplished, as they had the use of fire-arms, which were unknown to the Arabs; and as their strength was increased by the arrival of many thousands of Moors and Jews, who came thither from Spain. Hence many of the Arabs rather chose to become tributary to them, than to abandon their old habitations; while others, scorning a foreign yoke, retired into the more inaccessible parts of the kingdom, and lived free from tribute; and a third

part compromised matters with the new conquerors, by entering into a mutual obligation of not molesting each other. These two last, however, stand in little or no awe of the Algerine government, which, on account of their martial spirit, and happy situation, dares not venture to give them any molestation; for whenever such attempts are made, either upon their freedom or effects, they immediately conceal their corn and other provisions in some spacious caves in the rocks, and drive their cattle towards Biledulgerid, or some inaccessible mountainous parts, when they not only bid them defiance, but plague them by their frequent incursions.

There is another sort of these Arabs that wander along the banks of several rivers of Algiers, and never take the trouble of tilling the ground, but range in search of pasture, and live chiefly upon the plunder, not only of villages, but of towns and cities.

Several clans of the Arabs go bare-headed all the year round, like Maffinissa of old, binding their temples only with a narrow fillet, to prevent their hair being troublesome; but some of the richer clans wear, like the Turks and Moors, a small cap of scarlet woollen cloth of the manufacture of the country, round the bottom of which is folded the turban. The Arabs wear a loose garment like that worn by the wandering Moors, and above it also a cloak called a burnoose, which is wove in one piece with a kind of hood for the head; it is tight about the neck, and widens below: but they only wear this in rainy and cold weather. Some of them wear next their skins a close-bodied frock, or tunic, with or without sleeves, which, as well as the loose garment above it, is girded about their bodies. Their girdles are usually of worsted, wove into a variety of figures, and made to wrap several times round their bodies: one end, being doubled and sewed along the edges, serves for a purse. In this girdle the Turks and Arabs fix their knives and poniards; while the writers distinguish themselves by having an inkhorn, the badge of their office, suspended in a like situation.

The dress of the Turks of this kingdom is plain and light, especially among the common people: but persons of distinction affect a more sumptuous apparel, not unlike that worn in Turkey; it being mostly of fine cloth or silk: their vests are richly flowered, their turbans very expensive and curiously done up, and their legs are covered with boots of fine shining leather.

The garments worn by the women differ only from those of the men, in their lightness and length, their shifts and vests reaching down to their feet. Their hair is generally tied behind, and adorned either with jewels or less expensive ornaments, according to their rank and circumstances, over which they wear a cap of silk or linen. They are likewise fond of adorning their necks, arms, and wrists, with collars and bracelets set with jewels, and their ears with large pendants. When they go abroad, they usually throw a thin linen veil over their faces: this they fasten to their girdle, and wrap an upper garment over their usual dress; so that they are commonly known only by the slaves by whom they are attended. Those of a higher rank are conveyed about in litters made of osier twigs, and covered with a thin painted cloth; but so low, that they must sit cross-legged upon them, yet wide enough to contain two persons in that posture: thus they can see without being seen, and travel free from wind, dust, and rain; as well as from the too great heat of the sun.

None but the viceroy, some of his principal officers, and the chief members of the divan, are allowed to ride on horseback; at least in the metropolis and other places of concourse: the rest must either ride on asses, or walk.

The Christians who are free are allowed to wear their own country dress; but the slaves, who are much more numerous, have nothing but a coarse grey suit, and a seaman's cap.

The sharifs, who are descended from Mahomet, have the privilege of distinguishing themselves by the colour of their turbans, which are of green silk; the pilgrims who have performed their voyage to Mecca, and are esteemed hadgies, or saints, likewise distinguish themselves by their dress.

As for the common people, they wear a linen pair of drawers over their shirts, and an open white woollen jacket, with a kind of hood behind; and some wrap themselves up, especially when they go abroad, in a black mantle that reaches down to their heels.

S E C T. XIX.

Of the Government of Algiers, the Election of the Dey, and the different Orders of which the Divan is composed. The Manner of knowing the Opinion of the Divan. The Revenue of the Dey; his Forces; the Manner in which they march and engage an Enemy. Of the Power of the Algerines at Sea; and the Regulations with respect to their Ships.

THE government of Algiers is conducted by the dey and a common-council, composed of thirty yiah bathas; and, upon some emergencies, the musti, the cady, and sometimes the soldiery, are called in to give their votes. Affairs of moment are sometimes agreed upon by this assembly, before they pass into laws, and the dey is entrusted with the execution of them; but lately little account has been made of this body, which is at present only convened to give their consent to what has been before concerted between the dey and his favourites.

The dey is chosen out of the army, the most inferior person of which having an equal right to that dignity with the highest, every bold and aspiring soldier, though but lately taken from the plough, may be considered as heir apparent to the throne. Indeed they are not ashamed to own the meanness of their extraction. Dr. Shaw observes, that Mahomet Basha, who was dey when he was at Algiers, in a dispute with a deputy consul of a neighbouring nation, freely mentioned the meanness of his birth: "My mother, said he, sold sheeps trotters, and my father neats tongues; but they would have been ashamed to have exposed to sale so worthless a tongue as thine."

He who aspires to this high rank seldom waits till sickness or age has removed the present possessor; it is enough if he be able to protect himself with the same scymetar which he boldly sheathes in the bowels of his predecessor; for scarcely one in ten of them dies in his bed. Even the few who have had a more peaceful exit, cannot be said to have owed it to the high regard the army had for them; but rather to their good fortune or foresight in nipping a new insurrection in the bud, before the conspirators could put their designs in execution. Neither their mal-administration, tyranny, or avarice, serve to hasten their ruin; nor can the contrary amiable qualities prevent it. The want of success in an enterprize, though ever so wisely concerted and carried on, is a sufficient crime with these superstitious and mutinous troops to cause an insurrection, and cost the most sagacious dey, or officer, his life: nay, they are often slain from no other motive, than a desire of change, blown up by some bold aspirer to the supreme power. This, however, helps to keep up the show of a divan, which might otherwise have been abolished; and the deys are frequently obliged to assemble, and consult them on important affairs, merely to screen themselves from popular discontents; though in reality the chief members being for the most part his creatures, he may be said to act with a despotic authority, there being no appeal from this supreme tribunal. This factious humour, however, seems to be somewhat allayed by the many seasonable executions that have been made of these aspiring members. The grand signior, however, still styles the dey his viceroy, or basha, as he does the people his subjects, and claims the right of approving or disapproving of his election; though he has seldom ventured to disannul it, for fear of losing the shadow of authority he claims over them.

As the lowest person, as well as the highest, has a right to vote in the election of a dey, and as there are usually several candidates for that dignity, the election is seldom carried on without some tumult, if not blood-shed; but when the choice is fixed, the person elected is saluted by the words, Alla barik, that is, God blefs, or prosper you;

and immediately after he is invested with the caftan, or insignia of sovereignty; while the cady, or chief judge, addresses him in a congratulatory speech, that is generally closed with a pathetic exhortation to this purpose: That as it has now pleased the Almighty to raise him to the supreme dignity of the kingdom, it is his duty to govern it with justice and equity, to preserve the rights and liberties of his new subjects, and to take the utmost care to promote their safety and welfare.

The officer next in power and dignity to the dey is the aga, or general of the janizaries, who is one of the oldest officers in the army: he enjoys his post only two months, and is then succeeded by the chiah, or next senior officer, or eldest yiah basha. During those two months, the keys of the metropolis are in his custody; all military orders are issued in his name, and the sentence of the dey, upon any offending soldier, whether only corporal of capital, is executed in the court of his palace. He has no sooner served this short office, than he is considered as superannuated; yet regularly receives his pay, like all the rest of the soldiers, every two months, and is exempt from all farther duties, except giving his advice at the grand council, to which he has a right to come whenever he pleases, though he has no vote in it.

The next in dignity is the secretary of state, who registers all the public acts; and next to him are thirty chiah bathas, or chief colonels, under the aga, who sit next to him in the same gallery in the divan. Out of this class are commonly chosen those sent on embassies into foreign countries, or to convey the dey's orders throughout the province of Algiers. Next to them are eight hundred bolluk bathas, or eldest captains, who are raised to the rank of chiah bathas according to their seniority. The oldak bathas, or lieutenants, who are the next in rank, amount to four hundred, and are regularly raised to the post of captains, and to other employments in the state, according to their abilities. These, by way of distinction, wear a leather strap hanging down behind to the middle of their backs. One rule is strictly observed in rising to the above offices; this is the right of seniority, one single infringement of which would cause a revolt, and endanger, if not cost the life of the dey. This seniority, however, is not that of age, but of standing; and yet, with the dey's permission, may be purchased by a junior, in which case the latter descends to the rank of the former.

The other military officers of note are the purveyors of the army; the peys, who are the four eldest soldiers, and nearest to preferment; the foulaks, who are the eight next in seniority to them, and are part of the dey's body-guard: these all march before him when he takes the field, and are distinguished by their carbines, gilt scymetars, and a brass gun on their caps. The kayts, or Turkish soldiers, each band of whom has the government of one or more Moorish adowars, and collects the taxes for the dey; and the sagiards, who are Turkish lancemen, a hundred of whom attend the army. To these may be added, the three beys, or governors, of the three great provinces. All these officers compose the great council; but none of an inferior rank to the thirty chiah bathas, have a right to sit in the gallery next after the dey; the rest are obliged to stand in the hall or council-chamber, with their arms a-cross, and as much as possible without motion; nor are they permitted to enter it with any offensive weapon. Those who have any suit or affairs to transact with the divan must stand without the gates, let the weather be ever so bad; but they are generally presented with coffee by some of the chiabs, or inferior officers, till they are dispatched.

The manner of knowing the opinion of the divan is somewhat singular. The aga, or president, first proposes the question, which is immediately repeated with a loud voice by chiah bathas, and from them echoed again by four inferior officers, and then is repeated from one member of the divan to another, with strange gestures and contortions; and when they do not approve the question, with a most hideous noise from all, by which the aga easily concludes to which side the majority is inclined, and proclaims it accordingly. Hence the deys have of late years taken great pains to suppress those whom they knew to be ill affected to their measures, and to summon as few as possible,

possible, besides their own creatures. It has also been lately customary with them, immediately after their election, to cause all the officers of the divan, who had opposed it, to be strangled, and to fill up the vacancies with those who had been most zealous in promoting it; by which means the far greatest part of that supreme court becomes entirely devoted to his will.

The dey of Algiers pays no other revenue to the Porte than that of a certain number of handsome youths, and some other presents annually sent thither. His income is variously computed, and probably rises and falls according to the opportunities he has of fleecing and oppressing both the natives and foreigners: and, according to Dr. Shaw, the taxes of the whole kingdom bring into the treasury no more than three hundred thousand dollars; but he supposes, that the eighth part of the prizes, the effects of those persons who die without children, added to the yearly contributions raised by the government, presents from foreigners, fines, and oppressions, bring in as much more.

The whole force of Algiers, consisting of Turks and Cologlies, who are the sons of such soldiers as have been permitted to marry at Algiers, is, according to the latest and most accurate writers, computed at about six thousand five hundred, two thousand of whom are supposed to be old and excused from duty; and of the four thousand five hundred, two thousand are constantly employed in their garrisons; while the rest are either to arm out their cruizers, or form the three flying camps sent every summer to collect the taxes. To these Turkish troops may be added about two hundred Moorish horse and foot, kept in constant pay; but, being the hereditary enemies of the Turks, are considered as adding but little to the strength of the government. This extensive country is indeed kept in obedience less by force of arms, than by carefully observing the old political maxim, "Divide and command;" for there being continual jealousies and disputes between the Arabian tribes, the provincial viceroys have nothing to do but to keep up the ferment, and at proper times throw in new matter for discord. Thus, by playing one tribe against another, they are able to maintain their ground against all opposition.

The discipline of the Turkish soldiery, in time of war, is commonly strict and severe; and in one particular is highly commendable, that is, in expressly forbidding all kind of plundering during an engagement; which law is so strictly observed, that they leave that to the Moors and slaves, as being beneath the dignity of a Turkish soldier.

They have, like the Europeans, their cavalry, infantry, and artillery. The army is commanded by the aga of the janizaries. All the officers and soldiers of the infantry march on foot, except the bey, aga, and chiah; each soldier carrying only his sabre and musket, without any other incumbrance, the state furnishing horses for carrying their provisions, baggage, and tents, each of which holds twenty men. The order of marching is regulated by the commanding officers, till they enter an enemy's country; when the bey, having ordered the horse and foot to unite, forms them into squadrons and battalions, each under its proper officers and standards. The van is composed of a body of infantry; the wings of two squadrons, a little towards the rear: the rest of the infantry in two files, with the baggage in the middle; and two squadrons, forming two wings, behind; with a small battalion of foot which forms the rear.

When they engage, the baggage being left under a strong guard, a large body of infantry leads the van, with two wings of cavalry, supported by others at some distance. The main body makes the center, behind which both the horse and foot retreat to rally, and out of it fresh men are draughted to reinforce the van.

They fight more desperately against the Christians than against any other enemy, because those who are taken prisoners are never exchanged or redeemed; but being looked upon as dead to the state, their effects are seized, if they have neither children nor brothers to claim them.

The Algerines are indeed more formidable at sea than any other power along the coasts of Barbary; and though the commanders of their ships are not allowed any con-

cern in the affairs of state, or in the election of the dey, yet they are held in great esteem. Their navy, however, seldom exceeds twenty ships, only one of which belongs to the government, and is assigned to the admiral; this is stiled the deylik, or royal ship, and has her particular store-houses: all the rest belong to private persons, and have likewise their store-houses well provided, the captains never failing to strip their prizes of all the conveniencies they find in them. Indeed it is no wonder that a people who look upon all the rest of the world as their tributaries or slaves, should be so addicted to piracy, and treat their captives with such arrogance and inhumanity.

The captains of these ships have commonly a share in those they command, if they are not the sole owners, and accordingly may fit them out when they will, and cruize where they please; but are obliged, when required, to attend the service of the state, in transporting men or provisions, or in sailing on any particular cruize; and all this at the expence of the owners. They have also an agabachi, or some old experienced officer, appointed by the dey; and without the consent of this officer they can neither give chase nor return, nor even punish their sailors. On their returning to port, this aga makes his report how the captain has behaved; who, if found guilty of any misdemeanor, is sure of being chastised. The captain must also give an account of his success to the government, which claims an eighth part of all the prizes, slaves, and cargo; the rest being divided among the proprietors and ship's company, in such proportions as are agreed upon between them. Whatever is found on board these prizes that will fit their purpose, they make use of, without troubling themselves whether it be of the same size as the rest; for they give themselves little concern about the proportions of their yards, cables, or anchors; and range their guns without regard to their size. They have neither hammocks nor chests on board, nor any other food but biscuit, rice, and water.

The naval force of Algiers is said to have been for a considerable number of years on the decline. In the year 1732, they had only six capital ships, from thirty-six to fifty guns, besides brigantines and row-boats; and, at the same time, had not half that number of brave and experienced captains. A general peace with the three trading nations, and the impossibility of keeping up a proper discipline, where every private seaman disputes authority with his officer, are some of the principal reasons why so small a number of vessels are sometimes fitted out, and why so few persons of courage are willing to command them.

S E C T. XX.

The Manner in which Causes are tried, and Criminals punished in Algiers; with the Treatment of the Slaves.

IN the distribution of justice the cady is judge. He is generally educated in the seminaries of Constantinople, or Grand Cairo, where, 'tis said, the Roman codes and pandects, translated into the Arabic tongue, are taught and explained: he is obliged to attend once or twice a day at the courts of justice, where he determines the suits that are brought before him; but as he is generally supposed guilty of receiving bribes, all affairs of moment are laid before the dey; or, in his absence, before the treasurer, or other principal officer of the regency, who sits in the gate of the palace for that purpose.

All the formality used in the divan, and other courts, is hearing the complaint and witnesses, immediately after which they proceed to give sentence, there being neither counsellors nor attornies to retard the administration of justice. When the women have any suit to them, they come veiled, crying aloud, and often repeating the words Char Alla, that is, Justice in God's name; and these are generally accompanied with a crowd of their own sex, to back the petition with their joint outcries.

Justice is, however, administered in the most venal manner, with respect to the punishment of offenders; and more particularly when these are the Turkish soldiers, who behave with the greatest insolence, and commit acts

of violence with impunity; for they seldom suffer death for any crimes except that of rebellion, in which case they are commonly strangled with a bow-string. For some smaller offences they are either bastinadoed, fined, or their pay stopped; and, if officers, are reduced to the rank of common soldiers, whence they may gradually rise to their former stations.

For clipping or debasing the public coin, the old Egyptian punishment is inflicted, which is cutting off the hands.

If a Jew or Christian is guilty of murder, or any other capital crime, he is burnt alive without the gates of the city; but for the same crimes the Moors and Arabs are either impaled, hung up by the neck over the battlements of the city, or thrown upon hooks fixed in the walls below; where they sometimes hang thirty or forty hours in the most dreadful agonies, before they expire.

Moors found guilty of robbery or burglary have their right hand cut off, and hung about their necks; and are made to ride through the city on an ass, with their faces towards the tail.

The Jews and Christians for certain offences, as speaking against Mahomet and his religion, must either turn Mahometans, or be impaled; which is certainly one of the greatest indignities and barbarities that can be offered to a human being. The patient is laid on his face, and a stake, made sharp at one end, and about eight or nine feet long, is forced up his fundament; and then taking him by the legs, they draw on his body, till the point of the stake appears at his shoulders; after which they erect the stake, and fasten it in a hole dug in the ground.

The ancient inhuman custom of sawing in funder is still retained: this is done by laying the condemned person between two boards of the same length and breadth, and beginning to saw at the head.

Small offences are punished with the bastinado, which is given either upon the belly, back, or soles of the feet, according to the nature of the crime, or the arbitrary will of the cady, or judge, who also appoints the number of strokes to be given with sticks of the thickness of one's little finger; and these strokes sometimes amount to two or three hundred; but the number may be lessened, either by the influence of a bribe, or the interposition of friends. But though the offender frequently dies for want of one of these powerful advocates, yet this punishment is neither reckoned capital, nor is the judge called to an account for causing it to be inflicted in that inhuman degree.

In cases of debt, the debtor is usually detained in prison till the houses, or bailiffs, have seized upon, and sold his effects: when, if the sale amounts to more than the debt, the overplus is returned to the prisoner; or if it comes short, he is released, and no future demands are made upon him:

When the women offend, they are not exposed to the populace, but sent to a private house of correction; or if the crime be capital, they are tied up in a sack, carried out to the sea, and drowned.

Having given the punishments inflicted on malefactors, we shall conclude this section with their treatment of the Christian slaves, who, though innocent, may be said to be under a perpetual state of punishment.

As soon as these slaves are made prisoners, the corsairs make a strict enquiry into their country, condition, and quality, which is often done by bastinadoing them to extort a true confession; after which, having stripped them almost naked, they are brought to the palace of the dey, to which the European consuls repair, in order to examine whether any of them belong to their respective nations; and if any were only passengers, to reclaim them. But if it be proved that they have served for pay to any nation at war with Algiers, they cannot be released without paying their full ransom. Of these the dey has the choice of every eighth man, and chuses those who have some useful trades or professions, as surgeons mates, carpenters, &c. because they sell for a great price; and if of quality, for a still greater. The rest, who are left to the owners and captors, are carried to the bazaar, or slave-market, where a price is set upon them according to their profession, age, strength, and ability. From thence they are led to the court before the dey's palace, where

they are sold by auction; and whatever is bid above the price set upon them, belongs to the government.

These unhappy men have then an iron ring put round one of their ancles, and a long or short chain fastened to it, according as they imagine them more or less inclined to attempt their escape: but if any of these can procure a little money from their friends, or by way of charity, they are allowed to keep wine cellars; but must pay a certain tribute to the dey, according to the quantity they sell; by which means many of them grow rich enough in time to purchase their liberty; though, besides their tribute to the dey, they are obliged to contribute towards the maintenance of their poor sick brethren, and of the Christian chapels allowed for their use. As for the rest, who have neither trades, nor can put themselves in any way of living, they are used with very great severity; they fare and work hard all day, and at night are locked up in public prisons, where they lie on the bare ground, without any other covering than the sky, whence they are sometimes almost stifled in mud and water. In the cities and towns they are put to the lowest and hardest kinds of labour; in the country they are sometimes made to draw the plough instead of horses and oxen; and in all other respects, are treated with such inhumanity, as would be severely punished, if exercised on the lowest rank of brutes. The women slaves are treated with less severity, and, if handsome and witty, are commonly made concubines, and sometimes gain a perfect ascendancy over their masters; but if any of them refuse to comply, they spare neither threats nor cruelty to force them to it; and if application be made to the government in their behalf, the common answer is, that they are their master's property, and he is at liberty to put them to what use he thinks proper. Those who want youth and beauty, are usually consigned to some of the lower offices of the family, and are liable to be severely chastised for every slight miscarriage, especially in point of cleanliness, which they, in common with the Turks, affect to a very high degree, both with respect to their cloaths, provisions, utensils, and furniture.

The popish priests and monks who are slaves, are generally used with more gentleness, on account of their being better supplied with money, by which they procure an exemption from labour and other hardships; but whenever any Christian prince declares war against the Algerines, they are the first who become the victims of their cruelty and resentment.

S E C T. XXI.

Of the Religion and Superstition of the Algerines, the Education of the Children, and their Ignorance in the Sciences. Their Trades, Commerce, and Coin.

THE Algerine religion differs only from the Turkish in their cherishing a great variety of superstitions. Thus they hang the figure of an open hand round the neck of their children, as a counter-charm against an evil eye; and both the Turks and Moors paint it upon their ships and houses. The people who are grown up always carry about them some paragraph of the Koran, which they place upon their breast, or sew under their caps, to prevent fascination and witchcraft, and to secure themselves from sickness and misfortunes. These charms they esteem so universal, that they also hang them to the necks of their cattle, horses, and other beasts of burthen.

An opinion prevails over all Barbary, that many diseases proceed from some offence given to the Jenoune, a sort of beings placed by the Mahometans between the angels and the devils. These are supposed to frequent shades and fountains, and to assume the bodies of worms, toads, and other little animals, which being always in their way, are every moment liable to be molested and hurt. When any one is therefore maimed or sickly, he fancies that he has injured one of these beings; on which the women skilled in these ceremonies go upon a Wednesday, with frankincense and other perfumes, to some neighbouring spring, and there sacrifice a cock or a hen, a ram or an ewe, according to the quality and sex of the

patient, and the nature of the disease, a female being sacrificed for one of the male sex, and a male for the women.

The Algerines have three principal officers who preside over all religious matters; these are the musti, or high priest; the cady, or chief judge in ecclesiastical causes, and such other matters as the civil and military power turns over to him; and the grand marabut, who is at the head of his order, which consists of a kind of eremitical monks in such high veneration, that they bear an extraordinary sway, not only in most private families, but even in the government. These three officers have their seats in the great divan next under the dey, and on his right hand, where they are allowed to give their opinion in all difficult and important affairs of state; but have not the liberty of voting with the rest of the members. As to religious affairs they are usually referred to them, and their decisions, if unanimous, are esteemed binding, and no longer to be disputed.

The people have a great veneration for the marabuts, who are usually persons of a rigid austere life, continually employing themselves either in counting over their beads, or in prayer and meditation. Their chaplet usually consists of ninety-nine beads; on touching each of which, they either say, "God is great, God be praised, or God forgive me." This kind of saintship usually goes by succession, and the son, if he can behave with equal gravity, is intitled to the same esteem and reverence with the father. Some of them pretend to see visions, and to converse with the Deity, while others are supposed to work miracles. Dr. Shaw says, that Seedy Mustafa, caliph of the western province, told him, that a neighbouring marabut had a solid iron bar, which, upon command, would give the same report, and do as much execution as a piece of cannon; and that once the whole Algerine army, on the dey's demanding too exorbitant a tax from the Arabs under his protection, were put to flight by the miracle: yet, notwithstanding the frequency, as they pretended, of the experiment, neither the arguments urged by that divine on the merit of convincing a Christian, nor the solicitations of the company, could prevail so far as to have the experiment tried before him; for the marabut had too much policy to hazard his reputation by putting it to the proof. At Setceef that learned gentleman saw a marabut famous for vomiting fire; but though he was at first greatly surprised at seeing his mouth suddenly in a blaze, and at the violent agonies he counterfeited at the same time, he afterwards plainly perceived that it was all a trick, and that the flames and smoke with which he was surrounded, arose from some tow and sulphur which he contrived to set on fire under his burnoose.

The roving and unsettled life of the Arabs, and the perpetual grievances the Moors frequently suffer from the Turks, prevent either of them enjoying that liberty and security which give birth and encouragement to learning; hence the knowledge of philosophy, mathematics, and medicine, which once flourished among the Arabs, are now lost, and there are scarce any traces of them remaining.

The sons of the Moors and Turks are sent to school at about six years of age, when they are taught to read and write for the value of about a penny a week. Each boy, instead of paper, has a piece of thin square board, slightly dawked over with whitening; and on this he makes his letters, which may be wiped off or renewed at pleasure. On his having made some progress in the Koran, he is initiated in the several ceremonies and mysteries of religion: and when a boy has distinguished himself in any branch of learning, he is dressed in a splendid habit, mounted upon a horse richly caparisoned, and, as hath been already mentioned in treating of Morocco, is conducted, amidst the huzzas of his school-fellows, through the streets, while his friends and relations assemble to congratulate his parents, and to load him with gifts. The boys, after being three or four years at school, are put to trades, or enrolled in the army, where most of them soon forget all they have learned at school.

While the reverend divine we have so often quoted, was chaplain at Algiers, he endeavoured to become acquainted with the persons most distinguished for their

learning; and though from their natural shyness to strangers, and contempt of the Christians, it is difficult to cultivate a real friendship with them, yet he soon found that their chief astronomer, who regulates and superintends the hours of prayer, had not the skill to make a sun-dial: that the whole art of navigation, as practised at Algiers and Tunis, only consists in what is termed pricking of a chart, and distinguishing the eight principal points of the compass; and that even chemistry, once the favourite science of these people, is at present only applied to distilling a little rose water. The physicians chiefly study the Spanish edition of Dioscorides; but they oftener consult the figures of plants and animals than their uses. Notwithstanding this, these people are naturally subtle and ingenious, and only want time, application, and encouragement, to cultivate and improve their faculties.

As the Mahometans are generally predestinarians, they pay little regard to medicine, and usually either leave the disorder to contend with nature, or make use of charms and incantations. Yet in all distempers they resort to bagnios, and there are a few other remedies in general use. Thus a dram or two of the root of round birthwort is an established remedy for the cholic; in pleuritic and rheumatic cases, they make several punctures on the part affected with a red-hot iron, repeating the operation according to the violence of the disease, and the strength of the patient. The prickly pear roasted in the embers is applied hot for the cure of bruises, swellings, and inflammations. They pour fresh butter almost boiling hot into all simple gun-shot wounds, and some of them inoculate for the small-pox; though this practice is not much in reputation in this part of Barbary, and they tell a number of stories to discourage the use of it. They have few compound medicines; however, they use a mixture of myrrh, aloes, saffron, and syrup of myrtle-berries, which is frequently found effectual in the cure of the plague.

Our author was sometimes favoured with the sight of their ancient kalendars, in which the sun's place, the semi-diurnal and nocturnal arch, the length of the twilight, with the several hours of prayer for each day in the month, are calculated to a minute, and beautifully wrote in proper columns; but these are as little consulted as their ancient mathematical instruments, of which they know not the use: thus, if the cloudiness of the weather prevents their adjusting their large and small hour-glasses to some inaccurate meridian lines they have made for that purpose, their times for devotion, which should be punctual to a minute, are entirely left to the will and pleasure of their cryers; for public clocks are not allowed in this country, which is perhaps owing to the great aversion of the Mahometans to bells.

Though their ancestors were also distinguished for their skill in arithmetic and algebra, not one in twenty thousand appears to be at present acquainted with the first operations in these branches of mathematics; yet the merchants are frequently very dexterous in the addition and subtraction of large sums by memory, and have also a very singular method of numeration, by putting their hands into each other's sleeves, and touching one another with this or that finger, or a particular joint, each denoting a determined sum or number; thus, without moving their lips, or giving the least intimation to the by-stander, they conclude bargains of the greatest value.

Though piracy seems to suit best with the temper of the Algerines, they suffer free Christians, Jews, either natives or foreigners, Arabians and Moors, to exercise a fair commerce both by sea and land, and to carry on trades and manufactures in silk, cotton, wool, leather, and other commodities, which are mostly conducted by Spaniards settled in Algiers, especially about the metropolis. Carpets are another manufacture of this country, though they are greatly inferior to those of Turkey for beauty and fineness; but being both cheaper and softer, are preferred by the people to lie upon. There are likewise at Algiers looms for velvet, taffeties, and other wrought silks, and a coarse sort of linen is made in most parts of the kingdom, of which Susa produces the finest. These manufactures are chiefly consumed at home,

some

some of them; especially those of silk and linen, being so inconsiderable, that they are obliged to supply the want of a sufficient quantity by importing them from Europe and the Levant. The people send few of their commodities to foreign markets, their oil, wax, corn, and pulse, being barely sufficient to supply the country, though before the city of Oran became subject to Spain, the merchants have been known to ship off from the various ports of Barbary, seven or eight thousand tons of corn in one year. The consumption of oil, which is here very plentiful, is also so considerable in this country, that it is seldom permitted to be shipped off for Europe: so that their exports chiefly consist in ostriches feathers, wax, hides, wool, copper, rugs, silk-fishes, embroidered handkerchiefs, Christian slaves, and dates.

The goods imported, whether merchandize or prizes, chiefly consist in gold and silver stuffs, damasks, linen and woollen cloths and stuffs, cotton raw and spun, tin, iron, plated brass, lead, quick-silver, cordage, sail-cloth, bullets, cochineal, tartar, alum, rice, sugar, honey, wax, spices, aloes, opium, anise and cummin-seed, soap, copperas, arsenic, brazil, logwood, vermilion, gum-lack, sulphur, mastic, sarsaparilla, aspic, frankincense, galls, paper, combs, cards old and new, and dried fruits. But though there is a constant demand for all these commodities, yet a small quantity of them is imported by the merchants, on account of the frequent exactions and heavy duties to which they are subject, and the precariousness of payment; on which account those who want any of them will wait in hopes to meet with them on board some prize; for they are chiefly supplied with them by the corsairs. It is a misfortune that both the manufacturers and shop-keepers, which last are chiefly Moors and Jews, are severely treated by the government, and frequently fined for even pretended faults, which renders them so poor, that it often puts them upon cheating their customers, either in their weights or measures, though if they are discovered, they are sure of being treated with the utmost severity, either by a heavy fine, corporal punishment, or with death.

The coin in use here is mostly foreign, their own being only of three kinds, viz. the barba, of copper, six of which were formerly worth an asper; but is now of only half that value.

The asper is a small square piece of silver, and both this and the former has Arabic characters stamped on each side. Fifteen of these aspers are of the value of a Spanish ryal, and twenty-four of a dapta, which is worth about a crown. These are all the pieces of money coined in the city of Algiers.

They have likewise three sorts of gold coin; but these are only coined at Tremesen, viz. the rupee, worth thirty-five aspers; the median, and the dian, or zian, worth a hundred aspers. This last was the ancient coin of the kings of Tremesen, on which account that province has the sole privilege of coining these pieces.

Besides these, there are the Turkish sultanin of gold, which is worth about a ducat; the moticales of Fez, of the value of about one shilling and ten-pence; Spanish ryals, French crowns, Hungarian ducats, and other European money, are also current among them, though they have no fixed standard.

S E C T. XXII.

Of the Kingdom of TUNIS.

Its Situation, Extent, Divisions, Rivers, and Islands; of the Mountain of Zawan'er Zagoan, and of the Climate of Tunis in general.

THIS kingdom, which once comprehended the provinces of Constantina, Bugia, Tunis, Tripoli, and Zaab, or Ezzab, is bounded by the Mediterranean on the north and east; by the kingdom of Algiers on the west; and by Tripoli, with part of Biledulgerid, on the south; extending from the island of Jerba in thirty-three degrees thirty minutes to Cape Serra, in thirty-seven degrees twelve minutes north latitude, it being two hun-

dred and twenty miles in length from north to south, and a hundred and seventy in breadth from east to west; the city of Sbekka, the farthest city to the west, being situated in eight degrees, and Clybea, the farthest to the east, in eleven degrees twenty minutes east longitude.

This country, which was once divided into provinces, is now under the immediate inspection of the bey, and is only distinguished into the summer and winter circuits, which the bey takes in person through his dominions at those seasons with a flying camp; in the summer season traversing the fertile country near Keff and Bajjah, and the districts between Cairwan and Jereede, and in the winter proceeding through the rest of the country.

The summer circuit, or northern district, is much better inhabited than any of the neighbouring kingdoms of the same size, and is by far the most pleasant and fertile; and as it has a great number of cities, towns, and villages, has the finest appearance of affluence, prosperity, and cheerfulness, which doubtless proceeds from the mildness of its government, and its being freer from tyranny and oppression. Its fertility is, however, interrupted by several hills, plains, and marshes, dispersed over it, that will admit of little cultivation, nor scarce any manner of improvement.

The principal rivers of this circuit are, the Zaine, which divides Tunis from Algiers; the Mejerda, usually called Mejerada; the famous Bagrada of the antients, on the banks of which Regulus is said to have killed a monstrous serpent. The Miliana, supposed to be the Catada of the antients, is remarkable for its forming the bay of Tunis, and having that metropolis situated at its mouth; the Gabbs, or Caps, supposed to be the Triton of the antients, which rises only three or four leagues to the south-south-west of the city of its name, and falls into the sea to the northward of the old city, forming the ground on which it was built into a kind of peninsula; and the Mejerdah, or Old Bagrada, which is the most considerable of the whole kingdom.

A small island opposite to the mouth of the river Zaine, is in the possession of the Genoese, who pay an annual rent to the regency; but the coral-fishery, which was their chief inducement for making this settlement, failing considerably, it is probable they will not long keep possession of it, if they have not already abandoned it. They have, however, erected a fort for their protection against any surprize from the neighbouring Arabs on the continent, and from the insults of the cruising vessels of Algiers and Tripoli.

The other islands belonging to this state are, Cape Negro, which is situated about five leagues to the north-east of Tabarka, and has a settlement of the French African company, who pay a considerable sum of money to Tunis for the liberty they enjoy at La Calle, though that place is under the Algerine government, and for keeping up a fort here to protect them from the insults of the neighbouring Arabs.

Six miles to the north of Cape Negro is Jalta, the Galata, or Calathe, of the antients. This is a high rocky island, which has a very dangerous shoal. The Cani are two flat contiguous islands, where the Italian row-boats frequently lie in wait for the Tuniseens. These lie four leagues to the north-north-west of Cape Pilloe, and nearly in the mid-way to Cape Blanco; and four leagues beyond Cape Negro to the northward are the Three Brothers, which are three rocky islands near the continent, about half way to Cape Blanco.

The principal mountain of this kingdom is the Zowan, or Zagoan, whose summit affords a prospect of the greatest part of the kingdom. It is remarkable for a town of its name which stands at the foot of it, in great repute for dying scarlet caps, and for bleaching of linen; great quantities of both being daily brought thither from all parts of the kingdom. The stream which serves for that purpose, and runs from the top of the mountain, was formerly carried by a noble conduit to Carthage. Over the fountain was built a temple, the ruins of which are still to be seen. It has also on its declivity and about its foot several Roman antiquities, as the remains of towns, castles, forts, and inscriptions cut in marble. This moun-

tain stands about a league and a half to the south-south-east of the city of Tunis, and is mostly barren and desert, except a few spots which produce barley; but it has proper places where the people place a vast number of beehives.

This country is for the most part healthy and fertile, only in the south there are many sandy and barren deserts, and there the heat is excessive; hence, though the winds which blow from the sea are very refreshing, those which proceed from these deserts are quite suffocating, especially as they mostly blow in July and August, and will continue five, six, or more days in the same corner; so that the inhabitants are obliged to water the flooring of their houses to cool them. This wind is likewise apt to blow after the winter solstice, and then, if there be any snow on the ground, which is seldom the case, it quickly thaws and disappears. The sea-winds from the north and the west-north-west, bring dry weather in summer, and rain in winter; but both the easterly and southerly winds are for the most part dry, though in most seasons they are attended with thick clouds.

Their first rains commonly fall in September, and sometimes not till October; soon after which the Arabians break the ground, sow their corn, and about three weeks after plant their beans, lentils, and chick-pease. If they have any rain in April, as they usually have, they reckon their crop secure. Their harvest commonly begins in May, or in the beginning of June. Their ploughed lands are generally so light, that a pair of oxen may easily plough an acre in a day; and the quantity of seed, whether of wheat or barley, is about two bushels and a half to an acre, which one year with another yield about tenfold, and in some districts much more. The Tuniseans are much more addicted to agriculture than their neighbours the Algerines, and are for making the most of every inch of ground.

The story they tell of Mahomet, bey of Tunis, shews the high opinion they have of agriculture. This prince having been dethroned by his subjects, applied to Ibrahim Hojah, dey of Algiers, who engaged to restore him to his throne, on condition of his discovering to him the grand secret of the philosopher's stone, which he had the reputation of being master of; and, on his promising to fulfil this condition, he restored to him the government of Tunis. Mahomet then sent to the dey, with great pomp and ceremony, a multitude of plough-shares and mattocks; intimating to the Algerine prince, that the wealth of his country was to arise from a diligent attendance on the cultivation of the earth; and that the only philosopher's stone he could acquaint him with, was the art of converting a good crop into gold.

Eight leagues to the westward of Carvan are the ruins of Truzza, where are several vaulted chambers perpetually filled with sulphureous steams, much frequented by the Arabs for the use of sweating.

This kingdom and the rest of Barbary are very subject to earthquakes, which is easily accounted for from the great number of hot springs and sulphurous caverns, which are a proof of their being an almost inexhaustible store of nitre, sulphur, and other inflammable bodies in the earth, sufficient to cause those frequent and violent concussions. These earthquakes commonly happen after some great rains, at the end of the summer or in autumn, and will extend themselves a great way into the sea, where they have been felt when the depth of water has exceeded two hundred fathoms.

Among the natural curiosities of Tunis are several salt lakes, and a mountain of salt named Jibbel Haddeffa, which is hard and solid like a stone, of a reddish or purple colour, and bitter to the taste; but being washed down the precipices by the rain and dews, becomes soft and white as snow, and loses all its bitterness. There are other mountains whose salt is of a bluish colour, and, without undergoing such accidental purifications, are very palatable.

SECT. XXIII.

Of the principal Towns of the Kingdom of Tunis; particularly Bizerta, Tunis, Nabel, the Colonia Neapolis of Ptolemy,

Eusa, Cairwan, or Carvan, Media, or Mehedia, Urbs, or Tuberbo, Bayjak, or Beja, Forreanah, &c.

WE shall now describe the principal cities and towns of this part of Barbary. At the bottom of a large gulph is Bizerta, which is pleasantly situated on a canal; between an extensive lake and the sea, in thirty-seven degrees twenty minutes north latitude, two hundred and forty miles to the west of the city of Algiers, and thirty-seven miles to the north-west of Tunis. This town, which is about a mile round, is defended by several castles and batteries, the principal of which are towards the sea, from which the lake is continually receiving a brisk stream, or discharging one into it; the waters flowing into the lake when the wind is northerly, and returning back into the sea when it blows from the south. The channel between the lake and the sea was the ancient port of Hippo, which is still capable of receiving small vessels, but was once the safest and most beautiful haven on this coast; and there are still some traces of a large pier, which extended a considerable way into the sea; to break the force of the north-east winds.

The gulph of Bizerta, the Sinus Hipponensis of the antients, is a beautiful sandy inlet, near four leagues in diameter. As the ground is low, the eye penetrates through delightful groves of olive trees far into the country, and the prospect is bounded by a high rocky shore. Were proper encouragement to be given to trade and industry, Bizerta might be rendered a town of great wealth, it abounding with corn, pulse, fish, fruit, oil, cotton, and many other productions.

On the side of a spacious navigable basin, formed by the Mejerdah, lies Porto Farino, which was once a considerable city, but is now greatly decayed. It is chiefly remarkable for its beautiful cotton, where the Tuniseans keep their navy.

Tunis, the Tunes of the antients, and the capital of the kingdom, is situated in latitude thirty-six degrees twenty-six minutes, and in ten degrees fifteen minutes east longitude from London, on the western bank of the channel of Goletta, in the form of an oblong square, about a mile in length; but the whole town, with the suburbs included, does not exceed three miles in compass, though some authors have, without any foundation, given it a much larger circuit. It is not so populous as Algiers, nor are the houses so handsome and spacious. The lakes and marshes with which it is surrounded might probably render its situation less healthy, was not the moisture of the air corrected by the great quantity of mastic, myrtle, rosemary, and other aromatic plants, with which their ovens and bagnios are daily heated, and that frequently communicate a fragrance to the air. The want of sweet water is one of the greatest disadvantages under which the inhabitants labour; for the brackishness of their well-water, and the scarcity of their cisterns, oblige them to fetch a great part of what they drink from some places about a mile distant; but, except, this inconvenience, no place enjoys a greater plenty of all the necessities of life: for, besides ships continually bringing new supplies of provisions, their gardens abound with variety of fruit-trees, as palms, citrons, dates, lemons, and olives; which last grow in such abundance about a league distant round the city, that they supply not only the inhabitants but strangers with oil, and even with charcoal, that being the only wood they have to make it with.

They have their wheat chiefly from Urbs, Bugia, and other neighbouring places; and this they grind with a hand-mill; and having sifted it through a fine sieve, make of it fine cakes, and a flat kind of vermicelli; but this is only in use among the wealthy, the poor being forced to feed upon barley-meal, which they make into a kind of dumplings, and eat in oil or butter mixed with vinegar or lemon juice; but those who are very poor only stir it in water, and eat it raw, without any other preparation. However, they have plenty of honey, and fruits of all sorts pretty cheap.

Their principal streets of Tunis are large and crossed by narrow lanes at proper distances, and the houses are chiefly built with stone; but are meaner than those of Algiers, they being but one story high, and flat at the top. There are but

but few grand buildings, the chief of these are the great mosque, and the bey's palace. The gates of the city are five in number, but none of them are very handsome. Without the walls are the Turkish sepulchres, which are placed round the city, and are adorned with marble tombs, oratories, flower-pots, and other embellishments.

The bey's palace is the most magnificent edifice in the city. It has four noble gates, one at each front, and high turrets at each of the four corners; the courts are spacious, the galleries lofty and richly adorned, and the halls and apartments are very splendid, particularly that called the treasury, in which, among other things of value, is kept the book of their law written by Ali Mohadian, a celebrated doctor, from whom the beys boast that they are descended; and, in virtue of that descent, set up for the sole judges of all controversies about religion. The gardens are also very large, but not elegant.

The chief mosque just mentioned is built in the Turkish taste, and has nothing remarkable, except its extraordinary size and stately tower, which, next to that of Fez, is allowed to be the highest in all Africa.

Near the midst of the city is a piazza of great extent, which once contained no less than three thousand woollen and linen drapers shops, handsomely built, and was furnished with a great variety of those goods, besides a considerable number of others belonging to the druggists, and other trades and manufactures. Indeed the chief manufactures of this city are those of linen and woollen; for both which it has been long famous, on account of the peculiar way the women had of letting down their spindles from the top of their houses quite to the ground, the weight of which is supposed to make the yarn finer and smoother.

The baths of this city, for both sexes, are very numerous; and, though inferior in size and beauty to those of Fez and Algiers, yet people are here more handsomely treated, and better accommodated, notwithstanding the city being destitute of running water. Both these are chiefly furnished with that element from the cisterns on the top of the houses, which receive the rain water; and a certain quantity is let down from every house, by pipes, into one or two public reservoirs; from which this and the other exigencies of the city are supplied, though not in such a quantity as to permit the inhabitants to bestow any of it in watering or cleaning the streets, which, on that account, are always either dusty or dirty: so that it is very unpleasant walking in them, especially as their houses have no windows in the front, which has the appearance of walking between two dead walls.

Here are also several colleges and schools, in which are many of their learned men and doctors of their law, part of whom are maintained at the public expence, and part by begging; but all of them are held in high esteem, as the favourites of heaven. The janizaries have very handsome barracks, like those of Algiers; and their aga, or chief, a palace, to which they repair for orders. The merchants and tradesmen have a kind of public exchange, and the custom-house officers a large custom-house. There is also an arsenal and dock, seated upon the bank of the canal, in which they have materials sufficient for building several galleys.

On the opposite side is the fort of Goletta already mentioned, and about two leagues distant from it is another castle built on a small island in the lake; but as there is little probability of the town being attacked on that side, this fortification has been long neglected. The principal fortification belonging to the city is the castle, which is situated on an eminence that commands the whole; it makes a very good appearance at a distance, and has some cannon mounted before the gate: but the jealousy of the government is carried to such an excess, that it is very dangerous for a Christian to view it too attentively; and it is much the safest way to pass by it as fast as one can.

Nabel, the Colonia Neapolis of Ptolemy, is situated in a low ground, a mile and a half from the sea shore, about a furlong to the westward of the ancient Neapolis, and about nine miles to the east of Tunis. It is still a thriving town, and has been long famed for its potteries; the rest of its inhabitants are husbandmen. Here are

many inscriptions upon stones, six feet in length, and three in breadth; but they are so defaced and filled up with rubbish and mortar, as to be unintelligible. On the bank of a little brook that runs through the old city is a block of white marble, on which is curiously carved a wolf in basso relievo.

Hamamet, a small but opulent city, is compactly built upon a low promontory, and is well fortified by nature. Some columns and blocks of marble are here to be met with; these are ruins brought from the neighbouring places. This city is supposed to take its name from the number of wild pigeons bred in the cliffs of the adjacent mountains.

Susa, or Soufa, is a considerable trading city, and the chief mart for oil; besides which it carries on a flourishing trade in linen, a great deal of which is manufactured here; with wax, honey, and several sorts of pickled fish, especially that called tunny. The town stands upon a high rock, and was once very strong, populous, and wealthy. It is still the residence of the Turkish bashaws. The port is commodious and safe. The inhabitants, who are chiefly seamen, are civil to strangers; besides these, there are many merchants and tradesmen in the woollen way, who carry on a commerce with Turkey and other parts of the Levant.

Eight leagues to the westward of Susa is Kairwan, vulgarly called Carvan, the Vico Augusti of the ancients: This is a walled city, and the second in the kingdom for trade and the number of its inhabitants. It is situated in a barren plain, and at the distance of half a furlong from the walls is a pond and a capacious cistern, built to receive the rain-water; but the former, which is chiefly for the use of the cattle, drying up, or putrifying in the heat of summer, causes agues and other distempers. Here are some fine remains of the ancient architecture; and the great mosque, esteemed the most magnificent and the most sacred in all Barbary, is supported by an almost incredible number of granite columns, which the inhabitants say amount to five hundred; two of which are of so fine and lively a red, with little white spots, that they are esteemed inestimable, and the whole structure the most magnificent in all Africa.

Media, or Mehedia, is situated on a small peninsula on the eastern coast of the kingdom, and appears to have been formerly a place of considerable strength, though it is not above two hundred and thirty paces in breadth towards the land side; but widens on approaching the sea. The port, with an area of about a hundred paces square, lies within the walls of the city, with the mouth of it opening towards the south; but it is now so shallow, that it can hardly receive the smallest vessels. The walls which surrounded the place were strong and lofty, flanked with six stately towers, besides others of a smaller size; but all of them were very strong and high, and had small gates plated with iron, but so low, that a man could not go in or out without stooping, and each of these were a kind of separate fortrefs. But of all the six, one which faced the east, and was the only gate on the land side, was built with surprising strength, having under it a vaulted arch seventy feet long, guarded by six strong gates, one within another; some covered with plated iron, and others made of cross iron bars rivetted together, with retreats and port-culisses all of the same metal and form. These fortifications were erected by Mehedi, the first caliph of Kayrwan, who took no less pains in beautifying the city with noble buildings, if they were really his: but this a late judicious author much questions, from there being something too polite and regular in the several capitals, entablatures, and other pieces of ancient masonry, defaced as they now are, to imagine the founder of them to have been an Arabian. However, there is but little of its former splendour left, except the walls, and some other structures which are run to decay.

Monastier, an ancient city of Carthaginian or Roman extraction, received its modern name from a monastery of Augustine friars in its neighbourhood. It is now a neat thriving city, situated on the extremity of a cape, and encompassed by strong walls.

At the distance of six leagues to the west of Tunis is situated Urbs, or Tuberbo, the Tuburum Minus of the ancients, a small town on the banks of the Mejdah,

inhabited by Andalusian Moors. Mahomet, a late bey of this kingdom, planted in this neighbourhood a great variety of fruit-trees, placing each species in a separate grove: thus the citron trees are all placed by themselves, without being mixed with the orange or the lime; and where you gather the peach or apricot, you are not to expect the pear or apple. In the adjacent valley the same public spirited prince erected, out of the ruins of an ancient amphitheatre, a large masonry bridge, or dam, with sluices and flood-gates to raise the Mejerdah to a proper height, for the refreshing of his plantations: but this was too laudable a work for it to last long in Barbary, and therefore it has been entirely broken down and destroyed.

The city of Bayjah, or Beja, the Vecca of Sallust, is a place of great trade, and the chief mart for corn in the whole kingdom. It is built on the declivity of a hill, and has the convenience of being well watered. On the highest part of the city is a citadel of no great strength, and on the walls, which are raised out of the ancient materials, are several inscriptions. In the plains that lie before the city, a public fair is kept every summer on the banks of the Mejerdah, to which the most distant Arabian tribes resort with their families and flocks.

Fereanah is thought, from its lonely situation and other circumstances, to be the Thala of Sallust, and was once the largest city of Bizacium; though it has no other remains of its ancient grandeur, but some granite and other columns, which the Arabs have left standing on their pedestals. It has been extremely well watered; for, besides a considerable brook which runs under the walls, the city has had several wells, surrounded with a corridor, and vaulted over with a cupola. This, with the goodness of the air, are the only benefits this city can urge in favour of its situation; for, except a small extent of ground to the southward, which the inhabitants cultivate by supplying it, at proper times, with the water of the rivulet, the rest of the adjacent country is dry, barren, and inhospitable. The prospect to the westward is terminated by some naked precipices: and, where the eye is at liberty to wander through a valley between some narrow cliffs, you are entertained with no other view than of a desert scorched up with perpetual drought, and glowing with the ardent beams of the sun.

Twelve leagues to the eastward of Feereanah is Gafsa, the ancient Capfa, which is situated on a rising ground, almost enclosed with mountains; but the landscape is more gay and verdant than that about the last mentioned city, from the prospect it affords of palm, olive, pistachio, and other fruit-trees. However, this agreeable scene is of small extent, and only serves to refresh the eye in the more distant prospect of an interchange of barren hills and vallies. These trees are watered by two springs, one of which rises within the citadel, and the other in the center of the city. The latter is probably the fountain mentioned by Sallust, and was formerly covered with a cupola: it is still walled round, and discharges itself into a basin, which was perhaps originally designed for a bath. These two springs unite their streams before they leave the city, forming a pretty large brook, which, from the quantity of water, and the rapidity of the stream, might continue its course to a great distance, did not the inhabitants constantly use it in supplying their plantations. In the walls of some private houses, and more especially in those of the citadel, which is a slight modern building, is a great confusion of columns of granite, entablatures, and altars, which, when entire, and in their proper situations, must have been great ornaments to the city.

SECT. XXIV.

Of the Roman and other Antiquities to be found in the Kingdoms of Tunis.

FROM the account we have given of the principal towns of Tunis, it appears that this country abounds with Roman and other antiquities; and we shall now add to those we have already mentioned, others of a more extraordinary nature. The Rev. and learned Dr. Shaw

says, it is difficult to fix the exact situation of the ancient city of Utica, except we allow that the sea has been driven back three or four miles by the easterly winds, and the increase of the mud, which is probably the case; and then it may be justly placed at Boofhater, where are many traces of buildings of great extent and magnificence, as walls, cisterns, and a large aqueduct. These ruins lie about twenty-seven Roman miles from Carthage, and behind them we are entertained with a view of the large fields which the Romans have rendered famous by their military exploits.

The celebrated city of Carthage has not much better supported itself against the encroachments caused by the north-east winds, and the mud thrown out by the Mejerdah, which has stopped up the ancient harbour, and rendered it almost as far distant from the sea as Utica. The greatest part of Carthage stood upon three hills, inferior in elevation to those on which Rome was built. Upon a place which overlooks the south-east shore is the area of a spacious room, with several smaller near it: some of them have tessellated pavements, but neither the design nor the execution are very extraordinary. In rowing along the shore, the common sewers are seen in several places, which, as they were originally well built and cemented, time has not in the least impaired. Except these, the cisterns have suffered least by the ruin of the city; for, besides those which belonged to particular houses, there were two sets for public use: the largest, which was the grand reservoir, and received the water of the aqueduct, lay near the west wall of the city, and consisted of more than twenty contiguous cisterns, each about a hundred feet long and thirty broad. The smaller cistern is in a higher situation near the cothon, it being contrived to collect the rain water that fell upon the top of it, and upon some adjacent pavements made for that purpose. This, however, might be repaired with little expence, the small earthen pipes through which the water was conveyed wanting only to be cleaned.

No other remains of the grandeur and magnificence of this ancient city, the rival of Rome, are now to be seen. We find no superb pieces of architecture; no triumphal arches: no columns of porphyry or granite; no curious entablatures: all the broken walls and structures now to be seen, being erected either in the Gothic manner, or by the later inhabitants. However, the ruins of the celebrated aqueduct that conveyed the water into the great cisterns, may be traced to the distance of at least fifty miles. This was a very expensive work, and that part of it which extends along the peninsula, was beautifully faced with stone. Dr. Shaw observes, that at Arriana, a small village to the northward of Tunis, are several entire arches, which he found to be seventy feet high, and supported by piers sixteen feet square. The water channel above these arches was vaulted over, and plastered with a strong cement: a man of the ordinary size may walk upright in it, and at certain distances holes are left open both for the admission of fresh air, and the convenience of cleaning it. A temple was erected at Zowan, and at Zungar, over the fountains by which this aqueduct was supplied with water; that of Zungar appears to have been of the Corinthian order, and ends very beautifully in a dome that has three niches, and extends over the fountain. In these niches were probably statues of water-nymphs, or other deities.

Farther to the east is the sanctuary of Seedy Doude, which takes its name from David, or as they pronounce it Doude, a Moorish saint, whose sepulchre is here shewn five yards long. Yet this structure appears to be part of a Roman Prætorium, from the contiguous Mosaic pavements, all of them executed with the greatest symmetry and exactness: the figures are horses, trees, birds, and fishes, beautifully inscribed in such a variety of colours, that they even appear more gay and lively than many tolerable paintings. The horse, the insignia of the Caraginians, is represented in the bold posture in which it appears upon the African medals; the birds are the hawk and the partridge; the fishes the gilt-head and the mullet; and the trees the palm and the olive. The designer perhaps, intending to point out the strength, the diversions, the fishery, and the plenty of dates and olives,

olives, for which this country has always been famous.

Six miles farther to the east is Lowbareah, the Aquilaria of the ancients, where Curio landed the troops that were afterwards cut to pieces by Sabura. There are here several fragments of antiquities; but none of them very remarkable, except a surprizing cavern; for from the sea shore to this village, which is about half a mile distant from it, is a mountain hollowed with great art, from the level of the sea to the height of twenty or thirty feet, with large pillars and arches, which have been left standing at proper distances to support the roof. These are the quarries mentioned by Strabo, from whence the buildings of Carthage, Utica, and many other neighbouring cities, might receive their materials. Our author remarks, that as this mountain is all over shaded with trees; as the arches below lie open to the sea, with a large cliff on each side, and opposite to it is placed the island of Ægimurus; while springs are perpetually trickling down the rocks, and seats are raised for the weary labourer, there is scarce any doubt but that this is the cave played by Virgil some where in this gulph, though some have thought his description merely the work of imagination.

The amphitheatre of Jemme, the Tiftra of Cæsar, is a noble piece of antiquity, originally consisting of sixty-four arches, and four orders of columns. The upper order, supposed to be no more than an Attic, has suffered greatly from the Arabs, and in a late revolt of those people, who used this place as a fortress, Mahomet bey blew up four of the arches from top to bottom, otherwise nothing can appear more entire and beautiful, particularly on the outside; and within, the platform of the seats, with the galleries leading to them, are still standing. The arena is nearly circular, and in the center of it is a deep well of hewn stone, where the pillar that supported the velum, or awning, may be supposed to have been fixed.

Besides this noble structure, there are still to be seen many other antiquities; as a variety of columns, altars with defaced inscriptions, trunks of marble statues, one of which is of the colossal kind in armour, and another is of a naked Venus, in the attitude and dimensions of the Medicean, both by good masters: but their heads broken off. Not inferior to this, are the triumphal arches of Spaitla, the ancient Sufetula, which is of the Corinthian order, consisting of one large arch, and a smaller one on each side, with the fragment of an inscription upon it. From thence all along to the city, which is at about a furlong distance, is a pavement of large black stones, with a parapet wall on each side. At the end of this pavement you pass through a beautiful portico, built in the same manner with the triumphal arch. This leads into a spacious court, where are the ruins of three contiguous temples; but the roof, porticos and fronts are broken down, though all the other walls, with their pediments and entablatures, remain entire.

Upon an eminence six leagues to the west-south-west of Spaitla, is Caslareen. The river Derb runs winding below it, and upon a precipice that hangs over that river, is a triumphal arch, more remarkable for the quantity and value of the materials, than for the beauty and elegance of the design. It consists of only one large arch, with an Attic structure above it, that has some ornaments, resembling the Corinthian, upon the entablature; but the pilasters are entirely Gothic; yet notwithstanding the rudeness of the workmanship, and the oddness of the situation, it has an inscription, in which Manlius Felix, the founder, is gratefully commemorated. In the plains below the city are many mausolea, upon one of which is an elegy in hexameter and pentameter verses.

Upon the sea-coast, about two leagues west-by-south of Hamamel, is the Menara, a mausoleum erected in the form of a cylindrical pedestal, near sixty feet in diameter, with a vault underneath. On the top of this structure, just above the cornice, are placed several small altars, which the Moors suppose to have been designed for so many lamps for the direction of marines. All these altars had inscriptions, three of which are still leg-

ible, one of them has these words; *L. Emilio Africano Avunculo*; another, *C. Suellio Pontiano Patrueli*; and the other, *Vitellio Quarto Patr.*

There are also a variety of these mausolea at Hydra, some of a round, others of an octagon form; others again square, with a niche on one of the sides, or a wide open place like a balcony on the top, all of them supported by four, six, or eight columns, and well preserved; only their inscriptions are defaced by time, or by the malice of the Arabs.

It is perhaps impossible to conclude this section, with words more applicable to the subject, than a passage in the preface to the travels of the learned author we have so often quoted. "A traveller, says he, can scarce fail of falling into a serious train of thought, when he observes such large scenes of ruins and desolation, as are seen in these countries. He is struck with the solitude of the few domes and potticoes that are left standing, which history tells him were crowded with inhabitants; where Syphax, and Massinissa, Scipio and Cæsar: where the orthodox Christians and the Arians, the Saracens and the Turks, have in their turns given laws. Every pile, every heap of ruins points out to him the weakness and instability of all human art and contrivance, reminding him of the many thousands that lie buried below, now lost in oblivion, and forgotten to the world."

S E C T. XXV.

Of the Persons, Customs, Manners, and Buildings of the Tuniseens, particularly of the Turks, Moors, and Arabs; with many Customs that are agreeable to the Practice of the most early Ages.

THE Tuniseens in general, and particularly the inhabitants of the metropolis, are like those of Algiers, a mixture of Turks, Moors, Arabs, Jews, Christian merchants, and slaves; with this remarkable difference, that they are here more polite and civilized, and entirely free from that haughtiness, insolence and cruelty for which the rest of the people in Barbary are justly branded. They are in general much more kind and humane to their slaves, though they treat the knights of Malta, who are reduced to that condition with greater severity, chiefly to oblige them to purchase their freedom at a dearer rate: for besides the iron shackle which all are obliged to wear about their ankles, they have a huge heavy chain fastened to it, which commonly weighs twenty-five pounds, and which they are obliged, either to twist about their legs, though it is then very troublesome to walk with; or to hang it to their girdle by a hook, which causes a pain in the side; or else to hang it over their shoulder. They were formerly put to the hardest labours, such as carrying of sand, stone, and mortar for the builders, on which account they were obliged to write to Malta as soon as possible for their ransom. The Maltese, on the other hand, were no sooner informed of their ill treatment, than they ordered all their Turkish slaves to be cruelly bastinadoed by way of return. In consequence of which these were obliged to write to the Tuniseens, that if they continued to make the Maltese slaves work at Tunis, they should be cudgelled to death at Malta; and this at length put an end to this additional hardship.

The Tuniseens are, in other respects, very courteous to strangers, and all affairs with the regency are transacted in a very friendly manner. The consuls that reside at Tunis are treated with greater affability and condescension, justice, and dispatch, than in any other court on these coasts. Indeed, this nation has for many years been more intent upon trade, and the improvement of manufactures, than upon plundering and cruising; on which account the people have justly obtained the character of not living like their neighbours, in a perpetual open war with the Christian power; but of cultivating their friendship, and readily joining in their alliances.

The

The greatest part of the Moorish women here would be esteemed beauties even in England, and their children have the finest complexions of any nation whatsoever; but the boys are so exposed to the sun, that they soon attain the swarthiness of the Arab; but as the girls keep more at home, they preserve their beauty till they are thirty, when they are generally past child-bearing. One of these girls is sometimes a mother at eleven, and a grandmother at twenty-two; and, as they generally live as long as the Europeans, they sometimes live to see their children of many generations.

The dress of the Tuniseens of both sexes is also neater and more genteel, though nearly of the same fashion with that of the Algerines. The citizens of both sexes constantly wear drawers, especially when they go abroad, or receive visits. The virgins are, however, distinguished from the matrons, by having theirs made of needle-work, striped silk, or linen; but when the women are at home, or in private, they lay aside their hykes, and sometimes their tunics, and, instead of drawers, bind only a towel about their loins. The ladies affect to have their hair hang down to the ground, which they collect into one lock upon the hinder part of the head, binding, and plaiting it with ribbons; but where nature has been less liberal, they supply the defect by adding artificial to the natural locks. The hair being thus adorned, they tie close together above the lock the several corners of a triangular piece of linen, worked with the needle in a variety of figures. Those of superior fortune wear what is called a *farmah*, which is nearly of the same shape as the other head-dress; but is made of thin flexible plates of gold or silver, cut through, and engraved in the manner of lace; and the dress is completed by a handkerchief of silk, gauze, crape, or painted linen, bound close about the *farmah*, and negligently falling upon the lock.

But none of these ladies think themselves completely adorned, till they have tinged the eye-lashes and the edges of their eye-lids with the powder of lead ore. This operation is performed by dipping a wooden bodkin, of the thickness of a quill, into the powder of lead ore, and drawing it under the eye-lids over the ball of the eye, which communicates to the eyes a blackness that is thought to add great beauty to persons of all complexions. "This practice, says the learned Dr. Shaw, is of great antiquity; for we find that when Jezebel is said, in 2 Kings ix. 30. to have painted her face, the original words are, *She set off her eyes with the powder of lead ore.*" The same author has proved, that this kind of ornament was also in use among the antient Greeks and Romans; and, in the course of this work, we have shewn, that it is not only still practised in Barbary, but in Turkey in Asia, and other countries in the East.

The women of Tunis are not only handsomer and more neat, but more familiar than in the other parts of Barbary; they, indeed, put on their veils when they go abroad; but are allowed to be seen, and to converse with strangers, their husbands being less inclined to jealousy than the other Africans. The ladies of fortune are very fond of rich ornaments and perfumes, and are very constant in visiting the public baths belonging to their own sex; on which account the shops of the druggists and apothecaries are seldom shut before midnight, that being their chief time for bathing; in which they use a considerable quantity of odoriferous drugs and rich perfumes.

The men, as well as the women, resort much to these baths, their religion obliging them to use frequent washings, particularly before the hours of public prayers, after every trifling defilement, and more particularly after the matrimonial intercourse.

The merchants, officers, doctors, and scholars, when they go abroad, appear neatly dressed; but have such a sedate gravity, and good manners, that, though their streets are crowded with people, one may go from one end of the city of Tunis to the other, without fear of being insulted by the Turks, as one is sure to be at Algiers. Indeed the Tuniseens do not allow of many public mean taverns being kept by their slaves, as is done at Algiers, and those they have are better regulated; whence those very slaves are allowed to chastise even a Turk, if he drinks too much, or behaves insolently; and

even to pull off and keep his turban, till he has paid his reckoning. They sell none but white wine, which the country produces in great plenty, and is very cheap and good; but, to render it more intoxicating, they commonly mix quick lime with it. It is customary in the taverns at Tunis, if a person calls for a quart of wine, to set before him three or four dishes of meat, or fish, with a sallad, and other sauce; and when he goes away, he pays only for the wine at a common price.

Though many of the Tuniseens allow themselves the use of wine, yet few drink it to excess; and some are still so strict as to refrain from it entirely, and instead of that pernicious liquor, as they call it, make use of a compound drug, to which they give the name of *harix*, or, according to others, *laisis*; an ounce of which will inspire them with such surprising gaiety and intrepidity, that nothing can ruffle their mirth, or give them either fear or discontent. This composition, they say, they learned from the Turks, and, from its effects, it seems to be of the nature of opium, and is probably a mixture of that with other drugs.

The Turks and Moors are every where early risers, and constantly attend the public devotions at break of day; after which each person is employed in his proper trade or business till ten in the morning, the usual time of dining; they return again to business till the afternoon prayers, when all kind of work ceases, and their shops are shut up. The supper generally follows the prayers of five o'clock, and then repeating the same at the setting of the watch, when it begins to be dark, they go to bed immediately after.

Some of the graver people, who have no constant employment, spend the day either in conversing with one another in the barbers shops, in the bazar, or at the coffee-house: but a great part of the Turkish and Moorish youth, with many of the unmarried soldiers, attend their concubines with wine and mulic into the fields, or make merry at one of the public taverns.

As to the Arabs, their lives are one continued round of idleness or diversions. When they are not called abroad by any pastime, they spend the day in loitering at home, smoking their pipes, and reposing themselves under some neighbouring shade. They have not the least relish for domestic pleasures, and are seldom known to converse with their wives, or to play with their children. The Arab places his highest satisfaction in his horse, and is seldom in high spirits but when hunting or riding at full speed. The eastern nations are in general very dexterous at this exercise. At the hunting of the lion a whole district is summoned to appear, when forming themselves into a circle, they at first enclose a space three or four miles in compass, according to the number of the people and the nature of the ground. The footmen advancing first rush into the thickets with their dogs and lances to rouse the game, while the horsemen keeping a little behind, are always ready to fall on the wild beasts. Thus they proceed, contracting the circle, till they at last either meet together, or find diversion. The accidental pastime on these occasions is sometimes very diverting; for the various animals within the circle being thus driven together, the people seldom fail of having a variety of agreeable chases after hares, leopards, hyenas, jackalls, and other wild beasts.

Hawking is another of the principal diversions of the Arabs and gentry of the kingdom of Tunis, where the woods afford a great variety of hawks and falcons. Those who take delight in fowling, instead of springing the game with dogs, shade themselves with a piece of canvas stretched upon two reads, and painted with the figure of a leopard. The fowler thus concealed walks through the breaks and avenues, looking through some holes a little below the top of the screen to observe what passes before him. The partridges and some other birds, on the approach of the canvas, are observed to covey together, though they were before at some distance from each other; and the woodcock, quail, and some other birds that usually feed in flock, will, on seeing it, stand still with a look of astonishment. The sportsman has by this means an opportunity of coming near them, when resting the screen upon the ground, and directing the muzzle of his piece through one of the holes, he shoots at a whole

whole covey at once. The Arabs have likewise another method of catching partridges; for observing that after their being hastily sprung two or three times, they become fatigued and languid, they then run in upon them, and knock them down with their zerwatties, which are short sticks bound round with iron, or inlaid with brass or pewter. Those Arabs who are not masters of a gun make use of these both for offensive and defensive weapons.

The Bedoweens, a name given to the Arabs who live in tents, still retain many of the customs we read of in sacred and profane history; for except their religion, they are the same people they were two or three thousand years ago. Upon meeting each other, they still make use of the primitive salutation, "Peace be unto thee." The inferiors shew their deference and respect to their superiors, by kissing their feet, knees, or garments, while the children, or kinsfolk, pay the same respect to the heads of their parents, and aged relations. In saluting each other, they clap their right hand on their breast, while those who are more intimately acquainted, or are of an equal age or dignity, mutually kiss the hand, head, or shoulder; and, at their great solemnities, the wife also compliments her husband by kissing his hand.

Persons of the highest character, like the antient patriarchs and the heroes of Homer, perform what we should term menial offices. The greatest prince, when visited by a stranger, is not ashamed to fetch a lamb from his flock and kill it, while the princess makes haste to prepare her fire and kettle, and then dresses it. The custom of walking either bare-foot, or with sandals, renders the compliment of washing the strangers feet still necessary: this is done by the master of the family, who first presents himself, and is always the most officious in this act of kindness. When his entertainment is ready, he would think it a shame to sit down with his guests; instead of which he stands all the time, and waits upon them: yet, notwithstanding this respect, those are sometimes overtaken and robbed in the morning, by the very persons who entertained them with such hospitality the night before.

The respect paid by the polite nations of Europe to the female sex, is in this country considered as absurd infringements of that law of nature which assigns the pre-eminence to man: for the wives are only considered as a superior class of servants, who are yet to have the greatest share of toil and labour. While the lazy husbands take their repose under some neighbouring shade, and the young men and maidens attend the flocks, the wives are all day either employed at grinding at the mill, dressing provisions, or working at their looms; and, to conclude the day, they still, as in ancient times, take a pitcher, or goats-skin, and tying their sucking children to their backs, trudge two or three miles to fetch water: yet, notwithstanding all this business, neither these country ladies, nor those of still higher rank in the cities, will lay aside any of their ornaments, neither their nose-jewels, their bracelets for their arms and legs, or their ear-rings, all of which are very cumbersome; nor will they omit tinging their eyes with lead ore; so prevalent is custom, and so fond are even the ladies in Barbary of appearing in the fashion.

The method of building both in Barbary and the Levant seems also to have continued the same from the most early ages. Their houses are square buildings, with flat roofs, surrounding a court, where alone they are ornamented. Indeed large doors, spacious rooms, marble pavements, and cloistered courts, with fountains sometimes playing in the midst, are well adapted to the heat of the climate.

On leaving the streets, which are generally narrow, with a range of shops on each side, and entering one of the principal houses, you first pass through a porch, or gate-way, with benches on each side, where the master of the family receives visits and dispatches business, few persons, even among the nearest relations, being admitted any farther, except upon extraordinary occasions: from hence you pass into the court, which lying open to the weather, is, according to the ability of the owner, either paved with marble, or such coarser materials as are

proper for carrying off the water. When a number of people are to be admitted, as upon the circumcision of a child, or the celebration of a marriage, they are seldom received into any of the rooms, but only into this court, which is then covered with mats and carpets for their more commodious entertainment; and, to shelter them from the heat of the weather, a kind of veil is expanded upon ropes from one side of the parapet wall or lattice of the flat roof to the other. To this covering, which may be folded or unfolded at pleasure, Dr. Shaw remarks, that the Psalmist seems to allude, in that beautiful expression, "Thou spreadest out the heavens like a curtain."

This court is usually surrounded with as many cloisters above each other as the house is stories high, with either a balustrade, or lattice-work round those above, to prevent any persons from falling down. You are conducted from the cloister and galleries into large spacious chambers of the same length with the court; but they have seldom or never any communication with each other, and one of these rooms frequently serves a whole family, particularly when many persons join in the rent of a house; hence the cities of Barbary are extremely populous in proportion to their extent.

Their mosques are built exactly in the form of our churches, only instead of pews the floor is covered with mats. Near the middle a pulpit is erected, from whence the Mufti, or one of the Imams, every Friday explains a part of the Koran, and exhorts the people to piety and good works.

Near all the cities and villages is a large spot of ground, in which they bury the dead. Every family has a particular part of it walled in like a garden, in which the bones of their ancestors have, for many generations, remained undisturbed. In these enclosures the graves are all separate and distinct, each having a stone placed upright both at the head and feet, while the intermediate space is either planted with flowers, bordered round with stone, or paved all over with tiles. The graves of persons of distinction are distinguished by their having a square room with a cupola built over them; which being constantly kept clean, white-washed, and beautified, they to this day continue, as our author remarks, an excellent comment upon the expression of our Saviour, where he compares the hypocrites to whited sepulchres, which appear outwardly beautiful, but are within full of dead mens bones and all uncleanness, Matth. xxiii. 27.

It is worthy of observation, with respect to these several structures, that where extraordinary strength is required, the plaiter and cement are, to all appearance, of the same consistence and composition with those of the antients. Thus our author observes, that the cisterns built by Sultan ben Eglib, in several parts of the kingdom of Tunis, are of equal solidity with the famous ones at Carthage, and continue as firm and compact, unless where they have been designedly broken, as if they were but just finished. The composition is made in the following manner:

They take two parts of wood-ashes, three of lime, and one of fine sand, which, after being well sifted and mixed together, they beat incessantly for three days and nights with wooden mallets, sprinkling them alternately, and at proper times with a little oil and water, till they become of a due consistence. This composition is chiefly used in their cisterns, arches, and terraces: but the pipes of their aqueducts are joined with tow and lime beat together with oil only, without any mixture of water. Both these compositions soon assume the hardness of stone, and suffer no water to pervade them.

The ingenious and learned divine we have so often quoted, and from whom we have borrowed the above article, also observes, that, instead of common glue, the joiners frequently use a preparation of cheese, which is first to be pounded with a little water in a mortar, till the whey matter is washed out. When this is done, they pound it again with a small quantity of fine lime, and apply it afterwards as quick as possible to such boards as are to be joined together; which, after the cement becomes dry, it is said, will not be separated even by water itself.

We shall now take a view of the habitations of the Bedoweens and Kabyles, the former the inhabitants of the

the plains, and the latter of the mountains. The tents of the Bedowens, which are of an oblong figure, and resemble the hull of a ship turned upside down, are covered with a coarse hair-cloth, and differ in size, in proportion to the number of persons who live in them. Some of them are supported by a pole eight or ten feet high, and others by two or three poles of the same length, while a curtain, placed upon occasion at each of these divisions, separates the whole into several apartments; and these poles being covered with hooks, the Arabs hang upon them their cloaths, saddles, baskets, and warlike instruments. They take their rest by lying upon a mat, or carpet, wrapped in their hykes, which have been already described in treating of Algiers, and have neither bed, mattress, nor pillow. When there are a number of these tents together, they are usually placed in a circle, and in the night the cattle are inclosed in the area in the middle, to secure them from the wild beasts. In short, Virgil's description of their manner of living and decamping is as justly drawn, as if he had but lately made his observations.

The villages of the Kabyles consist of a number of cottages, built either with bricks dried in the sun, with the materials of some ancient ruins, or with hurdles daubed over with mud; while the roofs are covered with straw, or turf, supported by reeds, or the branches of trees. In the largest of them there is seldom more than one room, which not only serves for a kitchen, dining-room, and bed-chamber, but one corner of it is reserved for their fowls, calves, and kids. In these huts the women make their blankets called hykes, and the goats hair cloth for their tents; but, instead of weaving them with a shuttle, they conduct every thread of the wool with their fingers.

SECTION XXVI.

Of the Government, Laws, Commerce, and Language of the Tunisiens.

THE government of Tunis is at present, like that of Algiers, entirely despotic; but with this difference, that the dignity of Dey of Algiers is elective, while that of the Bey of Tunis is not only hereditary, but he has the power of nominating which of his sons he chooses for his successor; or, if he thinks none of them worthy of that honour, he may choose either a brother or a nephew to succeed him in the throne.

The Beys are also equally independent both of the Grand Seignior and the Divan. They were indeed once under the protection of the former; but the rapacious extortions and tyranny of the bashas in a manner obliged them to shake off their yoke, and form a government of their own, which was settled in such a manner, that their Deys, as they were then called, could do nothing without the consent of the divan: but they at length found means to rid themselves also of this uneasy clog, tho' the government still retains a shadow of both; for the Porte has still a basha who resides here; but his power and influence are so inconsiderable, that he only serves to remind the Tunisiens of their being once subject to the Grand Seignior, or at most to prevent the regency taking any measures prejudicial to his interest. As to the divan, it being chiefly composed of the friends and creatures of the Bey, they are rather assembled to give a forced approbation to his resolutions, than for him to consult them about their justice and expediency.

When this new form of government was first established, the Deyship, as hath been already intimated, was the supreme dignity, and the Beys, who were the next in rank, were entirely subordinate; but having since built their power on the ruin of the Dey's, they have by degrees raised themselves to their present independency; and, by making the office of Bey hereditary, have endeavoured to prevent those frequent depositions, rebellions, and massacres, which are too common in an elective monarchy. They have, however, been unable to prevent jealousies and cabals, or to hinder the sons rebelling against their fathers, or against such of their

brothers as are nominated to succeed them; whence the dignity of Bey oftener falls to the share of that son who has had the address to form the strongest party, than to him who has been appointed by his father, or is most worthy to fill the throne. Thus, whenever, this office becomes vacant, it is seldom filled up again without much bloodshed, rapine, and violence.

The dignity of Dey is now dwindled to such a degree, that he who enjoys it has scarce half the share in the government, which the Beys possessed when they held the next rank under it; for these were then appointed governors of the provinces, where they lived in great state and grandeur, gaining immense wealth by oppressing their fellow subjects, and by sinking a considerable part of the revenue into their own coffers: whereas the Bey, by dividing the Kingdom into two circuits, and collecting the revenue in person, at the head of his flying camp, has at once stripped them of the greatest branch of their wealth, grandeur, and authority, and left them only a mere dependence on the favour of the Bey. Both the Deys and the Divan took great umbrage at this excess of power, and much more on their entailing the royal dignity on their descendants, and rendering it still more secure to them by the alliances they contracted with the Arabian princes, their near neighbours; but the noble and united struggles they made to shake off this new and irksome yoke, instead of meeting with the success they expected, served rather to render it more heavy and durable.

The Bey, however, shews a great indifference to all the grandeur of state, and is contented with securing to him and his descendants the privilege of reigning with an uncontrouled sway. He has indeed very powerful reasons to prevent his making such a splendid figure as would rather create envy and jealousy, than awe and regard, either from his subjects, especially the Moors and Arabs, or from his neighbours, and more particularly the Dey of Algiers.

What the revenues and land-forces of the Bey of Tunis are, is not easy to guess, the former chiefly consisting in the tribute which the Moors and Arabs pay, and in the customs arising from imports and exports, both of which are in a constant fluctuation; for both the Moors and Arabs frequently find means of eluding the payment of their taxes. The forces of the Bey chiefly consist of renegadoes and a few militia, the latter of whom are chiefly kept in their garrisons and sea-ports; but are neither so well-paid nor disciplined as those of Algiers. The renegado soldiers, who chiefly compose the Bey's guard and the garrison of his capitol, are indeed better maintained and clothed. Besides these the Bey can, upon all emergencies, command a powerful army of Moors and Arabs, both horse and foot; but can have no great dependence on their fidelity.

Their ships are also much inferior to what might be expected from such a maritime trading nation. Those that belong to the government are seldom more than four, and all of them poorly rigged, the largest carrying no more than forty guns: beside these they have about thirty galliots, which carry from twenty to a hundred and twenty men: these are generally commanded by a renegado, and manned partly by some of the same people, and partly by Turks and Couloglies, or the sons of married soldiers. The Christian slaves work the ship, and those of the Mahometan religion are only concerned in the fighting part. The four great ships set out on a cruise, and are supplied with biscuit, oil, butter, and vinegar, by the Bey; but as these provisions are insufficient, their captains, for two piasters more from every Turk, enlarge the allowance.

Other galliots are also fitted out by private owners, who cruise at their own expence, pay the ship's crew, defray other charges, and are allowed the sole property of the prizes they take, except such perquisites as the Bey reserves for himself.

When any of the government ships bring in a prize, the hull of the vessel and half the cargo, after the ship's expence has been deducted, belong to the Bey; and the other half is divided between the rais, or captain, and the company. The rais has six shares, the under rais four, the master two, the cockswain two, and each private

private man has half a share. With respect to the slaves, the Bey, besides his half, has the privilege of buying the rest at a hundred piasters per head, though he seldom fails of selling them for three or four hundred; only every tenth head belongs to the divan.

A Christian merchantman, on entering the road of Tunis, hoists his colours, and salutes the castle of Goletta with three guns, and then the master goes ashore to inform the Aga whence he comes. But when a man of war belonging to one of the Christian powers comes in, he anchors at a farther distance from the castle than the merchantmen, and is first saluted from it according to his rate, which he returns with the same number of guns. While he stays, a flag is hoisted at the house of the consul belonging to his nation, and all the merchantmen of the same country keep their colours flying. The man of war is no sooner arrived, than the consul is obliged to give notice of it to the Bey, who instantly orders all the slaves to be shut up, lest any of them should find means to get on board; in which case there would be no reclaiming them. At the departure of a ship of war, the Bey commonly sends the captain the usual presents of oxen, sheep, poultry, and other refreshments.

All trading vessels which load or unload in this kingdom, are obliged to pay anchorage, which amounts to seventeen piasters, and also for loading and unloading. The average on ships loading being part of the public revenue, rises and falls according to the exigencies of the state. This duty, which ran high in the year 1733, amounted to twenty piasters for every ship, whether loading or unloading. To these may be added, the duty of two per cent. called the consilage, on every cargo taken on board at Tunis, and is for the salary of the consul and other officers. The passports granted to French captains are, at the desire of their own crown, limited to three years; at the end of which they are to appear before an admiralty-court in France, under severe penalties, before they renew it: but those granted to the English extend to fourteen years, without their being confined to the above-mentioned obligation.

All public conventions and instruments are written in the Arabic tongue, which, from the introduction of the Turkish religion into Barbary, and the intercourse with the Moors, is much corrupted from its antient energy and elegance. The public commerce is generally carried on by the help of the *Lingua Franca*.

The great number of renegadoes from France, Spain, and Italy, which are here much encouraged, on account of their abilities, usefulness, and professed hatred to all Christians, have likewise rendered their languages so familiar in these parts, especially in Tunis, that it would be dangerous to talk of state affairs in any of them before either the Turks or Moors. Many of these renegadoes find means to raise themselves to the most considerable employments, and gain immense riches.

The Jews also swarm in this kingdom, on account of their usefulness and commerce, and live after their own manner in their separate quarters. There are computed to be no less than nine or ten thousand in the city of Tunis, many of whom carry on a very considerable commerce; and as they are much addicted to cheat in their weights and measures, to make fraudulent bankruptcies, and also to adulterate gold dust and other commodities, they are generally more severely punished or fined than any other foreigners; especially if they are caught in diminishing or counterfeiting the coin, which is much the same here as at Algiers.

The punishments inflicted on criminals are much the same at Tunis as at Algiers, only their superstition has dictated a different method of putting to death those renegadoes who turn Christians. Their cruelty is here extremely dreadful, for they either wrap them up in a cloth dipped in melted pitch, and then set it on fire; or else put them to a more lingering death, by enclosing the whole body, except the head, and rubbing that and the face with honey, which exposes them to the bite and stings of wasps and other insects, by which they are tortured several days and nights before they expire.

They also punish with inhuman cruelty the slaves who attempt to run away, especially such as kill their Maho-

metan masters; for this last offence they break the offender's arms and legs, tie him to a horse's tail, and drag him thro' all the streets; after which, if he be still alive, they give his body to the Franks or European Christians; but the boys frequently take the body out of the executioner's hands, in spite of the mezoar, or sub-basha; and having dragged it about some time longer, roast it with straw, and, after many other indignities, at last throw it into some ditch, from whence it is fetched by the Franks in order to be interred.

Tunis exports to France, Morocco skins, hides, wool, corn, oil, beans, lentils, and wax; and receives in exchange Languedoc cloths, Spanish wool, iron, steel, hardware, paper, brandy, wine, pepper, cloves, sugar, and vermillion. The Italian trade is carried on entirely by the Jews, who send the same commodities as to France, and import from thence gold and silver tissue, Spanish cloths, damasks, and several sorts of silk and woollen stuffs. The Moors and Turks export to the Levant gold dust, chequins, woollen stuffs, bales of caps, and lead; and bring in return silks, calicoes, iron, vermillion, and allum. They vend much the same kind of commodities into Egypt; but the oil that is carried thither must be put up in jars, and not in casks, the greatest part of it being designed for the lamps of Mecca and Medina; and the Arabians would think it polluted, as the casks might formerly have contained wine. From thence they export in exchange rice, linen, flax, cotton, and coffee.

The number of French ships freighted at Tunis by the Turks, Moors, and Jews, are said to amount annually to no less than a hundred and fifty to the Levant, and fifty for France and Italy; but as for those of the English, their number is quite uncertain.

One considerable branch of the commerce of Tunis consists in the caravan vessels which trade to the Levant, not only on account of the half average they pay to the state, but of the vast concourse of people they occasion, and the tax on passports; but the most considerable of all the caravans are those from Saltee and the Cadensis; the first of which arrives about three weeks before the fast of Ramadan, and enriches the Tuniseens with gold dust and chequins to the value of a hundred thousand pounds sterling. The Cadentian, which comes in twice a year, also brings plenty of gold dust, besides a considerable number of negroes, which they exchange for cloths, Venice glasses, coral, wire, paper, &c.

In most other respects, the commerce of the Tuniseens is carried on much after the same manner as that of Algiers, with this advantage, that foreigners are used with much greater equity and humanity. The English, French, Dutch, Imperialists, and Genoese, have their consuls, who are likewise treated with much greater respect. They have not only fine houses in the metropolis, but handsome villas, or country seats, in its neighbourhood; and in both they live in a splendid manner. The duty of two per cent. on all the vessels that take their cargo on board at Tunis, which serves for their's and their officers salaries, is collected by a merchant of the greatest reputation, who passes his account every year before the consul, chancellor, and four other merchants.

S E C T. XXVII.

Of the Kingdom of TRIPOLI, or TRIPOLY, including BARCA. Its Situation and Extent; with a Description of the Gulph of Sidra.

THOUGH this state is tributary to the Porte, and under its protection, it assumes the name of a kingdom; the grand seignior being always fond of multiplying these titles, in order to swell the pomp and grandeur of his own. It receives its name from that of its metropolis, which is stiled New Tripoli, to distinguish it from a much more antient city in Phœnicia, which still retains its former name.

The kingdom of Tripoli, including the desert of Barca, and the rest of Barbary, is bounded on the east by Egypt, on the north by the Mediterranean sea, on the west by Tunis, and on the south by Nubia and unknown parts of Africa, extending from ten degrees thirty minutes to thirty

thirty degrees east longitude from London, which, with the windings of the coast, give it an extent of above twelve hundred miles in length: but as to its breadth from north to south, it varies very much, it extending in some places a hundred, and in others three hundred miles from north to south.

The coast affords no natural curiosity, except the gulph of Sidra, which has its name from a small island at the bottom of it. It was antiently called the Syrtis Magna, to distinguish it from a smaller one on the coast of Tunis, and its being more dangerous to mariners, from its drawing with greater violence, and the sands being deeper. But few rivers discharge themselves into it, and those are of no great note: nor are the Magra, Rufalmabas, Cafarnacar, and others, that empty themselves into the Mediterranean, of greater consequence, except their serving to nourish an infinite number of palm-trees by their being distributed into canals, without which it would be impossible for them to grow in the sandy deserts.

This country is at present divided into maritime and inland: the inhabitants of the former live chiefly upon commerce and the piratical trade, and the latter for the most part on plunder and robbery. Each of these divisions has some cities and towns, with a much larger number of villages, which lie chiefly scattered through the latter; but most of them are very poor and thinly inhabited, the country being almost every where sandy and barren. Indeed, all the cities and towns worthy of notice are situated along the coast. Of the most considerable of these we shall give some account, the rest being either gone to ruin, and entirely depopulated, or inhabited only by a few fishermen, people who burn lime, the makers of pot-ashes, and a few labourers, all reduced to extreme poverty through the exactions of the government, or the frequent depredations of the Arabs.

S E C T. XXVIII.

A Description of the City of Tripoly, or Tripoli, the Capital of the Kingdom; and particularly of an antient triumphal Arch in that City.

TRIPOLI, the metropolis of this kingdom, is situated in fourteen degrees thirty minutes east longitude from London, and in thirty-three degrees five minutes north latitude, and was once divided into two parts, the Old and the New. The former was the native place of the emperor Severus, and is supposed to have been built by the Romans; after which it was conquered by the Vandals, and at last destroyed by the Mahometans; since which time it has never recovered itself, or if it did, has been suffered to run to decay, and is now almost gone to ruin. The latter, which is situated at a small distance from it, is of no great extent; but is populous and in a flourishing condition. It stands on a sandy ground by the sea-shore, and is encompassed with high walls and strong ramparts, flanked with pyramidal towers, but has no ditch. It has only two gates, one on the south towards the country, and the other on the north fronting the sea, where the city spreads itself in the form of a crescent, near a spacious and commodious haven. The point to the east is little else besides a group of rocks, on which are to be seen some antient forts, which are now run to decay; but that to the westward is defended by a strong castle, encompassed with fortifications in the modern taste, and defended by some large cannon.

New Tripoli is supposed to have been built by the natives, who gave it the name of Tarabilis, or Trebilis, whence the Latins call it Tripolis. According to some authors it was formerly a place of very great trade, on account of its neighbourhood to Numidia, Tunis, and other considerable places; and was therefore resorted to by vessels from Malta, Venice, Sicily, Marseilles, and other ports, it having one of the most commodious havens along the whole coast till you come to Alexandria; and by this means it became so opulent, that it abounded with fine mosques, hospitals, and other public buildings, and being filled with rich merchants, excelled Tunis both in wealth and beauty. It now indeed retains but few traces of its antient splendour, it having little else

to invite the eye but the distant prospect; for the houses within the city are low and mean, dirty and irregular; yet it has some monuments, which remove all doubt of its having once made a much more noble appearance, particularly a triumphal arch, one half of which lies buried in the sand; but what is seen above it is a sufficient proof of its former grandeur.

This triumphal arch is the only antiquity to be met with in this country; and even this would have been long ago destroyed, had it not been for a tradition which passes among the inhabitants, that the very attempt to demolish it would infallibly be attended by some dreadful misfortune. In confirmation of this they shew a stone half loosened from the reel, and confidently assert, that a prince having begun to remove some of the stones, the workmen were as first frightened by a terrible earthquake; but still persisting in their work, in spite of this supernatural warning, they were all buried under a prodigious cloud of sand. It is probable some magnificent structure was erected near this elegant arch, since one cannot dig near it far under ground, without finding some of the largest pieces of marble that are any where to be met with.

The architecture and basso-relievos in this famous work are finely executed. The four corners of the building are supported by an equal number of pilasters adorned with vine leaves. Over each of the four gates is a triumphal chariot, in one of which is represented Alexander drawn by two sphinxes, with some slaves under it.

The inscriptions over the gates are all worn out, except one on the north side, which is still legible. The stones of this structure are all of fine marble, between five and six feet thick, and are fastened to each other by iron cramps, without either mortar or cement.

We need not, however, wonder at the decay of this city; as it labours under two great inconveniences; the first is the want of sweet water, here being neither rivers, springs, nor any other means of supplying it with that necessary element, but reservoirs for saving the rain; the second inconvenience is the great scarcity of corn, and the other produce of the earth, the city being surrounded for several miles together on the land-side with a dry sandy soil. This, some authors maintain, was formerly arable and fertile ground, that produced great abundance of corn and other grain, till being overflowed by the sea, it left those vast quantities of sand which now cover the whole surface of the earth, and render it incapable of producing any thing but palm trees, which are said to grow in great plenty, notwithstanding the barrenness and dryness of the soil, and yield the most delightful dates, which is a considerable part of their food; besides these they have the lotus, a fruit reckoned finer than dates; and as the natives make from it a most excellent wine, this plant serves them both for meat and drink.

Near the city walls is a famous burying-ground, in which are found coffins, urns, medals, and other curious relics of antiquity. The Franciscan friars have here a handsome church, convent, and hospital; the last of which is the more necessary, as the city is so often, and so severely, visited by the plague. Other orders of monks have been likewise settled there, but have since been obliged to abandon it. The country is, however, adorned with a multiplicity of handsome villas, the gardens of which are chiefly cultivated by Christian slaves. It is observable, with respect to those unhappy wretches, that there is only a very small number of them here, when compared with the many thousands in the cities of Algiers and Tunis, whence they are locked up at night in one single bagnio. The people just keep a sufficient number to cultivate their gardens and serve them in the lowest offices, and sell all the rest.

The people here carry on a great trade in linen cloth, great quantities of which are made by the inhabitants; but their chief dependance is on their corsairs, and those of other nations which resort to this city; they indeed keep only six or seven at most, yet these are so desperate and make such advantage of their situation, by being within reach of those merchant-ships which trade into Egypt, Italy, and the Archipelago, that they greatly infect those seas, and do much mischief.

S E C T. XXIX.

A Description of the Towns of El Hammah, Zara, or Zoara, and of the Towns and District of Derne and Mejrata.

EL Hammah, an antient town long gone to decay, is situated in thirty-four degrees, north latitude, and is only remarkable for its Roman walls of square stones, and some inscriptions mentioned by Leo Africanus and Dapper, but now so defaced as not to be read, and for its hot sulphureous springs, which are conveyed to it by an old aqueduct. It is now a poor miserable town, only inhabited by a few husbandmen and fishermen, and those who seek for a better livelihood from the piratical trade.

Zara, or Zoara, another ruinous town, encompassed by an old decayed wall, and seated near the sea, about thirteen leagues from the island of Jerba, or Jerbis. It is at present inhabited only by poor people, who live either by burning quick-lime and pot-ashes, or follow the piratical and fishing trade. All these stand on the eastern coast of the gulph of Sidra: those that are within it, and on its eastern side, are in a still more ruinous condition. What has most contributed to this and to the destruction of their piratical trade, on which, like their neighbours, they chiefly subsisted, is their being so near to the island of Malta; which being conveniently situated opposite to the coast, the knights of that island have constantly watched them, and, by suppressing their frequent excursions, oblige them to apply to fishing, and to cultivate as much land about those towns as will just serve them from hand to mouth.

The only place worthy of notice on the west side of the above gulph is Derne, now a small town. It stands about half a mile from the sea, and is surrounded with fine springs of sweet water, one of which runs through the town, and others round the walls, and therefore its territory is still capable of bearing corn and garden-stuff; but it is so poorly inhabited, that little advantage is obtained from it. This town is still the capital of a district of its own name, which extends from Cape Bomb on the east to the gulph of Bengasi, which is above three hundred miles; but is chiefly inhabited by wandering Arabs, who are said to amount to thirty thousand families, that pay a small tribute to the Bey of Tripoli. This tract is almost every where covered with a plant or shrub that bears a thick downy leaf, with branches of yellow flowers, and not only keeps green, but blossoms during the greatest part of the year. The bees chiefly feed upon this flower, which gives an excellent taste to their honey.

On the western side of the gulph of Sidra is also the district of Mejrata, which contains the country antiently called Cyrenaica and Pentapolis, from its then having five cities; but is now called Mejrata, from its capital. It has some towns and villages, both on the sea-side and within land, that trade with the Christians for European commodities, which they sell to the negroes, and exchange for slaves, musk, and civet, which they carry into Turkey. The inhabitants were formerly rich and warlike, impatient of the yoke of the Tuniseens, as they are now of that of the Tripolitans. They can muster about ten thousand men fit to bear arms, and are often at war with the Arabs.

The other countries within land are still more desert and void of towns; they are inhabited by much the same people with the two last mentioned, live after the same manner, and are perpetually endeavouring to free themselves from the tribute exacted from them. The land is for the most part dry, barren, and covered with such light sand, that one cannot travel through it without sometimes sinking into it above the middle; so that were it not for the abundance of dates that grow there, and for some mountains that afford pasture for their cattle, it would be impossible to subsist.

S E C T. XXX.

Of the Desert of Barca, its Situation and Extent, and the Manners of the Inhabitants.

THE desert of Barca, situated between Egypt and what is more properly called the kingdom of

Tripoli, is in breadth from north to south about thirty leagues; but its confines on the south side must be acknowledged to be very uncertain.

This country is for the most part, especially in the middle, nothing more than a tract of dry and barren sands, on which account the Arabs, its principal inhabitants, stile it The desert or road of whirlwinds. It almost every where labours under a great scarcity of water; and, except in the neighbourhood of the towns and villages, where the earth produces a small quantity of grain, as corn, millet, and some maize, the rest is in a manner uncultivated. Even of the small quantity of corn produced in the few spots capable of cultivation, the poor inhabitants are obliged to exchange a part with their indigent neighbours for dates, sheep, and camels; these last they stand in greater need of than they, on account of their great scarcity of grass, and other proper food.

The most desert and dangerous canton of all is that in which the temple of Jupiter Ammon antiently stood, which, though in other respects pleasantly situated, was encompassed a great way round with such quick and burning sands, as have always been detrimental to travellers, not only as they sink under their feet, but, being light and heated by the rays of the sun, are easily raised by every breath of wind, which, if it happens to be in their faces, almost burns out their eyes, and stifles them for want of breath; and, if vehement, often overwhelms whole caravans. The sad catastrophe of Cambyfes and his army in his bold attempt against that temple and oracle, as well as Alexander's more successful, though difficult expedition thither, are well known. Upon the whole, the country may be justly termed so wild a desert, that there is no travelling through it without the direction of the stars, or the help of a compass; and though it was once the thorough-fare for the caravans from Barbary to Mecca, yet it has been since so infested with wild Arabs, that those caravans are obliged to travel a hundred and fifty miles about to avoid being plundered.

Some of the French geographers divide the country of Barca into what they term the kingdom, and the desert; the former of which has some considerable ports, towns, and villages, and is under the protection of the Porte, and governed by a Cady who resides at Tripoli; but other authors call the coast, the eastern shore of Tripoli: it is, however, more commonly known by the name of Derne, from one of its most considerable towns and ports; besides which it has several others, and the ruins of many more, now reduced to poor villages; but what condition they are in, or by whom they are governed, is not known. Indeed the maritime towns are probably under the protection of the Porte; but whether under the government of the Basha of Tripoli or Egypt, or whether they have formed themselves into independent states, like those of Tunis and Algiers, is not easy to determine.

The inhabitants of the maritime towns are more civilized and conversable than those of the inland country, and have imbibed notions of humanity and justice, while the people who live in the desert appear in many respects savages, and, like other wild Arabs, subsist by robbery and plunder.

It was indeed by the Arabs that this tract, till then a continued barren desert, was first inhabited; these, at their first coming into it, settled in the best cantons; but as they multiplied, and the several tribes engaged in frequent wars against each other, the strongest drove the weakest out of the best spots, and sent them to wander in the desert parts, where they live in the most abject and miserable condition, the country yielding little food and no raiment. Hence they are represented as being the most disagreeable of all the Arabs, their bodies having scarcely any thing but skin and bones, their faces are meagre, their looks fierce and ravenous, and their garb, which is what they commonly take from the passengers and pilgrims who travel through those parts, is tattered with long wearing, while the poorest have scarcely a rag to wrap round their waists. It is no wonder that these are said to be the most resolute and expert robbers and plunderers; but both frequently yield them so miserable a harvest, that necessity forces them to make excursions as far as into Numidia, Libya, and other southern parts, to obtain fresh supplies. Hardened by indigence, they

they are said to commit the greatest cruelties on those that fall into their hands, making them drink warm milk, and then hanging them up by the feet, and shaking them in order to make them bring up any small coin they have swallowed, in order to conceal it from them; they even rake in their excrements, in hopes of finding something to recompense their trouble; it being usual for the merchants and pilgrims who travel through this desert, to take that method to save what small gold they carry about them; and whether any be found so concealed or not, they constantly strip them of all they have, even to the last rag of their cloaths.

SECT. XXXI.

Of the Government and Power of Tripoli: the Taxes laid on the Inhabitants, and their Commerce.

AS the government, laws, religion, and customs of Tripoli are nearly the same with those of Algiers and Tunis, we shall not tire our readers with a needless repetition of them. It is sufficient to observe, that the Beys of Tripoli are not mere titular vassals to the Porte, like the governments we have been describing, but are really under a kind of subjection, and pay an annual tribute to the Grand Seignior. This, joined to the other exigencies of the regency, the avarice of the Turkish Basha sent thither from Constantinople, and the general decay of commerce, obliges them to load the subjects with such heavy taxes and extortions, as hath reduced the greatest part of the people to the lowest degree of indigence.

The public revenues, like those of which we have already treated, arise chiefly from their corsairs, who are very few; and besides these they have only common small galleys, poorly manned and equipped. Another branch of the revenue arises from the duties on imports and exports, and from the taxes laid on the Jews, which are extremely high. These people are very numerous, and carry on the greatest share of the Italian commerce. The natives also, though ever so poor, must pay a part of the produce of their ground or other manufactures. The Moors and Arabs in the country are also heavily taxed, and among them the Bey sends his flying camp of janizaries, and sometimes goes himself at the head of them, to levy the impositions laid upon them: for both the Arabs and Moors are equally restive and impatient under the Turkish yoke, and are kept so poor, that nothing but force, and sometimes exemplary severity, can extort it from them.

The Bey, by receiving the protection of the Porte, still keeps up a kind of despotic power; for as he is generalissimo of all the forces, by appointing the officers who act in all capacities under him, he has obtained such an absolute power over the Divan, that it is now continued only as a matter of form, the members having nothing to do but to approve and ratify whatever he is pleased to lay before them; nor does the Porte, or its Basha, give themselves the least concern about the government; for, provided he does but punctually pay his tribute to the one, and satisfy the avarice of the other, they leave him to govern the rest in as arbitrary and tyrannical a manner as he chooses.

As to the commerce of Tripoli, it chiefly consists either of such slaves as are taken by their corsairs, or such as they traffic for with their neighbours; the greatest part of both they send into Turkey, where they can dispose of them to the best advantage. The next branch is that of ashes, which they buy from the Arabians, and sell to the Europeans to make glass and soap. The rest of their traffic is so inconsiderable as to be unworthy of notice.

It is observable, that the regency are here more scrupulous observers of their treaties with other nations, and punish the breach of them with greater severity than any of their neighbours: this punctuality, whether it proceeds from real probity, or a consciousness of their own weakness, is, nevertheless, of no small advantage to the navigation of the commercial nations.

SECT. XXXII.

Of the Manner of travelling in Barbary.

THE account of the manner of travelling through Barbary, as given us by the learned Dr. Shaw, will serve as a summary of the manners of the people, the climate, and state of the country.

In the several maritime towns of Barbary and the Levant, where British factories are established, our author was entertained with extraordinary marks of generosity and friendship, having the use not only of their houses, but of their horses, their janizaries, and servants. In the inland towns and villages there is generally a house set apart for the reception of strangers, with a proper officer to attend it, where persons are lodged and entertained for one night in the best manner the place will afford, at the expence of the community: but, except at these, and the places before-mentioned, there are no houses of entertainment throughout this extensive country; yet, were travellers to furnish themselves with tents, it would not only be attended with expence and trouble, but might raise the suspicion of the Arabs of their being persons of rank and fortune, and consequently too rich and tempting a booty to be suffered to escape. If, therefore, in the course of their travels they do not fall in with the hovels of the Kabyles, or the encampments of the Arabs, they can have nothing to protect them from the scorching heat of the sun by day, or the cold of the night, unless they have the happiness to find a grove of trees, the shelf of a rock, or a cave.

When they are so fortunate to find an encampment of the Arabs, they are entertained one night on free cost, and furnished with a sufficient quantity of provisions for themselves and their horses. Upon their arrival they are generally presented with a bowl of milk, and a basket of figs, dates, raisins, or other dried fruit; the master of the tent where they lodge then fetches them, according to the number of their company, either a kid, a goat, a sheep, or lamb, half of which is instantly boiled by his wife, and served up with cuscusu; and the rest is usually roasted, and served for their breakfast or dinner the next day.

But though the tents of the wandering Arabs may shelter them from the weather, they have their inconveniences; for, besides the fleas and lice, which are here in all their quarters, the apprehensions of being bit or stung by the viper, the scorpion, or the venomous spider, seldom fails, in some parts of these countries, to interrupt the repose so grateful to a weary traveller. They are no less disturbed by the calves, kids, and other young cattle, that are every night tied up in the tents, to prevent their sucking their dams; for the cords being generally made of loose spun yarn, they frequently break loose, and trample over them.

When they are entertained in a courteous manner, which is not always the case, they may highly please the master of the tent by giving him either a knife, a couple of flints, or a little English gunpowder; which being much stronger than theirs, they highly esteem, and keep it to serve as priming for their fire-arms; and the wife will return a thousand thanks for a pair of scissors, a skean of thread, or a large needle, which are extraordinary rarities.

Our author says, that during the excessive heats of summer, and particularly when they were afraid of meeting with a party of the Arab free-booters, they travelled in the night, which, according to an Arabian proverb, having no eyes, few of them dare venture abroad, from their not knowing into what dangers and ambuscades they may fall. Our travellers had then frequent reason to call to mind the words of the Psalmist. "Thou madest darkness that it may be night, wherein all the beasts of the forest do move; the lions roaring after their prey": for leopards, hyenas, and a variety of ravenous beasts then call to, and answer each other; the different sexes by this means, perhaps, finding out and corresponding with their mates; and these sounds

awfully

awfully breaking in upon the solitude, destroy the ideas of that safety they endeavoured to find by travelling at that season.

They did not always take stages of the same length; for while under the apprehension of danger, they travelled through all the bye-paths known to their conductors, sometimes for twelve or fifteen miles together, without resting; but an ordinary day's journey, exclusive of the time taken up in making observations, seldom exceeded eight or nine hours. They constantly rose at break of day, and setting forward with the sun, travelled till the middle of the afternoon, when they began to look out for the encampments of the Arabs, who, to prevent such parties coming to live upon them, choose such places as are least conspicuous: and, indeed, unless they discovered the smoke of their tents, and the barking of their dogs, or observed some of their flocks, it was with difficulty they were able to find them, and all their labour was frequently ineffectual. When they came up with them, they were accommodated as hath been already mentioned, for one night; and if in travelling the next day,

—— They chanc'd to find
A new repast, or an untattled spring,
They blest their stars, and thought it luxury.

ADDISON.

The best method to prevent falling into their hands, is for a traveller to be always dressed in the habit of the country; for the Arabs are jealous and inquisitive, suspecting every stranger to be a spy sent to take a survey of those lands, which they are taught to fear will one time or other be restored to the Christians.

S E C T. XXXIII.

Of the Bombardment of the City of Tripoli by the French; the Peace to which the Tripolitans were obliged to consent; and an Abstract of the Treaty which that Nation concluded with England.

THE bombardment of Tripoli being one of the latest and principal events in the history of that state, we shall here give it our readers, and shall add an abstract of the treaty of peace concluded between the Tripolitans and English; which will enable the reader to form a just idea of the footing on which the Tripolitans stand with the European and Christian powers, particularly England and France.

The dreadful execution we are going to mention was caused by a capture made by a Tripolitan corsair of a ship under French colours, and those people detaining a great number of French subjects in a state of slavery, upon the restitution of both which the French consul had in vain insisted. Lewis XIV. who was no less severe in punishing the breach of faith in others, than famous for his disregard to it himself, highly resented this treatment, and ordered all his captains who cruised in those seas to make reprisals.

Accordingly the marquis D'Anfreville, who was sent by commodore Du Quesne to convoy two prizes he had taken at the island of Hiero, on the north coast of Sicily, meeting with six vessels belonging to Tripoli, immediately attacked them; three of them, however, making all the sail they could, were so happy as to get out of the reach of his guns; while the other three venturing to stand the engagement, were at length much shattered, and glad to escape to the island of Chios, in order to refit.

Commodore Du Quesne, being informed of what had passed, followed them thither with a squadron of seven ships; but, before he began any hostilities, sent to acquaint the Aga who commanded in that place, "that he came as a friend, and had express orders to come in quest of some Tripolitan pirates, who, by the tenor of the treaties then in force, were stiled rebellious subjects, and given up to the just vengeance of the emperor of France." The Tripolitans, however, being at that time masters of the port and city, this specious

declaration did not meet with the favourable answer he expected; upon which drawing nearer to the place, he began to cannonade it with great fury. The Tripolitans, who were then employed in refitting their shattered vessels, swam with all possible haste to the two forts belonging to the town. Du Quesne tried in vain to enter the port, he being prevented by a strong floccado, which they had laid in his way. A furious combat ensued, which lasted three hours and a half, the castle all the while discharging their artillery at his squadron, which in their turn threw seven thousand bombs, few of which failed of making some execution, either on the Tripolitan ships or the city, where a great number of houses were either thrown down or much shattered, and many of the inhabitants killed or wounded. The next day the city sent to demand a parley, and promised either to oblige the Tripolitans to accept of a peace, or to drive them out of the port: but Du Quesne, instead of giving any answer to their proposals, removed farther off, in order to block up the corsairs more effectually.

This affair soon reached the Ottoman court, and the complaints made of it both to the Grand seignior and Divan, so greatly exasperated them against the French, that their ambassador at that court, who had express orders not to recede in the least from his masters pretensions, found it difficult to maintain his honour and interest, and was forced to make use of all his politics, bribes, and cabals, to prevent a rupture between the two crowns. But at length, after a long and strenuous contest, it was agreed,

That all the French slaves who had sailed from Constantinople, since the year 1681, either in Tripolitan corsairs, or other vessels, should be set at liberty.

That the ship of captain Cruvillier, which they had taken under the French flag, and carried to Chios, should be restored, with all its artillery, arms, rigging, &c.

That no Tripolitan ship should pretend to visit any trading vessels under French colours, in case they were provided with passports from the French admiral.

That all strangers on board any French vessel should pass free and unmolested; and likewise all Frenchmen who should be found on board any other vessel, even those of an enemy.

That no French prizes, or prisoners, should be sold in any port belonging to Tripoli; and that no corsair belonging to that kingdom should take any prize within a less distance than ten leagues of the French coast.

The Tripolitans, however, rejected these articles with the utmost indignation. This Lewis expected, and the next year, on the 1st of June, 1685, the marshal d'Etrees, vice-admiral of France, appeared before their capital at the head of his fleet, where being joined by the marquis of Anfreville and captain Netmond, they anchored within a league of the walls of the city, where they formed their line of battle. On the 22^d the bombardiers got all the mortars ready, while the shallops belonging to the men of war anchored within gun-shot of the town, and about eight at night began the attack. Mr. Tourville, who had the command, ordered three armed galleys before the port, to prevent any obstruction from the enemy. At about ten o'clock they began to throw some bombs into the place with great success, without any molestation from the Tripolitan sloops all that night, though they had kept a constant firing of their musquetry, the two foregoing nights, on the bombardiers, when they were at a farther distance. By six the next morning the French had thrown five hundred bombs into the place. They resumed the fire on the night following about midnight, and made such terrible execution, that they could see the spreading flames in several parts of the town, without receiving one shot from it; and the next day the marshal d'Etrees caused the port every where to be founded, in sight of all their fire, in order to discover a proper place for raising a fresh battery, which might destroy both the town and its fortifications. In the mean while some of the bombs falling on a place where the people were assembled, killed about thirty or forty of them, and threw the whole city into the utmost consternation, the people filling the air with the most dreadful cries. At length finding

finding the French bent on their destruction, they dispatched a herald to the marshal to obtain a peace upon his own terms. They chose for this purpose a venerable old man, aged ninety-four, who being introduced to the vice-admiral addressed him to the following effect: "I am the unfortunate Trik, the father-in-law of Baba Hassan, and was driven out of Algiers after I had reigned as Dey twenty-four years, and always behaved as a true friend to the French. I am now sent by the divan of Tripoli to know your demands, and to mediate a peace between you and them." The vice-admiral answered in terms that expressed his satisfaction, and having told him the motives that had induced the king his master to begin the war against the Tripolitans, proposed the most effectual means of putting an end to it, promising him, at the same time, a cessation of hostilities till the next day, that they might have time to determine on the articles that he should send them. Trik assured him that no time should be lost, the city being wholly inclined to peace; and leaving one of the principal members, who had accompanied him, as an hostage, returned with Mr. Raymond, a major of the French army, and Mr. La Croix, who was to serve as interpreter.

These met with a civil reception, and the next day the articles were read before the divan, the principal of which were that they should pay two hundred thousand crowns as an equivalent for all the captures they had made of French merchant-men, and that they should also restore all the Christian captives they had taken fighting under French colours. The first was greatly excepted against, on account of the impossibility of raising so large a sum; but, after some debates, they agreed to pay down five hundred thousand livres, and to release all the French captives. As to the money, they promised that one part of it should be sent that very night, and the remainder within twenty days. This term the vice-admiral reduced to fifteen, on condition of their furnishing his fleet with a daily supply of horned cattle for their maintenance, and that of the slaves. As to the Christian captives, they engaged to release two hundred of them, which they said were all they then had within the city and its neighbourhood; and as to the four hundred more which were then rowing in the seven galleys belonging to that state, and then in the service of the Grand Seigneur against the Venetians, they would send ten of their principal citizens as hostages for their release upon the return of those vessels.

An hundred and eighty of the former were accordingly restored the very next morning, with two other hostages for the remainder; but they raised several difficulties about the payment of the sum agreed on; yet not being able to obtain any abatement on any pretence, and being on the contrary threatened by the marshal with fresh showers of his destructive bombs, the Dey was under the necessity, not only of laying a tax on the citizens, but even of ordering the heads of five ring-leaders of the malcontents to be struck off. This execution, added to the admiral's menaces, struck such terror into the mutineers, that the next morning, when they had agreed to pay a hundred and fifty thousand livres, they brought in a small part of it in coin, and the rest in ingots, rings, bracelets, necklaces, gold chains, diamonds, pearls, and other jewels, which, they said, they were obliged to strip their wives of; and at the same time released a merchant-ship from Marseilles, which they had taken a little before. They did not, however, complete the payment of the stipulated sum till the ninth of July following, when they had stripped the Jewish synagogue of all its rich lamps, the finizaries of their mitred caps, their horses of their richest harness, and their grand standard of its gilt silver ball; the admiral protesting that he would not sign the peace till the sum was fully paid, and threatening the citizens with a fresh bombardment at every delay.

At length Mr. La Croix the interpreter, having translated the articles of peace into the Turkish language, went in and read them before the Dey and divan, where being solemnly signed and sealed, public notice was given of it by a double discharge of twenty-five cannon, the

one to express their joy, and the other to return thanks to the marshal d'Etrees for the services he had done the republic, which besides the above sum, exacted with such rigour, consisted in destroying a number of houses, and the death of three hundred persons buried under the ruins. The regency then begged that a consul might be appointed to reside at Tripoli, which was readily granted, and Mr. Martinel was nominated to that office. Upon his coming to the house appointed for his residence, the French flag was hoisted on the top of it, and saluted by a third discharge of the same number of cannon. Thus ended this dreadful expedition, to the great satisfaction of the French monarch and his trading subjects to those parts.

We shall conclude this account of Tripoli with a treaty of peace and commerce concluded by the regency of that piratical state with our vice-admiral Baker in the year 1716, in which the English are immediately concerned, especially the commercial part of the nation.

Articles of peace and commerce between his most sacred majesty George I. &c. and the most excellent Lords Mahamed Bey, Yusuf Dey, the divan, and the rest of the officers and people of the city and kingdom of Tripoli, renewed, concluded, and ratified, on the nineteenth of July, A. D. 1716, by John Baker, Esq; vice-admiral, &c.

I. That from this time forward, for ever, there shall be a true and inviolable peace between the most serene king of Great Britain and the most illustrious lords and governors of the city and kingdom of Tripoli, in Barbary; and therefore, if the ships and subjects of either party shall happen to meet at sea, or elsewhere, they shall shew all possible respect and friendship.

II. That all merchantships belonging to the dominions of Great Britain shall pay no more than three per cent. custom for all the goods they shall sell in this kingdom; and for those they shall not sell, they shall be permitted freely to take them again on board their ships, without paying any duty.

III. That all their ships and other vessels belonging to the subjects of Great Britain, and to the city and kingdom of Tripoli, shall freely pass the seas, and traffic where they please, without any search or molestation from each other; and that all persons and passengers of whatever country, and all money, goods, and merchandize belonging to any other people on board any of the said ships or vessels, shall be entirely free, and not stopped, taken, or plundered, or receive any damage from either party.

IV. That the ships of Tripoli meeting with any merchant ships or vessels of the subjects of the king of Great Britain, not being in any seas belonging to his majesty's dominions, may send on board one single boat with two fitters, who shall enter such merchant ships or vessels; and then, upon their producing to them a pass under the hand and seal of the commissioners of the admiralty, the said boat shall depart, and the vessels freely proceed on their voyage: and though the commanders of such merchant ships produce no such pass, yet if the major part of the ships or vessels company be subjects of the king of Great Britain, the boat shall immediately depart. And, on the other hand, if any of the ships of war or other vessels of his said majesty meet with any vessels belonging to Tripoli, and their commanders shall produce a pass signed by the governors of Tripoli, and a certificate from the English consul there; or if the major part of the vessels company be Turks, Moors, or slaves belonging to Tripoli, they shall be freely allowed to proceed on their voyage.

V. That no commander or other person of any ship or vessel of Tripoli shall take out of any vessel belonging to his majesty's subjects any person, or persons, to carry them to be examined, or upon any other pretence.

VI. That no ship belonging to the king of Great Britain, or to any of his subjects wrecked on any part of the coast belonging to Tripoli, shall become a prize; that neither the goods shall be seized, nor the men made slaves; but that all the subjects of Tripoli shall use their utmost endeavours to save the men and their effects.

VII. That

VII. That no vessel of Tripoli shall be delivered up or permitted to go to any other place at enmity with the king of Great Britain, to be made use of as a corsair against his majesty's subjects.

VIII. That if any vessel belonging to Tunis, Algiers, Tetuan, Sallee, or any other place at war with the king of Great Britain, bring any vessels belonging to his majesty's subjects to Tripoli, or to any port of that kingdom, the governors there shall not permit them to be sold within the territories of Tripoli.

IX. That if any of the king of Great Britain's subjects happen to die in Tripoli, or any of its territories, his goods or money shall not be seized, but shall remain with the English consul.

X. That neither the consul, nor any other British subject, shall be bound to pay the debts of any other subjects of Great Britain, unless they become surety for them by a public act.

XI. That the subjects of his Britannic majesty in Tripoli, or its territories, shall, in matters of controversy, be liable to no other jurisdiction but that of the Dey or Divan; except the difference be between themselves, in which case they shall be liable to no other determination than that of the consul.

XII. That if any subject of his Britannic majesty in any part of the kingdom of Tripoli shall happen to strike, wound, or kill a Turk or Moor, if he be taken, he shall be punished with no greater severity than a Turk for the like offence; but if he escape, neither the English consul, nor any other British subject, shall be in any manner questioned or troubled on that account.

XIII. That the English consul residing at Tripoli, shall always enjoy the entire freedom and safety of his person and estate, and shall be allowed to choose his own interpreter and broker. He may freely go on board any ship in the roads as often as he pleases; he may have the liberty of the country; he shall be allowed a place of worship, and no person shall injure him in word or deed.

XIV. That not only during the continuance of this peace and friendship, but also if any breach or war should hereafter happen between his Britannic majesty and the kingdom of Tripoli, the consul, and all the king of Great Britain's other subjects in the dominions of Tripoli, shall at all times have full and absolute liberty to depart, and to go into their own or any other country, in any ship or vessel they shall think fit; and to take with them all their effects, goods, families, and servants, though born in the country, without any molestation or hindrance.

XV. That no subject of his Britannic majesty while a passenger from, or to, any port, shall be molested, though he be in a ship or vessel at war with Tripoli.

XVI. That if any of his Britannic majesty's ships of war come to Tripoli, or to any other place of that kingdom with any prize, they shall have liberty to sell or dispose of it at pleasure, without any molestation. That these ships shall not be obliged to pay any customs whatever; and that if they shall want provisions, victuals, or any other things, they may freely buy them at the market-price.

XVII. That when any of his Britannic majesty's ships of war appear before Tripoli, upon notice given to the English consul, or by the commander to the chief governor of Tripoli, public proclamation shall be immediately made to secure the Christian captives, and if after that, any Christians escape on board any of those ships of war, they shall not be required back, nor shall the consul or commander, or any other British subject, be obliged to pay for those escaped Christians.

XVIII. That all the merchant ships coming to the city or kingdom of Tripoli, though not belonging to Great-Britain, may freely put themselves under the protection of the British consul in selling and disposing of their goods and merchandize, if they think proper, without any molestation.

XIX. That all British ships of war carrying his majesty's flag, upon their appearing before the city of Tripoli, shall be saluted with twenty-seven pieces of cannon fired from the castle, and that the ships shall return the same number.

XX. That no merchant ship belonging to Great-Britain, or to any other nation, under the protection of the British consul, shall be detained in the port of Tripoli, and hindered from proceeding to sea longer than three days, under the pretence of arming the ships of war of this government, or any other pretence whatsoever.

XXI. That no British subject shall be permitted to turn Mahometan in the city and kingdom of Tripoli, unless he voluntarily appears before the Dey or Governor, with the English consul's interpreter, thrice in twenty-four hours, and every time declares his resolution to become Mahometan.

XXII. That his Britannic Majesty's consul residing in Tripoli, shall at all times have liberty to put up the British flag on the top of his house, and to continue it there displayed as long as he pleases; and the British consul shall have the like liberty of putting up and displaying that flag in his boat when he passes on the water, and no man is to disturb, oppose, or injure him in doing it.

XXIII. That from this time forward for ever, the island of Minorca, and the city of Gibraltar, shall be esteemed in every respect by the government of Tripoli a part of his Britannic majesty's dominions, and the inhabitants thereof shall be deemed his natural subjects, as if they had been born in Great-Britain; and they with their ships carrying British colours, shall be permitted freely to trade in any part of the kingdom of Tripoli; and shall pass without any molestation, either on the seas or otherwise, in the same manner, and with the same freedom and privileges, as have been stipulated in this and all former treaties in behalf of the British nation and subjects.

XXIV. And whereas in the treaty concluded in the reign of king Charles II. in the year 1676, by Sir John Narborough, an article was inserted, by which the ships of Tripoli were excluded cruising before or in sight of the port of Tangier, which then belonged to his majesty, it is now ratified and concluded, that none of the ships or vessels belonging to Tripoli shall cruize, or look for prizes, before, or in sight of Gibraltar, and the island of Minorca, to disturb or molest their commerce in any manner whatsoever.

XXV. That all and every article in this treaty, shall be inviolably kept and observed between his sacred British majesty, and the most illustrious lords, &c. of the city and kingdom of Tripoli; and all other matters, not particularly expressed in this treaty, and provided for in any former, shall still remain in full force, and shall be esteemed the same as if inserted here.

Dated in the presence of Almighty God, in the city of Tripoli, on the nineteenth of June, 1716 of the Christian era, and of the Mahometan Hejira 1128.

The same year a treaty of peace was concluded with Tunis to the same purpose; only there are one or two articles of a different nature, particularly the following, which is worthy of notice.

It is agreed, concluded, and established, that at whatsoever time it shall please the government of Tunis to reduce the customs of the French to less than they pay at present, it shall always be observed, that the British customs shall be two per cent. less than any agreement that shall for the future be made by the French, or than shall be paid by the subjects of France.

And that in case any British ship or ships shall import into that kingdom of Tunis any naval or warlike stores, or any kind of provisions, they shall pay no duty or custom whatsoever.

We have only to add, that, with respect to Barbary in general, all that country capable of cultivation, was once extremely populous. Carthage, the rival of Rome, acquired immense wealth by commerce, and planted different nations. Its wars and its destruction form a remarkable period in history.

This extensive country, where Christianity is now despised, and its professors taken captive by the Mahometan pirates, and reduced to the lowest degree of slavery,

was once Christian. Indeed it early embraced Christianity; and in the third and fourth centuries there were several hundred bishoprics, of which the archbishop of Carthage was primate, and the celebrated St. Cyprian, Tertulian, St. Austin, and many others celebrated in ecclesiastical history, adorned this church.

SECT. XXXIV.

Of the Revolutions of Barbary in general, concluding with Reflections on those pyratel States.

WE shall conclude this account of Barbary with a concise history of the states on the coast, and some reflections on their pyratel trade, extracted from the Modern Universal History.

The coast of Barbary was probably first planted by the Egyptians. The Phenicians afterwards sent colonies thither, and built Utica and Carthage. The Carthaginians soon became powerful and wealthy by trade, and finding the country divided into a great many little kingdoms and states, either subdued or made the princes on that coast their tributaries, who being weary of their yoke, were glad of the opportunity of assisting the Romans in subduing Carthage. The Romans remained sovereigns of the coast of Barbary, till the Vandals, in the fifth century, reduced it under their dominion.

The Roman, or rather the Grecian emperors, having some time after recovered the coast of Barbary from the Vandals, it remained under their dominion till the Saracen caliphs, the successors of Mahomet, made an entire conquest of all the north of Africa in the seventh century, and divided the country among their chiefs, of whom the sovereign of Morocco was the most considerable, possessing the north-west part of that country, which in the Roman division obtained the name of Mauritania Tingitana, from Tingis or Tangir, the capital, and is now stiled the empire of Morocco, comprehending the kingdoms or provinces of Fez and Morocco. The emperors of these territories are almost always at war with the Spaniards and Portuguese. In the eighth century their ancestors made a conquest of the greatest part of Spain; but after the loss of Granada, which happened about the year 1492, they were dispossessed of this country; and Ferdinand and Isabella, who were then upon the throne of Spain, obliged them to renounce their religion, or transport themselves to the coast of Africa. Those who made choice of the alternative of going into exile, to revenge themselves on the Spaniards, and supply their necessities, confederated with the Mahometan princes on the coast of Barbary, and having fitted out little fleets of cruising vessels, took all the Spanish merchant ships they met with at sea, and being well acquainted with the country, landed in Spain, and brought away multitudes of Spaniards, and made slaves of them. The Spaniards hereupon assembled a fleet of men of war, invaded Barbary, and having taken Oran, and many other places on the coast of Algiers, were in a fair way of making an entire conquest of that country. In this distress the African princes applied to that famous Turkish rover, Barbarossa, desiring his assistance against the Christians. He very readily complied with their request, but had no sooner repulsed their enemies, than he usurped the government of Algiers, and treated the people who called him in as slaves; as his brother Heyradin Barbarossa afterwards did the people of Tunis; and a third obtained the government of Tripoli by the like means. In these usurpations they were supported by the Grand Seignior, who claimed the sovereignty of the whole coast, and for some time they were esteemed the subjects of Turkey, and governed by Turkish bashas, or viceroys; but each of these states, or rather the military men, at length took upon them to elect a sovereign out of their own body, and render themselves independent of the Turkish empire. The Grand Seignior has not now so much as a basha or officer at Algiers; but the Dey acts as an absolute prince, and is only liable to be deposed by the soldiery that advanced him. At Tunis and Tripoli he has still bashas, who are some check upon the Deys, and have

a small tribute paid them. All of them, however, in case of emergency, claim the protection of the Ottoman court, and they still continue to prey upon the Spaniards, having never been at peace with them since the loss of Granada. They make prize also of all other Christian ships that have Spanish goods or passengers on board, and indeed of all others that are not at peace with them. The Turks of Algiers, Tunis, and Tripoli, are an abandoned race, consisting of pyrates, banditti, and the very refuse of Turkey, who have been forced to leave their several countries to avoid the punishment of their crimes.

The Mahometans, wherever they are established, especially those of them who partake of the genius and disposition of the Turks, have very little inclination to the arts of industry. This evidently appears in the inhabitants of those parts we have been now describing on the African sea-coast. Being a rapacious and tyrannical people, disdaining all industry and labour, neglecting all culture and improvement, it made them thieves and robbers, as naturally as idleness makes beggars; and, being trained to rapine and spoil, when they were no longer able to plunder and destroy the fruitful plains of Valentia, Granada, and Andalusia, they fell to roving upon the sea. They built ships, or rather seized them from others, and ravaged the neighbouring coasts, landing in the night, surprising, and carrying away the poor country people out of their beds into slavery. This was their first occupation, and this naturally made pyrates of them; for, not being content with mere landing and plundering the sea-coasts of Spain, by degrees, being grown powerful and rich, and made bold and audacious by their success, they armed their ships, and began to attack, first the Spaniards upon the high seas, and then all the Christian nations in Europe, wherever they could find them. Thus this detestable practice of roving and robbing began. What magnitude they are since arrived to, what mischief they have brought upon the trading part of the world, how powerful they are grown, and how they are erected into states and governments, nay, into kingdoms, and, as they would be called, empires; for the kings of Fez and Morocco call themselves emperors, and how they are, to the disgrace of all Christian powers, treated with as such, is well known from the histories of those nations who have been at any time embroiled with them.

The first Christian prince, who, resenting the insolence of these barbarians, and disdaining to make peace with them, resolved their destruction, was the emperor Charles V. he was moved with a generous compassion for the many thousands of miserable Christians who were, at that time, kept among them in slavery; and, from a benevolent principle of setting the Christian world free from the terror of such barbarians, he undertook singly and without the assistance of any other nation, to fall upon them with all his power. In this war, had he been joined by the French and English, and the Hans-towns, (as for the Dutch they were not then a nation) he might have cleared the country; at least, he might have cleared the sea-coasts of the whole race, and have planted colonies of Christians in all the ports, for the encouragement of commerce, and for the safety of all the European nations. But Francis I. king of France, his mortal and constant enemy, envied him the glory of the greatest and best enterprize that was ever projected in Europe; an enterprize a thousand times beyond all the crusades and expeditions to the Holy Land, which, during a hundred and twenty years, cost Europe, and to no purpose, a million of lives and immense treasure. Though the emperor was assisted by no one prince in Christendom, the pope excepted, (and his artillery would not go far in battering down stone-walls) yet he took the fortress of Goletta, and afterwards the city, and the whole kingdom of Tunis; and, had he kept possession, it might have proved a happy fore-runner of farther conquests; but, miscarrying in his attempt against Algier, and a terrible storm falling upon his fleet, any farther attempt was laid aside, and the kingdom of Tunis returned to its former possessors, by which means their pyracies are still continued.

There seems, therefore, to be a necessity, that all the powers of Europe, especially the maritime, should endeavour

vour to free themselves from the insolence of these rovers. that their subjects may thereby be protected in their persons and goods from the hands of rapine and violence, their coasts secured from insults and descents, and their ships from capture on the sea. The conquest could not be attended with any great difficulty, if the English, Dutch French, and Spaniards would unite, to join their forces and fleets, and fall upon them in separate bodies, and in several places at the same time. The general benefit of commerce would immediately follow, by settling the government of the sea-coast towns in the hands and possession of the several united powers; so that every one should possess them, in proportion to the forces employed in the conquering them; the consequence of the success would soon be sensibly felt by the interested parties? for if the quantity of productions fitted for the use of merchandize be so considerable as we find it to be, even now, under the indolence and sloth of the most barbarous people in the world, how may we suppose all those valuable things to be increased by the industry and application of the diligent Europeans, especially the English, French, or Dutch? We might also reasonably suppose, that the Moors, being in consequence of such a conquest driven up farther

into the country, and being obliged to seek their subsistence by honest labour and application, would at length be induced to increase the product, and, as multitudes of Christians would be encouraged, by the advantages of the place, to go over and settle upon it, the manufactures and merchandize of Europe must soon find a great additional consumption; and the many new ports and harbors where those Christian nations might settle, would be so many new markets for the sale of those manufactures, where they had little or no sale or consumption before. Besides, would not the success be delivering Europe from the depredations of powerful thieves, and their commerce and navigation from the rapine of a merciless crew, who are the ruin of thousands of families, and, in some sense the reproach of Christendom? Such measures as these are far from being impracticable; they are worthy of being undertaken by the princes and powers of Europe, and would therefore, bring infinitely more glory to the Christian name, than all their intestine wars among each other, which are the scandal of Europe, and the only thing that, at first, let in the Turks and other barbarians among them.
